Digital Flexo Suite for Flexible Packaging and Labels 23.11

85
85
86
86

System Requirements

The following minimum requirements must be met:

- Intel Dual Core 2 processor
- 8 GB RAM
- Network board
- screen resolution of 1,280 x 1,024 pixels
- Microsoft Windows 7 64bit
- disabled firewall
- disabled UAC (User Account Control)
- Grapholas 14 on the CDI
- Grapholas 20.1.4 for "PlateID"

The following configuration is recommended:

- Intel i9 processor
- 16 GB RAM
- Hard drives: 512 GB SSD
- 1 GB network board
- Microsoft Windows 11 64 bit
- disabled firewall and user account control (UAC)
- Grapholas 23.11 on the CDI

Windows Service and Ports

The service for the "Digital Flexo Suite" is started automatically.

The following programs must be enabled:

- gravurd
- cmotsim
- cdid

The Digital Flexo Suite Service "bsl_cdisvc / Esko DFS" and an http server "bsl_http / Esko HTTP" are installed to allow communication with the CDI.

The following ports are used for communication with the CDI:

- Port 5542: gravurd (TCP)
- Port 5543: cmot (TCP)
- Port 5544: cdid (TCP)
- Port 5544: cdid (UDP)
- Port 5580: http server (TCP)

In the firewall, these ports (in/out) must be released on the DFS as well as on the CDI.

First Start-up of the Software

LEN and TIF files are prepared for exposure on a CDI using the "Merger". It positions the images on the printing plate, and can also rotate, mirror, crop and invert the images as required.

Several CDIs can be controlled via the network simultaneously.

"XL CUT" generates cutting files so that the generated plate can be cut automatically on the Kongsberg table.

"Staggered Cut" (option) creates a user-defined cutting shape which then can be cut using "XL-CUT".

The "Viewer" is used for viewing and measuring the Len/TIF files. The angle and the rasterization can also be measured.

"iMask" (option) adds an adjustable frame to the output data and creates an additional LEN or TIF file.

"Lenticular" (option) adjusts the width of the job to adapt the data to the lens system for creating 3D images.

All important settings are copied over during an update. When the software is being installed for the first time, the output devices must be set up and the network settings must be set.

Entering the License Key

During initial installation or when updating from an older version, the license key must be entered to start the "*Merger*":

Warning	
	📓 License 🛛 🗙
Your copy of Grapholas has an invalid license. Do you want to register now ?	ProductID: 55YCD-02WJR-RR8ME-ERUH4-8RG7T
	Serial Number:
OK Cancel	

The ESKO-Service provides a serial number for this "*ProductID*" which needs to be entered in the "*Serial Number*" field and confirmed by ENTER. The license can be subsequently changed with the "*New License*" program in the Windows Start Menu under "Esko - Digital Flexo Suite - System".

Setting the Language

The language can be changed in the Windows start menu under "ESKO – Digital Flexo Suite - System – UI Language":

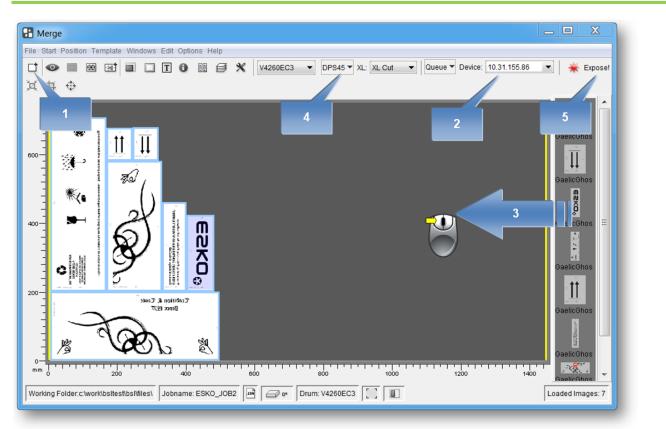

💩 Grapholas Language Selection	German
Language Selection Tool	English
	French
Sprache German 🗸	Spanish
	Dutch
	Italian
	Japanese
OK Abbrechen	Simplified Chinese
	Traditional Chinese

Merger

The "Merger" is used to load the image data from the local hard drive or from the network and to send it to the preselected CDI.

In addition, simple tools such as "mirror", "crop" and "rotate" are available. A description on how to use the functions "XL CUT" and "Staggered Cut" is provided in the chapters of the same name.

Quick Start

- 1 Start the Merger and load the required images. They are displayed in the image gallery (on the right).
- 2 If necessary, select the CDI or the TIF output device. All important parameters are updated in the Merger.
- 3 Position the images on the working surface. Click on the images or the working surface with the right mouse button to display additional information.
- 4 Select the required plate. Right-click on the plate to display additional information.
- 5 Send the job to the CDI or the TIF output device.

The User Interface

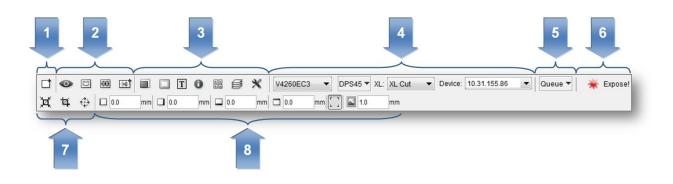

The Merger can be divided into four areas:

	B Merge	_ O X
	File Start Position Template Windows Edit Options Help	
1	🗋 👁 📰 🖼 🔜 🔲 T 🚯 🏭 🎒 🛠 V4260EC3 🗸 DPS45 🛪 XL: XL Cut 💌 Queue 🕶 Device: 10.31.155.86	💌 🌟 Expose!

4	Working Folder:c:\work\bsltest\bsltist\files\ Jobname: ESKO_JOB2 iii Core Drum: V4260EC3 iii Iii	Loaded Images: 7

- Area 1: menu bar / toolbar with icons for the most important options
- Area 2: working surface on which the images are positioned
- Area 3: display of loaded image data
- Area 4: status bar display of the most important settings

Toolbar

All important functions are listed in this area. The toolbar is subdivided into seven areas:

- 1 Opens a dialog box to load the image files.
- 2 Opens additional functions such as "Bitmap Viewer" and "Staggered Cut".
- 3 Activates additional functions in area 7 to adapt the output.
- 4 Allows to set the data output, for example, the drum, the plate, the Kongsberg cutting file and the CDI.
- 5 Opens an overview of the jobs lined up on the selected CDI.
- 6 Opens a dialog box to send the job to the CDI or to the TIF output device.
- 7 Allows to modify the image data, for example, rotating and cutting.
- 8 Area for the various functions selected in area 3.

If some required functions are not displayed, they can be activated in the Merger configuration settings.

Loading Images

Ctrl + E

calls up a file dialogue box in which the LEN or TIF files can be selected.

files Esko_Testfiles\		
Working Folder: d.\bsitest\DFS75/files\work	٨	
	Files:	
_	20001 J.201, Britema ini 20001 J.201, Britema ini 20001 J.201, Britema ini 20001 J.201, Britema ini 20001 J.2001 Antoneo ini Testim, JOCO, 20001 Antoneo Festim, JOCO, 20001 Antoneo Festim, JOCO, 20001 Antoneo Antoneo ini Alta Antoneo ini Alta A	
File Name:		
2100DPI_124LPI_Reference.ien	1 4	
	4	

- 1 Selection of network shares.
- 2 Display of directories.
- 3 Display of files. By pressing the "*Control*" or the CAPS button together with the left mouse button, several files can be marked simultaneously; they can then be loaded by pressing "*OK*". Single files can directly be loaded by double-clicking them.

4Multiple loading of the files.

Displaying and Modifying Image Data

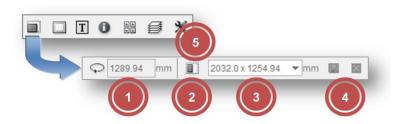

1 Opens the "Bitmap Viewer".

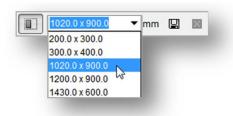

Several files can be marked simultaneously by pressing the "Control" button together with the left mouse button to view these files, each superimposed on top of the other, in the "Viewer".

- 2 "Staggered Cut" (option) Opens a new window to create user-defined cutting lines. "PlatePatcher" and "Plato Staggered Cut" files cannot be edited.
- 3 "Line Editor" (option) Opens a new window in which the cutting lines can be created manually. "PlatePatcher" and "Plato Staggered Cut" files cannot be edited.

Plate Size and Partial Plate

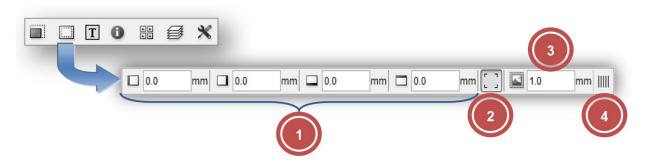

- 1 Display of the drum circumference This value can be changed for sleeves.
- 2 Switchover to partial plate In this mode, the vacuum on the CDI is not analysed and is reduced to a lower, safer speed.
- 3 Allows to set the plate width and plate height in partial plate mode. The data is entered in the format 'width x height' (e.g. 768 x 500).
- 4 Save the newly entered entry or delete an entry from the existing list:

Digital Flexo Suite for Flexible Packaging and Labels 23.11

Frames and Cutting Lines

- 1 Allows to enter a frame area which is not available for the imaging process. The area is marked red.
- 2 If activated, cut marks are added in the corners of each image.
- 3 Distance between cut marks and image.
- 4 Expose the right plate frame for the CCC workflow.

Adding Text

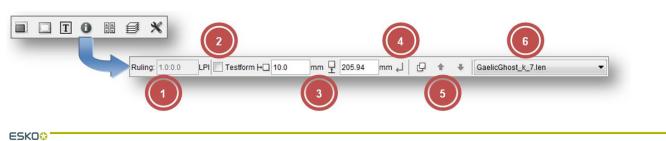

- 1 Add text to or delete from all positioned images. A frame is automatically added to all images.
- 2 Allows to switch the position (top or left).
- 3 Selection of the text size.
- 4 Input field for the text. The text should not be longer than the image width or height. The position and width of the text is marked in yellow on the working surface. A frame is automatically added to all images.

The text can be deleted by clicking on the "X" at the end of the input field.

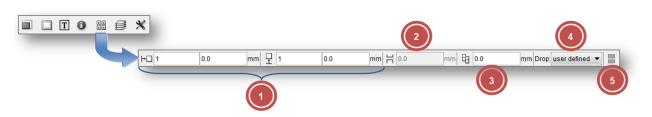

5 Addition of an image name together with a date and time stamp.

Information on Grids and Image Position

- 1A llows to enter the raster count and the angle if they have not yet been included in the image. Images without this information are marked in red on the work surface.
- 2 Allows to mark an image as a test wedge. For this image, the output optimisation function is deactivated to increase productivity. If these two fields are highlighted in grey then they are irrelevant for the selected CDI.
- 3 Allows to display and change the current image position.
- 4 Confirmation of the changed image position. The image is not positioned until the changed image position is confirmed.
- 5 Activation of the overlaying option. The images can be positioned on top of each other. Using the arrows, the selected image can be positioned above or below another image.
- 6 Allows to display and change the image to make further changes.

"Step & Repeat" and Seamless Option for Sleeves

- 1 Allows to enter the number of repetitions in horizontal and vertical direction. It is possible to set a gap between the images.
- 2 Displacement of the image above the zero point of the sleeve (5 activated).
- 3 Offset of the images to each other when horizontal repetition is selected (5 activated).
- 4 Predefined offset of the images to each other (5 activated).
- 5 Activates the seamless option. If the image is smaller than the circumference, a gap will be automatically added and repeated in vertical direction if possible.

"PreMount" Output

To ensure the dimensional accuracy and the focus on the CDI for "*PreMount*" output, the thickness of the glued materials must be specified.

1 thickness of the mounting film

- 2 thickness of the adhesive tape
- 3 thickness of the support such as, for example, an "airbag"

The thickness of the mounting film, of the adhesive tape and of the support can be changed by selecting the "Premount Support" function in the "Edit" menu:

Should one entry no longer be required, select this entry and remove the value by pressing the Delete key on the keyboard.

New entries are entered in the desired field using the keyboard and confirmed by pressing the Enter key. The values are automatically sorted.

If the value "0" is entered in a field, this field will not be displayed in the Merger.

Mirroring, Inverting, Lenticular, iMask

If this icon is not displayed, it can be displayed by selecting "Image Manipulation" under *"Options - Configuration"*.

- 1 Allows to mirror (horizontally or vertically) and invert the selected image. "ymir", "xmir" or "inv" is added to the new files.
- 2 "Lenticular" output settings. For more information, refer to chapter "Lenticular".
- 3 "iMask" output. For more information, refer to chapter "iMask" Output.

Output Options

- 1 Selection of the drum on the CDI. This option is only shown if more than one drum or the drum and the sleeve have been set up on the CDI.
- 2 Selection of the plate. To ensure an optimum imaging result, the right plate needs to be selected. Additional information such as "UV Inline" and "Full HD Flexo" is stored on the plate.

Normal plates are marked with a circle and Inline UV plates are marked with a square.

Plate Type:	DFH 1.14 (045)		
• • • other	Thickness:	1.14	mm
O AFP-DSF 1.14 (045)	Job Type:	PLATE	
AFP-DSF 1.70 (067)	Energy	3.2	J/sqcm
DEC 5.51 (217)	UV Main Exposure:	360	sec
	UV Main Energy:	22	mW/sqcm
DFH635			

Using the right mouse button to click the plate entry displays information on the plate properties.

Only the plate types which fit the selected drum are displayed.

For more information, refer to chapter "Managing the Plate List".

3 Selection of the required Kongsberg settings. If activated, a yellow bar is visible on the left or on the bottom in the Merger.

The cutting file for the Kongsberg is stored in the directory which was selected for this setting.

For more information, refer to chapter "Kongsberg Output (XL CUT)".

4 Selection of the output device. CDIs and TIF output devices are listed separately.

Sending a Job to CDI or Creating a TIF File

Ctrl + E

opens a dialogue window in which the job name can be entered. By pressing "*OK*", the job is sent to the CDI or a TIF file is created in the output directory.

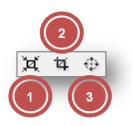

Displaying the Job List of the CDI

displays the job list of the connected CDI. In the "Action" column, the job can be deleted by clicking on the cross. The job status is displayed in the "Status" column. An explanation of the icons can be found in the "Grapholas" user manual.

Jobname	Plate	Status:	Action	
ESKO_JOB1	DPN 1.14 (045)	•	×	
ESKO_JOB2	DPR 1.14 (045)	•		
ESKO_JOB3	DWF95	•	×

ESKO_JOB5	FAC_550	•	×	
ESKO_JOB6	DFM 1.14 (045)	•	×	
ESKO_JOB7	DFM 1.14 (045)	•	×	
ESKO_JOB8	DPN 1.14 (045)	•	×	
ESKO_JOB9	DPN 1.14 (045)	•	×	
ESKO_JOB10	DFH_67	•	×	
ESKO_JOB11	DFH 67	•	×	

Cropping and Rotating Images

1 Automatic cropping of the selected images. Unused frame areas are removed.

Right-click the icon to undo the changes.

The distance to the "Bleed" pixels can be set in the Merger properties. If the image contains "Staggered Cut" information, the image is cut on the cutting line.

- 2 Opens a new window in which the image can be cut. For more information, refer to chapter *"Manual Cropping"*.
- 3 Rotates the selected images by 90°. The rotated files are generated when sending the data to the output device. Depending on the resolution, this may take some time.

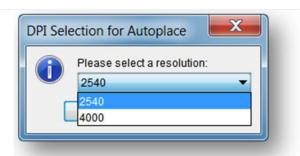

Automatic Positioning of the Images

The images loaded in the Merger can be automatically positioned.

Use the key combination Ctrl + a to reposition all images automatically. Images which were already positioned on the working surface are removed.

Use the key combination *Ctrl* + *h* to position all non-positioned images automatically. Already positioned images are **not** removed.

When more than one image was marked (*Ctrl* + *left mouse button*), only these images are used for automatic positioning.

Images with different resolutions cannot be sent on one plate to the CDI. When multiple resolutions are available for the automatic positioning, a selection is displayed.

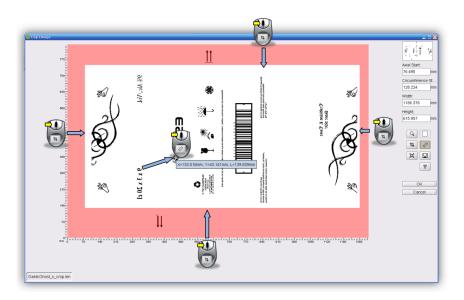

Only the images with the selected resolution are then positioned.

You can define in the basic settings of the Merger how to position the images. If the images are to be subsequently cut by hand, then the cut-optimised positioning method is a good choice.

Manual Cropping

Þ

opens a new window in which the image can be cropped:

Þ

Starting from the frame area, a lasso can be pulled open by pressing and holding down the left mouse button and pulling the mouse across the work surface; or the exact lasso size can be entered in the four input fields on the right-hand side (1).

The distance between two positions in the image can be measured by pressing and holding the left mouse button down.

Digital Flexo Suite for Flexible Packaging and Labels 23.11

0

Individual sections of the image can be enlarged with a square magnifier by pressing and holding down the left mouse button and pulling the mouse across the section of interest. The magnified image section can then be positioned using the arrow keys on the keyboard.

displays the entire image.

performs the automatic cropping.

Ľ.

sets back all cutting edges.

saves the current image section as a new LEN file.

Manual cropping is not available for LEN files of the "PlatePatcher" and the "Staggered Cut".

Menu Bar

Only the additional functions which are not listed in the toolbar are described. The menu bar is situated above the toolbar.

Unloading Images

"File - Unload Image" (Ctrl + u) removes the selected image from the "Merger". The file is not deleted from the hard drive.

Unloading Positioned Images

"File - Remove All Positioned Images" (Ctrl + d) removes all images from the "Merger" which are positioned on the working surface. The files are not deleted from the hard drive. This is useful when the job was sent and several images are still in the queue.

Select Working Folder...

"File - Select Working Folder" (Ctrl + w) changes the working directory in which all images are copied or moved during the loading process. This option is not available if images are loaded.

Saving the Image Arrangement

"File - Save Plate" (Ctrl + s) saves the compilation and the exposure parameters as plate. When the compiled images are sent to the CDI, the plate is automatically saved under the entered name.

"File - Save Plate as" saves the compilation under another name.

Loading the Image Arrangement

"*File - Load Plate*" (*Ctrl + L*) loads a previously saved or sent compilation with all parameters. All currently loaded images are removed.

Deleting the Image Arrangement

"File - New Plate" (Ctrl + n) removes all images from the "Merger" and resets the parameters.

Automatic Positioning of the Images

"Position - Auto Arrange Images" (Ctrl + a) automatically positions as many loaded images as possible on the working surface. Beforehand, images which were already positioned on the work surface are removed. The type of positioning can be selected in the Merger properties.

automatically position new images

"Position - Auto Arrange New Images" (Ctrl + h) automatically adds the loaded images to the compilation on the working surface. Already positioned images are not removed.

Removing Images from the Working Surface

"Position - Unplace all" (Ctrl + u) removes all images from the working surface. The images are not unloaded.

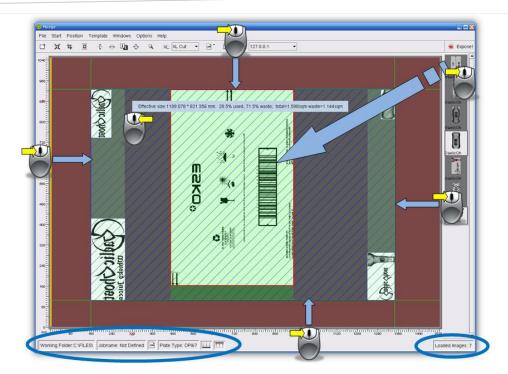

Displaying File Names

"Windows - Display Names" shows the file names in the images positioned on the working surface.

Working Surface and Status Bar

The working surface shows the available area on the plate. It is not necessary to enter the upper and lower borders as the entire working area is shown.

The loaded images are pulled from the right queue on the working surface by holding down the left mouse button.

In addition, guides can be pulled from the grey frame area by holding down the left mouse button. The images cannot be positioned in the red area. The guide can be removed again by clicking with the right mouse button on the grey frame area.

Using the right mouse button to click the image file displays information on the image.

The status bar shows the current settings and the number of loaded images.

Displaying Plate Use

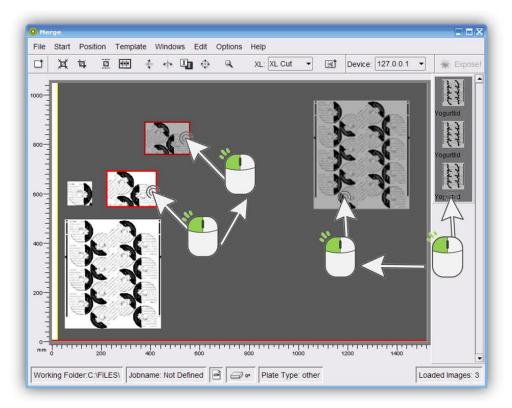

Using the right mouse button to click on the work surface displays information on the plate size and the use of the plate.

	Width: [mm]	Height [mm]	Used [%]	Waste [%]	Used [sqm]	Waste [sqm]
Partial Plate	947.744	277.462	49.4	50.6	0.263	0.133
Full Plate	1000.0	800.0	16.2	83.8	0.8	0.67

The line "Partial Plate" shows the values for the marked area. The line "Full Plate" refers to the entire work area.

Multiplying Images

An image can be multiplied by holding down "Ctrl" on the keyboard and pressing the left-hand mouse button:

This is possible on both the working surface and from the image gallery (right).

Manage Plate List

"*Edit – Edit Plate List*" opens a new window in which new disks can be created, changed and deleted.

Select medium

The possible media are displayed at the top of the disk list editor. Only the entries for the corresponding medium are displayed:

Create a new plate entry

Generel

Modify Plate		×
Plate Name DEC 3.94 (155) Plate Settings		
General Imaging Inline UV XPS Automation	Brand DEC 3.94 (155) Plate DEC 3.94 (155)	
PlateID Content	Thickness 3.94 mm Distortion 0 % Laser Energy 3.2 //cm ²	

"Name" determines the display name in the disk list and "Thickness" determines the plate thickness. For sleeves, enter the "Circumference" field:

In addition, the output in the Distortion field can be distorted in the circumferential direction. The input is made in percent. Entering "5.0" would increase the output by 5 percent in the scope direction. The input "-5.0" would reduce the output accordingly.

With "Laser Energy" the energy density is adjusted, at which speed and power are automatically selected.

Imaging

Modify Plate	;
Plate Name DEC 3.94 (155)	
Plate Settings	
General Imaging Inline UV XPS Automation PlateID Content	Imaging Technology Select at least one imaging technology Allow Standard Selection
	Boost Values Microscreen 0 Groovy 0
	Save Cancel

The red dot appears if no imaging type "Imaging Technology" is set.

With "Allow Standard Selection" the normal imaging method of the CDI is used, which helps to avoid moiré.

Pixel Boost for 4000ppi jobs is enabled with the "Pixel+" option.

As soon as "Pixel+" or "Full HD Flexo UV" is used, the "Boost Values" must be defined so that the microcell structure can be imaged.

For Optics 100v2 machines, the option "Speed" can also be activated. This reduces the speed at 2400ppi and 2540ppi jobs by using a different imaging method.

Inline UV

Modify Plate	>
Plate Name DEC 3.94 (155) Plate Settings	
General	Enable inline UV exposure
Imaging

	UV Main Energy 0 mW/cm ²
	Full HD
	UV Main Exposure: 0 sec
	UV Main Energy 0 mW/cm ²
	Speed: 1 Rotations
	Save Cancel

If the CDI has inline UV, this function can be activated with "Enable UV exposure".

For inline-UV, the UV exposure time "UV Main Exposure" and the UV-Energy "UV Main Energy" can be entered.

If the CDI is prepared for Full HD, the number of revolutions can also be entered in the "Speed" field in the "Full HD" section.

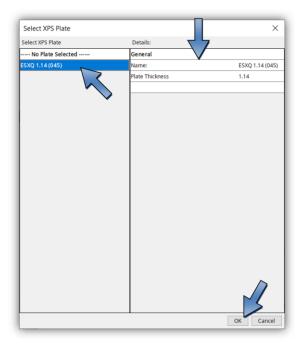

UV exposure can be deactivated individually by entering a value of "0" for "UV Main Exposure".

XPS Automation

		Save Cancel

"XPS Automation" is only available if an XPS is connected to the CDI with the PlateHandler. If this function is activated, the plate is automatically transported to the XPS and exposed with UV after imaging on the CDI.

If this option is activated, an XPS disk with "Select XPS Plate" must be selected.

PlateID Content

Modify Plate		×

	Save Cancel	

With "PlateID" information is illustrated in the flexo plate without it being visible in the print. A special raster is applied to the "PlateID" areas.

Since each flexo plate behaves differently, each plate must be retracted on the CDI. The raster to use is stored in the CDI's disk list.

Once the license has been installed on the CDI, the "PlateID" grid can be set with the Disk List Editor.

Save

If all parameters are set correctly, the disk can be saved with the "Save" button in the lower right corner.

Save	Cancel

The disk parameters are summarized in the right column.

Modify Plate

Select the desired disk and click on "Modify".

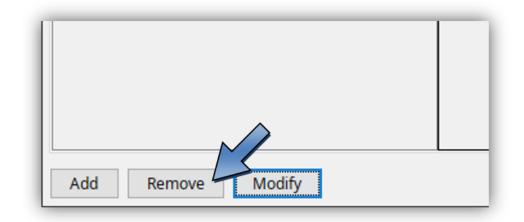

Add Remove Modify	

Change and save the parameters as previously described.

Digital Flexo Suite for Flexible Packaging and Labels 23.11

Erase disk

Select the disk you want to delete and click Remove.

TIF Output

"Edit – Edit Device List" opens the dialogue window to subsequently add new TIF output devices (special license required):

		X
Edit Preferences	Hosts Host: 127.0.0.1 Remove Host Alias: Lokal Computer Scan Network: No Scan Elements found New Accept Test Other Devices Device: TIFF 4835 V Remove	
Workflow Editor Edit Device List	Image width: 900.0 mm Image height 1200.0 mm Tiff Target Folder: c:\eskol/FILESIOutput\tift Browse Tif-Compression: G4 V Mirror (NX Output)	
	Tif-Compression: G4 Mirror (NX Output) Printing Method: New Negative Background Quit	d

"New" in section "Other Devices" opens a new dialogue box in which you can enter the name of the TIF output device.

Width and height can be set in the fields "Width" and "Height".

"Mirror (NX Output)" mirrors the TIF-File for the output to an NX-Device.

"Negative" inverts the background colour for the output on film. The output directory is defined in field "TIF Target Folder".

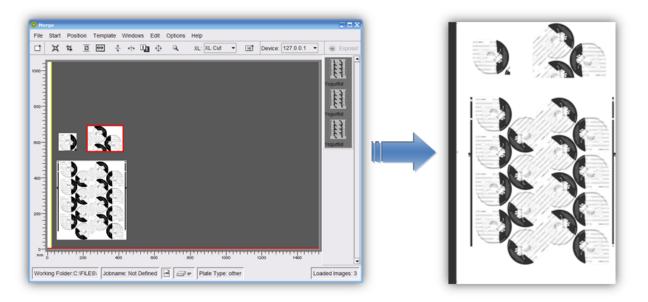

"Remove" deletes the selected entry.

"Expose" creates the TIF file.

Exposing Plate Borders

The "*Expose frames*" option can be activated in the basic settings of the "Merger" under "*Edit – Preferences…*", giving the plate more stability in the washer.

The left and the right border can be set in the *"Drum Window"* and is now shown in white. When the TIF output is negative, the border is displayed in black.

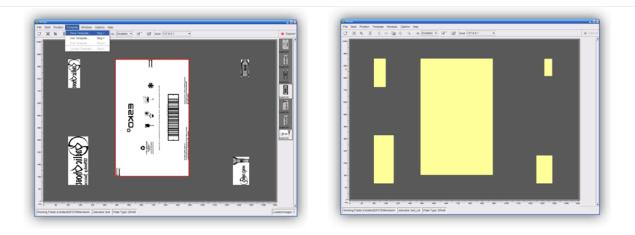

Templates

If these functions are not displayed, they can be activated in the basic settings.

The positions, image sizes, image resolution and plate parameters are stored in the template in order to position images quickly at a later time. This working mode is interesting for register pinwheels such as, e.g. for Letterpress.

Creating a Template

To create a template, you first position the required images onto the working surface and then select the plate type. This compilation is then saved by pressing *"Template - Save Template"*.

Loading a Template

"Template - Use Template" loads the template. This is only possible when no other images are loaded in the "Merger".

The stored positions and sizes are shown as yellow fields. After loading the images, they can be positioned in the yellow fields.

The images must be within a certain size tolerance in order to be assigned to a field.

Modifying a Template

After loading the template and positioning all the images, the mask can be opened using "Template - Edit Template". Now you can change all parameters as required and save them using "Template - Save Template".

The modified template can now be loaded using "Template - Use Template".

Moving a Template

"Template – Template Editor" opens a new program in which the template can be loaded using *"File – Load Plate"*.

A result is investing of the investin		-	 ~

	Save		

The position of single or multiple images can be changed horizontally using "Across" and vertically using "Circumference". The value is entered absolute or relative to the current position, ENTER is then pressed and the value is set using "Set Position".

Several images are marked by pulling a square around the required images with the left mouse button pressed.

The template is saved by clicking the "Save" button.

Activate and set "Time Stamp" in the template

"Template – Template Editor" opens a new program in which the template can be loaded using *"File – Load Plate"*.

🛃 Template Editor test_cdi	-	×
Image Position Across: 176.539 mm Circumference: Set Position		
Template Time stamp options		
3		
5 · · · · · · · · · · · · · · · · · · ·		
Save		

With the "Time Stamp" function, a text is inserted to each image when the job is started on the CDI. The position of the text can be modified via the template.

"Use Time stamp option" activates this function. With "Accross" the horizontal position is determined, with "Around" the vertical position from the edge of the image. With "Top" the text is inserted at the top of the image with the distance "Around". In addition, the text can be rotated with "Vertical".

This function must also be activated in the CDI Exposer.

Job information

An HTML or XML file with the respective job name is created in the "HTM Target Folder" output directory for each sent job.

All important information concerning the job is stored in that directory. The output directory "d:\files\output\html" is preset.

Loading Images via "Drag & Drop"

Image files (LEN and TIF) can directly be dragged into the right image bar of the "Merger" from the Windows Explorer. First, the data is copied into the working directory, then it is loaded. If the *"Ctrl"* key is pressed at the same time, the data is always copied.

Working Folder:D:\FILES\ Plate Type: other		Loaded Images: 4

"Unique ID"

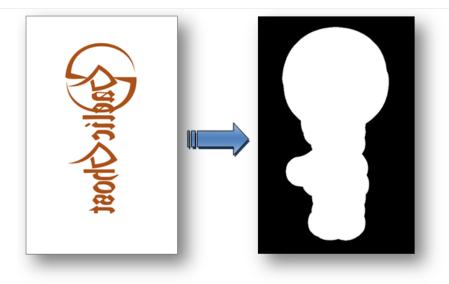

All LEN and/or TIF files from an AE12 system contain a unique code which can be read by the Merger.

As soon as the "Unique ID" option is activated under "Options – Configuration", this code is added to all images.

Depending on the output, the code is either inserted at the top or in the left frame area as normal text or, for XL CUT, it is output as front text or back text.

"iMask" Output (Option)

As soon as "iMask" output is activated, a LEN or TIF file with the mask is generated in addition to the job. An appropriate license is required to output TIFs. Depending on the settings, a frame is added to the contour compiling the various elements.

The output directory and the parameters can be changed under "Edit – Edit Mask Output":

Mask-Generator valu	es:	
Workflow:	Mask1	
Mask Export Folder:	C.\imask2\	Browse
Frame	10.0	mm
Resolution:	600.0	DPI
	Apply to White	
	G4 👻	
	Vegative	

"Workflow": Displays the name of the parameter set.
"Mask Export Folder": Output directory.
"Frame": Size of the extension frame.
"Resolution": Output resolution.
"Apply to White": White pixels are expanded.
"Tiff Output": Activates the TIF output.
"Negative": Inverts the output.

Changes are saved by pressing "Save". "New" creates a new parameter set. "Remove" removes the currently selected parameter set. "Close" closes the setup window.

"Lenticular" Output (Option)

As soon as the "Lenticular" function is activated, the output is converted into the required resolution and then sent to the CDI. To achieve an optimum printing result, the output is reprocessed on the CDI.

Digital Flexo Suite for Flexible Packaging and Labels 23.11

- 1 Activates the "Lenticular" function.
- 2 Allows to enter a new resolution. This value may differ from the original resolution of the positioned images by a maximum of 50 DPI.
- 3 Allows to set the number of lenses used for printing.

To ensure an optimum printing result, the correct number of lenses needs to be set.

The resolution results from the test print and the resulting change in the size of the image which is set via the new resolution.

The "Lenticular" output must not be used for normal jobs.

Basic Merger Settings

The basic settings of the Merger can be changed via the menu item "Options - Preferences...":

Merge Folder Plugins				×	Merge Folder Plugins
Output Units:			Digits: Post Colon:	3	Plate Patcher Patch Redo Folder. D\FILES\OutputPatcherRedo\ Brows V Use Job-Name Subfolder for File-Export Microcross
File Copy Method: Bleed	Expose frames	mm Server		Check Images before start Show Ruler Autoload Job Arial	Microcross Mount Folder. D/FILES/Outputmount. Brows HTML Job Into HTM Target Folder. D/FILES/Outputhtmit. Brows
Archiving interval: [Disc-Space Warning: Auto Arrange Images		days mByte	JDF Server		Merge Folder Plugins
Autoplace Mode: Timeout		sec		Auto Rotate	Plugin Configuration Microcross and Centerlines: Minimal Width: 20.0 mm Minimal Height: 20.0 mm

"Units" switches between "mm" and "inch".

"Digits" and "Post colon" set the amount of numbers and/or decimal points.

"Check Images before start" checks the images of all outgoing jobs.

"File copy method" sets the behaviour while loading images. With the setting "Copy", the files are always copied; if "Move" is selected, they are deleted from the source directory.

"Bleed" sets the border during automatic cropping.

"Expose frames": When activated, the left and right border is exposed to provide more stability to the plate in the washer.

"Show Ruler" activates or deactivates the ruler.

When restarting the "Merger", "Autoload Job" actuates automatic loading of the last job.

"Font" changes the font type for text in the bitmap output files. All fonts installed in Windows are available for selection. OCR fonts must be additionally installed:

Arial	-
Serif.plain	•
Shonar Bangla	
Shonar Bangla Bold	
SHOWCARD GOTHIC	
Shruti	
Shruti Bold	Ξ
SimHei	
SimSun	-

"Archiving Interval:" determines the number of days after which the HTML overview files and the files of the directory "Mergelog" are archived in a ZIP file.

"Disc-Space Warning": The Merger warns the user as soon as the drives being used indicate that their available disc space has fallen below the set value.

"JDF Server": Enter IP number or computer name of JDF server.

"Autoplace mode:" sets the method (mode) of how the images are automatically arranged on the working surface. The fast, space-optimised and cut-optimised methods are available.

In most cases, the fast positioning method is sufficient. The space-optimised method will continue trying to position the images until the maximum time "Timeout" is reached. The cut-optimised method places the images so that the plates can be subsequently better cut by hand.

"Auto Rotate" activates the rotation during automatic positioning to save more space.

In the "Folder" window, the preset output directories can be changed.

The job information is saved in the "HTM Target Folder" directory.

Under "*Plugins*", the minimum size for "*Microcross*" and "*Centerline*" images can be entered. The images are automatically enlarged to this size.

The "Merger" must be restarted after any change.

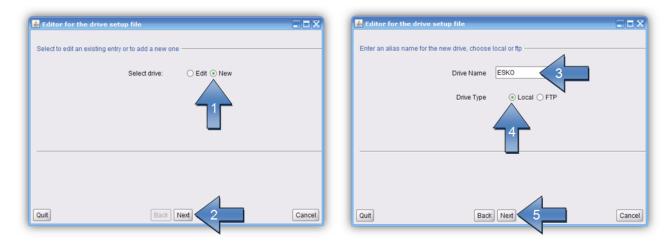

Managing Data Sources

The image data can be loaded from the local hard drive, by means of a network release, or by FTP. Transmission using FTP protocol is generally more secure than using a network release.

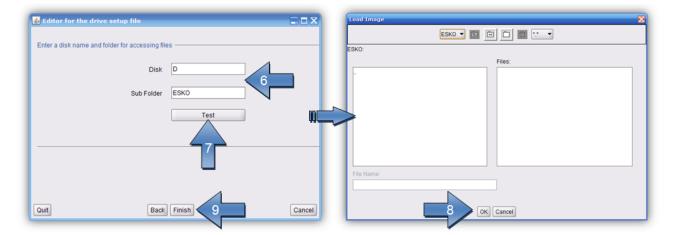

The path entered during installation for the *"User Data"* is already released as a network drive. Additional data sources can be set up under "Edit – Data Source".

Adding a Local Data Source

Local data sources can be located on the hard drive of the computer or accessible in the network via "share" function.

The name of the data source "Drive Name" (3) will be shown later in the load dialogue.

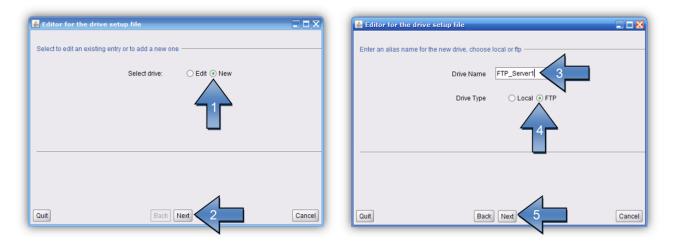

"Disk" and "Sub Folder" (6) designate the drive letter and the directory containing the data.

Clicking "Test" (7) opens a new window with the data source set up. "Finish" (9) completes the process. You can always switch to the previous page by pressing *"Back"*.

Adding an FTP Data Source

The FTP server of the data source requires a virtual directory. For a detailed installation manual, refer to "Digital Flexo Suite 101 Installation".

The name of the data source "Drive Name" (3) will be shown later in the load dialogue.

Editor for the drive setup file	Editor for the drive setup file
Enter FTP parameters host, user-name and password	Enter a disk name and folder for accessing files
Host RIP1 6	Disk C
User-Name anonymous	Sub Folder LEN
Password:	Test
4	4
Quit Back Next 8 Cance	Dut Back Finish 10 Cancel

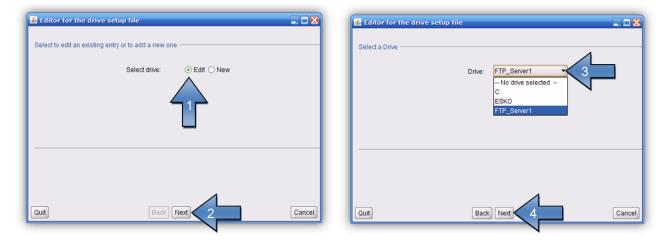

Enter the IP address or the network name in the field "Host" (6). If the FTP server was installed as specified, enter the "User-Name" (7) and the "Password" (7) as shown in the illustration.

"Disk" and "Sub Folder" (9) designate the virtual drive and the directory containing the data. Should no virtual directory be available, leave the "Disk" field empty.

Clicking "Test" opens a new window with the data source set up. "Finish" completes the process. You can always switch to the previous page by pressing "Back".

Changing an Entry

The settings of the data source can be subsequently changed.

After selecting the "Drive" (3), you can change the following settings.

Deleting an Entry

Editor for the drive setup file	Editor for the drive setup file
Select to edit an existing entry or to add a new one	Select a Drive
Select drive: O Edit O New	Drive: FTP_Server1
Quit Back Next 2 Cancel	Quit Back Next Cancel

After selecting the "Drive" (3), you can remove it by pressing "Remove" (4).

Saving Settings

When you terminate via "Quit", a new window opens requesting whether you want to overwrite the current settings.

Pressing "OK" saves the current settings.

Setting the Output Devices

If no output device such as, e.g., a CDI has been set up yet, the "Edit Device List" window in which you can define various output devices is displayed when the "Merger" is started for the first time.

"Edit – Edit Device List" opens the dialogue window to subsequently add new or delete output devices:

	Edit Device	List 192.168.172.121 Name: 192.168.172.121	V Host Alias: CDI Crystal 5080
Windows Edit Options Help I □ T XL-Cut Workflow Editor 5 ▼ PlatePatcher Workflow Editor Edit Plate List Edit Data Source PreMount support Edit Mask-Output	New Other Devices — Device: Image width: Image height: Tiff Target Folder: Browse Tiff-Compression: Printing Method: New	Save	1

A TIF license is required in order to create TIF output devices!

"New" in section "Hosts" opens a new dialogue box in which you can enter the IP address or the computer name of the CDI. Press "OK" to search for the CDI on the network.

In the entry *"Host Alias:"* a name for the connected CDI can be defined.

"Scan Network" scans the network 60 seconds for CDIs and then displays them in a list. A new connection can be selected from this list.

"Accept" accepts the new CDI.

"Test" checks the connection to the CDI.

"New" in section "Other Devices" opens a new dialogue box in which you can enter the name of the TIF output device. Width and height can be set in the fields "Width" and "Height". "Negative" inverts the background colour for the output on film. *"Mirror (NX Output)*" mirrors the TIF-File for the output to an NX-Device. The output directory is defined in field "TIF Target Folder".

"Remove" deletes the selected entry.

If an old CDI SUN computer is to be connected, you must enter the IP address "127.0.0.1". In addition, service needs to adapt the LEN output format for the SUN.

Adjusting the "Merger" User Interface

The user interface and some of the functions of the "Merger" can be customised and protected with a password (*"Edit – Configuration"*):

	Activate or deactivate options	X	Activate or deactivate options

Kongsberg Output (XL CUT)

In order to properly process the cutting data on the Kongsberg table, at least XL/XN- Guide version 6064 or IPC 2.0 must be installed!

The Kongsberg file is generated automatically after each transmission tot eh CDI or each time a TIF file is generated in the output directory. The position, the size of the images and additional information is made available on the Kongsberg table in the form of an ACM file. Different settings can be created and selected in order to adjust the cutting settings on the Kongsberg table (2).

The reserved area (1) marked yellow on the left side is needed for later alignment of the plate on the Kongsberg table. This area contains two marks and the ACM file name.

Depending on the plate thickness, an additional frame is put around each image as soon as the 45° knife is activated (3).

Once an image has been placed, you can click on the image with "shift + the right-hand mouse button" to change the lettering.

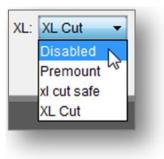

Cutting Accuracy

Using the Kongsberg table, it possible to reach a cutting accuracy of ± 0.2 mm depending on the kind of registration. The camera is more accurate than the laser.

The 4-point registration can compensate the distortion of the Flexo plates resulting from the exposure process.

Activating / Deactivating the XL-CUT

When "Disabled" is selected, the XL CUT output is deactivated. No ACM files will be created.

Selecting the Type of Knife

The type of knife can be defined in the XL CUT settings.

Back Labelling of the Plate

Using the pen, the plate can only be labelled on the back. For this purpose, the option "Mirror X" or "Mirror Y" must be selected in the settings.

Cutting the back with the 45° knife is **not** recommended.

Front Labelling of the Plate

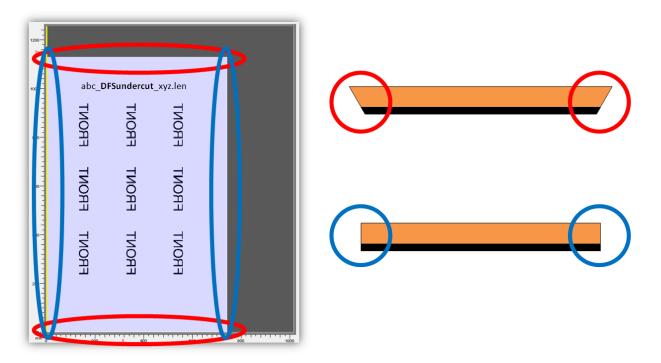

The image name (for front labelling) or the plate name (for images from the PlatePatcher) is carved into the frame area with a knife.

This option must be activated in the settings of the XL CUT or the PlatePatcher.

Undercutting the Plate

Irrespective of the selected XL Cut template, an undercut can be added to files at the bottom and top. No change to the XL Cut settings is required for this function.

The files must contain the designation "DFSundercut" after the first underscore and before the second underscore (e.g. esko_**DFSundercut**_44234_k.len):

The top and bottom always refers to the original alignment of the image, if it is loaded into the Merger. In the event that the image is rotated, the undercut side is also rotated.

IPC output

IPC 2.0 is prepared for flexo plate cutting. Depending on the plate thickness different parameters are applied.

The output is a .dfscut-file which contains the cut and additional information for the flexo plate cutting. This file cannot be loaded directly into IPC. Instead the import function via KBQS is used.

In the xl-cut settings the material needs to be selected. With the selection "AUTO" the plate type is used for the material. "User Defined" allows to enter a fixed output material. Additional default material which do exist on IPC already can be used for testing.

Setting the XL CUT Options

Templates can be created for the XL CUT options by calling up the "XL Cut Workflow Editor..." under "Edit":

+		+	
2 JOBMANE TEXT

The "XL Cut Workflow Editor" can be divided into five areas:

- 1 Allows switching between XL Cut settings and channel overview
- 2 Schematic view of the selected options
- 3 Selection of the saved settings
- 4 Options for the current selection
- 5 Store, delete and create new settings

Adding Settings

By selecting "New", a new window appears in which you can enter a name for this setting. "OK" confirms the input. The new setting is automatically selected. Adjust the required settings and save them by pressing "Save".

Changing Settings

Select the setting (1) and change it. Press "Save" to store the setting.

To not lose existing settings, the new settings can be renamed by pressing "Save as".

Deleting Settings

Select the setting (1) and delete it by pressing "Delete".

Possible Settings

"*Register Mark*": The register marks for later alignment on the Kongsberg table can be selected from a list. An overview can be found in the appendix.

"*Knife Type*": Thick plates are often cut at an angle of 45°. For this purpose, select "*BevelKnife*". Depending on the plate thickness, an additional frame is put around each image except for images from the PlatePatcher (Plot / PreMount). For "*PreMount*", this option is controlled automatically.

○ 0* ▼	
🗇 🛯 Knife	
📣 🖘 BevelKnife	

"Safe Distance": The distance between the cutting lines can be specified to avoid double cuts.

"Cut Gap": A base area that cannot be cut can be selected close to the corners to prevent plate pieces coming loose during cutting.

"Reserved Area": Sets the width of the reserved area in which the marks for setting up and labelling of the plate are positioned.

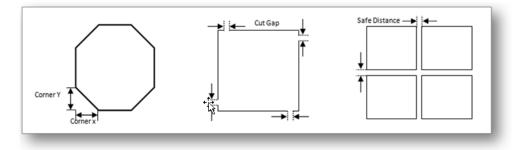

"*Mat Info":* As an option, the name of the X-Guide "Job Setups" which will be automatically loaded on the Kongsberg table can be entered in this field.

"Output Device": The plates can be used with XL/XN-Guide (X-Guide) or IPC 2.0 (IPC).

"4-Point Registration": This option activates the 4-point registration. In order to balance the plate distortion, four register marks instead of two are exposed on the plate.

"Round Corner": The corners of the plate are rounded. Provided that this option is active, the radius can be set in the "Corner radius" field.

"Corner X – Corner Y": The parameters for X and Y need to be specified (see sketch) if the edges are to be cut at an angle.

"Landscape": In order to cut e.g. a 4260" plate on an XL20 Kongsberg table, it must be 90° rotated before mounting it. The options *"Vertical"* and *"Y-Mirror"* are deactivated. In this case, the yellow reserved area is always on the bottom.

"Align Vertical": This option is activated to display the reserved area on the left of the working surface in the "Merger". If deactivated, the reserved area is shown at the bottom.

"Mirror X" / "Mirror Y": The coordinates of the cut on the X axis and/or the Y axis can be mirrored depending on the alignment of the plate on the Kongsberg table.

"Kongsberg Target Path": Output directory of the ACM file.

"Safe Cut": If plate pieces are lifted during the cutting process, this option can be activated. As a consequence, the processing time of the Kongsberg table will increase.

"Text Height": when labelling the back of the plate, the text height can be changed.

"Mirror Job Name": This option is used to mirror the job name on the plate.

"Front Text": This option activates the front labelling in the frame area using the knife. This deactivates all options for back labelling. The text can be positioned at the bottom or on the left.

"Mirror Plot-Text": As an option, the label on the back can be output as a mirror image.

"Translate Space": The file name determines the labelling of the image. If this function is active, underscores are converted into spaces.

"Text Orientation": Three positions on the left and lower side can be used to label the image. On the back, the text can be set to *"Center"*.

Recommended Settings in XL-CUT

- The plate can be set up on the Kongsberg table more easily with vertically arranged positional markers ("Align Vertical").
- For small plate pieces, a "Cut Gap" of 0.5 mm is recommended so that the plate pieces are not triggered automatically.
- The marks "reg_5010_h" and "reg_5015_h" are suited for positioning using the laser pointer on the Kongsberg table.

Advanced Free-Cut (Option to Staggered Cut)

"Advanced Free-CUT" allows the use of free shapes for cutting the flexo plates.

The technical inks in the LEN(x) file are used for cutting, as long as they match the correct naming scheme.

Naming scheme of the technical inks

Once the name of the technical color corresponds to the following scheme, it is automatically used for cutting:

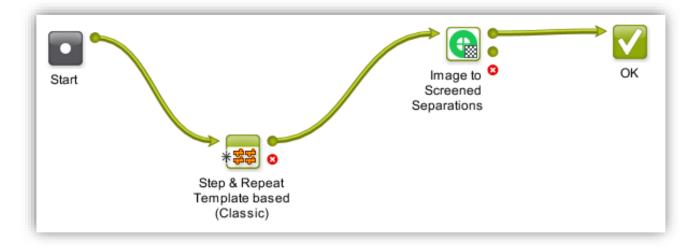

Name	Application to
FREECUT_ALL	all colors
FREECUT_K	File with color name "_K"
FREECUT_C	File with color name "_C"
FREECUT_Y+K+WHITE	Files with color names "_Y", "_K" and "WHITE"

A design can therefore contain several technical colors so that they can be applied later as desired.

It is important that the LEN(x) file is correctly named. The color is specified with a "_" in the LEN(x) file. This must correspond to the name in the technical color.

Integrating the technical color into the LEN(x) file

The technical color is integrated via the "Step & Repeat Template based (Classic)" module.

The following parameters must be set:

- Output Format: Normalized PDF (embed all)
- "Include CAD info for Digital Flexo Suite"

Edit Ticket of Step & Repeat Template based (Classic)	×	Edit Ticket of Step & Repeat Template based (Classic)	
State	iii ()	Vulput in:	in l
A File Name:	ii ()	File Name:	in l

Template Type: MFG File 🗸		Include CAD info for Digital Flexo Suite	
Template:	in ()		
Origin: \$* +\$ \$ ₊ +\$ Unit: mm √			
Screen Registration			
SmartMarks:	[] ~		
Load Mark Set in bottom layer			
Save As Advanced - OK	Cancel	Save As Advanced OK	Cancel

Depending on the workflow, the parameters may differ. For more help, see the Automation Engine User Guide.

More information on how to set up "Advanced Free-Cut" can be found here:

Automation Engine complete manual

Applying the Cut File in the Merger

The cut file is automatically applied in the merger of the Digital Flexo Suite with the XL-Cut workflow if a "*Staggered Cut*" license is available.

Mergers without XL-Cut output ignore the cut content of the LEN(x) file.

Applying the Cut File in "Device Manager" 23.11

The cut file is applied automatically with the cutting workflow enabled. No extra settings are necessary.

Troubleshooting

If the desired incision is not applied, please check the following:

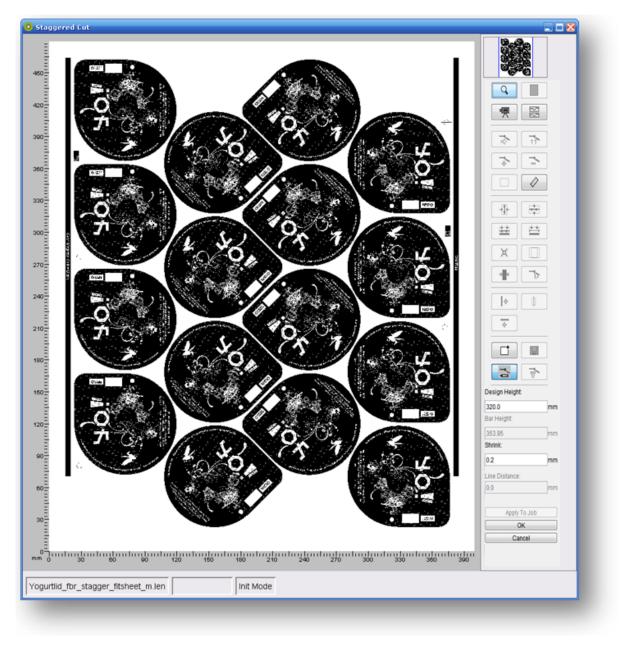

- Does the name of the technical color match the LEN(x) file?
- Digital Flexo Suite: Do I have a "Staggered Cut" license?
- Device Manager: Is the "Apply cutting flow" option enabled?
- Does the LEN(x) file contain technical colors at all (checking with Bitmap Viewer)?

"Staggered Cut" (Option)

opens a new window in which the cutting line can be created.

Cutting lines created by Plato cannot be edited with "Staggered Cut" in the Digital Flexo Suite.

Toolbar

The toolbar is always located on the right-hand side. Only available functions are activated.

Digital Flexo Suite for Flexible Packaging and Labels 23.11

Q

Individual sections of the image can be enlarged with a square magnifier by using the mouse wheel or by holding down the left mouse button and pulling the mouse across the section of interest. The magnified image section can then be positioned using the arrow keys on the keyboard. The image section can be zoomed out by pressing "Ctrl" and the left mouse button.

displays the entire image.

릣

opens module "*Digital Video Drill*" if the respective license is available. For a detailed operating manual of this module, refer to document "Digital Flexo Suite Tools".

X

activates or deactivates the split screen which displays the upper and the lower cutting line simultaneously.

4

moves a point. By pressing this button and the "Ctrl" button, the distance to the original position is displayed in addition.

↑↑

moves the upper line. For this purpose, a point is moved with the left mouse button. By pressing this button and the "Ctrl" button, the distance to the original position is displayed in addition.

adds a point.

deletes a point.

marks the points in an area. These can then be deleted by pressing the "DEL" button.

centres the points vertically between two objects.

centres the points horizontally between two objects.

adapts the points to the upper object contour.

Ø

creates a line at the upper object contour.

The distance between two positions in the image can be measured by pressing and holding the left mouse button down.

Digital Flexo Suite for Flexible Packaging and Labels 23.11

corrects excessively acute angles so that the plate will not crack in these areas.
cuts the margins. This function is only available if the entire image is displayed.
changes the margins. This function is only available if margins were automatically created beforehand.
creates an additional vertical line at the desired position by clicking the left mouse button.
creates an additional horizontal line at the desired position by clicking the left mouse button.
detects the desired position for the vertical cutting line automatically. The section containing the object must be enlarged beforehand.
detects the bear bar automatically. This function is only available if the section with the bear bars was enlarged.
loads a saved cut.
saves the current cut.
indicates that a new cutting line must be created.
deletes the cutting line.
"Design Height" sets the distance between the upper and the lower cutting line.
"Bar Height" sets the height of the bear bars. This function is only available if bear bars were detected.
"Shrink" reduces the lower line for gapless mounting of the plates.
"Sample Step" and "Line Distance" are available if the adaptation to the object contour is selected. With these functions, the distance between the points and the distance to the object

"Apply To Job" applies the cut contour to the entire job. For this purpose, the cut contours must be loaded in the Merger.

contour is set.

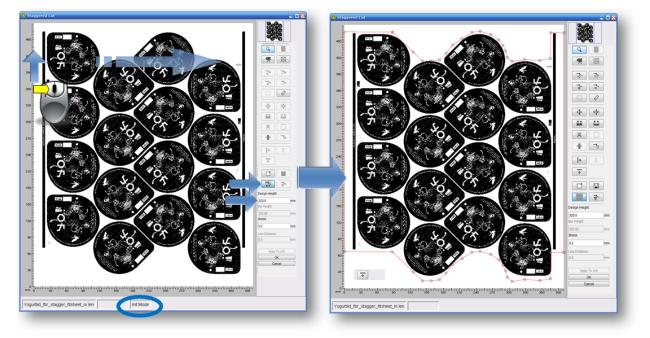

"OK" applies the cut contour.

"Cancel" cancels the editing process.

Creating a New Cutting Line

If the file contains no cutting information, the starting point on the left side of the image must be determined by clicking the left mouse button, then the cutting lines must be added one after another with the left mouse button.

Angles larger than 90° cannot be entered.

The contour can only be further edited when the line was created for the entire width.

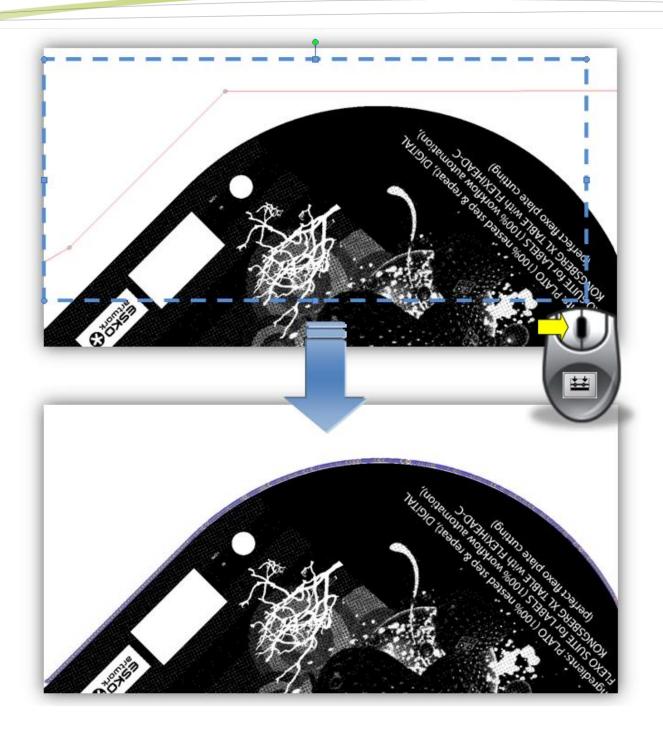

The distance to the lower cutting lines can be set in the "Design Height" field.

Adapting Points to the Object Contour

adapts the points to the upper object contour. To this end, a frame is drawn around the desired area by pressing and holding the left mouse button down. The distance to the object contour can be set with *"Line Distance"*. If negative values are entered, the cutting line will be drawn in the design.

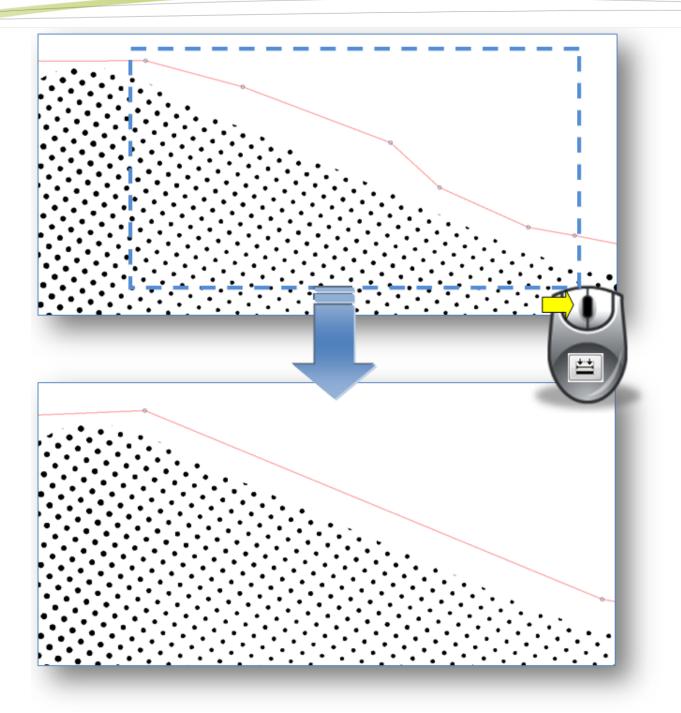

Creating a Line at the Object Contour

creates a line from the upper object contour. To this end, a frame is drawn around the desired area by pressing and holding the left mouse button down. The distance to the object contour can be set with *"Line Distance"*. If negative values are entered, the cutting line will be drawn in the design.

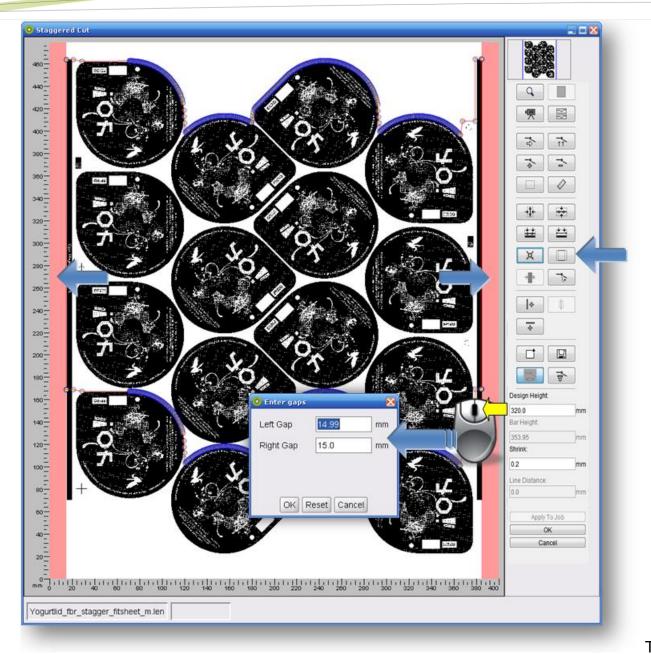

Digital Flexo Suite for Flexible Packaging and Labels 23.11

Cutting Margins

cuts the margins. This function is only available if the entire image is displayed and no bear bars have been defined yet.

The red

areas on the right and left of the image show the unused space. The cutting line is automatically moved to the lateral margins of the image.

changes the margins. This function can also be called up by right-clicking the red area. A new window is opened in which you can enter the "Left Gap" and the *"Right Gap"* of the margins.

"OK" applies changes.

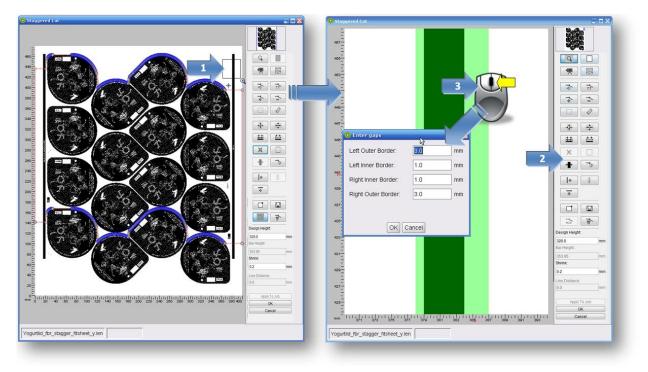

"Reset" removes the frame.

"Cancel" cancels this change.

Detecting the Bear Bars Automatically

detects the bear bars automatically. This function is only available if no margins have been defined yet and an area was enlarged.

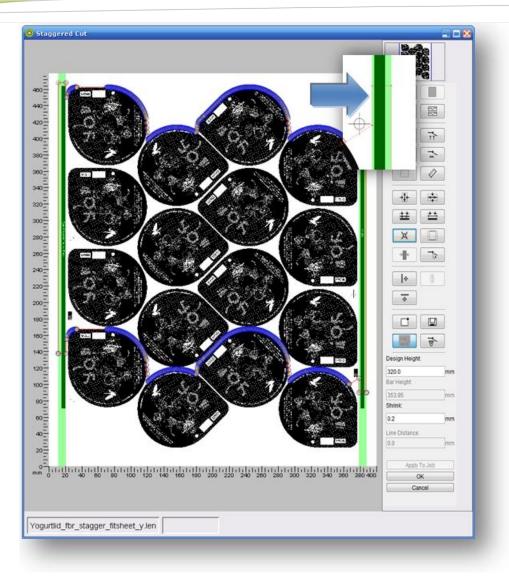

- 1 Enlarge the bear bars until no other elements are visible.
- 2 By left-clicking on the icon for automatic detection, the image section is analysed and the detected area is displayed in green.
- 3 By right-clicking on the green area, a new window is opened in which the width of the bear bar can be changed asymmetrically. The last changed values will be applied automatically.

"Left Outer Border"	➔ left bear bar - left margin
"Left Inner Border" → Ie	ft bear bar - right margin
"Right Inner Border" "Right Outer Border"	 → right bear bar - left margin → right bear bar - right margin

Repeat this step for the second bear bar.

Now you can enter the height of the bear bars in the "Bar Height" field. These bars will always be arranged in the centre of the cut.

If the difference between "Design Height" and "Bar Height" is 20 mm, the bear bar will be 10 mm longer at the top and at the bottom than the cut.

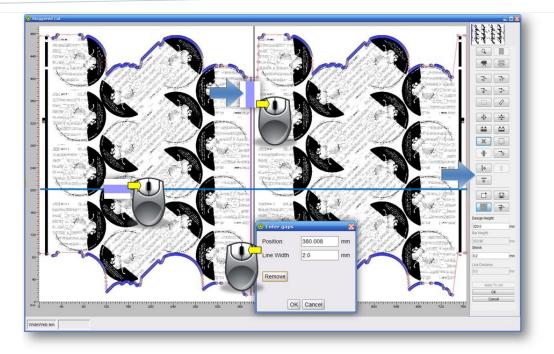

Creating Vertical and Horizontal Lines

•

creates an additional vertical line at the desired position by clicking the left mouse button.

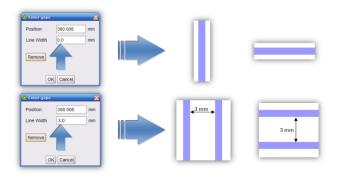

4

creates a horizontal line at the mouse position.

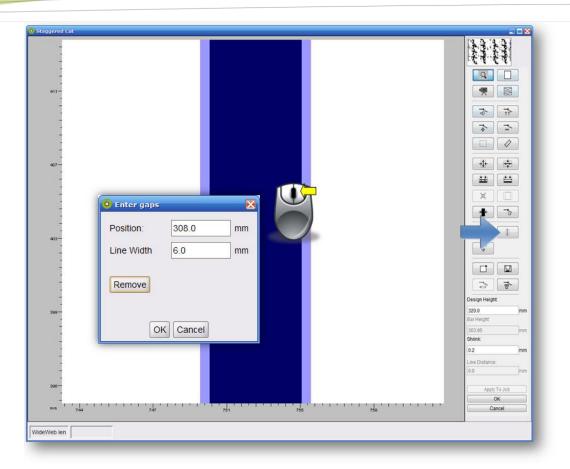

Right-clicking on a line opens a new window in which the "*Position*" and the "*Line Width*" can be changed. "*Remove*" removes the line.

When a line width of "0" is entered, only one line is created. When "2" or more is entered, two lines will be inserted having this distance.

Creating Lines Automatically

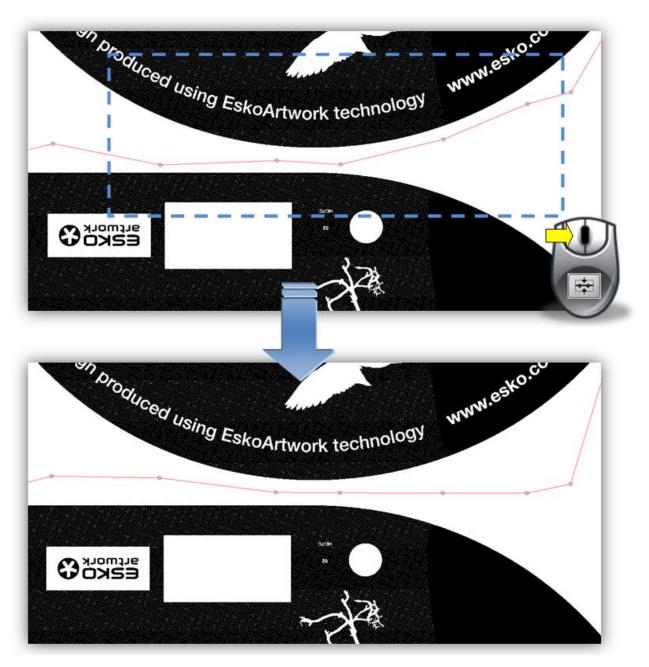

detects the desired position for the vertical cutting line automatically. The section containing the object must be enlarged beforehand.

The width of the first detected object is automatically used as line width for all vertical cutting lines. If not requested, the line width can be changed by right-clicking the vertical line.

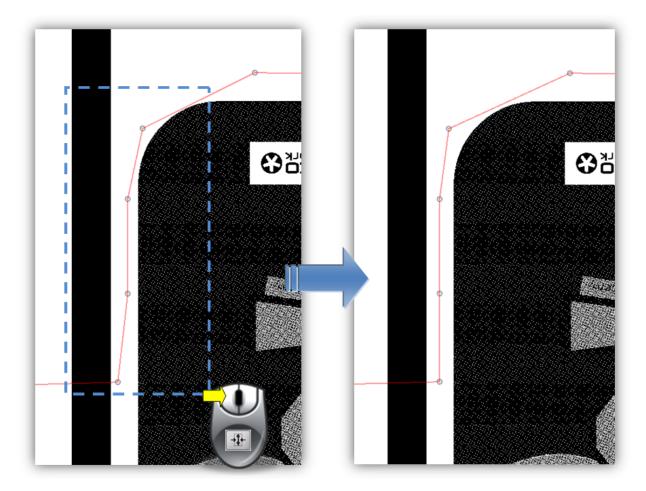

Centring Points

centres the points horizontally between two objects. A frame can be pulled around the relevant points using the left mouse button (hold pressed and pull). If there is no graphic object on one side (top or bottom), the frame is used as border:

centres the points vertically between two objects.

Applying the Cutting Line to the Entire Job

After creating the cutting line, the "Apply To Job" button can be used to automatically transfer the cutting line to the entire job. To this end, the other separations must already have been loaded into the merger:

"Line Editor" (Staggered Cut License)

opens a new window in which the cutting lines can be created manually.

Cutting lines created by Plato cannot be edited with the "Line Editor" in the Digital Flexo Suite.

Individual sections of the image can be enlarged with a square magnifier by using the mouse wheel or by holding down the left mouse button and pulling the mouse across the section of interest. Using the arrow keys on the keyboard or the right mouse button, the image section can be moved in the desired direction. The image section can be zoomed out by pressing "Ctrl" and the left mouse button.

displays the entire image.

÷ ÷

activates the setting of lines using the left mouse button.

Digital Flexo Suite for Flexible Packaging and Labels 23.11

automatically creates a square around the objects in the visible area.

marks a line, so that it can be deleted.

marks a line, so that it can be moved.

marks several objects, so that they can be deleted.

loads a stored template.

Ì

saves the information in a template.

The distance between two positions in the image can be measured by pressing and holding the left mouse button down.

deletes the information.

Using Masks

The software does not recognise halftone screen areas as a contour. To write the corresponding cut contour into a file with halftone screen areas, a file with a solid area is required for each job or ink. The file with a solid area is loaded and edited using the "Line Editor".

When pressing "OK", the information is additionally written into the desired file with the halftone screen areas provided that **"FREECUT"** is used in the file name as follows.

Applying a Mask to the Entire Job:

Mask: Job Name_FREECUT.len

Ink 1:job name_ink1.len

Ink 2:job name_ink2.len

Applying a Mask to One Ink Only:

Mask 1: Job Name_Ink1_*FREECUT*.len

Ink 1:job name_ink1.len

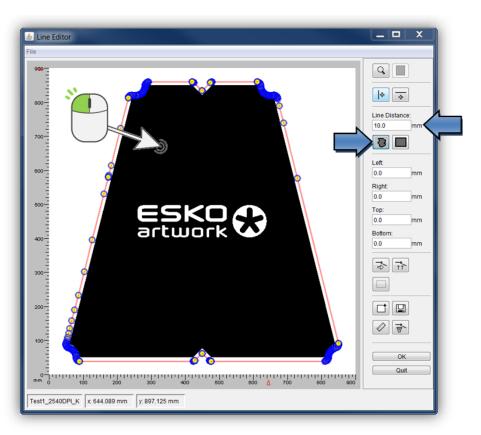

Mask 2: Job Name_Ink2_*FREECUT*.len

Ink 2:job name_ink2.len

Contour Recognition

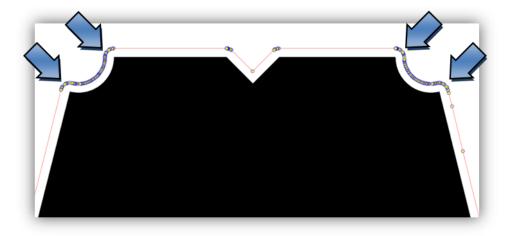

activates contour recognition. Left-clicking selects the desired contour.

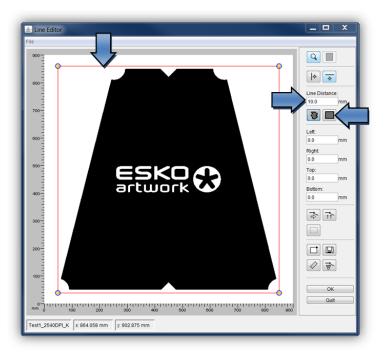

The first black-to-white change to the left of the selected mouse position is used as the starting point for the contour.

The distance to the selected contour can be set in the "Line Distance" field. To maintain this distance, the corners receive a round contour:

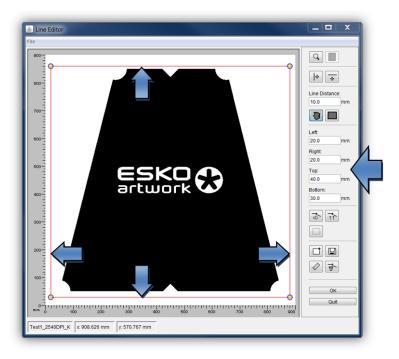

Creating Rectangles

Automatically creates a square around the objects in the visible area when left-clicking this option:

The distance to the selected contour can be set in the "Line Distance" field.

Alternatively, a square can be created across the entire distance from the image border:

Creating Lines

|+ +

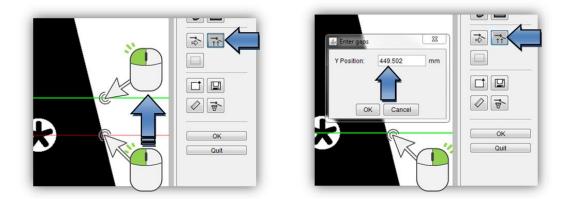

creates vertical and horizontal lines across the entire image height or image width using the left mouse button.

Moving Lines

marks a line, so that it can be moved.

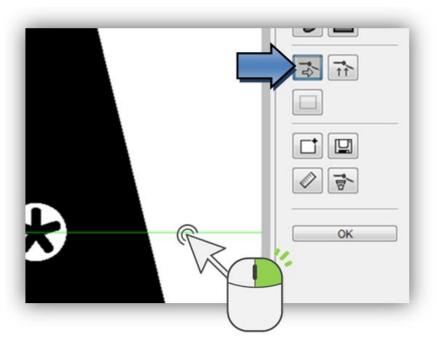

The line can be moved manually using the left mouse button.

Right-clicking opens a new window in which the new position can be entered.

Deleting Lines

3

activates the marking function. You can mark a line with the left mouse button and delete it using the "Delete" key on the keyboard.

Deleting Several Objects

marks several objects, so that they can be deleted.

By pressing and holding the left mouse button, a rectangle is pulled across the desired objects. Then use the "Delete" key on the keyboard to delete them.

You cannot delete individual lines from the contour recognition and from the rectangles. The whole object is selected when marking it.

Creating a Template

saves the information in a template.

Loading a Template

loads a previously saved template. In case the dimensions of the image are correct, the information is applied to the loaded job.

Loading an Image

The menu item "File - Load Image" shows the dialogue "Load":

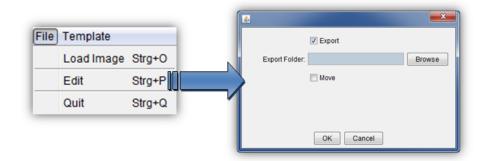

Saving Information

After all lines have been set, the information is written into the LEN files with "OK".

Exporting Finished Files

When the option "*Export*" is activated, the job is copied or moved to the output folder automatically.

In the "File – Edit" menu under "Export Folder", the path of the output directory is specified where the files are copied to.

Using the option "Move", you can move the files into the output folder.

Connection to the "Device Manager"

The "Device Manager" is part of the "Automation Engine 16". As soon as the Merger is connected to the "Device Manager", the "Merge Queues" are displayed and LEN files can be loaded and jobs can be sent to the CDI via the "Device Manager".

The CDIs are connected in the Device Manager and the corresponding plate lists and functions are read.

LED files are stored in the "Merge Queues". Each queue must be assigned to a plate entry.

A queue can contain various "Image Groups". One Image Group comprises images, which can be used together. This depends on the resolution of the exposure technology, such as Pixel+ or Full HD Flexo.

Setting up the "Device Manager" Connection

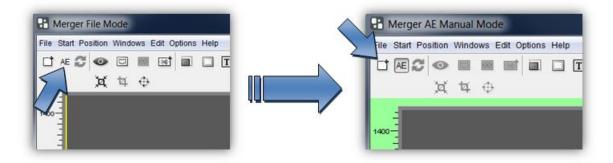

The computer name or the IP address of the "Device Manager" is entered in the "Merger" options "*Options – Preferences*" in the "*Workflow-Server*" field.

H Preferences				×		
Merge Folder Plugins						
Basic						
Units:	mm	•	Digits:	8 •		
	Lock Circumference		Post Colon:	3 •		
File Copy Method:	🖲 Copy 💿 Move			Check Images before start		
Bleed	0.0	mm		Show Ruler		
	Expose frames			Autoload Job		
Archiving interval:	14	▼ days	Workflow Server	192.168.1.150		
	Reset Jobcount					
Auto Arrange Images –						
Autoplace Mode:	SORTED	•	Rotate Level:	1.5		
				Auto Rotate		
OK Cancel						

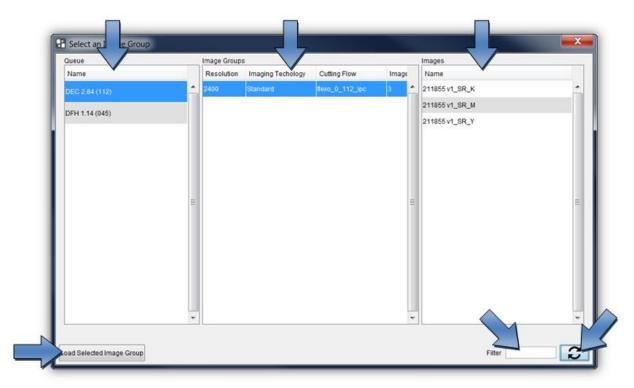

The Merger must be restarted for the Workflow-Server to connect.

Loading the LEN Data from the "Device Manager"

As soon as the Merger has connected to the "Device Manager", the window colour of the Merger will change and the window name will change from "Merger File Mode" to "Merger AE Manual Mode".

Pressing the button for the load dialogue displays the predefined Device Manager queues ("Merge Queues").

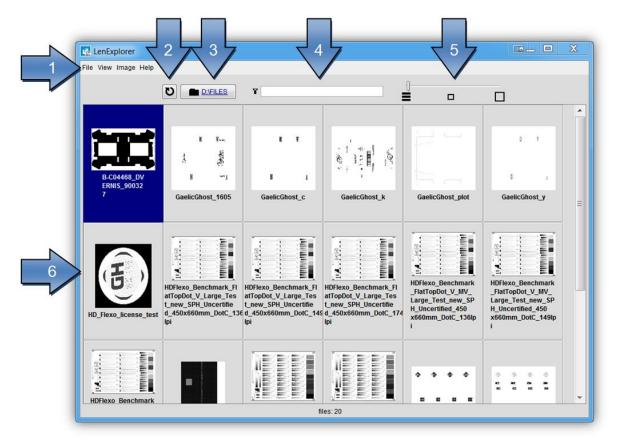

"Load Selected Image Group" loads the selected Image Group. The LEN data contained per Image Group are displayed under "Images".

The complete list can be filtered according to certain image names at the bottom right.

DFS Explorer

The "Len Explorer" is an add-on product used to display LEN, TIFF and ACM files. In addition, LEN and TIF files can be directly drawn from the "DFS Explorer" into the Merger or the PlatePatcher via drag & drop.

- 1 menus for additional functions
- 2 file reread
- 3 display and selection of the folder
- 4 display filter
- 5 Changing the View
- 6 file preview

Changing the View

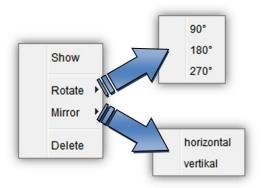

The slider can be used to change the view from detail (far left) to large preview (far right).

In the detailed view, a left mouse click on the respective field sorts the table by name, date, width, height, resolution or file size.

Rotating, Mirroring and Deleting Files

In the DFS Explorer, several files can be selected and rotated, mirrored or deleted with a right mouse click.

Displaying Data

Double-clicking the file opens the Bitmap viewer for LEN or TIFF files and the DFS-Viewer for ACM files.

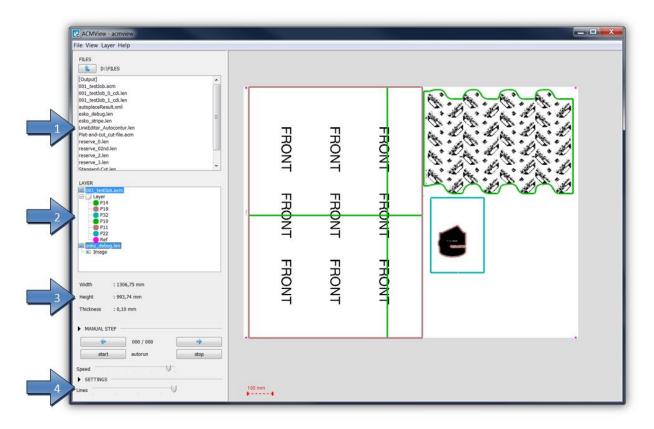

DFS-Viewer

This program is used to display and control the output files which were created by using the Digital Flexo Suite. In addition, LEN files are displayed with the cuts (Staggered Cut, Line Editor, etc.) that they contain.

After the Digital Flexo Suite installation, all output files are automatically linked to the "DFS-Viewer".

Simulation in DFS Merger

Simulation of the cutting job is started in the "Merger" with Ctrl+R. All output files are generated and superimposed on top of one another in the DFS-Viewer:

- 1 Content of the active directory
- 2 Loaded files with the cut contours they contain
- 3 Information on the loaded files
- 4 Adjustable line thicknesses

Displaying Individual Cutting Channels

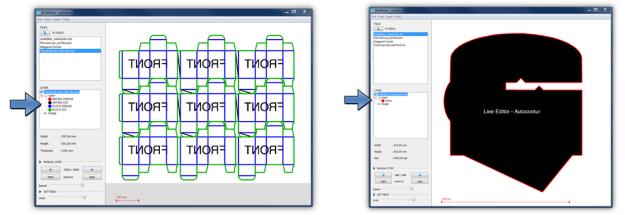

An individual cutting channel can be selected for display in the "LAYER" section. Additionally holding down the Ctrl button on the keyboard allows multiple channels to be selected:

ACMView - acmview	
File View Layer Help	
FLES [Output] 001_test0bb.acm 001_test0bb.acm 001_test0bb.1cd.len 001_test0bb.1cd.len 001_test0bb.1cd.len 001_test0bb.1cd.len 001_test0bb.1cd.len test0bb.1cd.len test0bb.1cd.len test0bb.1cd.len reserve_0.len reserve_0.len reserve_0.len reserve_0.len reserve_0.len	
LAYER 001_test2ub.acm 01_tes	
Width : 1306,75 mm Height : 993,74 mm	
Thickness : 0,10 mm MANUAL STEP	
Speed U- SETTINGS Unes U	100 mm

The LEN file is displayed with the selection "Image".

Displaying LEN Files

When the DFS-Viewer is opened, the LEN files can also be displayed. Cutting information is stored in some LEN files, which is displayed under "LAYER":

Overlaying Multiple Files

By holding down the "Ctrl" button on the keyboard, multiple files can be displayed at the same time in the active directory.

LEN files from the Merger which were created with a cutting file contain a minimum of two register marks. In order to verify the correct cut, the correct register must first be checked.

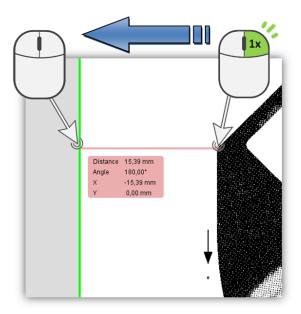

By holding the "Ctrl" button on the keyboard, you can move the contour of the ACM with the left mouse button until both register marks are above each other. Only the cutting file is moved.

Enlarging, Moving and Measuring

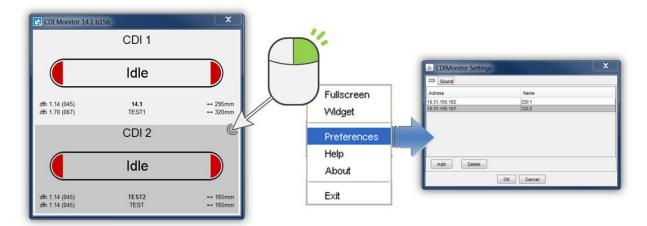

The display can be enlarged and reduced with the mouse wheel. Holding down the left-hand mouse button moves the content.

The measuring function is activated by pressing the right-hand mouse button at the point to be measured. The distance and angle to the current mouse position are now displayed permanently.

CDI Monitor

The CDI monitor displays the current job, the status and the remaining time for the current imaging processes of the CDIs in the network: In addition, the next jobs are also displayed with the width:

The CDI status is displayed with the following colours:

- grey: CDI or service is not activated
- red: CDI is activated and is waiting for jobs
- green: CDI is exposing a plate the remaining time is displayed.

The CDI list of the Digital Flexo Suite is used automatically. Right-click on the CDI monitor to change CDI list under "*Preferences*".

"Fullscreen" displays the monitor as full screen. "Widget" removes borders and the monitor will always be displayed in the foreground.

Support

Contact information can be found on <u>www.esko.com</u>.
