

WebCenter 18.1

Complete Documentation

01 - 2020

Contents

- 1. Copyright Notice..... 11**
- 2. Installation Guide..... 13**
 - 2.1. Copyright Notice..... 13
 - 2.2. Overview of a WebCenter Installation..... 14
 - 2.3. Hardware and Software Requirements..... 15
 - 2.4. WebCenter Installation Tips..... 18
 - 2.5. Installation Checklist..... 20
 - 2.5.1. Installation Checklist for Fresh Installation..... 20
 - 2.5.2. Installation Checklist for Upgrade..... 22
 - 2.6. CHILI-WebCenter Connection..... 24
 - 2.6.1. Share between CHILI and WebCenter..... 24
 - 2.6.2. Requirements for Reverse Proxy for CHILI Server..... 24
 - 2.7. Pre-Installation Steps..... 25
 - 2.8. Installing WebCenter..... 28
 - 2.8.1. Overview of the Installation Procedure..... 28
 - 2.8.2. Install SQL Server 2012/ 2017 Express Edition on the Database Server..... 30
 - 2.8.3. Install the Application Server Components..... 30
 - 2.8.4. Run the Database Schema Scripts on the Application Server..... 35
 - 2.8.5. Install the Web Server..... 37
 - 2.8.6. Install the On-Board Graphics Engine (OBGE) on the Application Server..... 41
 - 2.9. Testing WebCenter..... 43
 - 2.10. Configuring WebCenter..... 44
 - 2.10.1. Configure the OBGE..... 44
 - 2.10.2. Configuring the E-Mail Notifications..... 45
 - 2.10.3. Configure WebCenter for Use with ArtiosCAD Enterprise..... 47
 - 2.10.4. Secure your WebCenter Site with SSL..... 50
 - 2.10.5. Install Certificates for LDAPS on the Application Server..... 63
 - 2.10.6. Integrate WebCenter with a Workflow Production Server..... 65
 - 2.10.7. Expose WebCenter to the Internet..... 69
 - 2.11. Deploying WebCenter..... 71
 - 2.12. Localizing WebCenter..... 72
 - 2.12.1. Understanding Localization in WebCenter..... 72
 - 2.12.2. How to Install Custom Translations..... 73
 - 2.13. The Help System..... 73
 - 2.14. Upgrading WebCenter..... 74
 - 2.14.1. Forced System Reboot during Upgrade..... 75
 - 2.14.2. Configuration Retained During Upgrade..... 75
 - 2.15. Prepare for the Upgrade..... 76

2.15.1. Prerequisites for the Upgrade.....	77
2.15.2. Prepare for the Upgrade on the Application Server.....	78
2.15.3. Prepare for the Upgrade on the Web Server.....	79
2.16. Upgrade WebCenter.....	79
2.16.1. Remove WebCenter.....	79
2.16.2. Install WebCenter 18.1.1.....	79
2.16.3. Upgrade the OBGE.....	80
2.16.4. Configure WebCenter.....	81
2.16.5. Additional step when you upgrade from 18 to later versions.....	81
2.17. Uninstalling WebCenter.....	82
3. Administration Guide.....	84
3.1. Copyright Notice.....	84
3.2. What's New?.....	85
3.3. WebCenter Administration Basics.....	86
3.3.1. A Note on Web Browsers.....	86
3.3.2. Understanding the WebCenter Page Layout.....	87
3.3.3. Filtering Content.....	89
3.3.4. The Admin Menu.....	89
3.4. WebCenter Preferences.....	89
3.4.1. General Preferences.....	90
3.4.2. Password Preferences.....	101
3.4.3. Security Preferences.....	102
3.4.4. Document Type Preferences.....	104
3.4.5. Notifications Preferences.....	106
3.4.6. Menus.....	106
3.4.7. My Work Preferences.....	125
3.4.8. Dashboard.....	130
3.4.9. Reports.....	136
3.5. CAD Options.....	143
3.5.1. CAD Download Format.....	143
3.5.2. Boards.....	144
3.5.3. Run a CAD Standard from WebCenter.....	145
3.5.4. Canvas related Attribute Categories.....	150
3.6. CHILI.....	150
3.6.1. Configure WebCenter-CHILI Server Connection.....	150
3.6.2. Upload a CHILI Package.....	151
3.6.3. Locking behavior.....	151
3.6.4. Download CHILI Documents.....	152
3.6.5. Dynamically assign workspaces and constraints to CHILI Documents.....	153
3.6.6. Loading Assets into the CHILI Editor.....	153
3.7. Project Management for Administrators.....	154
3.7.1. Projects.....	154
3.7.2. Project Templates.....	154

3.7.3. Document Templates.....	157
3.7.4. Project Creation Settings.....	159
3.7.5. Document Creation Settings.....	160
3.7.6. Document Types.....	162
3.7.7. Create Project Thumbnails Automatically from Documents.....	162
3.7.8. Deleted Projects and Templates.....	163
3.7.9. Project Statuses.....	163
3.7.10. JavaScript Rule Action.....	171
3.7.11. Delete View Files.....	172
3.7.12. Configure a Landing Page for a Role.....	173
3.7.13. Configure Rules in a Project.....	174
3.8. Advanced Search Setups in WebCenter.....	176
3.8.1. Advanced Searching.....	176
3.8.2. Creating Advanced Saved Searches.....	177
3.8.3. Projects Calendar View.....	196
3.8.4. Search on Project Duration.....	201
3.8.5. Asset Browser.....	203
3.8.6. How to Search for Document Reference Attributes.....	219
3.8.7. Searching Documents.....	223
3.8.8. Search on Pending Approvers.....	231
3.8.9. Searching for Parent or Child Projects.....	231
3.8.10. SmartNames in Search.....	232
3.8.11. Drilldown Searches.....	236
3.8.12. Search Results Dashboard.....	237
3.8.13. Search Results Formatting.....	247
3.8.14. Setting Up Project Operations in Saved Searches.....	251
3.9. Managing Companies.....	253
3.9.1. Create a New Company.....	253
3.9.2. Edit a Company.....	253
3.9.3. Merge Companies.....	254
3.9.4. Delete a Company.....	254
3.9.5. Add Locations.....	255
3.9.6. Edit a Location.....	255
3.9.7. Merge Locations.....	255
3.9.8. Set up My Work page.....	255
3.9.9. Delete a Location.....	256
3.10. Managing Users.....	256
3.10.1. Licensing and Users.....	256
3.10.2. Users, Groups and Roles.....	260
3.10.3. Create a User.....	261
3.10.4. Editing Users and their Preferences.....	263
3.10.5. Deactivating Users.....	267
3.10.6. Delete a User.....	269

3.10.7. Create and Invite a User from the Approval Page.....	269
3.10.8. Managing User Memberships in Projects.....	271
3.10.10. Delegation.....	273
3.11. Managing Groups.....	275
3.11.1. Create a New Group.....	275
3.11.2. Add Users to a Group.....	276
3.11.3. Remove Users from a Group.....	276
3.11.4. Copy or Move Users Between Groups.....	276
3.11.5. Rename a Group.....	277
3.11.6. Change the Group Visibility.....	277
3.11.7. Set Group Download Formats.....	277
3.11.8. View Group History.....	278
3.11.9. Setting Group Notifications.....	278
3.11.10. Managing Group Memberships in Projects.....	279
3.11.11. Overview of My Group's Tasks.....	279
3.12. Managing Roles.....	283
3.12.1. Roles.....	283
3.12.2. Creating a Role.....	284
3.12.3. Renaming a Role.....	285
3.12.4. Changing the Role Visibility.....	285
3.12.5. Deleting Roles.....	285
3.12.6. Converting Empty Groups to Roles.....	285
3.12.7. Delegating Roles: Setting up Roles to Assign Roles.....	286
3.12.8. View Roles History.....	287
3.13. Discussions.....	288
3.13.1. Global Discussions.....	288
3.13.2. Enabling Discussions in Task Type.....	288
3.13.3. Copying Discussions from Project / Template.....	289
3.13.4. Deleting a Discussion or message.....	290
3.14. Project and Document Characteristics.....	290
3.14.1. Create a Characteristic.....	291
3.14.2. Edit or Delete a Characteristic.....	291
3.14.3. Export/Import Characteristics.....	291
3.15. Project and Document Attributes.....	292
3.15.1. Restricted Sets.....	292
3.15.2. Attributes.....	294
3.15.3. Attribute Categories.....	298
3.15.4. Lists.....	337
3.15.5. Document References.....	353
3.16. WebCenter Configuration.....	394
3.16.1. Configure E-Mail.....	394
3.16.2. Configure Search Crawler Setup.....	395
3.16.3. Configure External Web Connections.....	396

- 3.16.4. Configure Workflow Connections.....400
- 3.16.5. Configure Asset Management Connections..... 407
- 3.16.6. Configure Push-Through Configurations for Workflow Folders.....408
- 3.16.7. Configure Workflow Approval and Tunnel Clients..... 410
- 3.16.8. Upload Saved Search Results Template..... 411
- 3.16.9. View System Information.....411
- 3.16.10. Troubleshooting Tool.....412
- 3.16.11. Workflow Engine.....413
- 3.16.12. Cleanup Tool..... 414
- 3.16.13. Site Service..... 415
- 3.16.14. Authentication.....416
- 3.17. Configure Microsoft Office Files for Viewing..... 424
 - 3.17.1. Steps to Configure Viewable Other Files..... 425
 - 3.17.2. Pixel Based Viewing Vs SVG Viewing.....425
 - 3.17.3. Recommendations and Examples.....426
- 3.18. Connecting to Automation Engine..... 426
 - 3.18.1. Create a Tunnel between WebCenter and Automation Engine..... 427
- 3.19. SmartNames..... 428
 - 3.19.1. Using a SmartName..... 429
 - 3.19.2. List of Available SmartNames..... 429
- 3.20. Bill of Materials..... 431
 - 3.20.1. What is a Bill of Materials?..... 431
 - 3.20.2. Enabling the Bill of Materials Feature.....432
 - 3.20.3. Viewing a Project's Bill of Materials..... 432
 - 3.20.4. Editing the Bill of Materials..... 433
 - 3.20.5. How to Search for a Bill of Materials.....440
 - 3.20.6. How to See if a Document is Part of a Bill of Materials..... 441
 - 3.20.7. Bill of Materials History.....441
 - 3.20.8. Email Notifications for Bill of Materials Changes.....441
 - 3.20.9. Working on the Bill of Materials from ArtiosCAD Enterprise..... 441
- 3.21. Autonaming..... 442
 - 3.21.1. Autonaming Projects / Documents..... 442
- 3.22. Program Management.....448
 - 3.22.1. Introduction.....448
 - 3.22.2. Program Management Related Components.....449
- 3.23. Packaging Content Management in WebCenter..... 463
 - 3.23.1. Introduction to Packaging Content Management in WebCenter.....463
 - 3.23.2. Basic Concepts.....463
 - 3.23.3. Essential Configuration Steps to enable Packaging Content Management..... 472
 - 3.23.4. Managing Text Permissions.....479
 - 3.23.5. Creating a New Text Document..... 485
 - 3.23.6. Creating a Copy Sheet.....487
 - 3.23.7. How to Configure a Setup to Extract Dynamic Content..... 494

3.23.8. How to Configure a Setup to Extract Images, Symbols and Graphics.....	499
3.24. Nutrition Facts Tables.....	499
3.24.1. Table Content Document in WebCenter.....	501
3.24.2. Creating Tables.....	512
3.24.3. Workflow Tasks for Tables.....	515
3.25. Product Content Sheet.....	520
3.26. Migrating your Data.....	522
3.26.1. Migrating Self-contained Data.....	522
3.26.2. Migrating other Data.....	528
3.27. Getting a list of existing projects.....	536
4. User Guide.....	539
4.1. Copyright Notice.....	539
4.2. Getting Started with WebCenter.....	540
4.2.1. Opening WebCenter.....	540
4.2.2. Understanding the WebCenter Page Layout.....	542
4.2.3. The Default WebCenter Menus.....	544
4.2.4. Filtering Content.....	581
4.2.5. Using the Cart.....	582
4.3. Working with Projects and Documents.....	583
4.3.1. View a Project.....	583
4.3.2. Add Documents.....	584
4.3.3. Working with Documents.....	592
4.3.4. Assigning Document Attributes.....	601
4.3.5. Viewing Document References of a Document.....	603
4.3.6. Assigning Document Characteristics.....	603
4.3.7. Downloading a Project.....	604
4.3.8. E-Mailing Links to Documents and Projects.....	604
4.3.9. E-Mailing Links to Download Documents.....	605
4.3.10. Viewing the Action History.....	606
4.3.11. Viewing ArtiosCAD meta-data.....	607
4.3.12. Viewing Project History.....	609
4.3.13. Running a Project Report.....	610
4.4. The WebCenter Viewers.....	610
4.4.1. The Java Viewer.....	610
4.4.2. The HTML5 Viewer.....	626
4.5. Approving and Rejecting Documents.....	739
4.5.1. Evaluate a Document in the Viewer.....	739
4.5.2. Evaluate a Document in the Document Details Page.....	740
4.5.3. Evaluate Multiple Documents at Once.....	742
4.6. Working with Page Lists.....	743
4.6.1. About Page Lists.....	743
4.6.2. Page List Views.....	743
4.6.3. Page Lists in the Java Viewer.....	745

4.6.4. Notes on Page Lists and Approval Cycles.....	746
4.6.5. Approve or Reject a Page List.....	747
4.6.6. Uploading and Updating Page Lists.....	749
4.7. Working with 3D Files.....	752
4.7.1. About 3D Files.....	752
4.7.2. Creating and Exporting 3D Files.....	752
4.7.3. Uploading 3D Files to WebCenter.....	753
4.7.4. Viewing 3D Files.....	754
4.7.5. Using 3D file as 3D perspective.....	757
4.7.6. Approving 3D Files.....	757
4.7.7. Annotating in 3D Files.....	757
4.8. Working with ArtiosCAD Documents.....	758
4.8.1. Canvas.....	758
4.8.2. Opening Documents in ArtiosCAD Standard Edition / Enterprise Edition.....	760
4.9. Project Management in WebCenter.....	761
4.9.1. Creating Projects and Folders.....	762
4.9.2. Editing Projects.....	772
4.9.3. Managing Project Members and Permissions.....	780
4.9.4. ArtiosCAD Default Projects.....	786
4.9.5. Defining Approval Settings.....	786
4.9.6. Forcibly Accept or Reject Documents.....	802
4.9.7. Delegation.....	803
4.9.8. Search on Project Duration.....	807
4.10. Project and Document Security.....	809
4.10.1. Set Security on a Project.....	810
4.11. Reassign a Project to Another Project Manager.....	811
4.12. Create a User.....	812
4.13. Editing Users and their Preferences.....	813
4.13.1. Edit a User.....	813
4.13.2. Change the Password for a User.....	813
4.13.3. Set the Preferences for a User.....	814
4.13.4. Copy Preferences to Users.....	814
4.14. Discussions in WebCenter.....	814
4.14.1. Start a New Discussion.....	815
4.14.2. Post a Message in Discussion.....	816
4.14.3. Viewing Messages in Discussions tab.....	817
4.15. Task Management in WebCenter.....	819
4.15.1. What You Can Do with Task Management.....	819
4.15.2. Basic Concepts of Task Management.....	820
4.15.3. Task Types.....	822
4.15.4. Getting Started with Tasks.....	837
4.15.5. Working with Tasks.....	838
4.15.6. Working on Tasks Assigned to You.....	843

4.15.7. Overview of My Group's Tasks.....	845
4.15.8. Sequential Tasks.....	849
4.15.9. Linking Documents to Tasks.....	849
4.15.10. Setting Up Task Notifications.....	867
4.15.11. Tasks, Templates and Copying Tasks.....	868
4.15.12. Example: Assign a Role using a Task.....	869
4.15.13. Task Reporting.....	870
4.15.14. Workflows.....	871
4.16. Packaging Content Mangement in WebCenter.....	963
4.16.1. Introduction to Packaging Content Management in WebCenter.....	963
4.16.2. Working with Text Content.....	964
4.16.3. Text Document Actions.....	979
5. Customization Guide.....	985
5.1. Copyright Notice.....	985
5.2. Why Customize WebCenter?.....	986
5.3. Where to Start the Customization?.....	987
5.4. Applying your WebCenter 12.X or 14.X customization to WebCenter 16.X or 18.X.....	988
5.5. Customizing the Look and Feel of WebCenter Using the Customizations Page.....	990
5.5.1. Viewing and Editing a Customization.....	991
5.6. Customizing the Look and Feel of WebCenter Using the customizationConfig.xml file.....	994
5.6.1. Customizing Logos and their Hyperlinks.....	995
5.6.2. Change the Color Scheme.....	998
5.6.3. Change the Fonts.....	999
5.6.4. Customize Static Text.....	999
5.6.5. Customize the Language Files.....	1004
5.6.6. Forgot Password.....	1005
5.6.7. Fixed Navigation Bar.....	1006
5.7. Customizing the WebCenter Menus.....	1006
5.7.1. Create a Custom Menu.....	1007
5.7.2. Examples.....	1013
5.7.3. Will My Customizations Survive New Updates?.....	1022
5.8. Integrating an External Web Connection into the User Interface.....	1022
5.8.1. Integrating an External Web Connection into a Top-Level Menu.....	1022
5.8.2. Integrating an External Web Connection into a Project Menu.....	1024
5.8.3. Integrating an External Web Connection into a My Work Section.....	1026
5.9. Customizing the Attributes.....	1028
5.9.1. Create Image Label for an Attribute.....	1028
5.9.2. Create HTML Information for an Attribute.....	1030
5.10. Customizing the E-Mail Notifications.....	1032
5.10.1. E-Mail Notification Templates In Detail.....	1032
5.10.2. Start from the example.....	1033
5.10.3. Technology Used: XSLT.....	1038
5.10.4. The E-Mail Template File Structure.....	1038

5.10.5. Customizing E-Mail Language Files..... 1039

5.10.6. Customizing the Notification Templates Step by Step..... 1039

6. Maintenance Guide.....1042

6.1. Copyright Notice..... 1042

6.2. Maintenance..... 1043

6.2.1. Installation Tips..... 1043

6.2.2. WebCenter Schema..... 1044

6.2.3. Cleaning Up the Database and FileStore..... 1044

6.2.4. Temporarily Block Access to a WebCenter Site..... 1045

6.2.5. Moving the FileStore..... 1046

6.3. Configuration..... 1048

6.3.1. Configuring ArtiosCAD Defaults..... 1048

6.3.2. Configuring to use NAT translation..... 1049

6.3.3. Create Usage Log Files for Each Virtual Site..... 1049

6.3.4. Modify main configuration files..... 1050

6.3.5. Change file name used at the time of download..... 1051

6.3.6. Change CAD plotting style in WebCenter and Viewer..... 1052

6.4. Backup and Restore Strategy..... 1052

6.4.1. What to Back up for WebCenter..... 1053

6.4.2. Microsoft SQL Server 2008 R2 Backup and Restore..... 1057

6.5. Troubleshooting..... 1061

6.5.1. Testing WebCenter..... 1061

6.5.2. Easily Identify when WebCenter is Ready to Access..... 1068

6.5.3. Log files..... 1068

6.5.4. Interacting with services for troubleshooting..... 1072

6.5.5. Possible Problems..... 1072

6.5.6. E-mail Troubleshooting..... 1076

6.5.7. Troubleshooting proxy servers..... 1078

2.2. Overview of a WebCenter Installation

The WebCenter installation procedure involves a number of different steps that need to be performed in a specific order.

The table below shows a list of the steps required to install WebCenter either for the first time or as an upgrade:

Step	Description
1	Check the Requirements and perform pre-installation work: <ul style="list-style-type: none"> • Hardware and Software Requirements on page 15 • Pre-Installation Steps on page 25

Step	Description
2	<p><i>Installing WebCenter</i> on page 28:</p> <ol style="list-style-type: none"> 1. <i>Install SQL Server 2012/ 2017 Express Edition on the Database Server</i> on page 30 2. <i>Install ArtiosCAD Enterprise on the Application Server</i> on page 31 3. <i>Install the WebCenter Application Server</i> on page 32 4. <i>Install the WebCenter Web Server</i> on page 39 5. <i>Start the WebCenter Services</i> on page 40 6. <i>Install the On-Board Graphics Engine (OBGE) on the Application Server</i> on page 41
3	<p><i>Testing WebCenter</i> on page 43</p>
4	<p><i>Configuring WebCenter</i> on page 44:</p> <ol style="list-style-type: none"> 1. <i>Configure the OBGE</i> on page 44 2. <i>Configuring the E-Mail Notifications</i> on page 45 3. <i>Secure your WebCenter Site with SSL</i> on page 50 4. <i>Install Certificates for LDAPS on the Application Server</i> on page 63 5. <i>Integrate WebCenter with a Workflow Production Server</i> on page 65 6. <i>Expose WebCenter to the Internet</i> on page 69

2.3. Hardware and Software Requirements

Attention: For the latest hardware and software requirements, please check [the Esko website](#).

WebCenter employs three distinct servers, a **Web Server**, an **Application Server**, and a **Database Server**.

It also has a **FileStore** and an **On-Board Graphics Engine (OBGE)**, which is used to generate view data.

New IT Requirements since WebCenter 18

There are no specific new requirements for WebCenter 18. For the latest hardware and software requirements, please check [the Esko website](#).

New IT Requirements since WebCenter 14

Since 14, WebCenter runs on 64-bit operating systems only. Only Windows Server 2008 R2 or later are supported.

Entry Level (Two Server Systems Required)

WebCenter Entry Level requirements are based on an activity with 10 concurrent users active at any time and less than 100 users in the system. Customers with higher performance needs should refer to the Advanced Level requirements.

In the Entry Level setup, the installation of the **Application Server** and **Database Server** is combined onto a single machine. The **OBGE** and the **FileStore** are on the Application Server.

For reasons of security the **Web Server** is always on its own dedicated computer and placed in a demilitarized zone (DMZ). We recommend the use of hardware firewalls for creating the DMZ.

Advanced Level (Three or More Server Systems Required)

When the WebCenter Entry Level cannot meet the load requirements of the system, it is possible to scale the system.

For reasons of security the **Web Server** will always be a separate computer in a DMZ.

Each of the other WebCenter components (**Application Server**, **Database Server**, **FileStore** and **OBGE**) can be offloaded onto separate machines in different combinations.

For Advanced Level installations, it is recommended to choose the **Advanced** Installer option to allow more custom configuration, and to choose **Extra Large** for the Deployment Size.

Requirements

Category	Entry Level (Standard - < 100 users)	Advanced Level (Extra Large - 100+ users)
Operating System	Microsoft Windows Server 2008 R2 SP1 or better	Microsoft Windows Server 2008 R2 SP1 or better
	Note: Microsoft Windows Server 2000 and 2003 are no longer supported.	Note: Microsoft Windows Server 2000 and 2003 no longer supported.
Processor - Application Server with On-Board Graphics Engine	x86-64 compatible processor (Intel or AMD), minimum 8 cores	x86-64 compatible processor (Intel or AMD), minimum 12 cores, 6 + 6 per 100 users
Processor - All other WebCenter Servers	x86-64 compatible processor (Intel or AMD), minimum 4 cores	x86-64 compatible processor (Intel or AMD), minimum 6 cores, 2 + 4 per 100 users, 2 + 6 per 100 users for separate DB server
RAM Memory (Application Server with DB and OBGE)	16 GB or more	36 GB or more
RAM Memory (Application Server with OBGE)	16 GB or more	28 GB or more
RAM Memory (Application Server)	12 GB or more	18 GB or more
RAM Memory (Separate Database Server)	12 GB or more	minimum 12 GB or the size of the DB (whichever is larger), add 8 GB per 100 users
RAM Memory (Web Server)	6 GB or more	12 GB or more

Category	Entry Level (Standard - < 100 users)	Advanced Level (Extra Large - 100+ users)
Available hard disk space - Application Server	20 GB or more	60 GB or more
Available hard disk space - Web Server	20 GB or more	60 GB or more
Available hard disk space - Database Server	40 GB or more	80 GB or more
Display	1024 x 768 pixels, 16-bit color minimum	1024 x 768 pixels, 16-bit color minimum
Media drives - Application Server	DVD-ROM or connection to networked DVD-ROM drive	DVD-ROM or connection to networked DVD-ROM drive
Media drives - Web Server	DVD-ROM or connection to networked DVD-ROM drive	DVD-ROM or connection to networked DVD-ROM drive
Network (all servers)	10/100/1000 Base-T Ethernet, TCP/IP v4 protocol	10/100/1000 Base-T Ethernet, TCP/IP v4 protocol
Database software	<ul style="list-style-type: none"> Microsoft SQL 2008 R2 (Express Edition (SP2), Workgroup Edition, Standard Edition, Enterprise Edition) Microsoft SQL Server 2012/2014/2016/2017 (Express Edition, Workgroup Edition, Standard Edition, Enterprise Edition) Oracle 10g or 11g or 12c Enterprise Edition <p>Note: Oracle 8i and 9i are no longer supported.</p>	<ul style="list-style-type: none"> Microsoft SQL 2008 R2 (Workgroup Edition, Standard Edition, Enterprise Edition) Microsoft SQL Server 2012/2014/2016 /2017 (Workgroup Edition, Standard Edition, Enterprise Edition) Oracle 10g or 11g or 12 c Enterprise Edition <p>Note: Oracle 8i and 9i are no longer supported.</p>

Notes

- The Database Server needs 10 GB of free space on the partition containing the database files to allow for database expansion.
- The Application Server is the default location for uploaded files (also known as the FileStore).

Ensure it has at least 50 GB of available hard drive space, and that **the disk space is expandable**. Alternatively, find a network location with expandable disk space to specify as the file storage location when loading the Application Server.

- The Web, Application and Database Servers must have the same OS language, regional setting (such as `English (United States)`), and time zone setting.
- You must be able to download and install Java applets automatically to use the Java Viewer.
If Java is installed but a red X appears in the browser when launching the Viewer, consult your system administrator to see if a firewall or proxy blocks Java downloads.
- If you are using a Microsoft Hyper-V hypervisor virtual machine, do not install both the WebCenter Web Server and the Esko Licensing software on this virtual machine.

2.4. WebCenter Installation Tips

Licenses

- **WebCenter Licenses**

To install WebCenter 18.1.1, you will need to request WebCenter 18.1 licenses. The old WebCenter 16.x, 14.x or 12.x licenses will not work anymore.

- WebCenter supports two types of licensing models. You can have counted licenses in the Named User Model and Concurrent License Model where you can have licenses that are taken up during a log-in sessions.
 - **Named User Licenses:** A **named user license** is an exclusive licensure of rights assigned to a single software **user**. This License model lets you pay for the number of users you want to create in WebCenter. This means that the purchased number of licenses (per type of users) limit the number of users that can be created. Read more in: [Licensing and Users](#) and in this [FAQ](#).
 - **Concurrent Licenses:**

In this model, you can create as many users as you want. The number of users who may use the system at the same time is determined by your **Concurrent Licenses**. The licensing model distinguishes between three types of users: guaranteed users, concurrent users, and editor users.

Note: Since WebCenter 14.0.2, large installations from 50 concurrent users require a WebCenter Advanced License. A special 'advanced' variant of the concurrent user licenses is also needed in this case.

Network Licensing Tool

For WebCenter 18.1.1, you need to install ArtiosCAD Enterprise 18.1, this installation includes the required Network License Manager.

To know more about Network Licenses, [click here](#).

Server Configuration

Port Configurations

Below you can find the ports which need to be open/available for proper functioning of WebCenter:

- Port 80 (HTTP) from the internet to the WebCenter Web Server (DMZ).
- Port 443 (HTTPS) from the internet to the WebCenter Web Server (DMZ).
- Port 80 (HTTP) from the LAN to the WebCenter Web Server (DMZ).

- Port 443 (HTTPS) from the LAN to the WebCenter Web Server (DMZ).
- Port 4444 from the WebCenter Web Server (DMZ) to the WebCenter Application Server (LAN).
- Port 5445 from the WebCenter Application Server to the Automation Engine server (LAN) for approval feedback
- Port 25 (SMTP) from the WebCenter Application Server (LAN) to the Mail Server.

Note:

- The following ports are internal ports for the Application Server and need not be configured on the firewalls. However, if any of these ports are taken by another application, the Application Server will not start. Ports: 8083, 8086, 1161, 1162, 1090.
- The following ports are internal ports for the WebServer and do not need to be configured on the firewalls. However, if any of these ports are taken by another application, the WebServer will not start. Ports: 8081, 8009.

Note: It is recommended to install the external viewer during the installation process.

- **Database**

The database shipped as default with WebCenter 18.1.1 is MSSQL 2012 Express.

- **OBGE**

In case the OBGE 18.1.1 is installed on the Web Server (not recommended), make sure to stop the EG Web Server service before starting Tomcat.

Note: Since 16.1, Automation Engine no longer uses Hot Folders explicitly, but you can now configure the FileStore JDF Hot Folder by creating an Access Point which is described in [Create a JDF Hot Folder \(Access Point\) for WebCenter](#).

- **IIS**

If you move to WebCenter 18.1.1 from WebCenter 12.x, leaving the installation of IIS intact, a change to IIS may be needed. In IIS, go to Application Pools and open the Advanced Settings for DefaultAppPool. Make sure that 'Enable 32-Bit Applications' is set to 'False'. After changing the setting, click 'Recycle...'

- **Simple or Advanced Installation**

Since WebCenter 14, it is possible to choose between a Simple or Advanced installation. If the Advanced installation mode is selected, the memory size allocated for the JBoss service on the Application Server and the TomCat service on the Web Server need to be specified. Choosing the Extra Large option is recommended for servers that are expected to experience a heavy load and high concurrent user access.

- **Internal or External Viewer**

In case of an Advanced installation, the Viewer service can be set to Internal or External. Selecting External will make the Viewer service run as a separate process. Note that choosing External requires extra ports to be opened between the Application and Web Server: 14444. And the following ports need to be available for the application server: 1091, 3528 and 4446.

- **Database user**

In case of an Advanced installation, it is possible to set a custom password for the WebCenter database user.

- **Boards**

Previously, in older versions of ArtiosCAD Enterprise, the Boards needed to be installed by running a .bat file after the WebCenter installation. Since ArtiosCAD Enterprise 14.0, you can install the Boards automatically during the ArtiosCAD Enterprise installation, this is highly recommended.

Servicing

- **Admin Console**

Since WebCenter 14, it is possible to inspect JBoss by going to: `http://yourhost:8086/admin-console`.

- **Services**

Since WebCenter14, you will only see the following services:

- JBoss
- Tomcat
- CAD-X

The App-X and Search Crawler services are no longer needed since WebCenter 12.

Note: In order to run the services interactively, open the command prompt and go to `..\Esko\Artios\WebCenter\ApplicationServer\NAMEOFSERVICE\bin` for each service, and run `wcr_nameofservice_srv_cmdrun.bat`. For example: `C:\Esko\Artios\WebCenter\ApplicationServer\JBoss\bin\wcr_jboss_srv_cmdrun.bat`.

2.5. Installation Checklist

The Installation Checklist can be used as a tool alongside the rest of the Installation Guide to ensure you completed all the necessary steps during the installation. There are two versions, the first one can be used for a fresh installation, the second one can be used in case of an upgrade.

2.5.1. Installation Checklist for Fresh Installation

This checklist can be used whilst performing a fresh installation of WebCenter (meaning WebCenter was not installed on the same machine(s) before).

Please complete the Installation Checklist in the same order as listed here.

Note: Do not run this installation from a network share.

On the Application Server...

- Install ArtiosCAD Enterprise located on the WebCenter DVD.
- Install **License Server Components** from the ArtiosCAD Enterprise Installer.
- Activate Network Licenses via the **Network License Manager**:
 - WebCenter (Standard or Advanced)

- CAD Engine
- OBGE
- Optional licenses
- If you are going to use MS SQL Server (no prerequisites for Oracle):
 - Install **MS .NET framework 3.5** (run the script from the WebCenter DVD to install it).
Or, if you use a MS SQL Database on Windows Server 2008 r2 without access to the Internet: <https://wiki.esko.com/display/KBA/KB208233361%3A+How+to+install+.NET+3.5+on+Windows+2012%2C+Windows+8+and+late>
 - Install **MS .NET framework 4.5** (run the script from the WebCenter DVD to install it).

Note: For servers with Windows Server 2012 or with access to the Internet, this will happen automatically.

- Install the **SQL Server 2012 SP1 Express Edition** Database engine for WebCenter or **SQL Server 2017 Express Edition**
- Always install **SQL Management Studio** on the Application Server.
- Create the local **BGSYSTEM** Windows user (run the script from the WebCenter DVD to create it).
- Create the **FileStore** folder and share it as a network folder with all rights enabled for the **BGSYSTEM** user.
- Install the **Application Server** component of WebCenter; build the Database schema and **REBOOT**.
- Install the **OBGE** from the Automation Engine DVD by selecting the option: **Install Automation Engine 18.1.1 as On Board Graphics Engine (OBGE) for WebCenter**.
- Configure the **Access Point** (formerly known as Hot Folder) in the Automation Engine Pilot to generate view files for graphic files.

On the Web Server...

- Install and configure **IIS 7** (Windows Server 2008 r2) or **IIS 8** (Windows Server 2012) on the Web Server.
It is recommended to auto install IIS using the provided PowerShell Script from the installation disk, to configure IIS on Windows Server 2012 or later.
- Make sure that **Enable 32-bit programs** in IIS is set to **False**.
- Increase the upload limit in the request filtering.
- Install the **Web Server** component of WebCenter and **REBOOT**.

On the Application Server...

- Since WebCenter 12.1, services are started automatically. Verify that the following services are started:

- JBoss
- CAD-X
- Application Monitor

On the Web Server...

- Verify that the following services have been started:
 - TomCat
 - Application Monitor
- Connect to WebCenter in your browser: `http://[WebServer]/WebCenter_Inst.`
 - Username: admin. Password: [blank].
 - Change password.
- Install the **ArtiosCAD Defaults** in **English** and **Import the Boards** (directly from the ArtiosCAD Defaults Installer).
- Run the CADX User Defaults installer, to install optimal **Defaults for the WebCenter Cad-X service**
- Run the Studio Defaults installer, to install **Studio Print Finishing Profiles** for working with advanced material effects in 3D visualization

2.5.2. Installation Checklist for Upgrade

This checklist can be used whilst performing an upgrade installation of WebCenter 18.1.1 from an older version.

Please complete the Installation Checklist in the same order as listed here.

Note: Do not run this installation from a network share.

On the Web and Application Server...

- Stop all WebCenter services.

On the Application Server...

- Backup the whole `..\WebCenter\ApplicationServer` folder (make a **copy**, do not move it) and backup the following:
 - FileStore
 - Database
 - Email configuration (if you upgrade from a WebCenter < 12)

On the Web Server...

- Backup the whole `.. \WebCenter\WebServer` folder (make a **copy**, do not move it).
- Uninstall** the old version of WebCenter on both Application and Web Server and **REBOOT** both servers after uninstall.
- Remove all** WebCenter **instances** in **IIS** on the Web Server.

On the Application Server...

- Upgrade to ArtiosCAD Enterprise 18.1 located on the WebCenter DVD.
- Upgrade the **Network License Manager** via the **Install License Server Components** from the ArtiosCAD installer.
- Upgrade WebCenter **Licenses and dependants** (CAD Engine and OBGE) to 18.1.
- If you are using MS SQL Server, make sure that **SQL Management Studio** is always installed on the Application Server.
- Install the **Application Server** component of WebCenter using the existing FileStore and Database. **DO NOT REBOOT YET**
- Re-apply email customization on the Application Server.
- Build the **Database schema** if this was not done during the installation.
- REBOOT**
- Update to Automation Engine OBGE 18.1.1 and configure the **Access Point** (formerly known as Hot Folder) in the Pilot to generate view files for graphic files.

On the Web Server...

- Install the **Web Server** component of WebCenter.
- Make sure that **Enable 32-bit programs in IIS** is set to **False**.
- To be able to use Excel based lists from the Web Server, install a 64-bit driver (see link on the WebCenter DVD). **DO NOT REBOOT YET**
- Re-deploy WebCenter Instance(s) and re-apply customizations.
- REBOOT**

On the Application Server...

- Since WebCenter12.1, services are started automatically. Verify that the following services are started:
 - JBoss**
 - CAD-X**
 - Application Monitor**

On the Web Server...

- Verify that the following services have been started:

- TomCat**
- Application Monitor**
- Connect to WebCenter in your browser: `http://[WebServer]/WebCenter_Inst.`
- Username: admin. Password: [old admin password].
- Install or merge the **ArtiosCAD Defaults** in **English** and **Import the Boards** (directly from the ArtiosCAD Defaults Installer).
- Install the **ArtiosCAD Defaults** in **English** and **Import the Boards** (directly from the ArtiosCAD Defaults Installer).
- Run the CADX User Defaults installer, to install optimal **Defaults for the WebCenter Cad-X service**
- Run the Studio Defaults installer, to install **Studio Print Finishing Profiles** for working with advanced material effects in 3D visualization.

2.6. CHILI-WebCenter Connection

2.6.1. Share between CHILI and WebCenter

A **CHILI share** is used to temporarily hold the files while registering them to the **CHILI server**. WebCenter will create a sub folders corresponding to the CHILI environments in this CHILI share root folder.

Note:

The share must have:

- read and write permissions for WebCenter 'BGSYSTEM' user.
- read permissions for CHILI server.

2.6.2. Requirements for Reverse Proxy for CHILI Server

IIS ports accessing CHILI over the WebCenter web server should be:

- 80 for IIS `http`
- 443 for IIS `https`

The `https` ports must have a security certificate attached to it in order to be able to work with Web Server.

Note: The best practise is to install a properly signed certificate, matching the CHILI server hostname (NOT the tricked hostname) on the CHILI server. In this scenario, the validation of the SSL certificate will be smooth when the WebCenter Application Server makes a connection to it.

Alternatively, you may use a self-signed certificate. However, these are NOT supported for the WebCenter Web Server. You may get SSL validation errors when the WebCenter Application Server tries to connect to the CHILI server due to this.

As a work-around, use the WebCenter LDAP CertInstall tool:

- Go to the <Installation Directory>\ApplicationServer\LDAP.
- Run the following command:

```
CertInstall.bat <chiliserver>:443
```

- Select the right certificate to install by entering a digit.
- Restart the JBoss.

This will solve the SSL validation problems.

2.7. Pre-Installation Steps

Execute the following steps to make sure you have all the required information and materials for the installation.

1. Log on to all servers as a **local administrator** user.

Attention:

Logging on as DOMAIN ADMIN does not ensure you are a member of the local Administrators group.

Verify that the account you are using to log on to each machine belongs to the local Administrators group before you continue!

2. Make sure you use **compatible** software versions:
 - a) Gather the installation media on CD or DVD for ArtiosCAD Enterprise, WebCenter, and Automation Engine (OBGE).
 - b) Only very specific versions of ArtiosCAD Enterprise, WebCenter, and Automation Engine (OBGE) work with each other.

You CANNOT assume that a new version or build of one product will be compatible with older versions of the other products.

Software	Version	Build
ArtiosCAD Enterprise
WebCenter
Automation Engine

3. Check the **licenses** for the Esko installers:

- a) Gather Graphics and CAD licenses.
- b) If this is an upgrade, you will need to ask for updated license files.
- c) Check the license files against your software order.

Verify that the licenses have the correct number of users, the expiration date if applicable, and the correct ArtiosCAD Enterprise, WebCenter, and Automation Engine (OBGE) version information.

4. Gather the required **mail server** information:

Note:
 The mail server must be on the same network as the WebCenter Application Server.
 Also, ensure this mail server has a send-only e-mail account already created for specific use with WebCenter notifications (this usually requires creation of an account such as webcenter@mycompany.com).

Mail Server Information	Value
Mail Server Name
Mail Server IP Address
SMTP Port
WebCenter Sender Address
SMTP Authentication User Name
SMTP Authentication Password

5. Gather the required **database information** from the database administrator:

Database	Item	Value
SQL Server	server name
	"sa" password
	database instance name
	database port (default is 1433)
Oracle Server	server name
	'sys' password
	TNS name

Database	Item	Value
	System ID (SID)
	database port (default is 1527)

6. Ask the database administrator whether a custom password for the 'WebCenter' database user will be required and if so, retrieve the expected target password for this database user.
7. Perform a Web Server health check:
 - a) We highly recommend not to begin the install with the Web Server inside the DMZ. It is best to **configure on a local LAN** first.

Get all applications installed, configured, and fully functional before moving the Web Server inside the DMZ. Otherwise any required troubleshooting will be difficult and will take longer than needed.
 - b) Verify that **Internet Information Services (IIS)** is installed and its services are started: IISADMIN and W3SVC (World Wide Web Publishing).
 - c) Make sure the **Server** service is running.
8. Test the mail server connection:

Note:
Ensure that you can use telnet commands and that its port is not blocked in any way. Make sure you test this before starting the installation. IT Administrators often block the required SMTP ports.

- a) From the Application Server, open a command prompt.
- b) Use a telnet command with the following syntax: `telnet <mail_server_name_or_ip> <smtp_port#>`.

For example, my mail server name is `mail.eskowebcenter1.com` and my SMTP port is 25.

I would type: `telnet mail.eskowebcenter1.com 25`.

You are looking for a successful response (for example like the one below); a 220 response is good.

```
telnet mail.eskowebcenter1.com 25Trying 62.204.32.250...Connected to
mail.eskowebcenter1.com (62.204.32.250).220 mail.eskowebcenter1.com Mail Server;
Mon, 2 Jun 2014 11:26:40 EST
```

Type `QUIT` to exit the telnet command.

9. Make sure the **Server** service is running on the Application Server.
10. Check the Database Server:
 - a) Ensure the correct database engine, version and service pack are installed. See section [Install SQL Server 2012 Express Edition on the Database Server](#).
 - b) For SQL Server 2008/2012/2017 or Express 2008/2012/2017 verify these configurations:
 - Must be configured to run in Mixed Mode for authentication;

- Language/Character set of SQL Server must match the Operating System language;
 - TCP/IP must be enabled.
 - If a named instance is used, the SQL Server Browser must be set to start automatically (and must be running).
- c) This assumes that the system is protected by an external firewall.
- 11. Check performance for all servers:**
- a) For all servers (Web, Application, Database), ensure Windows System Performance is set to **Adjust for Best Performance**:
- Go to **Control Panel > System > Advanced** and select **Adjust for Best Performance** from the **Performance** list.
- b) Ensure **Control Panel > Automatic Updates** is set to **Download updates for me, but let me choose when to install**.
- Windows Updates have been known to interfere with WebCenter operation: some updates lock down ports and stop services related to web and internet.
- It is your responsibility to test Microsoft updates before applying them to production servers.
- c) Ensure **Windows Firewall** is disabled:
- Go to **Control Panel > Network Connections**, right-click on the active network connection and choose **Properties**. On the **Advanced** tab, ensure **Internet Connection Firewall** is disabled.
- d) Stop and **temporarily disable virus software**.
- Temporarily stop virus services on the Web Server and the Application Server as they are known to interfere with the WebCenter installation script.
- Only after the software is installed should you enable the virus software again.

2.8. Installing WebCenter

Installing WebCenter is a multi-step process spread over two or three servers depending on your configuration. We strongly recommend having three servers.

2.8.1. Overview of the Installation Procedure

This is a broad overview of the steps required to install WebCenter.

1. Perform the [Pre-Installation Steps](#) on page 25.
2. On the **Database Server**, optionally create a database called `WebCenter4_0` if using Microsoft SQL Server. If you do not create the database at this point, it will be done by the WebCenter installer.

If using Oracle, we recommend that the SID (System Identifier) of the database be `WCenter`, but it can be anything; just make sure you know the exact name so you can enter it while loading WebCenter on the Application Server.

3. On the **Application Server**:

- a) If using Microsoft SQL Server or SQL Server Express Edition, install Microsoft SQL Server Management Studio (if you have not done so already). This is provided as part of the MSSQL Express installer provided on the DVD. If you are using Oracle, it is advised to also install SQL Developer Studio, which can be downloaded from the Oracle web site.
- b) *Install ArtiosCAD* Enterprise.

Even if the Application Server already has a version of ArtiosCAD Enterprise on it, you must load the version that came with WebCenter.

For more information on loading and configuring ArtiosCAD Enterprise, refer to the installation instructions on its media.

- c) *Activate the Licenses* on page 32
- d) *Install the WebCenter Application Server*.

4. Run the Database Schema Scripts on the **Application Server**.

This is only required if the database schema scripts were not run automatically, or if the automatic run failed. Running the database schema scripts automatically is preferred. If needed, it is still possible to run the database scripts manually from the **Application Server**.

5. On the Web Server, install the WebCenter Web Server.

Reboot the Web Server machine if prompted.

6. Start the WebCenter Services:

- a) On the **Application Server**, start **JBOSS** and **CAD-X**.
- b) On the **Web Server**, start **Tomcat**.

Note: These services are set to start automatically by the installer and will thus be started automatically after each machine reboot. If you prefer to start the services manually, you may set them to start manually by changing their properties in the **Services** applet via **Control Panel > Administrative Tools**.

Note: Since WebCenter 12 a new monitoring service is installed and started automatically. This service can be used by your WebCenter support agent for troubleshooting.

7. Install the On-Board Graphics Engine (OBGE) from the Automation Engine media. This will take about a half hour.

Note:

You must install the OBGE even if you are running a separate Automation Engine production server.

The OBGE will handle files uploaded through the WebCenter user interface, reducing the load on your Automation Engine production server.

WebCenter is now installed.

8. Log on the WebCenter web interface and:

- a) *Change the administrator password*.
- b) *Configuring the E-Mail Notifications* on page 45 if you will be using it.

9. Install the ArtiosCAD defaults.

See [Loading the ArtiosCAD Defaults](#) for details.

2.8.2. Install SQL Server 2012/ 2017 Express Edition on the Database Server

Microsoft SQL Server 2012 / 2017 Express Edition (supplied with WebCenter) is a free version of Microsoft SQL Server 2012/ 2017 that can serve as the database engine for WebCenter.

To install it, use the **Install the SQL Server 2012 / 2017 Express Edition database engine for WebCenter** link on the WebCenter installation media.

Following steps describe how to install the MSSQL Server 2012/ 2017 Express database on a clean system:

1. When the **SQL Server Installation Center** launches, select the option **New SQL Server stand-alone installation or add features to an existing installation**.
2. If prompted, accept the **License Terms** and click Next.
3. A quick check will be done and the installation will be prepared.
4. Select the **Features** you wish to install. If unsure, enable all except **LocalDB**.
5. On the **Instance Configuration** screen, select **Named Instance** and name your instance **WEBCENTER**. You can also change the instance root directory if you want.
6. On the **Server Configuration** screen, you can define separate accounts for each service, leave as default.
7. You can also specify your **Database Engine Collation**, leave as default.
8. On the **Database Engine Configuration** screen, choose the **Mixed Mode** authentication type.
9. On the same screen, specify the **SQL Server system administrator (sa)** password. The default password is (xxxxxxx), but you can enter a different one if desired.
10. On the **Reporting Services Configuration** screen, select **Install and Configure** and click **Next**.
11. The system will now continue with the installation. The last screen shows that the installation process was completed successfully. You may be asked to restart the computer.
12. If you now inspect your Programs, you should see **Microsoft SQL Server 2012 / 2017** listed, along with other tools like **SQL Server Management Studio**.
13. Launch the **SQL Server Management Studio** to check the connection to the Database Engine.
14. In case it has not been created yet, add a new database named **WebCenter4_0**.
15. Launch the **SQL Server Configuration Manager** to check the TCP/IP and SQL Server service statuses.
16. Choose **SQL Server Network Configuration > Protocols for WEBCENTER >** , make sure **TCP/IP** is set to **Enabled** for **WEBCENTER**.
17. In the **SQL Server Services** section, restart the **SQL Server** service. Also, make sure the **SQL Server Browser** service is running.

2.8.3. Install the Application Server Components

Install ArtiosCAD Enterprise on the Application Server

1. Log on to the Application Server as a member of the local Administrators group.
2. Load the ArtiosCAD Enterprise media that came with WebCenter.

Important:

Even if the Application Server already has a version of ArtiosCAD Enterprise on it, you must load the version that came with WebCenter. In the case of WebCenter 18.1.1, you need ArtiosCAD Enterprise 18.1.

Make sure to also run the **Install Network License Components** installer from the **ArtiosCAD Enterprise Installer**.

In order for WebCenter to output PDF files, the ArtiosCAD PDF option must be purchased and then chosen when installing.

For more information on loading and configuring ArtiosCAD Enterprise, refer to its installation instructions on the ArtiosCAD media.

3. In the **Esko ArtiosCAD Setup** window, click **Install Esko ArtiosCAD Enterprise 18.1 en**.

Depending on your system configuration prior to loading ArtiosCAD, the Microsoft Data Access Components and MSXML 6 may be copied to your system.

If the system prompts you to reboot, do so; the installation program will resume automatically when you log in after the system comes up again. Do not postpone rebooting if the system requests it.

4. The **Esko ArtiosCAD Enterprise 18.1en InstallShield Wizard** opens.

- a) In the **Licensing Method** screen, choose **Network Licenses**. Make sure the **Server** field contains the name of the Application Server (it should be filled in by default).
- b) In the **Setup Type** screen, choose **Typical** for a regular WebCenter installation, or **Advanced** if you will be working with ArtiosCAD Enterprise.
- c) In the **Feature Selection** screen, make sure **PDF Import/Export** is enabled.

Note: You will only see this screen when performing an **Advanced** setup to work with ArtiosCAD Enterprise.

- d) In the **Advanced Options** screen, you can leave the default options selected. If you wish to change them please see the ArtiosCAD documentation for details.

Note: You will only see this screen when performing an **Advanced** setup to work with ArtiosCAD Enterprise.

- e) In the **User Files Folder** screen, keep the default location for the storage of user files, or **Change** it if desired. If you change the location to another system, use a UNC locator (for example `\\system2\designs`) instead of a mapped drive letter.

Note: You will only see this screen when performing an **Advanced** setup to work with ArtiosCAD Enterprise.

- f) Click **Install**.
- g) Once the installation is complete, click **Finish** to close the installer.

5. If the system asks you to reboot, do so.

Note: You will need to perform *extra configuration later* to work with ArtiosCAD Enterprise.

Note: Since ArtiosCAD Enterprise 14.0, you can install the Boards automatically during the ArtiosCAD Defaults installation, this is highly recommended. In case you do not choose to install the Boards during the ArtiosCAD Enterprise installation, you will have to import them manually later.

Create a Detailed Installation Log

For Installation debugging and troubleshooting purposes, you can create a detailed installation log file for any Esko Installer programs. To do this:

Run setup using the following syntax: Path+program space /v"/l*v space path+logfile name

- For example: For ArtiosCAD Enterprise installation from CD-ROM in my D:\ drive,
- Open a command prompt and Change to the D:\ drive
- Type: setup /v"/l*v c:\temp\ACsetup.log"

Activate the Licenses

If you have not done so already, install the **Network License Components** from the **ArtiosCAD Enterprise Installer** first.

Activate your licenses using the Esko Network License Manager.

Note: To perform this task, consult the **Network License Manager User Manual**.

You need to activate:

- your ArtiosCAD Enterprise license,
- your WebCenter licenses (your basic WebCenter license and any additional WebCenter license you have, for example WebCenter Task Management, WebCenter Advanced Approval, Reporting, etc.).
- your license for the OBGE (Automation Engine license).

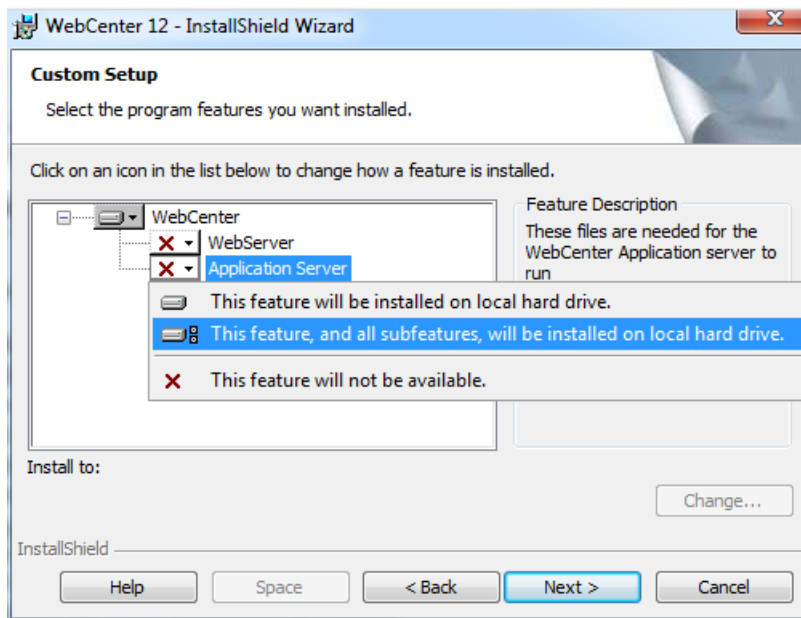

Install the WebCenter Application Server

The Application Server components of WebCenter can be installed from a link on the installation media.

Before doing so, click the link on the DVD to **Create the local BGSYSTEM Windows user** in case this user was not created before.

1. Log on to the Application Server as a member of the local Administrators group.
2. Insert the WebCenter media into the media drive, and click **Software Installation** on the menu that appears at left, then **Install WebCenter 18.1.1**.
3. The setup wizard opens with a **Welcome** screen. Click **Next**.
4. In the **License Agreement** screen, read the agreement, and if you agree to it, select **I accept the terms in the license agreement** and click **Next**.

5. Select either **Simple (default)** or **Advanced** Installation. Keep **Simple (default)** selected unless you mean to specify non-default values for either **Installation Size**, **Image Viewer Service** or **Database User management**.
6. In the **Custom Setup** screen:

- a) Click the icon next to **WebServer** and select **This feature will not be available**.
 - b) Click the icon next to **Application Server**, and select **This feature, and all subfeatures, will be installed on local hard drive**.
 - c) If desired, click **Change** to change the installation folder.
 - d) Click **Next**.
7. In the **WebCenter File Storage Folder** screen, choose the location where all data files uploaded to WebCenter will be stored (the **FileStore**).

Note: If you want to change the FileStore location, click **Change...** and browse to your desired location or enter a UNC address. Using a UNC location such as `\\system\sharename\FileStore` is the most reliable option. The FileStore should be on a partition with **at least 50 GB of free space**.

Troubleshooting:

If the installer fails to create the FileStore, it will give you a message saying that you have to set it up manually.

Go to the folder that you will use as a FileStore (by default, `C:\Esko\Artios\WebCenter\FileStore`, or the location of your choice), and **share** it (typically to the user `BGSYSTEM`).

Click **Next**.

8. In the **Web Server System** screen, enter the name you will give to the Web Server and click **Next**.

Note: Once you have completed the installation and launched WebCenter, the Application Server must be able to **resolve the Web Server name you have entered here into an IP address.**

9. In the **Database Configuration** screen, enter your database information:
 - a) Choose your **Database program (Microsoft SQL Server or Oracle).**
 - b) Enter the name of your Database Server in **Database server system.**
 - c) If you chose...
 - **Microsoft SQL Server**, enter your **Database Instance Name.** By default, this is `WEBCENTER` (using the SQL Server 2012/2017 Express Edition installer on the WebCenter installation media created this instance).
 - **Oracle**, enter your **Database System Identifier (SID).**

Click **Next** when done.

10. A custom **webcenter** database user password can be set. In that case you will need to provide a password value. This screen will only be shown in case of an Application Server installation.

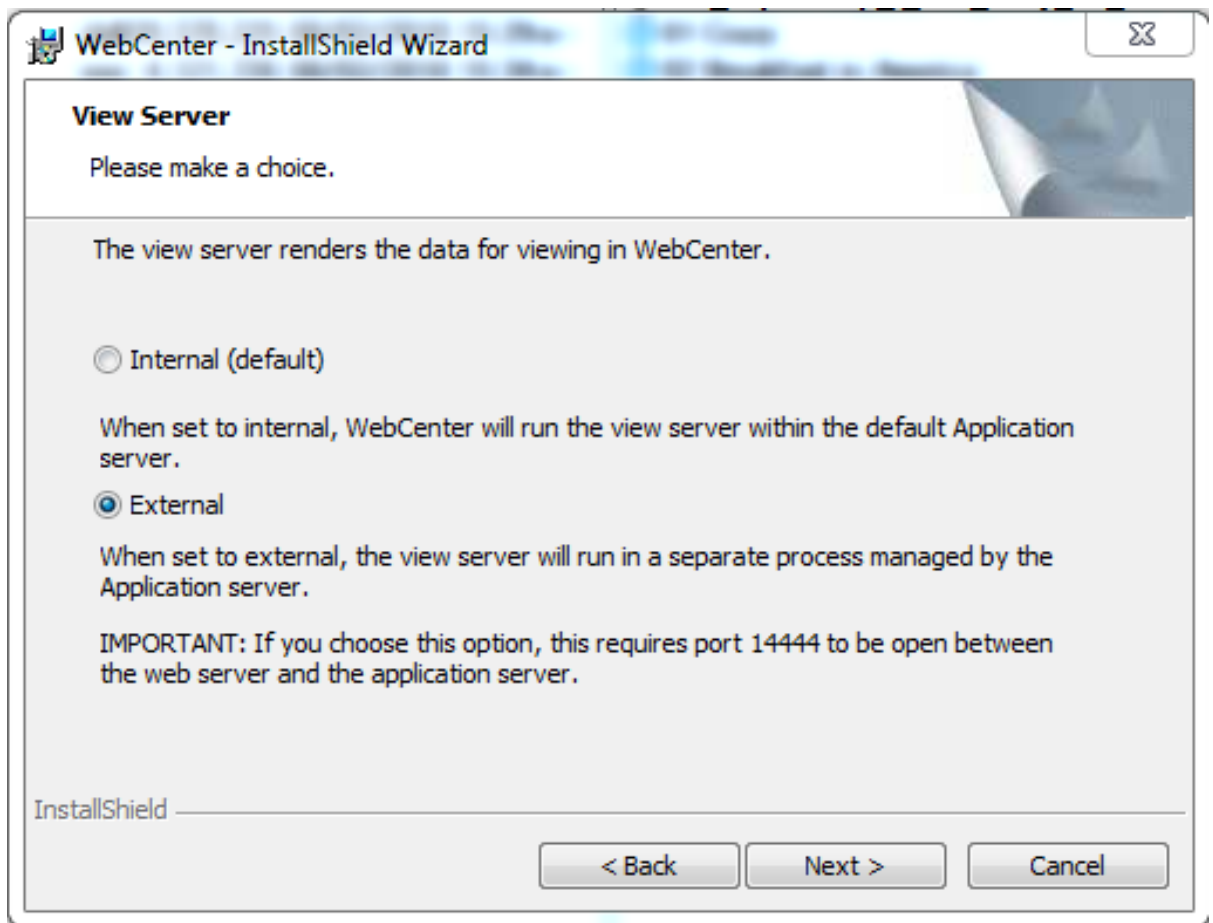

Note: This screen appears only for Advanced installation.

11. Choose between a **Standard (default)** and an **Extra Large** deployment. If **Extra Large** is selected, Tomcat and/or JBoss (depending on the server being installed) will be able to allocate 3 times more memory as is the case with a Standard installation.

Note: This screen appears only for Advanced installation.

12. Choose between an **Internal (default)** or **External** View server. If Internal is selected, the View Server will be running inside the JBoss process. If External is selected, an additional process running the View Server will be started automatically. For the External view server to work, other ports need to be open in the firewall between the web and the application server: 14444.

Note: If installing Web and Application server component separately – a matching mode (either external or internal) has to be selected for both the Application server and Web server – otherwise the Viewer will not function properly.

13. Click **Install** in the **Ready to Install the Program** screen.

14. The **Esko Station Information Service** may be installed if this is the first Esko software being loaded on the machine.

If it installs, click **Continue** when it is done, or wait 10 seconds for the process to continue automatically.

15. Click **Finish** when the installation completes.

16. If prompted, reboot the system.

Attention: This is important; do not postpone this step!

2.8.4. Run the Database Schema Scripts on the Application Server

Since WebCenter 12.1, it is no longer necessary to run the database schema scripts manually. The database schema scripts can now be run from the installer dialog, for both local and remote databases.

When the database scripts are run automatically, a system console readout window will show feedback on the progress. Individual SQL statement blocks are displayed as they are being executed.

To run the database scripts automatically, database connection parameters need to be entered in the **Database Configuration** dialog which is displayed during the installation of the WebCenter Application Server:

1. Choose your database type from the **Database program** list.
2. Enter the database host name in the **Database Server system** field.
3. For SQL, enter the instance name in the **Database Instance Name** field.
4. For Oracle, enter the SID in the **Database System Identifier (SID)** field.
5. The checkbox **Run DB update scripts during installation** determines whether the database schema scripts are run automatically during installation (preferred), or not.
6. If running the scripts automatically is enabled, the **DB sysadmin connection password** field becomes available. Enter the password of the default database administrator user for your Database Server in this field.

If you still want to run the scripts manually, do the following:

1. Locate the `ServerTools\update_db.bat` file in your WebCenter installation folder (for example `C:\Esko\Artios\WebCenter\ServerTools\update_db.bat`).
2. Run this file with the appropriate parameters in the console.

Tip:

Run this file without parameters first to see help about which parameters you need to use.

- If you have a SQL database, you will see this:

```
C:\Esko\Artios\WebCenter\ServerTools>update_db.bat

WebCenter Database Updater

Minimally required argument is an 'sa' password
Full usage:
update_db.bat <sa_password> [ <db_type> [ <db_host> [ <db_instance> [ <db_sa_user>
r> ] ] ] ]

Parameters other than the password are optional. The sequence of
parameters is not. If you want to specify a certain parameter, you need to
specify all preceding parameters. Any of the params you do not specify,
will default to the value specified at installation time. If you need to pass
empty parameters, use "".

db_type can be mssql or mssql
mssql (default) will create the webcenter DB if it doesn't exist yet
If you want to switch to oracle a reinstall is required.

Current defaults are:
<db_type> = mssql
<db_host> = RDUMWC11
<db_instance> = WEBCENTER
<dba_user> = sa

C:\Esko\Artios\WebCenter\ServerTools>_
```

- If you have an Oracle database, you will see this:

```
C:\Esko\Artios\WebCenter\ServerTools>update_db.bat

WebCenter Database Updater

Minimally required argument is a 'sysdba' password
Full usage:
update_db.bat <dba_password> [ <db_host>[:<db_port>] <db_service_name> [ <dba_us
er> [ <db_string_data_type> [ <db_data_table_space> [ <db_temp_table_space> [ <d
b_index_table_space> ] ] ] ] ] ]

Parameters other than the password are optional. The sequence of
parameters is not. If you want to specify a certain parameter, you need to
specify all preceding parameters. Any of the params you do not specify,
will default to the value specified at installation time. If you need to pass
empty parameters, use "".

If you want to switch to MS SQL a reinstall is required.

Current defaults are:
<db_host>[:<db_port>] = RDUMWC04
<db_service_name> = XE
<dba_user> = sys
<db_string_data_type> = varchar2
<db_data_table_space> = USERS
<db_temp_table_space> = TEMP
<db_index_table_space> = USERS

C:\Esko\Artios\WebCenter\ServerTools>_
```

2.8.5. Install the Web Server

Uninstall IIS on the Web Server if Configured Incorrectly

In some cases IIS may already be installed on the Web Server, but configured incorrectly. For example, your hosting company may have set up IIS for you. In this case, IIS needs to be uninstalled. After which it can be installed again and configured correctly.

The procedure below describes how to uninstall IIS 7.

1. Start the Server Manager.
2. Navigate to the **Roles** section using the navigation tree.
3. Click **Remove Roles**.
4. The **Remove Roles Wizard** is started, use this to remove the IIS role. Removing roles and services from the server can take a couple of minutes.
5. You may get prompted to restart your server. If so please do this.

Install IIS on the Web Server

If IIS is not installed on your Web Server, you need to install it. The procedure below explains how to install IIS 7 on Windows Server 2008 R2, or IIS 8 on Windows Server 2012.

Note: From WebCenter 18.1 installation, IIS can also be installed with a script provided in the Installation disk.

1. Open the Server Manager.
2. IIS 7: Click **Roles** in the left panel, then click **Add Roles** at right. IIS 8: Choose **Manage > Add Roles and Features** from the top menu.

This opens the **Add Roles Wizard**.

3. IIS 8: In the **Select installation type** screen, select **Role-based or feature-based installation**.
4. IIS 8: In the **Select destination server** screen, select the appropriate server (local is selected by default) and click **Next**.
5. In the **Select server roles** screen, select **Web Server (IIS)**.
If the wizard prompts you to add features required for the Web Server, do so.
6. IIS 8: In the **Select features** screen, you do not need to add any additional features. Click **Next**.
7. IIS 8: Click **Next** in the subsequent **Web Server Role (IIS)** screen as well.
8. In the **Select role services** screen:
 - a) Enable **ASP, ISAPI Extensions** and **ISAPI Filters** in the **Application Development** section.

If the wizard prompts you to add role services required for ASP, do so.

- b) In **Health and Diagnostics**, enable **HTTP Logging, Logging Tools, Request Monitor** and **Tracing**.
- c) In **Management Tools**, enable **IIS Management Tools** and **IIS 6 Management Compatibility, IIS 6 Metabase Compatibility, IIS 6 Scripting Tools** and **IIS 6 WMI Compatibility**

- d) In **Common HTTP features**, make sure **Default Document**, **Directory Browsing**, **HTTP Errors** and **Static Content** are enabled.
 - e) In **Security**, make sure **Request filtering** is enabled.
 - f) In **Performance** make sure to enable Dynamic and Static Content Compression.
9. In the **Confirm installation selections** screen, check the settings and click **Install**.
- This installs the IIS 7 or 8 Role with the settings you have selected and the default settings.
- The **Installation Results** screen should show `Installation succeeded`.
10. Click **Close** to exit the wizard and restart the server if prompted.

Extend the Upload Limitation

IIS 7 has a limitation on how much you can upload at once (30 MB). You can change it to 2GB by following these steps:

1. Open **IIS Manager**.
 2. Select the website for which you want enable large file uploads.
 3. In the main window, double click **Request filtering**.
 4. Once the window is opened you may see a list of tabs (file name extensions, rules, hidden segments...).
- Regardless of the tab you select, right-click in the main window and select **Edit Feature Settings**.
5. Modify the **Maximum allowed content length (bytes)**: change the value to 2000000000 (a 2 and 9 zeros) to be able to upload files close to 2GB.

Disable 32 Bit Applications

Note: Only do this if you previously had WebCenter 10.x or 12.x installed on the same system. Previously, 32 Bit Applications needed to be enabled. Now however, this settings needs to be disabled.

1. In IIS, go to **Application Pools** and select the **DefaultAppPool**.
2. Click **Advanced Settings...**, then set the **Enable 32 Bit Applications** option to **False** and click **OK**.
3. Click **Recycle...** at right.

Install the WebCenter Web Server

The Web Server components of WebCenter can be installed from a link on the WebCenter installation media.

1. Log on to the Web Server as a member of the local Administrators group.
2. Ensure that **Internet Information Services (IIS)** has already been loaded by verifying that the **Internet Information Services** applet is in **Administrative Tools** in the **Control Panel**.

Note: If it has not been loaded, you must load it through **Add/Remove Windows Components** in **Add/Remove Programs** in the **Control Panel**.

3. Insert the WebCenter media into the media drive, and click **Software Installation** on the menu that appears at left, then **Install WebCenter 18.1.1**.
4. The setup wizard opens with a **Welcome** screen. Click **Next**.
5. In the **License Agreement** screen, read the agreement, and if you agree to it, select **I accept the terms in the license agreement** and click **Next**.
6. In the **Custom Setup** screen:
 - a) Click the icon next to **WebServer**, and select **This feature, and all subfeatures, will be installed on local hard drive**.
 - b) Click the icon next to **Application Server** and select **This feature will not be available**.
 - c) If desired, click **Change** to change the installation folder.
 - d) Click **Next**.
7. In the **Option Selection** screen:
 - a) Enter the name of the **Application Server**.

This should be a different machine than the one currently running the installation.

Note:

You cannot configure WebCenter with IP addresses. If the web server is not able to find the application server via name resolution, you can map the IP address of the application server and the hostname of the application server in the C:\Windows\System32\drivers\etc\hosts file. For example: 10.31.140.69 myappserver.

- Read also: <https://wiki.esko.com/pages/viewpage.action?pageId=76730042>.
- [Configuring to use NAT translation](#) on page 1049.

- b) If you want to install WebCenter using an already-existing IIS website (rather than the **Default Web Site**), select it in the list.
 - c) Click **Next**.
8. Click **Install**.
9. The **Esko Station Information Service** may be installed if this is the first Esko software being loaded on the machine.

If it installs, click **Continue** when it is done, or wait 10 seconds for the process to continue automatically.
10. Click **Finish** when the installation completes.
11. Reboot the machine if prompted.

Start the WebCenter Services

After installing WebCenter, you need to start its services using the **Services** applet in the **Windows Administrative Tools**.

Start the WebCenter Services on the Application Server

1. Log on to the **Application Server** as a member of the local Administrators group.
2. Click **Start > Settings > Control Panel > Administrative Tools > Services**.
3. Select the **WebCenter JBOSS Application Server** and click **Action > Start**.

4. If not started yet, select the **WebCenter Application Monitor** service and click **Action > Start**.
5. Select the **WebCenter CAD-X Server** and click **Action > Start**.
6. If you want to change the services to start automatically when the machine reboots, do so now:
 - a) Right-click a WebCenter service and choose **Properties**.
 - b) In the **General** tab, choose **Automatic** in the **Startup type** list.
 - c) Click **OK**.
 - d) Repeat for each service that has to start automatically.
7. Close the **Services** tool and log off.

Start the WebCenter Services on the Web Server

1. Log on to the **Web Server** as a member of the local Administrators group.
2. Click **Start > Settings > Control Panel > Administrative Tools > Services**.
3. Start the Tomcat service:
 - a) Right-click **Tomcat Web Server** and choose **Properties**.
 - b) In the **General** tab, choose **Automatic** in the **Startup type** list.
This makes the service start automatically when the machine reboots.
 - c) Click **OK** to close the **Properties** dialog.
 - d) Select the **Tomcat Web Server** and click **Action > Start**.
4. If not started yet, select the **WebCenter Application Monitor** service and click **Action > Start**.
5. Close the **Services** tool and log off.

Easily Identify when WebCenter is Ready to Access

WebCenter services load a lot of data into memory during startup of its services. It is important to watch the CPU activity before accessing a WebCenter site.

You want both the Web Server and the Application Server to have a CPU activity of under 5% before accessing the site, otherwise all components may not have started and you may experience error messages. Another way is to check whether `wcr_jboss_srv.exe` threads exceed 160 and `wcr_tomcat_srv.exe` threads exceed 100.

To help watch the CPU activity easily, add the CPU performance monitor to the system tray of each WebCenter server. To do this (on both the Web Server and the Application Server):

1. Create a new shortcut in the **Start Menu > Programs > Startup** folder.
2. Browse to `Windows\system32\TASKMGR.EXE`.
3. Set the shortcut to Run "Minimized".

2.8.6. Install the On-Board Graphics Engine (OBGE) on the Application Server

The Automation Engine On-Board Graphics Engine or OBGE is required for WebCenter systems to generate view data.

How to perform the Automation Engine 18.1.1 System Readiness Check

Before you install the OBGE, a System Readiness Check is required. This checks whether the operating system is suited for installing and running this Esko product.

1. On the DVD, in the section **Software installation**, click the type of installation that fits your purpose (as explained in [Types of Installations](#)).
2. In the section **Installation**, under **Instructions**, click **Run the Automation Engine Readiness Check**.
3. At the end of the **Readiness Check**, read the resulting messages carefully.
4. If the **Readiness Check** resulted in any problem, correct it before proceeding.
5. Click **Exit**.

How to install the Prerequisite Components

Depending on the products to be installed on this particular system, various components are required for installation. The installation wizard for these prerequisite components checks the licenses, lists the prerequisite components to install, requests confirmation for installation and then installs the required components.

The installation wizard installs the following components:

- **Microsoft Visual Studio Redistributables**
- **Database Engine for the Automation Engine** components (if you choose a **Standard** Automation Engine Installation)

Follow these steps:

1. On the DVD, in the section **installation**, click **Install the Prerequisites Components**.
2. Follow the instructions of the installation wizard.
3. When you choose a **Standard** installation, when asked to enter a password for the SQL Server, click **Use Default** to use the default **sa** password. Or you can enter a **Password**, confirm it and click **Use Password** to use a different password, for example because of "Strong Password" requirements.

Note: During the pre-installation of the Database Engine for Automation Engine, the Microsoft .NET Framework 4.6.1 will be installed. You may get a warning saying that the system needs to be rebooted, followed by a fatal error "The SQL Server instance is not installed". If this happens, reboot your server and install the prerequisites again.

4. Depending on your activated licenses, the **Automation Engine Prerequisite Components First Installation** process may ask you separately about the **CAD-X** component installation for both the Standard Edition component and the Enterprise Edition component. Click **No**.
5. Click **Exit**.
You will be redirected to the installation page to continue with the next step.

How to install Automation Engine 18.1.1

1. After running the **System Readiness Check** and installing the **License Server Components**, when all prerequisites are fulfilled, you can start the installation.
2. Click the **Install Automation Engine 18.1.1** link on the installation page.

The **Automation Engine 18.1.1 Software Installation** wizard will open up.

3. Follow the instructions of the installation wizard.
4. Read the **Software and Data license agreement** carefully and select **Yes, I accept the license agreement**.
5. When asked to select the products to install on this system, select **Automation Engine 18.1.1**.

The group **Common Components** cannot be deselected and will be installed on all systems.

6. Select the **Destination Folder** for the chosen products or accept the defaults.
7. Follow the instructions of the installation wizard.
8. At the end of the installation, click **Finish**.

The pre-installation task checks the password complexity rules and domain policies. If the default password for the **BGSYSTEM** user does not fulfill the requirements, a pop-up dialog requests a password.

During installation, only a **BGSYSTEM** user is created. This user will be used as Automation Engine **System Account** (you can choose to change it later using [the System Account page](#)). A clean installation ends with two empty local user groups: **BGUSERS** and **BGADMIN**. Add the **BGSYSTEM** user to the **BGADMIN** local user group.

Note: Learn more about [Users and Groups](#) in the separate chapter [Pre-Install IT Requirements Guide](#).

After installation of Automation Engine, a shortcut named "**Automation Engine Client Apps**" is put on the desktop of the server computer.

Double-click this shortcut to open the Automation Engine **Client Apps** web page in your default browser.

This page describes the two types of Client Applications:

- Desktop Client Applications (Pilot or Shuttle): These need to be installed on each workstation where you want to use Automation Engine.
- Browser based Client Applications: These run inside the browser and do not need to be installed.

2.9. Testing WebCenter

On the Application Server and the Web Server, ensure IIS and the WebCenter services are started and configured to start automatically.

After starting/restarting the WebCenter services, always wait a few moments until the CPU processor activity on both servers become idle (<5%) before attempting to access the login page.

Testing each facet of WebCenter in the exact order below helps to easily and quickly identify points of failure, if any.

- IIS Connectivity – use IIS Manager to access the WebCenter_Inst site
- IIS Security settings – can access the home page after logging in
- Database connection and Schema – can add a new record to the database

- FileStore connectivity – can write a file to the FileStore and then retrieve it
- View Data generation – can upload a graphic file and the OBGE does its job
- View and Annotate applet – can launch the applet successfully on a Graphic file
- View the status in the Trouble shooting tool for **View Server Deployment Status**

2.10. Configuring WebCenter

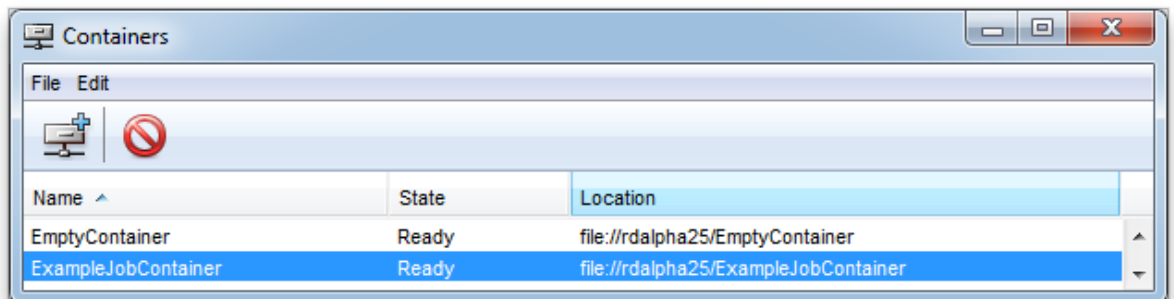

2.10.1. Configure the OBGE

The Pilot lets you configure the Automation Engine On-Board Graphics Engine (OBGE) for use with WebCenter.

You must create a container and a hotfolder pointing to the WebCenter FileStore.

Create a Container

1. Log on to the Application Server as a member of the local Administrators group.
2. Double-click the **Pilot** icon on the desktop.
3. In the **Logon Information** dialog, enter BGSYSTEM as the **User Name** and xxxxxxxx as password. Type the name of the Application Server in **Server Name**. Click **OK**.
This opens the Pilot.
4. Go to **Tools > Containers** to open the **Containers** window.

5. In that window, go to **File > New** or click .
This opens the **Create Container Wizard**.
6. In the **Welcome** screen, click **Next**.
7. In the **Location of the Job Container** screen, select **Existing Shared Folder** and click **Next**.
8. In the **Location of the Network Folder** screen, type the name of the Application Server in the **Computer Name** field and click **Next**.
9. In the **Select the shared folder** screen, select the FileStore share and click **Next**.
10. Click **Finish** and close the **Containers** window.

Create a JDF Hot Folder (Access Point) for WebCenter

1. Choose **Tools > Access Points** from the **Pilot** main menu.
2. Click the **Create a new Access Point** button.
3. Choose type **Folder** and click **OK**.
4. Enter a **Name**.
5. In the **Folder Settings** tab, specify the **hotin** folder. This should look like: file://myserver/FileStore/JDFHotfolder/hotin.
6. In the **Monitoring** tab, set **Check every...minutes** to a low number preferably, the recommended setting is **1**.
7. In the **Automatic Actions** tab, fill in the **hotout** folder in the **Move File to** and **Output Folder** fields. This should look like: file://myserver/FileStore/JDFHotfolder/hotout. Make sure **Action** is set to **Process JDF**.
8. Click **OK**.

The Hot Folder/Access Point now appears in the Pilot and is ready for use.

2.10.2. Configuring the E-Mail Notifications

Use the E-Mail Notifications page to configure the e-mail environment for the notifications framework. Only WebCenter Administrators can access this page.

Configure E-Mail Notification

While logged in to the WebCenter web interface as an administrator:

1. Go to **Admin > Configuration > E-Mail Environment Setup**.
2. Set up your e-mail environment:

Setting	Description
E-Mail Service Protocol	WebCenter only supports the SMTP protocol.
E-Mail functionality enabled	To enable/disable e-mail functionality.
E-Mail debugging output in log	To enable/disable e-mail debugging output in log files.
E-Mail Service Host	The address for the preferred mail server that will act as the server for dispatching WebCenter e-mail notifications (this server has to comply to the selected protocol type (see above)).
E-Mail Service Port Number	The port number on which the defined mail server is listening for incoming e-mails.

Setting	Description
Outgoing E-Mail Notifications' "FROM" Address	Supply a valid e-mail address. This will be used in the "From" e-mail header for every e-mail sent by WebCenter.
Use TLSv1.2	Select this option to use TLSv1.2 when you are trying to connect over SSL to the SMTP server. WebCenter uses the STARTTLS protocol command to indicate that, it can upgrade the insecure connection to TLSv1.2. To ensure that TLSv1.2 is used during the connection, the SMTP server should be configured to prevent insecure connections. Note: This however does mean that if the smtp server doesn't support TLSv1.2, the insecure connection will be used instead.
E-Mail Session Authentication	Select this option if the mail server connection requires authentication with a user name and password.
E-Mail Service Username	Provide the mail account user name if authentication is required.
E-Mail Service Password	Provide the mail account password if authentication is required. Note: This password is stored in an encrypted form.

3. Click **Send Testing E-mail**.

The **Test E-Mail Environment Settings** page appears.

4. Type a **Recipient** address and click **Send E-mail**.

WebCenter attempts to send an e-mail to the recipient.

The E-Mail Configuration page appears, displaying a message depending on the result of the test:

- **Test E-Mail Sent:** The environment is set up correctly.
- **JMS System Error:** Communication with the JBoss' proprietary messaging framework failed.
An administrator should check the JBoss server configuration and/or log files for possible causes.
- **Mail Server Connection Error:** The connection to the specified mail server did not succeed.
Either the data the administrator supplied on the e-mail environment setup page was incorrect, or the mail server is currently down.
An administrator should either check the e-mail environment settings for possible misspellings or contact the mail provider as to the status of the mail server.

Note: The settings you defined are saved in the database. For updates from older WebCenter installations, the email setup is first loaded from the old `emailconfig.xml` file and the settings are subsequently stored in the database.

2.10.3. Configure WebCenter for Use with ArtiosCAD Enterprise

Configuring BLOBs

ArtiosCAD Enterprise supports the use of BLOBs in the database. BLOBs are Binary Large Objects - files stored as data in the database. Using BLOBs is transparent for the user.

When you configure ArtiosCAD Enterprise to use BLOBs, it also stores managed documents in the WebCenter FileStore as a cache to improve performance. If you delete a file from the FileStore, the next time you save it in ArtiosCAD Enterprise, it will be recreated in the FileStore from the BLOB.

Note:

You should decide if you want to use BLOBs when you install WebCenter. Switching to using BLOBs after having used ArtiosCAD Enterprise is not recommended or supported.

Editing `appconfig.xml` on the Application Server

To enable BLOBs, you must change a line in a configuration file on the Application Server. On the Application Server:

1. Log in as `Administrator` or as a user with administrative privileges.
2. Make a backup copy of `C:\Artios\WebCenter\config\appconfig.xml`. This file will be on the C: drive no matter where you installed WebCenter.
3. Open the file named in the previous step in a text editor such as Notepad.
4. Scroll down to `<store_files_in_blob value="false"/>` and change `false` to `true`.
5. Save the file and exit the text editor.

Restarting Services

Once you have changed `appconfig.xml` on the Application Server, restart all the Application Server's WebCenter services to start using BLOBs in ArtiosCAD Enterprise.

1. On the Application Server, still logged in as Administrator or as a member of the local Administrators group, open the Services applet in the Administrative Tools group in Control Panel.
2. Restart the following services by clicking each one and then clicking the **Restart** link:
 - a) WebCenter JBOSS Application Server
 - b) WebCenter CAD-X
3. Close the Services applet and log off the Application server.

ArtiosCAD Enterprise is now configured to use BLOBs. Note that WebCenter will keep copies of managed documents in its FileStore to improve performance.

Step 2 - Optionally Uploading Boards

In case the boards were not installed yet, follow this procedure after logging in to WebCenter for the first time:

1. Log in on the Web server as a member of the local Administrators group.
2. Run the setup program with WebCenter DVD.
3. Click **Upload Boards**.
4. In the Log In To Web Browser dialog box, enter the address of the WebCenter server, an admin user's username, and that user's password. Click **OK**.
5. An Upload Boards progress bar will appear.
6. Click **Close** when the upload finishes.

Step 3 - Creating Shared Defaults for the First Time

The next step is to run the ArtiosCAD Defaults Manager installed when you installed ArtiosCAD Enterprise on the Application server. The first time you install ArtiosCAD Enterprise 16 or later, you have to create the Shared Defaults. You can choose to either create completely new Shared Defaults, or you can choose to migrate older Defaults that are merged with the defaults for the version you are installing. In the future, you will add a new version's Defaults to the existing Shared Defaults Project.

You may also use this utility to migrate location and user defaults from older versions of ArtiosCAD Enterprise to newer versions of ArtiosCAD Enterprise.

Note:

Even if you do not plan to use WebCenter in combination with ArtiosCAD Enterprise, it is still necessary to install the Defaults in order for WebCenter to be able to process CAD files properly. Therefore, it is highly recommended to install the Defaults, even if you do not plan to use CAD files initially.

Note:

The system you use for loading the Defaults must be able to keep the Defaults on it. You will have to follow the same process to load future Defaults and the new installation will reference the older version's Defaults as part of its installation. We recommend using the Application Server for this process.

Note:

This procedure takes a significant amount of time. We recommend starting it and doing other things until it completes.

1. Log in to the Application Server as a member of the local Administrators group.
2. Click **Start > All Programs > Esko > ArtiosCAD > Defaults Management** to start the Defaults Manager.
3. In the Login to Web Browser dialog box, enter your WebCenter server URL, admin username, admin password, and click **OK**.
4. Click **Create new shared defaults**.
5. A progress bar appears. This step will take a few minutes.
6. Click **Close** when the installation process is done.

Configuration in the WebCenter User Interface

Note: See the WebCenter Administration Guide for more details about the following steps.

1. Log on to WebCenter with the `admin` account (see [Log On to WebCenter and Change the Admin Password](#)).
2. Configure a **Company** and **Location** for the initial ArtiosCAD Enterprise users.
3. Create a custom group, if desired, for the initial ArtiosCAD Enterprise users.
4. Create the initial ArtiosCAD Enterprise users. While creating them:
 - a) Make sure they are at least **Project Managers with Limited Visibility of Companies and Groups**.
 - b) Assign them to the **Company** and **Location** you created.
 - c) Assign them to one or more groups.
Even if you did not create any custom group, you should assign them to the **USERS** group.
5. Invite them to the **System Defaults** Project (which is **Shared Defaults** in ArtiosCAD Enterprise).

Tip: You can do this either individually for every user or once through Group membership if you added all users to the same group (such as **USERS**).

Inviting them to the Project means that they will be able to use the Defaults.

In order for users to change Shared Defaults, they must have Full permissions on the Project and be members of the **ADMINS** group.

Note: All ArtiosCAD Enterprise users must be invited to the **System Defaults** Project. Users who are not invited to the project will receive a UFANEX error when they launch ArtiosCAD Enterprise.

2.10.4. Secure your WebCenter Site with SSL

SSL is a **protocol for securing communication over the Internet**. It works by using a private key to encrypt data that is transferred over an SSL connection.

URLs using an SSL connection start with `https://` instead of `http://`.

To use SSL, you are required to obtain an **SSL certificate** and install it into Internet Information Services (IIS) on the Web Server.

Note: We strongly recommend you secure your WebCenter site with SSL, especially if you plan to use WebCenter over the internet (not only within a Local Area Network).

Secure the WebCenter Web Server with SSL

You will need to:

1. [Create a Certificate Signing Request \(CSR\)](#) on page 50.
2. [Request an SSL Certificate from a Certificate Authority](#) on page 51.
3. [Install the Intermediate SSL Certificate](#) on page 52.
4. [Install your Signed Certificate](#) on page 53.
5. [Export your Certificate if Necessary](#) on page 53.
You only need to do this if you haven't installed the certificates directly on your Web Server.
6. [Bind your Certificate to your WebCenter Site](#) on page 54.
7. [Redirect HTTP Traffic to HTTPS](#) on page 54.

Create a Certificate Signing Request (CSR)

To get an SSL certificate, you need to first create a Certificate Signing Request, that you will send to a Certificate Authority.

1. On the Web Server, click **Start**, then **Administrative Tools**, then **Internet Information Services (IIS) Manager**.
2. In the **Internet Information Services (IIS) Manager** dialog, click your server name (at left).
3. In the dialog's central pane, double-click the **Server Certificates** icon in the **Security** section.
4. In the **Actions** pane at right, click **Create Certificate Request...**

This opens the **Request Certificate** wizard.

5. In the **Distinguished Name Properties** screen, enter your information as follows:
 - **Common Name:** the name through which the certificate will be accessed (usually the fully-qualified domain name, for example `www.domain.com`).
 - **Organization:** the legally registered name of your organization/company.

- **Organizational unit:** the name of your department within the organization.
- **City/locality:** the city in which your organization is located.
- **State/province:** the state in which your organization is located.
- **Country/region:** the two-lettered ISO-3166 country code of the country in which your organization is located. You can find a list of valid country codes on http://www.ssl.com/csrs/country_codes.

Click **Next**.

6. In the **Cryptographic Service Provider Properties** screen:

- leave **Cryptographic Service Provider** to **Microsoft RSA SChannel Cryptographic Provider**,
- in **Bit length**, select **2048** or higher.

Click **Next**.

7. In the **File Name** screen, enter a name for your Certificate Signing Request, and select a location in which to save it.

Click **Finish**.

Request an SSL Certificate from a Certificate Authority

The customer is responsible for choosing the SSL provider (Certificate Authority), obtaining certificates, as well as following that company's specific instructions for installation and configuration.

Esko cannot obtain SSL certificates on behalf of its customers.

1. Send your [Certificate Signing Request file](#) to a public Certificate Authority.

Note:

- If you do an Internet Search for "SSL certificate", you will find many providers with different pricing and options. We have good experiences with VeriSign, Network Solutions, Godaddy.com, and Thawte.
- The application process can take up to 30 days... Start the application process well in advance!
- If your company has a DNB (Dun & Bradstreet) number, the application process will be a lot easier and quicker if you can provide it.
- Your certificate will be linked to your website (for example `webcenter.domain.com`). Changing your website name will require a new certificate.

2. The Certificate Authority will provide you with:

- an intermediate certificate, verified by the root certificate installed by default on your Web Server (where you created the Certificate Signing Request),

Note: You may need to download this from a web link.

- your server certificate, verified by that intermediate certificate (signed by the Certificate Authority).

Make sure you have both certificates before going further! You will need to install both of them on your Web Server.

3. Copy those certificates to your Web Server.

Install the Intermediate SSL Certificate

You need to install the intermediate certificate before you [install your signed certificate](#).

1. On your Web Server, click **Start**, then **Run...**
2. Type `mmc` and press **Enter**.
3. In the Microsoft Management Console (**Console1**) window that opens, go to **File > Add/Remove Snap-in...**
4. In the **Add or Remove Snap-ins** dialog, select **Certificates**, and click **Add**.
5. In the **Certificates snap-in** dialog, select **Computer Account**, and click **Next**.
6. In the **Select Computer** screen, select **Local Computer**, then click **Finish**.
7. Click **OK** in the **Add or Remove Snap-ins** dialog.
8. In the **Console1** window:
 - a) expand the **Certificates (Local Computer)** folder,
 - b) right-click **Intermediate Certification Authorities**, and go to **All Tasks > Import...**
9. In the **Certificate Import Wizard** dialog:
 - a) click **Next** to get to the **File to Import** screen,
 - b) browse to the location containing your intermediate certificate file,
 - c) in the **Open** dialog, change the file extension filter to **PKCS #7 Certificates (*.spc;*.p7b)**,
 - d) select your `*_iis_intermediates.p7b` file, and click **Open**.

Note: Only install your intermediate certificate, not your signed certificate in this area! Installing your signed certificate here would remove your intermediate certificate from the list, and you would need to reinstall it.

- e) Click **Next**.
10. In the **Certificate Store** screen:
 - a) select **Place all certificates in the following store**,
 - b) click **Browse**, select **Intermediate Certification Authorities** in the **Select Certificate Store** pop-up, and click **OK**,
 - c) click **Next**.
 11. Click:
 - a) **Finish** in the **Certificate Import Wizard** dialog,
 - b) **OK** in the **Certificate Import Wizard** pop-up stating that the import was successful.
 12. Close the **Console1** window, then click **No** in the pop-up asking to save the console settings.

Install your Signed Certificate

Once your *intermediate certificate is installed*, install your signed certificate:

1. On the Web Server, extract your *.cer certificate file from the zip file you got from the Certificate Authority.
2. Click **Start**, then **Administrative Tools**, then **Internet Information Services (IIS) Manager**.
3. In the **Internet Information Services (IIS) Manager** dialog, click your server name (at left).
4. In the dialog's central pane, double-click the **Server Certificates** icon in the **Security** section.
5. In the **Actions** pane at right, click **Complete Certificate Request...**

This opens the **Complete Certificate Request** wizard.

6. In the **Specify Certificate Authority Response** screen:
 - a) browse to your *.cer certificate file,
 - b) enter a **Friendly name** for your certificate.
This will be used by the server administrator to easily distinguish the certificate.
 - c) Click **OK**.

Your certificate is now installed. If you cannot see it yet in the **Server Certificates** list of the **Internet Information Services (IIS) Manager** dialog, press **F5** to refresh.

Export your Certificate if Necessary

We recommend you create the *Certificate Signing Request* and install the certificates directly on your WebCenter Web Server.

However, if you do this on another server, you can export the signed certificate then import it on your Web Server.

1. If you haven't done so already, *install the intermediate certificate on your Web Server*.
2. Export your signed certificate from the server it is installed on:
 - a) In **Internet Information Services (IIS) Manager**, select your certificate in the **Server Certificates** list and click **Export...** in the **Actions** pane at right.
 - b) In the **Export Certificate** dialog that opens:
 1. Type a file name in **Export to**, or click the browse button to navigate to a file in which to store the certificate for exporting.
 2. Type a **Password** if you want to associate a password with the exported certificate.
 3. Retype the password in **Confirm password** and click **OK**.

This exports your certificate to a .pfx file.

3. Import your signed certificate on your Web Server:
 - a) Click **Start**, then **Administrative Tools**, then **Internet Information Services (IIS) Manager**.
 - b) In the **Internet Information Services (IIS) Manager** dialog, click your server name (at left).
 - c) In the dialog's central pane, double-click the **Server Certificates** icon in the **Security** section.

- d) In the **Actions** pane at right, click **Import...**
- e) In the **Import Certificate** dialog that opens:
 1. browse to your **Certificate file (.pfx)**,
 2. enter the **Password** associated with your certificate if there is one,
 3. make sure that **Allow this certificate to be exported** is selected.

Note: This is important, as due to a bug in IIS, the *site binding* will not work if the certificate is not exportable.

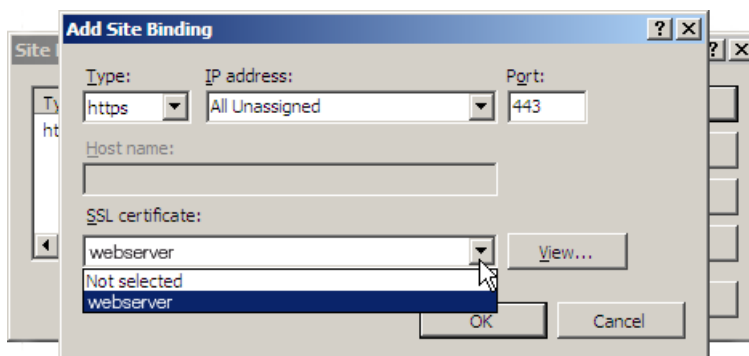

- 4. Click **OK**.

Your certificate is now installed on your Web Server. If you cannot see it yet in the **Server Certificates** list of the **Internet Information Services (IIS) Manager** dialog, press **F5** to refresh.

Bind your Certificate to your WebCenter Site

Once you have installed your certificate on your Web Server, you need to bind it to your WebCenter site, so that the certificate will be used to authenticate your WebCenter site when users browse to it.

1. Still in the **Internet Information Services (IIS) Manager**, right-click the **Default Web Site** node in the **Connections** pane, (or the node of the IIS website you have deployed your Web Server on if it's not the default website) and select **Edit Bindings...**
2. In the **Site Bindings** dialog that opens, click **Add**.
3. In the **Add Site Binding** pop-up:
 - a) Choose **https** as **Type**.
 - b) Leave the default https **Port (443)**.
 - c) In the **SSL Certificate** list, select your Web Server.
 - d) Click **OK** and then **OK** again.

Redirect HTTP Traffic to HTTPS

To ensure security, end users should only use `https://` to access your WebCenter site. If someone accidentally uses `http://` instead, they will not be using a secure connection.

To avoid this, you can make sure `http://` traffic to your WebCenter site is automatically redirected to `https://`. This will be transparent for the users (they will not get an error page but will simply be able to access your site through `https://`).

For this, you need to download a (free) extension for IIS.

1. On your Web Server, download and install the **URL Rewrite** extension for IIS.
 Go to <http://www.iis.net/downloads/microsoft/url-rewrite>, click the **Install this extension** button and follow the steps on screen.
2. In the **Internet Information Services (IIS) Manager**, make sure SSL is not required so users don't get an error when connecting to your site using `http://`:
 - a) Select the **Default Web Site** node in the **Connections** pane, (or the node of the IIS website you have deployed your Web Server on if it's not the default website).
 - b) Double-click **SSL Settings** in the center pane.
 - c) Under **SSL Settings**, make sure that **Require SSL** is not selected.
3. Click **Default Web Site** or the node of your IIS website again, then double-click **URL Rewrite** in the center pane.
4. Create a blank inbound rule:
 - a) Click **Add Rule(s)...** in the **Actions** pane at right.
 - b) In the **Add Rule(s)** pop-up, click **Blank rule** under **Inbound rules**, then click **OK**.

The center pane now shows the **Edit Inbound Rule** form.

5. Edit the rule as follows to perform the automatic redirection:
 - a) Enter a **Name** for the rule, for example `HTTP to HTTPS redirect`.
 - b) Under **Match URL**, fill in the settings as follows:

Requested URL	Matches the Pattern
Using	Regular Expressions
Pattern	(.*)
Ignore case	on

- c) Under **Conditions**, select **Match All** in **Logical grouping**.
- d) Add the first condition:

1. Click the **Add...** button to open the **Add Condition** pop-up.
2. Fill in the settings as follows:

Condition input	{HTTPS}
Check if input string	Matches the Pattern
Pattern	off
Ignore case	on

This ignores addresses starting with `https://` (they don't need to be redirected).

3. Click **OK**.

e) Add the second condition:

1. Click the **Add...** button to open the **Add Condition** pop-up.
2. Fill in the settings as follows:

Condition input	{SERVER_ADDR}
Check if input string	Does Not Match the Pattern
Pattern	::1
Ignore case	on

This ignores addresses using localhost through IPV6 (::1), as forcing https:// for those would give a certificate error as the one below (because the certificate is linked to your site name and not the server's IPV6 address).

There is a problem with this website's security certificate.

The security certificate presented by this website was issued for a different website's address.

Security certificate problems may indicate an attempt to fool you or intercept any data you send to the server.

We recommend that you close this webpage and do not continue to this website.

- [Click here to close this webpage.](#)
- [Continue to this website \(not recommended\).](#)
- [More information](#)

3. Click **OK**.

f) Add the third condition:

1. Click the **Add...** button to open the **Add Condition** pop-up.
2. Fill in the settings as follows:

Condition input	{SERVER_ADDR}
Check if input string	Does Not Match the Pattern
Pattern	127.0.0.1
Ignore case	on

This ignores addresses using localhost through IPV4 (127.0.0.1), as forcing https:// for those would give a certificate error (because the certificate is linked to your site name and not the server's IPV4 address).

3. Click **OK**.

g) Under **Action**, fill in the settings as follows:

Action type	Redirect
Redirect URL	<p>https://website-name.com/{R:1}</p> <p>where website-name.com is the name of your WebCenter site, to which you have linked your certificate</p>
Append query string	on
Redirect type	Found (302)

Your rule should look like this:

Edit Inbound Rule

Name: HTTP to HTTPS redirect

Match URL

Requested URL: Using:

Pattern:

Ignore case

Conditions

Logical grouping:

Input	Type	Pattern	
{HTTPS}	Matches the Pattern	off	<input type="button" value="Add..."/>
{SERVER_ADDR}	Does Not Match the Pattern	::1	<input type="button" value="Edit..."/>
{SERVER_ADDR}	Does Not Match the Pattern	127.0.0.1	<input type="button" value="Remove"/>
			<input type="button" value="Move Up"/>
			<input type="button" value="Move Down"/>

Track capture groups across conditions

Server Variables

Action

Action type:

Action Properties

Redirect URL:

Append query string

Redirect type:

h) Click **Apply** in the **Actions** pane at right.

You should now see your rule in the **URL Rewrite** list in the center pane.

6. Browse to your WebCenter site using `http://` and check that it is redirected to a `https://` connection.

Install SSL Certificates on the Workflow Production Server

If...

- you are planning to integrate your Automation Engine server with WebCenter,
- your WebCenter site is secure (it demands `https://` connections),
- your Automation Engine server and your WebCenter are not located within the same Local Area Network,

... you need to make sure your Automation Engine server can communicate with your WebCenter server over `https://`.

Important:

If you have installed your certificates properly on the Web Server (the *intermediate certificate* and the *signed server certificate*), **this should work without you having to do anything.**

If you haven't, or you are still experiencing connection problems, you should import the WebCenter certificates into the Automation Engine keystore.

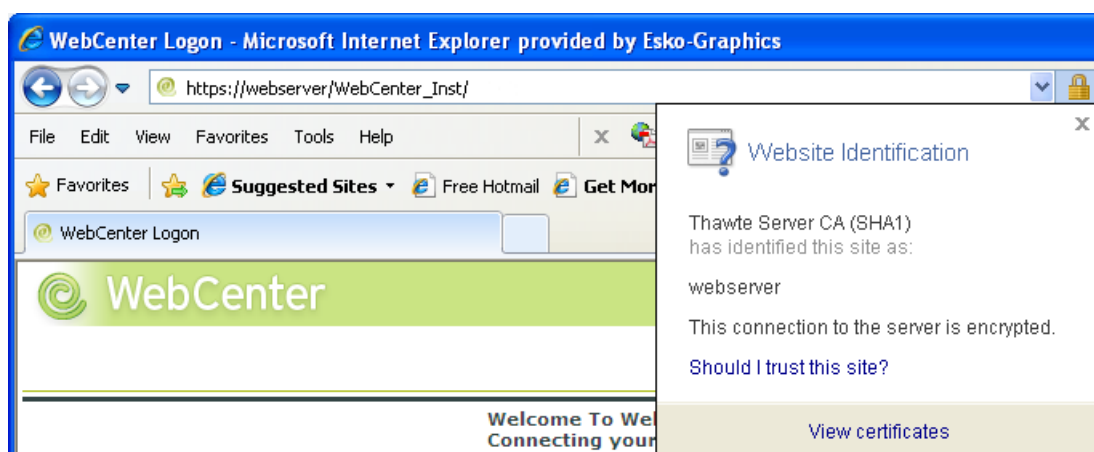

This can also apply when WebCenter and Automation Engine are in the same LAN, if `https://` communication is also enforced inside the LAN. Check with your network administrator if this is the case.

Export the Certificates from the WebCenter Site

1. Log on to the Automation Engine server as a local administrator.
2. Open a web browser and navigate to the secured WebCenter site.
3. Examine the WebCenter site's certificates.

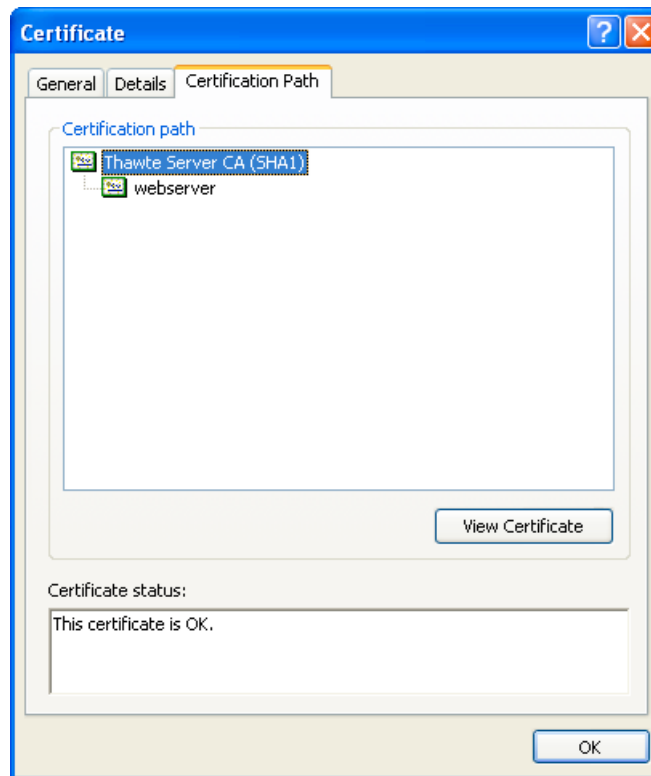

How you do this depends on the web browser you use; for example in Internet Explorer:

- a) Click the lock icon at the end of the address bar and click **View certificates** in the pop-up.

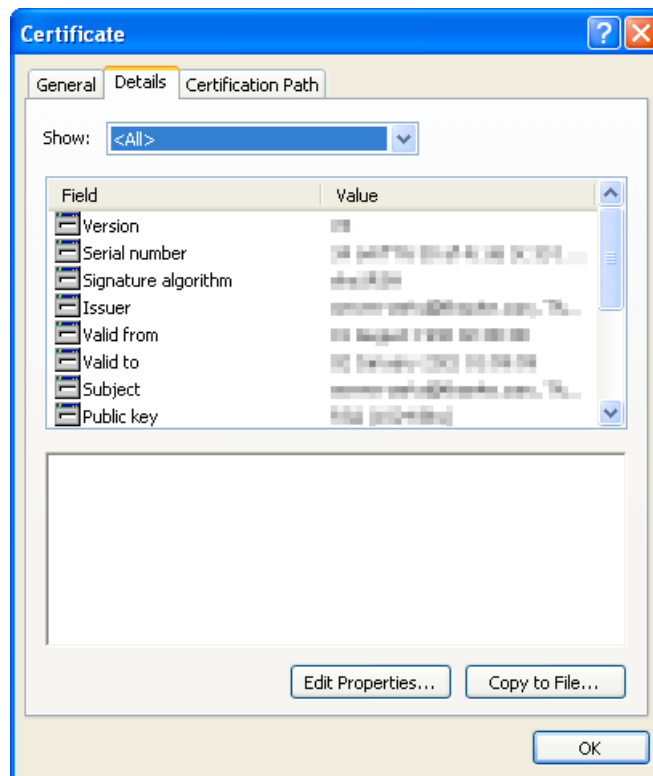

- b) In the **Certificate** dialog, click the **Certification Path** tab.

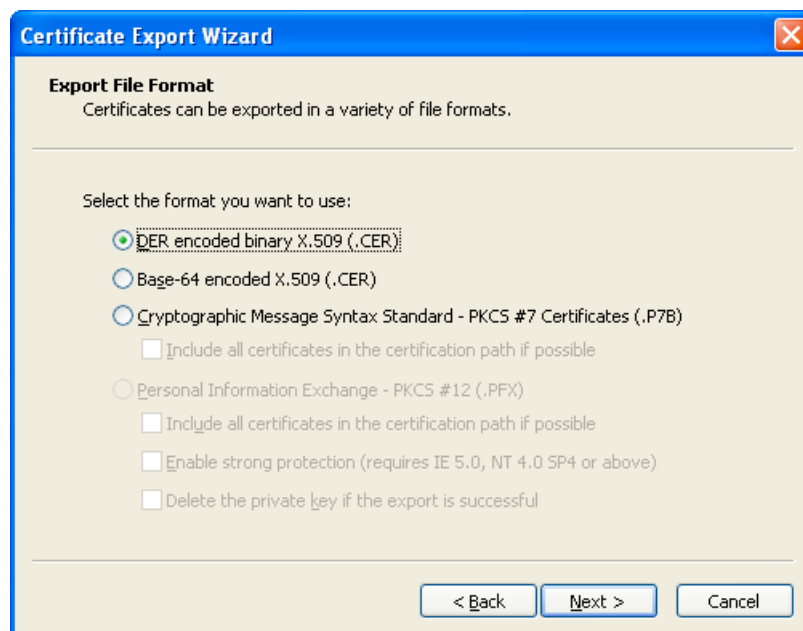

This tab displays the certificate hierarchy. Each top-level entry in the hierarchy represents a certificate.

4. Export all the certificates (top-level entries) in the hierarchy:
 - a) Highlight the first certificate in the hierarchy (for example, Thawte Server CA (SHA1)).
 - b) Click **View Certificate**.
 - c) Click the **Details** tab.

- d) Click **Copy to File** to begin the **Export Wizard**. Click **Next**.
- e) Select **DER encoded binary... (.CER)** and click **Next**.

- f) Click **Browse** or type in a valid path and name the certificate (*.cer). We recommend using a short path and name (such as c:\temp\vali.cer). Click **Next**.
- g) Click **Finish**, then **OK** and once more **OK**.

- h) Repeat these steps until you have exported all the certificates. Close the web browser when you are finished.

Import the Certificates into the Workflow Server Keystore

While still logged on to the Automation Engine server as a local administrator, import the certificate files into the Automation Engine keystore:

1. Open a DOS command prompt.
2. Change to the Esko Automation Engine software directory which contains the keytool utility:
`\bg_prog_fastserver_vxxx\jre\bin`
 For Suite 14, this will typically be `c:\esko\bg_prog_fastserver_v140\jre\bin`
3. Run the import utility for each certificate downloaded, in the proper order: `keytool -import -file <path>*.cer -alias <aliasname> -keystore <keystore_path>`.
 Your `<keystore_path>` is the path to `bg_prog_fastserver_vxxx\jre\lib\security\cacerts`. For example: `c:\esko\bg_prog_fastserver_v140\jre\lib\security\cacerts`.
 You will be prompted for a password. The password is: `changeit` (case sensitive).
4. You might be asked to trust the certificate. Enter `Y` for Yes.
 It is also possible that the tool tells you that this certificate is already installed. If so, that's ok, go on with the next certificate.
 You should get a successful message like `Certificate was added to keystore`.
5. Repeat for each certificate to import in the hierarchy.
6. Reboot the Automation Engine computer to ensure that the changes take effect.

Example

You are running Automation Engine 14 and the Automation Engine server software is installed on `E:\Esko`.

You have downloaded two certificates from the WebCenter site in the folder `c:\temp`: `valicert.cer` and `starfield.cer`.

`valicert.cer` was first in the hierarchy, so you would import this first, then repeat for `starfield.cer`.

You would proceed as follows:

1. Using a command prompt, go to `e:\esko\bg_prog_fastserver_v140\jre\bin`.
2. Type `Keytool -import -file c:\temp\valicert.cer -alias valicert -keystore e:\esko\bg_prog_fastserver_v140\jre\lib\security\cacerts`
3. If asked for the password, type `changeit`.
4. If asked to trust the certificate, type `Y`.
5. Repeat the same command for the next certificate, `startfield.cer`.
6. Reboot the Automation Engine computer to ensure that the changes take effect.

Import the Certificates into the Workflow Client Keystore

With a secured WebCenter site (requiring `https://`), you cannot check the connection between Automation Engine and WebCenter with the **Check Connection** button in **Configure**.

To be able to do this, you need to install the Web Server certificates in the Automation Engine **client** keystore too (even if the client is running on the same machine as the Automation Engine server).

Tip:

You should also do this if publishing fails because Automation Engine doesn't have the appropriate certificates. Typically, this gives an error message like the one below:

```
javax.net.ssl.SSLHandshakeException: sun.security.validator.ValidatorException: PKIX path
building failed: sun.security.provider.certpath.SunCertPathBuilderException: unable to
find valid certification path to requested target
```

1. While logged on to the Automation Engine client machine as a local administrator, open a DOS command prompt.
2. Change to the Esko Automation Engine software directory which contains the keytool utility:
`\bg_prog_fastserverclnt_vxxx\jre\bin`

For Suite 12, this will typically be `c:\esko\bg_prog_fastserverclnt_v120\jre\bin`

Note: For the client, make sure to use `bg_prog_fastserverclnt` and not `bg_prog_fastserver` as for the server!

3. Run the import utility for each certificate downloaded, in the proper order: `keytool -import -file <path>*.cer -alias <aliasname> -keystore <keystore_path>`.

Your `<keystore_path>` is the path to `bg_prog_fastserverclnt_vxxx\jre\lib\security\cacerts`. For example: `c:\esko\bg_prog_fastserverclnt_v120\jre\lib\security\cacerts`.

You will be prompted for a password. The password is: `changeit` (case sensitive).

4. You might be asked to trust the certificate. Enter `Y` for Yes.

It is also possible that the tool tells you that this certificate is already installed. If so, that's ok, go on with the next certificate.

You should get a successful message like `Certificate was added to keystore`.

5. Repeat for each certificate to import in the hierarchy.
6. Reboot the Automation Engine computer to ensure that the changes take effect.

2.10.5. Install Certificates for LDAPS on the Application Server

To connect your WebCenter installation to a secure LDAP server (LDAPS), you have to install a certificate obtained from that LDAPS server.

1. Open a command prompt on the WebCenter Application Server.

2. Change directory to the location of `\WebCenter\ApplicationServer\LDAP\CertInstall.bat`.
3. Issue the following command: `CertInstall servername:port`, where `servername` is the name or IP of the LDAP server and `port` is the port used for secure connection (typically 636).

```

C:\WINDOWS\system32\cmd.exe

C:\Esko\WebCenter\ApplicationServer\LDAP>dir
Volume in drive C is System
Volume Serial Number is BC5B-7E1F

Directory of C:\Esko\WebCenter\ApplicationServer\LDAP

03/11/2009  08:41 AM    <DIR>          .
03/11/2009  08:41 AM    <DIR>          ..
03/10/2009  12:47 PM                656 CertInstall.bat
03/05/2009  07:59 PM            1,086 InstallCert$SavingTrustManager.class
03/05/2009  07:59 PM            5,507 InstallCert.class
03/03/2009  12:20 PM            5,042 InstallCert.java
               4 File(s)              12,291 bytes
               2 Dir(s)      5,242,126,336 bytes free

C:\Esko\WebCenter\ApplicationServer\LDAP>CertInstall esko-graphics.com:636
    
```

4. To make changes active ensure that you restart JBoss, if JBoss was running.
If successful, a list of certificates sent by the server is displayed (ignore any additional messages).

```

C:\WINDOWS\system32\cmd.exe - CertInstall webcenter2.esko.com:443

Server sent 1 certificate(s):

 1 Subject CN=webcenter2.esko.com
   Issuer CN=webcenter2.esko.com
   sha1 25 59 4e e9 9d 33 3e 15 ea 03 8f 6e 03 6a fa c9 29 eb 79 70
   md5  5a 0f 6a 08 c1 0d 61 3d bc e2 9f 73 58 45 39 f6

Enter certificate to add to trusted keystore or 'q' to quit: [1]
    
```

5. To install a given certificate, enter its number in the list and press `Enter`.
We suggest that you install all certificates. Only one certificate can be installed each time you run `CertInstall` so it can be necessary to run it multiple times.

```

Added certificate to keystore 'jssecacerts' using alias 'webcenter2.esko.com-1'
Copying the keystore file jssecacerts to C:\Program Files\Java\jdk1.5.0_15\jre\l
ib\security
1 file(s) copied.
C:\Esko\WebCenter\ApplicationServer\LDAP>
    
```

Note:

Troubleshooting the certificate installation

The certificates should be properly installed. If not, try these troubleshooting tips:

- **Server or port name is not correct**

If the supplied parameters are wrong, the result can look something like the following:

```

C:\WINDOWS\system32\cmd.exe
Installing Certificate for SSL connection...
Loading KeyStore C:\Program Files\Java\jre1.6.0_07\lib\security\cacerts...
Opening connection to esko-graphics.com:636...
Starting SSL handshake...

known Source)
    at com.sun.net.ssl.internal.ssl.SSLSocketImpl.startHandshake(Unknown Sou
rce)
    at com.sun.net.ssl.internal.ssl.SSLSocketImpl.startHandshake(Unknown Sou
rce)
    at InstallCert.main(InstallCert.java:56)
Caused by: java.io.EOFException: SSL peer shut down incorrectly
    at com.sun.net.ssl.internal.ssl.InputRecord.read(Unknown Source)
    ... 5 more
Could not obtain server certificate chain
Copying the keystore file jssecacerts to C:\Program Files\Java\jdk1.5.0_15\jre\l
ib\security
The system cannot find the file specified.
C:\Esko\WebCenter\ApplicationServer\LDAP>
    
```

In this case, contact your IT system administrator and verify the parameters supplied.

2.10.6. Integrate WebCenter with a Workflow Production Server

You can configure WebCenter to integrate with your existing Automation Engine production server.

In this documentation, we assume that you have both these applications installed and running properly.

Understanding WebCenter Integration

WebCenter can run without Automation Engine, but its full potential is realized when integrating both systems.

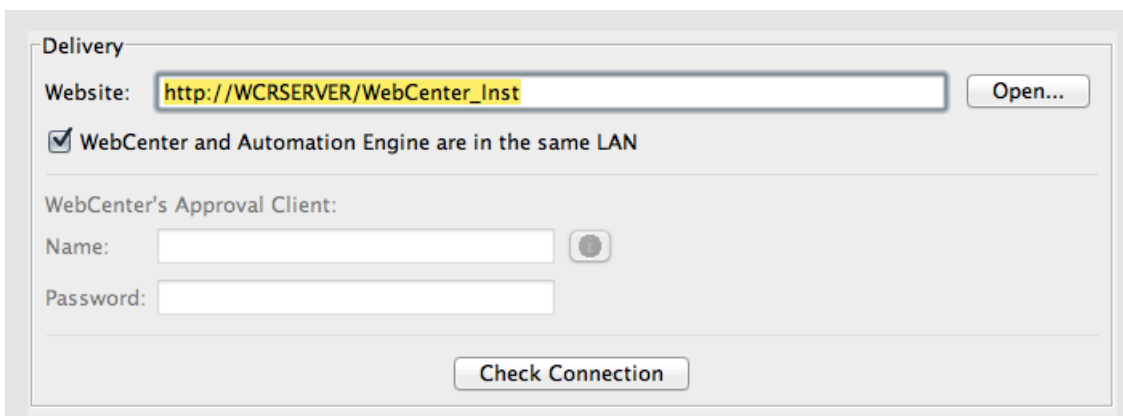

Integrating WebCenter with an Automation Engine production server allows you to upload production files to WebCenter for approval and advanced project management.

To make this collaboration between the systems possible, you must:

- Add the WebCenter site information in the Automation Engine **Configure** window.
- Configure the Job Web Page URLs in the Automation Engine **Configure** window.
- Set up the **WebCenter View** information for the Automation Engine users.
- Set up the **Publish on WebCenter** ticket.

Add the WebCenter Site Information

1. Launch the Automation Engine Pilot and connect to the production server with an administrator account.
2. Choose **Tools > Configure**.
3. In the **Configure** window, select **WebCenter Sites** in the left pane.
4. Click the + icon.

5. In the **Website** field of the **Delivery** area, enter the URL of the WebCenter site (for example: `http://wcrserver/WebCenter_Inst`).

Note: If your site uses secure HTTP, make sure to enter an HTTPS address.

6. Click **Open...** to test the connection. The login page for WebCenter should appear. If it doesn't, check your settings.
7. If the Automation Engine server and the WebCenter Application Server are not on the same LAN, deselect **WebCenter and Automation Engine are in the same LAN**.

If using Automation Engine 18.0.1, 18.0, or 16.1.1 to connect to WebCenter for outside-LAN approval feedback, you need to install a hotfix on Automation Engine for this functionality to still work after updating to WebCenter 18.1.

The hotfixes can be downloaded from mysoftware.esko.com:

- Automation Engine 16.1.1: HF_201801047_20181212_AE-WCR_18_1
- Automation Engine 18.0: HF_201806059_20181212_AE-WCR_18_1
- Automation Engine 18.0.1: HF_201811018_20181212_AE-WCR_18_1

Older versions of Automation Engine are not officially supported.

The **User Name** and **Password** fields then become available. This is where the Automation Engine Approval Client configuration in WebCenter is used.

Create a user name and password combination in WebCenter, then enter that same (case-sensitive) user name and password in the appropriate fields in Automation Engine **Configure**.

Click **Check Connection** to test the connection.

Important: You must be using the Pilot on the Automation Engine server itself to run this check.

A dialog box appears, proving that the connection works and displaying the WebCenter version number.

8. If the **Connect to JDF Processor** area is visible, leave **JMF** selected in it.
9. Click **Check** to test the connection.
An **Info** dialog appears, reporting that the connection is OK. Click **OK**.
If this dialog does not appear, check your settings.
10. On the left of the **Configure** window, scroll down and select the new **WebCenter1** entry under **WebCenter Sites**.
11. Click **File > Rename** and enter a descriptive name for your WebCenter site.
12. Click **File > Save** to save the settings.

Configure the Job Web Page URLs

The Job Web Page enables you to go to your WebCenter project from within your Automation Engine Job.

1. Launch the Automation Engine Pilot and connect to the production server with an administrator account.
2. Choose **Tools > Configure**.
3. In the **Configure** window, select **Jobs > Job Web Page** in the left pane.
4. In the **Address** field, enter the URL of the WebCenter site (for example: `http://pacwebserver/WebCenter`).
5. Still in the **Address** field, append this text to the end of the URL: `/projdetails.jsp?projectName=`

Attention: This is case-sensitive; enter it exactly as written. Do not include a space or period at the end.

6. Click **+ [] InsertSmartNames**.
7. In the **SmartNames** column, scroll down and click **JobName**.
8. Click **Insert** to append it to the URL in the **Address** field.
9. Click **Close** to return to the **Configure** window.

The result should resemble `http://pacwebserver/WebCenter/projdetails.jsp?projectName=[JobName]` with `[JobName]` in green.

10. Click **File > Save** to save the settings.

You can now right-click your Job folder in the Automation Engine Pilot and select **Go to Job Web Page**; this opens the WebCenter project associated with your Job in a browser.

Set Up the Publish on WebCenter Ticket

The **Publish on WebCenter** ticket in Automation Engine creates output and uploads the resulting files to WebCenter.

For more details, please see the Automation Engine documentation.

1. Launch the Automation Engine Pilot and connect to the production server with an administrator account.
2. Click the **Tickets** view.
3. Locate the **Publish on WebCenter** default ticket, right-click it and click **Duplicate...**
4. In the **Save As** pop-up that opens, replace the word `Default` in the **Save As** field with a meaningful name (for example the name of your WebCenter site).
5. In the **Scope** area, select the **Global** option.
If you have no blue job folders containing files, you are not prompted to select the scope.
6. Click **Save**. The new ticket should appear in the list.
7. Double-click your new **Publish on WebCenter** ticket to change its settings.
8. On the **Destination** tab, define where you want to publish your file:
 - a) In the **Site** list, select your desired WebCenter site.
 - b) In the **Project** field, enter the **JobName** SmartName so that the files are published to the WebCenter project corresponding to your Automation Engine job.

Note:

- The project does not have to exist in WebCenter at upload time. If the project does not exist, it will be created. In this case, the person that does the upload from Automation Engine needs to be **Project Manager** in WebCenter! Otherwise the upload will fail.
- If your main goal is not to upload files but to create WebCenter Projects through Automation Engine, we recommend you use the **Create or Modify WebCenter Project** ticket instead (see the Automation Engine documentation for more information).

c) Leave the **Folder** and **Project Template** fields blank unless you know the exact names of the folder and project template you want to use for every new Project.

In this case, enter them as appropriate; all new WebCenter Projects created with this ticket will use these values.

Note:

- The **Project Template** field refers to a template in WebCenter, not Automation Engine.
- You can only use templates that are visible by the WebCenter user performing the upload (see sub-step f).

- d) Enter a **Document Name** if you want your published document to have a name different from the input file name.

Note: If the document already exists, the task will create a new version of that document. If it exists but is in a different folder, the task will fail.

- e) Enter a **Document Description** if desired; this description will be available in WebCenter as a **Version Comment**.
- f) Leave the **User Name** and **Password** fields blank unless there is a specific (and valid!) WebCenter user who will own each document revision published using this ticket; in that case, enter the appropriate information.

If you leave these fields blank, anyone using the ticket will have to supply a valid user name and password each time it is used.

9. On the **Publish tab:**

- a) Leave **Prepare for viewing and annotating** and **Make available for download** selected.
- b) In the **Allow Downloading in WebCenter** area, choose the kind of files to upload to WebCenter.
- **Input files** are the original files themselves.
 - **PDF files for proofing** are proxy files created by using the selected ticket. If you choose PDF files for proofing, leave the default **Create SoftProof for WebCenter** ticket selected, or choose another ticket if desired. Proxy files uploaded in this manner will have **Download PDF for printing** as an option in WebCenter.

The combination of preparing for viewing but not making available for download is intended for Graphics files that only need Approval.

10. On the **Approval tab, deselect **Start the Approval Cycle**.**

11. Click **Save. Then click **Yes** to confirm overwriting the ticket.**

2.10.7. Expose WebCenter to the Internet

Exposing WebCenter to the Internet is the responsibility of your local IT department. Esko cannot do this for you.

Register a Domain Name

Register and pay for a domain name, such as `www.esko.com`, to allow internet users to navigate to your WebCenter site.

Once you have registered the domain name, your company is the only one authorized to use that specific domain name for a certain period.

- Contact a proper authority (VeriSign, GoDaddy, etc) and purchase a domain name.

Contact Your ISP to Set Up an A Record

The purpose of an **A record** is to associate your domain name to your public firewall/router, so web traffic (HTTP and HTTPS) going to the domain name is routed to that public firewall/router.

Think of this as telling the Postman how to get to your mailbox.

Note: It takes several days for the A record information to propagate around the world.

1. Identify the public IP Address of your router/firewall.
This is the hardware appliance your Internet connection is plugged into (i.e. T1, DSL).
For example: My T1 is plugged into a firewall with 66.55.44.33 as public IP address.
2. Contact your ISP and ask them to add an 'A' Record (Address record) to the global DNS (Domain Name Servers), associating your domain name and your router/firewall public IP address.
3. Verify that you can ping your domain name from computers inside and outside your LAN.
4. Ensure the reply you get contains the correct IP address for your public firewall/router.

Example

MCI is your ISP. You contact MCI and ask them to add an A record for your new domain name, www.esko.com, to forward HTTP and HTTPS traffic to your public firewall IP address of 66.55.44.33.

After about 3 days or so, this record has been propagated across the world. If someone in Thailand 'pings' the domain name www.esko.com, he/she should receive a reply with the IP address of 66.55.44.33.

Move the Web Server Inside the Demilitarized Zone (DMZ)

You should physically arrange the network devices so that the Web Server is in a proper DMZ architecture (between two firewalls or plugged into a DMZ port of the public router/firewall).

1. Configure Firewall 1 (public router/firewall):
 - a) Allowed to route traffic to Web Server inside DMZ for HTTP and HTTPS.
 - b) Default ports 80 (HTTP) and 443 (HTTPS).
2. Configure Firewall 2 (gatekeeper for private network):
 - a) Allowed to route traffic on specific ports to WebCenter's Application Server.
 - b) Default ports 1099, 2500, 4444.

Note: You can change the default port numbers used at any time—to do this, modify the IIS settings and the WebCenter configuration files on both the Web Server and the Application Server to reflect these custom port numbers.

Configure IIS to Receive Traffic

Web traffic is delivered to the public firewall because of the A record. That firewall then forwards the web traffic to the Web Server inside the DMZ.

The Web Server application (IIS) needs to be configured to pick up this traffic for processing. To do this, the Web Server must be assigned a static Private IP Address.

1. On the Web Server, click **Start > Run** and type `inetmgr`. Then click **OK** to start **Internet Information Services (IIS) Manager**.
2. Expand the **Web Site** node.
3. Right-click the **Web Site** node and choose **Properties**.
4. Click the Web Site tab and verify that the **IP Address** is correct (or use the drop down list to change it).
5. In the **TCP Port** field, ensure you are using the correct port for HTTP traffic; the default port is 80 (this needs to match your firewall rules).
6. Close IIS Manager.

2.11. Deploying WebCenter

WebCenter uses a three-tier installation framework to facilitate in-house development and configuration before deploying it in production form. The three tiers are the **Installation** version, the **Development** version, and the **Production** version.

Deployment Workflow

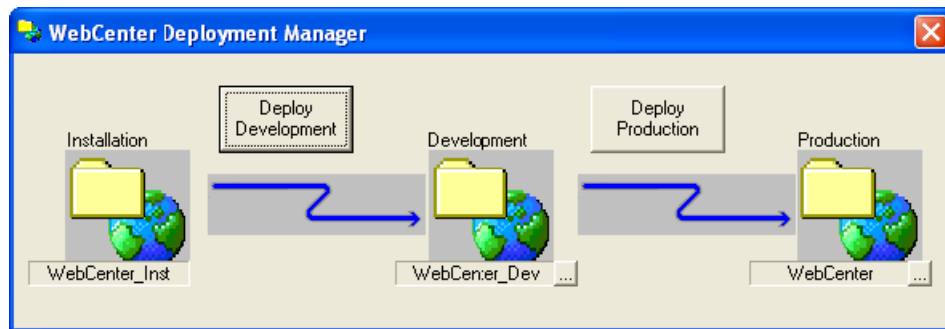

The intended workflow is to install WebCenter, deploy it to Development, modify the Development version, and then when you are satisfied, deploy the Development version to Production.

As time goes by, you can keep modifying the Development version as desired without affecting the Production version. When you are satisfied with the changes made to the Development version, you can deploy it to Production.

At the time of deployment, the custom directory is not overwritten if it already exists in a target instance, so `customizationConfig.xml` and any other customized files in the custom directory are not changed. But when a new instance is created by deployment, the custom directory is created with its default configuration.

The WebCenter Deployment Manager

The **WebCenter Deployment Manager**, located in **Start > Programs > WebCenter**, manages the deployment process. If there is more than one website on the Web Server, choose the website with which the **WebCenter Deployment Manager** will work and click **OK**.

To further develop the installed version, use the WebCenter Deployment Manager:

- If you want to change the name of the development version, click the ... button in the Development area, and specify the new name of the development version. When you have changed the name, click **Deploy Development**.

Web authors can then modify the site at http://WebServer_name/WebCenter_Dev (or whatever name you chose earlier), while normal users can still work using the site at http://WebServer_name/WebCenter_Inst.

- Once the developed version is ready for production use, use the WebCenter Deployment Manager again.

If you want to change the name and location of the production version, click the ... button in the Production area and enter the new name. Then, click **Deploy Production**.

The site in WebCenter_Dev will be copied to WebCenter. Production use starts by users pointing their browsers to http://WebServer_name/WebCenter.

Note:

You can have multiple development and deployment versions of WebCenter by changing the names for each deployment, e.g. DEV1, DEV_Other, WebCenter_Prod1, and so forth.

Also, the deployment name is not case sensitive, so for example WebCenter_Dev and WebCenter_dev are considered to be the same deployment instances.

2.12. Localizing WebCenter

Localization is the process of making a program ready to run anywhere in the world.

It encompasses modifying the display language, the way units are displayed, decimal separators, time and date formats, and currency format to match the local user preferences.

2.12.1. Understanding Localization in WebCenter

WebCenter uses references to separate language files (text strings files) instead of using hard-coded words. WebCenter ships with a variety of language files. Additionally, the text strings files can be translated into any language.

Each WebCenter user can change to a different language in **My WebCenter > My Preferences**.

The default language can be changed in **General Preferences** at any time by any WebCenter user who is a member of the Admins group.

2.12.2. How to Install Custom Translations

The language files are in the `languages` subdirectory of the WebCenter installation on the Web Server, such as `\Artios\WebCenter\WebServer\tomcat\webapps\<site name>\languages`.

They are named `wcstrings_xx.xml` where `xx` is a two-letter code for the language, for example `en` for English, `fr` for French, and `de` for German.

1. Copy one of the existing language files, and rename the copy changing the two-letter language code to the new language code.

Note: The language code must match the official list of two-letter ISO 639-1 codes at <http://www.loc.gov/standards/iso639-2/englangn.html>. For example, a Danish language word strings file would be named `wcstrings_da.xml`.

2. Translate the strings in the file.
3. On the Web Server, open `\Artios\WebCenter\WebServer\tomcat\webapps\WebCenter_instance\config\config.xml` in a text editor or an XML editor. In the Languages section of the file, add a key for the new language, for example `<Language key="da"/>` for a Danish translation.
4. Put the translated language file in the `languages` subdirectory of the WebCenter installation.
5. Open every other `wcstrings_xx.xml` file and add a `<NLanguage_xx>Language</NLanguage_xx>` string after the strings for the existing languages.

For example, add the string `<NLanguage_da>Danish</NLanguage_da>` to install a Danish strings file, substituting the word for Danish in the appropriate language for the string file.
6. If the chosen language is a multi-byte language (such as Japanese, Chinese, or Thai), log on to the Application Server and edit `\Artios\WebCenter\config\appconfig.xml`. Change the value in the `index_lang` field to the appropriate language code that is listed in the comment below the field, and save the file.
7. Restart the Web Server to see the changes.

2.13. The Help System

Old style dynamic help system

WebCenter uses a dynamic help system that checks for the existence of specifically-named XSL files on the Web Server in `\Artios\WebCenter\WebServer\tomcat\webapps\<WebCenter_instance>\help`.

A Help link will appear in the menu of the page that has the same name as an XSL file in this directory. The content of a Help file can be anything provided it is in XSL and the file has an `.XSL` extension.

Note: Esko recommends the use of xmlspy® for authoring WebCenter Help XSL files. It is available from <http://www.xmlspy.com>. There are also shareware and freeware XSL editors available. You could also modify the sample provided using a text editor such as Notepad; do not use WordPad as it inserts its own formatting codes.

- To change the Webmaster contact name and e-mail address displayed on the login help page, edit login.xml.
- If using foreign-language files, append _xx (where xx is the code for the language) to the end of the file name before the extension, such as login_fr.xml for a French help file for the login page.

When determining if a Help link should be on a page, WebCenter looks for a localized Help file, and then for an English one if a localized one is not found. If neither exist, WebCenter does not put a Help link on the page.

New style dynamic help system linked to help.esko.com

Since WebCenter 12.1, a lot of pages (mostly in the admin section) use a dynamic help system linked to help.esko.com. When a user clicks the help icon, context-aware help information is displayed. By default the documentation from help.esko.com is shown, but this behavior is customizable.

It is possible to customize a specific help topic, or to link a subset of help topics to a specific manual or page. The behavior of the help functionality can be configured in the custom folder on the Web Server.

Each help link has a topic (i.e. common/wc/reference/re_task). The topic of a help link can be found by looking at the link address: a help icon always links to help.jsp?topic={TOPIC}&lang={LANG}.

For customization, the following options are available:

- By placing html files in the correct location in the custom folder on the Web Server: Customization for help pages is done in the custom/help directory. Customization can be done per language (by adding files to custom/help/{LANG} directory (where {LANG} is the abbreviation for the language in WebCenter i.e. custom/help/en for English). Customization can also be done for all languages. This is done by putting files in custom/help/all.
- By adding a helpconfig.xml file with specific settings to the custom/help folder on the Web Server: This file can contain a set of rules that will be applied when no specific custom topic is found. In the custom help file you define rules that match topic names. When a rule matches, the rule is applied by sending the user to the correct location, defined in the rule.

Note:

The system first searches in the language specific custom folder for a customized html file, if no html file is found for a specific language, it will search in the custom/help/all folder for that topic.

2.14. Upgrading WebCenter

You can upgrade directly to WebCenter 18.1.1 from older versions.

If you have an older version than 10.0, you will need to first upgrade to WebCenter 10.1 or 10.2, make sure it is running correctly, then upgrade to WebCenter 18.1.1.

2.14.1. Forced System Reboot during Upgrade

When updating WebCenter, a full re-installation is required. You need to remove the existing installation before installing a new version.

After uninstalling, you have to reboot to be able to proceed with a new *Installation* process. This is enforced before installing another version.

Note: Reboot pending state of a system can be activated not only by WebCenter but also by completed Windows updates or other application installation operations.

2.14.2. Configuration Retained During Upgrade

Retained Configuration Values during Upgrade

WebCenter Installer will store specific configuration values of the existing installation when it is being uninstalled. These configuration values will be used during the upgrade.

The Installer input fields will use these stored values for the new installation. You only have to verify if this pre-populated data during the installation process.

The following values are stored by the system:

- Web Server
 - Application Server Hostname
- Application Server
 - Web Server Hostname
 - Database Server Hostname
 - Database type (MS SQL or Oracle)
 - Database Instance name (MS SQL only, default instance can be used in which case this setting is empty)
 - Database connection SID (Oracle only)
 - SA database User password (default password)

Note: The password value is not retained if a custom password was used during the previous installation. You will have to type in this password in this field.

- FileStore folder path(s) (UNC path is allowed)

Note: As this mechanism includes persistence of custom FileStore path values, the `appconfig.xml` configuration file does not have to be modified after re-installing a new WebCenter version.

- Installation Choice: Simple or Advanced
 - If Advanced Installation is selected, the following choices are retained:

- Java Heap Space Size: Normal or Extra Large
- View Server: Internal or External
- Database (internal) User password: Default or Custom

Note: The password field is always left empty.

FileStore Split during Upgrade

To prevent FileStore size problems, WebCenter supports FileStore split into separate folders. The configuration of the different FileStore paths is stored within `appconfig.xml`.

During the uninstallation phase, the application reads the `appconfig.xml` file and stores all the custom settings. When you re-install, the Installer updates the `appconfig.xml` with these custom values instead of default values (derived from the default FileStore location).

Following FileStore paths can be customized in `appconfig.xml` and the custom values are kept during the reinstall process:

- **temp_dir**- This node mentions the folder used to keep temporary work files.
- **viewer_data_dir**- The node mentions the folder used to store 2D Viewer data files for individual viewable WebCenter Documents.
- **document_thumbnails_dir**- The node to store thumbnail files for Documents that support having custom thumbnails generated per Document WebCenter object.

This is optional. If it is missing, Document Thumbnails are stored in the same folder as the main Document files (as set in **document_dir** node).

- **document_perspectives_dir**- The node to store various default and custom Document Perspective files for individual Documents (set of supported Perspective types varies based on the Document Type).

This is also an optional folder. If it is missing, Document Perspectives are stored in the same folder as the main Document files (as set in **document_dir** node).

2.15. Prepare for the Upgrade

This describes how to upgrade WebCenter 10.1, 10.2, 12, 14 to the latest build of WebCenter 16.1.

Note:

This procedure **applies to all upgrade installations** of WebCenter 18.1.1, even to "minor" updates between builds of the same version.

Note:

This procedure is fairly complex and involves direct manipulation of core application and database files.

Expert help is available to **perform the upgrade for you at a minimal cost**: contact your local Esko Customer Services division for a quote and scheduling.

For more detailed instructions than the brief overview provided in this document, please consult the main WebCenter Installation Guide on the installation media.

2.15.1. Prerequisites for the Upgrade

Installation Media and Licenses

Make sure you have the following at hand before proceeding:

Media

- WebCenter 18.1.1 DVD
- Automation Engine 18.1.1 DVD

Licenses

- ArtiosCAD 18.0 (FlexNet server license)
- WebCenter 18.1.1 (plus optionally Task Management, Advanced Approval, PDF download, Reporting, extra concurrent users)
- OBGE (On Board Graphics Engine)

Information Needed

Make sure you collect the following information:

- The location of the FileStore (you can find this information in C:\Artios\WebCenter\Config\appconfig.xml)
- The database engine to use (SQL Server 2008 (R2) / 2012(Express Edition) /2014(Express Edition)/2016 (Express Edition), 2017(Express Edition), Oracle 10g or Oracle 11g or Oracle 12c).
- The name of the Database Server, the Oracle Database Identifier (SID) if using an Oracle database, and the database administrator password (sys password).
- The name and location of the WebCenter4_0 database instance (you can find this information in

```
<DRIVE>:\Esko\Artios\WebCenter\ApplicationServer\jboss\server\default\configuration\standalone.xml. Use your Esko customer login and password for activating licenses.
```
- The IP address or name of the LDAP server and the port used for the secure connection (typically 636).

If you are upgrading from 16.1.1 or 18.0 to 18.0.1

WebCenter Installer will store specific configuration values of the existing installation when it is being uninstalled. These configuration values will be used during the upgrade.

The Installer input fields will use these stored values for the new installation. You only have to verify if this pre-populated data during the installation process.

The following values are stored by the system:

- Web Server
 - Application Server Hostname
- Application Server
 - Web Server Hostname
 - Database Server Hostname
 - Database type (MS SQL or Oracle)

- Database Instance name (MS SQL only, default instance can be used in which case this setting is empty)
- Database connection SID (Oracle only)
- SA database User password (default password)

Note: The password value is not retained if a custom password was used during the previous installation. You will have to type in this password in this field.

- FileStore folder path(s) (UNC path is allowed)

Note: As this mechanism includes persistence of custom FileStore path values, the `appconfig.xml` configuration file does not have to be modified after re-installing a new WebCenter version.

- Installation Choice: Simple or Advanced
 - If Advanced Installation is selected, the following choices are retained:
 - Java Heap Space Size: Normal or Extra Large
 - View Server: Internal or External
 - Database (internal) User password: Default or Custom

Note: The password field is always left empty.

2.15.2. Prepare for the Upgrade on the Application Server

1. Copy the following onto the Application Server:
 - WebCenter 18.1.1 DVD
 - Automation Engine 18.1.1 DVD
 - ArtiosCAD en license
 - WebCenter 18.1 license (plus optional module licenses)
 - OBGE (On Board Graphics Engine) license
2. Back up:
 - the FileStore
 - the WebCenter4_0 database
 - the `\Artios\WebCenter` folder
 - the `\Esko\Artios\WebCenter` folder
 - any E-mail Notification customizations that may be stored in `\WebCenter\ApplicationServer\EmailNotifications\Custom`
 - all other non-standard customizations you may have implemented outside of the `custom` folders
3. Make a restore point for the OBGE.
4. Make a backup of the server software configuration.

For detailed instructions on step 3 and 4, please refer to the **Automation Engine 18.1.1 Installation Manual**.

2.15.3. Prepare for the Upgrade on the Web Server

1. Copy the following onto the Web Server:
 - WebCenter 18 DVD
2. Back up `\Artios\WebCenter` and any non-standard customizations you have implemented outside of the WebCenter instances.

2.16. Upgrade WebCenter

2.16.1. Remove WebCenter

1. On the Application Server:
 - a) Remove the **WebCenter** software using the **Add/Remove Programs** applet in the **Control Panel**.
 - b) Reboot the server.
 - c) Using Windows Explorer, remove the `\Artios\WebCenter` and `\Esko\Artios\WebCenter` folders, and any other remaining WebCenter-related folders.

Note: Take care not to remove the FileStore if it is inside a WebCenter folder!
2. On the Web Server:
 - a) Remove the **WebCenter** software using the **Add/Remove Programs** applet in the **Control Panel**.
 - b) Reboot the Web Server.
 - c) Using IIS, remove all WebCenter instances (only the default "WebCenter_Inst" is removed automatically).
 - d) Using Windows Explorer, remove `\Artios\WebCenter`, and any other remaining WebCenter-related folders.

2.16.2. Install WebCenter 18.1.1

1. On the Application Server, update the older version of ArtiosCAD Enterprise to the latest version of ArtiosCAD Enterprise, choosing the options described in [Install ArtiosCAD Enterprise on the Application Server](#) on page 31 and the **Use the default configuration** upgrade option.
2. Upgrade the license component using the Automation Engine 18.1.1 DVD:
 - a) Insert the **Automation Engine 18.1.1** DVD.
If the DVD does not auto-start, double-click `setup.exe` in its root folder.

- b) In the window that opens, click **English**.
- c) Click either:
 - **Software Installation** in the main menu on the left of the window,
 - **Proceed to the installation >>** at the bottom of the window.
- d) Click **Install** on the next page.
- e) On the **Instructions** page, click **Run the Automation Engine System Readiness Check**.

At the end of the Readiness Check, read the resulting messages carefully. If the Readiness Check resulted in a problem, correct it before proceeding. Click **Exit** in the **Automation Engine 18.1.1 System Readiness Check** dialog when this is done.

- f) Click **Install the License Server Components**.
 - g) Click **Install the System Controller 1.0** and follow the instructions of the installation wizard.
3. [Activate the Licenses](#) on page 32.
 4. Uninstall the old version of ArtiosCAD Enterprise.
 5. Install WebCenter 18.1.1, using the English language installer, on the Application Server and on the Web Server, making use of the existing FileStore location and WebCenter4_0 database location.

Note: The installers in other languages should not be used, until further notice.

See [Installing WebCenter](#) on page 28 for more information on the installation procedure.

6. [Install Certificates for LDAPS on the Application Server](#) on page 63.

2.16.3. Upgrade the OBGE

Note:

- The OBGE must have the same or a later version than the Automation Engine production server.
- Make sure that you do not update any CADx component while updating the OBGE! CADx must only be updated by the ArtiosCAD Enterprise installer.

Upgrade the OBGE (On-Board Graphic Engine) to Automation Engine 18.1.1 :

1. Upgrade the prerequisite components:
 - a) Insert the **Automation Engine 18.1.1** DVD.

If the DVD does not auto-start, double-click `setup.exe` in its root folder.
 - b) In the window that opens, click **English**.
 - c) Click either:
 - **Software Installation** in the main menu on the left of the window,
 - **Proceed to the installation >>** at the bottom of the window.
 - d) Click **Install** on the next page.
 - e) Click **Install the prerequisite components** and follow the instructions of the installation wizard.

Note: Remember to not update any CADx component!

The prerequisite components are now upgraded.

2. Test the OBGE and check its configuration (Hot Folder and container, see [Configure the OBGE](#) on page 44 for details).

2.16.4. Configure WebCenter

1. If you had WebCenter customizations:
 - a) Reapply the email notification customization that you backed up in your `custom` folder. Mentions of an older version of WebCenter are automatically updated to "WebCenter 14".
 - b) Apply any standard customizations you saved earlier to your new WebCenter instance(s).
 - c) Redo any other non-standard customization that you may have had.
See the WebCenter Customization guide for more information.

Attention:

- Do NOT copy the files as the XML structure might be different and you might break it.
- Do not customize the **Default** instance of WebCenter as if it doesn't work anymore you will have to completely reinstall it!

2. In case running the database scripts automatically (preferred) is switched off, run the WebCenter 14 database scripts.

See [Run the Database Schema Scripts on the Application Server](#) on page 35 for more information on the database schema scripts.

3. Log on the WebCenter web interface and change the administrator password (see [Log On to WebCenter and Change the Admin Password](#)).
4. Deploy new WebCenter instances as desired.
See [Deploying WebCenter](#) on page 71 for more information.

The upgrade is complete.

2.16.5. Additional step when you upgrade from 18 to later versions

When performing an upgrade to installation of a WebCenter 18.0 or later, if the Web server is on the same host as the installer, then the following options are available if the custom folders is backed up:

- **Redeploy web instances with customizations:** This is the default option. Re-deploys the custom instances marked during the previous uninstall procedure as well as the custom folders backup.
- **Redeploy web instances without customizations:** Re-deploys the custom instances marked during the previous uninstall procedure but will not retain the backed-up custom folders.
- **Do not redeploy automatically:** Will not re-deploy any of the custom instances and their custom folder backups.

2.17. Uninstalling WebCenter

1. Log on to the Web Server as a member of the local Administrators group.
2. Stop the **IIS Admin** service.
3. Backup all deployed sites within `\Artios\WebCenter\WebServer\Tomcat\webapps` in case they are needed in the future.
4. In WebCenter 18.0 or later, Web server installer records the names of all the custom WebCenter instances while backing up the custom folder where all Web server based customizations of a given instance including the default `WebCenter_Inst` are stored.

Common App Data root folder is used to store the customization files backup on the target Web server host. The default path on most Windows server would be `C:\ProgramData\Esko\WebCenter\WebInstanceCustomData`.

This folder is the root and each WebCenter web instance custom folder files that was backed up is stored under a subfolder that takes the name of the appropriate instance.

The list of web instances that were found and can be later re-deployed are stored in the registry among the other WebCenter upgrade values. Read more about this here [Additional step when you upgrade from 18 to later versions](#) on page 81.

5. Use the **Add/Remove Programs** applet in **Control Panel** to remove WebCenter.
6. Manually delete all subdirectories under `\Artios\WebCenter`.
7. Log on to the Application Server as a member of the local Administrators group.
8. Back up `\Artios\WebCenter\Filestore` and all its subdirectories in case they are needed in the future.
9. Use the **Add/Remove Programs** applet in **Control Panel** to remove WebCenter.

10. Manually delete all subdirectories under `\Artios\WebCenter` if you are intending to never again use WebCenter.

If WebCenter is uninstalled with the intention of installing a newer version (and keeping an existing database), do NOT delete the files in `\Artios\WebCenter` as they contain information needed for the new version to run with the existing admin password.

11. If using Microsoft SQL Server 2008, or Microsoft SQL Server 2008 Express Edition, back up the WebCenter4_0 database and then use Enterprise Manager to manually delete the WebCenter4_0 database.

If using Oracle, backup the database and either delete the instance, or, if it is shared, connect to the instance and issue the `drop user webcenter cascade;` command.

12. If the OBGE is installed, remove all the Esko products using the **Add/Remove Programs** applet in **Control Panel**. Select all products except the FLEXIm flexid drivers.

13. Remove ArtiosCAD Enterprise by using the **Add/Remove Programs** applet in **Control Panel**. Once all the products are removed, WebCenter should be completely removed.

14. Reboot your machine. *If you need to install another version, this is a required step.*

3.2. What's New?

WebCenter 18.1 is a major release with lots of new innovative features being introduced. The main changes are:

Improved Reporting

- More visual and easier to detect risks faster
- Easier KPI reporting and analysis
- Localized to your needs

User Experience inspired by Social Media

- Easier to navigate
- Faster adaption by new users

- Training is hands on and simpler
- Look and feel based dashboards created using drag and drop

Dynamic 3D

- High Quality 3D virtual mockups in minutes
- Import Chili content using Import Dynamic text workflow node

Global Discussion

Drive collaboration with frequent user interaction

What's New in WebCenter 18.1.1

WebCenter 18.1.1 is a minor release with few very useful and incremental features added to the previous version. Main changes for this release are:

Search

- Focus Layout for Search Results
- Persistent Search Selection
- Live Text Search
- Viewer Dashboard Block
- Improvements to Search Indexing

Improved PCM Functionality

- Add/ Remove columns and rows in Tables
- PDF format reports for table previews

3.3. WebCenter Administration Basics

WebCenter installs with a minimal configuration because every installation has different needs. This guide explains as how to set up WebCenter and make it ready for use.

3.3.1. A Note on Web Browsers

Due to differences between the Web browsers, some configuration issues in Firefox and Safari require extra action in order for WebCenter to function properly. Anyone using WebCenter with either of these browsers on any platform should consider performing these configuration changes.

Mozilla Firefox

Refreshing pages may not get the most current data from the WebCenter Web server. In order to ensure the most current data is seen, caching must be disabled, or you must press ctrl-r on any suspect pages to forcibly reload them.

To disable caching, do the following:

1. Log in and start Firefox.
2. In the Address field, type about:config and press enter.

3. Scroll down to the network.http.use-cache entry and double-click it so that its value changes from true to false.
4. Restart Firefox.

Safari

When using Safari, the built-in browser for Apple Macintosh computers running OS X, there is no way to configure caching. When using the Back button, click Refresh to ensure you see the most current data.

3.3.2. Understanding the WebCenter Page Layout

Header

The top right of the WebCenter page always shows:

- the name of the current user,
- a  icon to go back to the user's start page,
- a  Discussions icon which indicates the unread messages and redirect to My Discussions. You can view all discussions related to Project or Document or Tasks that you are involved in. For more details, refer to [Discussions in WebCenter](#) on page 814
- the Cart ,
- Avatar  icon displays the user initials (first letter of first name and last name),
- a link to the WebCenter **Welcome** page,
- **Admin** (if the user is a member of the Admins group),
- **Contact**,
- **Logout**.

Top Menu Bar

By default, the top menu bar contains the following menus: **My Work**, **Projects**, **Task Types**, **Search**, **My WebCenter**, **Create** (if you are a Project Manager) and **Upload** (see [The Default WebCenter Menus](#) on page 544 for more details). An administrator can customize the menus.

If you have the optional Task Management module and the **User Can Create Task Type** permission, **Task Types** also appears in the top menu bar.

Documents Pages

Below is a sample of project's **Documents** page, in grid layout, for a user who is a Project Manager.

Area 1 is the project actions area, allowing you to perform actions on the whole project (for example, mail a link to the project to a reviewer, add the project to your favorite projects...)

- **Area 2** is the Project Details area, containing the project icon, the name and description of the project, the project status...
- **Area 3** shows links to the project pages. For example, click **Members** to view the project members. The page you are on is shown in bold.
- **Areas 4** and **5** are part of the content pane, that changes depending on the project page you are on. Here, on the **Documents** page, they show the project folders and documents.
- **Area 4** is the Folders pane, showing the projects folders. Click a folder to see the documents it contains.
- **Area 5** is the document pane, that can show the documents in a list or grid view, with or without thumbnails.

Notes

- To act on many documents at once, select their check boxes and then choose an action in the **Actions** menu.
- To select all documents in the current folder, select the check box before the **Documents** header.
- To switch to a list layout, click **Show as List**.
- Hovering over a thumbnail shows a larger version of it in a pop-up window.

For Graphic documents viewable by the WebCenter Viewer, you can click the zoom icon to show an even larger thumbnail (500 x 500 pixels). This is applied to all Graphic documents on which you hover until the page is reloaded.

The pop-up window closes when you move the cursor off the thumbnail.

There is usually more than one way to accomplish a task by using a combination of menu entries, action menus, and clicking status messages. Many methods will lead to the same result.

Note: This layout is the default layout. However, your layout might be different depending on your customization.

3.3.3. Filtering Content

As more information is managed over time by WebCenter, some pages can potentially show large amounts of information. To reduce the time needed to show the page when it first loads, some pages have a filter.

To use the filter, enter a search string with an asterisk either before it, surrounding it, or after it in the **Search** field, and click . For example, on the **Companies** page, to only see those companies with the word Containers in their name, enter `*Containers*` and click .

When filtering users, use the last name of the user.

To show all the items, up to the truncation limit, click  with nothing in the field.

Note: The truncation limit prevents lists of thousands of items from impacting response time; if you know in advance that your search will return that many items, refine it with the filter. The truncation limit can be changed; contact Professional Services at your local Esko office for more information.

3.3.4. The Admin Menu

All administration is done initially by Admin, the administrative user who has full control over WebCenter.

The Admin user and members of the Admins group have the Admin  button in the right side of the header.

Click the **Admin**  button to go to the Admin menu. The **Users** page is shown by default.

To return to the normal WebCenter menus, click the **Exit Admin**  button.

3.4. WebCenter Preferences

The **Preferences** menu in the Admin section of WebCenter allows you to set system-wide preferences in a number of categories:

- **General**
- **Password Preferences**
- **Security**
- **Document Types**

- [Notifications](#)
- [Menus](#)
- [My Work](#)
- **Customizations**
- [Reports](#)

3.4.1. General Preferences

Click **General** on the **Preferences** bar to set system-wide preferences.

Note: The individual users can override nearly all of these properties for themselves in **My WebCenter > My Preferences**. Those users who have changed these settings are not affected by later changes made to the same fields in **Admin > Preferences > General** by an administrator.

General

- **Language** sets the language used by the user interface.
- **Start Page** sets the page that appears when you log on. It could be either Dashboard, Document Search, My Favorites, My Locked Documents, My Preferences, My Profile, My Work, Projects, Project Search, Saved Search, Welcome page. If Dashboard or Saved Search is chosen, further drop down is shown to chose from the existing Dashboard or Saved Search.
- **Default Project Page** sets the page that appears when clicking a project name. It could either be Project Dashboard, Documents Page, Attributes page, Tasks page, Bills of Materials page.

Note: When Dashboard is chosen as **Default Project Page** or **Start Page**, you can either chose from the existing dashboards or **Create New Dashboard**.

- **Default Document Page** sets the page that appears when clicking a document name. It could be either be History, Approval, Attributes or Details page.
- **Units** sets units for all measurements to either **Metric** (mm, cm, dm, m) or **Imperial** (in, ft, yd).
- **Thumbnails:** selecting **Show thumbnails** shows thumbnails in document lists by default.
- **Cart: Clear Cart on Logout** is always enabled by default. Disable this option if you want your users to access their **Cart** contents across sessions.

Project Lists

- **Show ... rows** sets the number of projects displayed in the List layout.

Document Lists

- **Default Layout** sets the default view for document lists: **Grid** or **List** layout.
- **Show in Grid** sets the number of documents displayed on a single page in the Grid layout (defined as a number of **Columns** and **Rows** in the grid).
- **Show in List** sets the number of documents displayed on a single page in the List layout (defined as a number of **Rows** in the list).

Search Results - All

Show in List sets the number of documents displayed on a single page in the **Search** results List layout (defined as a number of **Rows** in the list).

Show Cards sets the number of individual document objects that are displayed as a table of document thumbnails on a single page in the Search Results.

You can choose to **Show date and time for Date Attributes/Specifications**. By default date attributes in Search Results will not show time information.

Search Results - Documents

- **Default Layout** sets the default view for document **Search** results pages to **Grid, List** or **Cards** layout.
- **Show in Grid** sets the number of documents displayed on a single page in the Search results Grid layout. You can also specify the position of the **Thumbnail position** in the results as Top or Left.

Search Results - Projects

- **Default Layout** sets the default view for project **Search** results pages to **Grid** or **List** layout.
- **Show in Grid** sets the number of projects displayed on a single page in the Search results Grid layout. You can also specify the position of the **Thumbnail position** in the results as Top or Left.

Discussions

- **Discussions per Page** sets the number of discussion threads displayed per page on the **Discussions** pages.
- **Postings per Page** sets the number of discussion posts displayed per page on the **Discussions** page.

Roles

Invite Group Default sets the system-wide default state of the **Invite Group** check box, available on the **Manage Roles** page and in the **Members** area of the Project Creation page (when creating a project based on a project/template that contains roles).

Bill Of Materials

Use Bill of Materials enables the Bill of Materials functionality for the entire WebCenter system. See [Bill of Materials](#) on page 431 for more information.

My Work Defaults

- **My Approvals Assignee Filter** sets what users view by default in the **My Approvals** section of their **My Work** page (approvals assigned to **Me, Me or Group I Am In** or **Group I Am In**).
- **My Tasks Assignee Filter** sets what users view by default in the **My Tasks** section of their **My Work** page (tasks assigned to **Me, Me or Group I Am In** or **Group I Am In**).
- **Non Started Tasks** sets whether users' **My Work** page displays tasks assigned to them that aren't started yet.

Project Autaname Generation

Use the **Project Autaname Generation** settings to automatically generate project names.

These settings use a naming template (**Prefix, Suffix** and **Counter Length**) to define the automatically generated names.

Define **Prefix** and **Suffix** by selecting from **Smart Names** drop-down menu.

Note: Make sure to read the notes at the bottom of the page for restrictions. The building blocks are case-sensitive.

The **Counter Length** is a numerical field that gets incremented for each new Project using the same prefix. It is placed between the prefix and the suffix.

In the **Counter Length** field, enter the length of that incremental counter. For example, enter 5 for numbers that will be five digits long.

Select **Use Automatic Naming for Creation of Blank Projects** if you want to automatically generate the names of projects created from a blank project.

Discussions

- **Discussion Counter** option is enabled by default. When enabled, the counter will display all the unread messages including the unread messages from private discussions within a project, where the PM / Admin users are also part of. This option only affects the global counter on the top menu bar.
- **Default Participants:** This is a radio button option. You can either choose
 - To start the discussion with everyone who has access to the current Project / Document/ Task
 - To restrict the option to have the default participant as the Discussion Creator.

Other Preferences

- **Host URL** sets the URL at which the WebCenter site can be accessed. This is the URL used to send automatic email notifications.
- **Host URL for internal use** sets the URL at which internal components, like Automation Engine, can access the WebCenter site. Use this to go through the local network (using your WebCenter server's local computer name) instead of through the internet (using your WebCenter server's public IP or computer name).

You should use this if, due to your setup, the DNS doesn't know the WebCenter server's public name inside your Local Area Network.

Note: You can only use this when Automation Engine and WebCenter are on the same LAN. If this is not filled in, Automation Engine will connect to WebCenter using the **Host URL**.

For both **Host URL** and **Host URL for internal use**, you can choose to use either **http://** or **https://**. Choose the protocol defined during the WebCenter installation.

PDF Download Options

Admin user can set options to add some more information to the PDF documents when they are downloaded by selecting the required options.

- Add Approval information to downloaded PDF
- Show Approval information in landscape layout
- Prepend Approval Information
- Show User Company / Location in a separate column

You can also add the Project Attribute IDs and Document Attribute IDs of either Text or Date/Time attribute type in the respective fields, which are then displayed in the report when the document is downloaded.

Note: You may contact Esko Solution Architects for further details.

Viewer

- Select your **Viewer Type**. You can set your preference to the [HTML5 Viewer](#) or keep at the default ([Java Viewer](#)).

Note: You can always switch to [Java Viewer](#) from [HTML5 Viewer](#) using the  button.

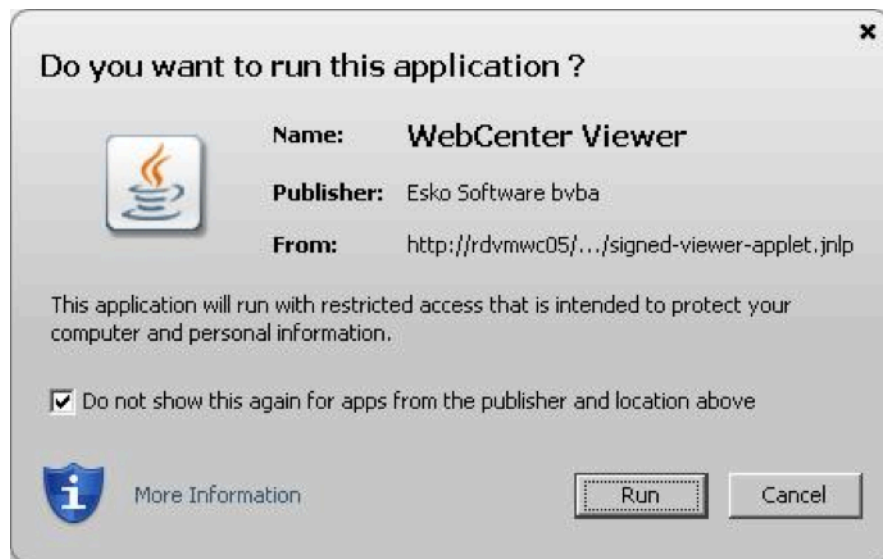

- **Viewer and Workflow Applet:** When [opening a document in the Viewer](#) or when [creating a workflow](#), WebCenter will download a Java applet to your computer.

From Java 1.7.0_21 (for Windows and Mac OS X 10.7 or later), you will get a security warning as the one below when the applet is downloaded. This makes the WebCenter applet look like a security risk for your computer.

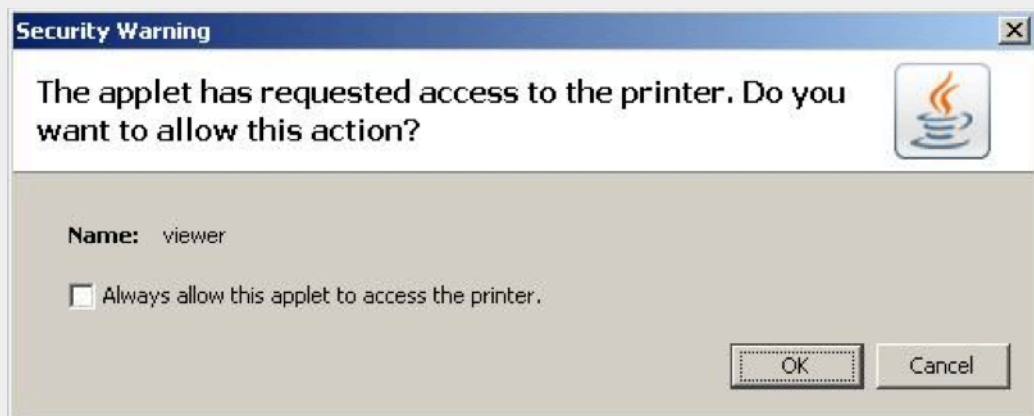

You can adapt how this security warning will look like when downloading the applet. In **Viewer and Workflow Applet**, choose either:

- **Signed (sandboxed)** if you want to run the applet in a strict sandboxed environment (with no access to your computer's resources). As the applet is signed by Esko, the security warning looks less threatening.

Note:

As the applet is sandboxed, it will also show a warning when trying to print from the Viewer. You will just need to click **OK** to be able to print.

- **Signed (not sandboxed)** if you want to run the applet without restricting it to a sandbox (the applet can request additional access to your computer's resources). This means that you will not get an additional warning when printing from the Viewer.

As the applet is signed by Esko, the security warning looks less threatening.

- **Unsigned** if you want to run the applet as a default unsigned applet. You will get the default security warning that does not mention Esko, but the applet will be sandboxed. This means that you will have an additional security warning when printing from the Viewer, as for the **Signed (sandboxed)** applet.

Tip:

By default, the applet is set to run as **Signed (sandboxed)**. This will work fine for most users.

More frequent users may want to switch to the **Signed (not sandboxed)** option to avoid always having to click an extra warning away when printing from the Viewer.

Mac OSX 10.6 users running Java 1.6.0 may also want to switch to the **Signed (not sandboxed)** option to avoid getting a warning when closing the Viewer by clicking .

With the latest versions of Java 1.7 installed, most browsers block unsigned applets by default. In this situation, it is recommended to use one of the signed settings instead.

- **Viewer Style** sets the Viewer mode as:
 - **Normal** (Default): All HTML5 Viewer features are available in this mode.
 - **Restricted**: In this mode, the user cannot access features such as [Channels widget](#), [CAD widget](#) and [View widget](#).
The side panels displaying the widgets will be in a collapsed format by default.
 - **Advanced** (Java Viewer only): All HTML5 Viewer features are available in this mode. In Java Viewer all features are activated.
 - **Restricted (New Look)** comes with all the enhanced features available in the HTML5 Viewer. This new viewer presents a cleaner, clutter-free look.
- Specify the **Viewer Quality** as:
 - **Best Performance** (Default):
In this mode, the Viewer uses less compression to transfer images. These images are transferred faster but may contain small compression artifacts.

- **Best Quality:**

In this mode, the Viewer uses less compression to transfer images. It takes longer to transfer these images. However, you can view them without compression artifacts.

Note: This setting is applicable to both the HTML5 and Java Viewers.

- **Annotation Color** sets the color in which annotations will be displayed in the Viewer (you can set **Viewer Default** or choose a color from the list).
- **Annotate Approved Documents** sets if and how the users are allowed to annotate documents that are already approved.
 - Select **Enabled** if you want the users to be allowed to annotate approved documents.
 - Select **Warn if Approved** if you want to display a warning before allowing the users to annotate approved documents.
 - Select **Read-Only if Approved** if you don't want the users to be allowed to annotate approved documents.
 - Select **Warn if Approved or Rejected** if you want to display a warning before allowing the users to annotate approved or rejected documents.
 - Select **Read-Only if Approved or Rejected** if you do not want the users to be allowed to annotate approved or rejected documents.
- **Annotate Documents under Approval** sets who can add annotations in the documents under approval.

Note: A document version is considered under approval as soon as an approval cycle is started

Choose from the following settings:

- **All Users:** This is the default setting. All users with view access to a document can annotate that document once the approval cycle has started.
- **All Approvers and Approval Master:** The Approvers and Approval master defined in the document approval setup (all stages) for the current version can annotate during the approval cycle.
- **All Approvers:** All approvers defined in the document approval setup (all stages) can annotate the document while it is being approved.
- **Pending Approvers and Approval Master:** Only an approval master or approvers who can submit an approval state (Approve or Reject) for the current version can annotate the document during the approval cycle.
- **Pending Approvers Only:** Only approvers who can submit an approval state (Approve or Reject) for the current version can annotate the document during the approval cycle.
- **Log out user when inactive** option can be checked, to log out the users whose sessions are not active for a period of time. Option is given to log in again and continue when the user returns to the viewer.
- **Show Discussions in Viewer** Enable this option to view discussions widget in the viewer and view all the discussion posts about the document viewed.

Note: Project Managers who can Force Approve or Force Reject is not considered an approver. They can add annotations only if the setting is **All Users**.

Approval

Approval Cycle Start when Uploading New Document or Version

Define what should happen to a document approval cycle **When uploading a new document or version**. You can choose to:

- **Start if previous version's approval is on-going or finished**
- **Always start (if Approval setup exists)**
- **Never start**

Check the

- **Allow the uploader to override the approval cycle start option** check box to allow the user to overwrite the approval start behavior upon upload.

Require Approval Comments on Viewable Documents

Use this option to require the approvers to add their comments as annotations in the document. Select:

- **Prompt** to start a dialog with a comment field when the Approver Rejects or Approves with a Condition. The Approver can choose to comment in the dialog or leave the comment field empty. This is the default setting.
- **Any Annotation** to enforce that at least one annotation is present while Rejecting or Approving with a Condition. The comment field will contain the following message.

Document annotated

- **User Annotation** to force the Approver to add at least one annotation in the document version before Rejecting or Approving with Condition. The comment field will always contain the following message.

Document annotated

Note: This setting will be applied when submitting an Approval Status from pages outside the viewer.

Block approval when an annotation was set/changed on current version

Check this option to prevent users who have created an annotation on the current version of a document from submitting the **Approved** status without a condition.

If **Approved with Condition** is not enabled, you can submit only the **Rejected** approval state. If users have replied to an existing annotation from another user, they will no longer be able to approve the document without condition.

Note:

This setting will also be applied when submitting an Approval Status from any page outside the Viewer. The user will then get the corresponding feedback.

Reasons for Rejection List

After configuring and uploading a list of Reasons for Rejection, an admin user can choose the list from the drop down to enable reasons for rejection on the system. Then, when a user rejects a document, the reasons for rejection can be picked from this structured list. Read more on how to configure the list of [Reasons for Rejection](#).

Note: When the Reasons for Rejection are enabled in the system, bulk rejection is automatically disabled.

ArtiosCAD

To open your document in the ArtiosCAD desktop application directly from the WebCenter server, you need to set the **ArtiosCAD Preferences** accordingly.

Open ArtiosCAD Documents

- **No Application:** This is the default **Preference**. When this is selected, you cannot open the documents in the ArtiosCAD desktop applications.
- **ArtiosCAD Standard Edition:** Select this setting to be able to download ArtiosCAD documents and open them in your ArtiosCAD desktop application.
- **ArtiosCAD Enterprise Edition:** Select this to open your ArtiosCAD documents in the installed ArtiosCAD Enterprise Edition directly from WebCenter.

The documents will open in the **managed mode** allowing you to make modifications to the file and update it without having to browse to the corresponding project and folder.

Note: This option is only supported from ArtiosCAD Enterprise 14 onwards.

Document Upload Preferences

- To set the mode for **Multiple Document Upload type**, select HTML5 Upload or Java Applet from the **Document Upload Preferences**. HTML 5 upload is selected by default.
- **Allow raising Document Revision when uploading a new Document Version:** Enable this to allow the users to raise the **revision** while uploading a new **document version**.

Packaging Content Management

Note: You need the Packaging Content Management license to be able to use this module.

Smart Role Names for Editors and Approvers

To work with language specific [Smart Role Naming](#) on page 483 specify your:

- **Language Editor Role Prefix**
- **Language Approver Role Prefix**
- **Add Language Role Prefix**

The specified prefixes will be used to automatically create **Role names** specific for each language in the **Role Mapping > Manage Permissions** page. If the **Roles** column in **Manage Permissions** is left blank, values in **Language Editor Role Prefix**, **Language Approver Role Prefix** and **Add Language Role Prefix** are taken to calculate the role names for Editor, Approver Text Content and Add Language permissions.

A change in a Text document creates a new document version. To allow or prevent the users from creating new Revisions use the **Revision Raise** option:

Select **Raise revision when Master Text Contents are updated** to allow raising a Revision when master text is updated.

Select **Never raise revision** if master text changes should not be saved as a new Revision.

Note: This setting is independent of the **Allow raising Document Revision when uploading a new Document Version** setting.

Copy comments from a text document

Choose either to **Keep Comments** or **Remove comments if state reverted to Draft** or **Remove Comments always** when copying a document.

You can choose the option **Keep Comments** to copy all the comments when copying a document.

Comments are cleared if the state of the element is changed to draft, when the option **Remove Comments if state reverted to Draft** is chosen.

Similarly, all the comments in the elements are cleared while copying, when the option **Remove Comment always** is chosen.

Note: Same behavior is replicated in workflow when documents are copied using Copy/ Move Document. Move document option does not respect this setting.

Workflow Editor

By default, HTML5 is used as Workflow editor.

User Creation

To create a new approval User from an approval page quickly, you can select and apply a particular user's settings as the **Approval User Template**.

Tip: If you do not want to take up a license for a Template User, deactivate the user by unchecking the **Active User** option in the Profile page.

It is possible to configure this at two levels.

- To specify a global template, go to **Admin > Preferences > General > User Creation Preferences**. Select a particular user existing in the system as your **Approval User Template**.

This template will be set as the system wide approval user template. However, it is possible to override this in **My WebCenter > My Preferences > User Creation Preferences**.

- To specify a template for a User who can create other users, go to **My Preferences > User Creation Preferences** and specify an **Approval User Template**. You have the following options and your choice will override the admin settings:
 - **Do No Use a Template**
 - **Use Global Approval User Template** to apply the user template specified in the **Admin Preferences**.

Note: If you have not explicitly selected the **Do not Use a Template** option or has any other user specified as the template, the global template will be applied by default.

- You can select a particular user as your template. In the drop-down you will see your own Users if you are a Project Manager and all Users if you are an administrator.

The following Preferences and settings of the template are copied to the newly created user:

1. Preferences:

- **Language**
- **Units**
- **Start Page**
- **User Menu**
- **My Work Setup**
- **Viewer Preferences**
- **Collada Viewer Preferences**
- **Workflow Editor Preferences**
- **Document Upload Preferences**
- **ArtiosCAD Preferences**
- **Download Formats**(copied only if the user creating the new user is an Administrator)
- **Group Memberships**(copied only if the user creating the new user is an Administrator)
- **Other Preferences** are the user preferences not mentioned above (for example: show thumbnails or not, search results layout, etc.).

2. The Authentication Settings ([Deactivation](#), SSO, etc.)

Project creator

A new user type has been introduced from WebCenter 18.1 onwards called **Project Creator**. This user can create new projects, but cannot manage them. This user type is similar to **Project Manager** but the main difference is that the Project Creator does not have any rights over the project, once the project is created.

Note: A Project Creator user can access the project created,

- if added as a member of the project either directly or in a Group or Role within the project
- if the option **Project Creator becomes Salesperson after Project Creation** is enabled by the admin user.

When WebCenter is under the Named User License model, a dedicated license is available for the Project Creator users. Similar to the other named user license types, you can create as many Project Creator users as you have licenses.

When WebCenter is running in the concurrent license model, you can create an unlimited number of Project Creator users.

You can have two types of permissions for Project Creators users, namely:

- **Limited Visibility of Companies and Groups:** Can view only the list of Groups / Users, Company and locations that are limited to the user's visibility scope
- **Full Visibility:** Can view all Groups/ Users, Company and locations without any restrictions.

Delegation Preferences- System Wide

Delegation Restrictions

To ensure that your user(s) delegate to a limited list of users, you can use the **Delegation Restrictions** either as a system wide settings or per user.

The Administrators can specify system wide delegation restrictions. Admin users can place restrictions on delegation based on various factors like:

- **No Delegation** which prevents your users from delegating their work.
- **All Visible Users** which allows to delegate any user who are visible in his or her list.
- **Users in the same Company** which allows you to choose delegates, only within the same company.
- **Users in the same Location** which allows you to choose delegates, only within the same location.
- **Users in the same Group** which allows you to choose delegates, only within the same group.

You can also enable **Delegator receives e-mail notifications during delegation period** option to receive email notifications when a user has delegated the work.

3.4.2. Password Preferences

The Password Preferences determine whether passwords must meet security requirements, whether they expire, and whether or not users need to provide their passwords when approving or rejecting documents.

Password Complexity

You can enforce a number of password rules by enabling **Passwords must meet complexity requirements**. When this feature is not enabled the only requirement is that passwords be non-blank.

If **Passwords must meet complexity requirements** is enabled, WebCenter passwords:

- May not contain the user's username, first name, or last name
- Must contain characters from three of the following four categories:
 - English uppercase characters (A through Z)
 - English lowercase characters (a through z)
 - Base 10 digits (0 through 9)
 - Non-alphanumeric characters (for example: ! \$ # %)
- Admin can also additionally enable two more options in **Password Complexity** namely :
 - **Set minimum password length** which can be between 6 to 16 characters.

Note: Enabling this option or changing the value expires all passwords. Users will be required to change their password on the next login. By default, it is set to eight characters.

- **Set enforce password history** reflects the number of unique passwords the users has to change before an old password can be reused. This can be set between 1 to 20 and by default is set to 1.

Expiration Settings

Enabling password expiration allows you to limit the length of time that a password may be used. When a user logs in with a password that has not been changed in the required number of days, he/she will be required to change their password before accessing the site.

To enable password expiration, select the option **Expire user passwords when they are ... days old** and type a number of days.

Note: To immediately expire all passwords without changing the other password preferences, click **Expire all passwords now** in the top right of the page.

Consecutive Failed Logins

If there are Consecutive Failed Logins, you can select the option **Block authentication after ___ failed consecutive login attempts** or you can choose to **Never block authentication after failed login attempts**.

Digital Signature

- Enable the option **Require password for Approvals/Rejections**, if you want to force users to provide their passwords whenever they approve or reject a page or document in WebCenter. Admin users can also set additional options like
 - **Prompt for password** : This is the default option. When this option is chosen, only the password has to be provided for approval or rejection.
 - **Prompt for username and password**: When this option is chosen, both the User name and password has to be provided.
 - **Prompt for username and password once, afterward only prompt for password**: When this option is chosen, user name has to be provided in the first instance and thereafter only the password has to be provided.
- Enable the option **Allow alternative passwords to be used for Approval/ Rejections and Tasks**, in case the users need another level of authentication other than the WebCenter password authentication.
- You can choose **Block browser auto complete on password confirmation** to ensure passwords are not stored for any users in WebCenter.

Note: It is applied to both the login page and also when the user does re-authorization for Approvals and Task completion.

3.4.3. Security Preferences

Use the **Security** preferences if you want to tighten the security in WebCenter.

By default, all the actions are allowed unless mentioned otherwise in the explanation. Deselect them if you don't want any user to perform these actions.

- **Approval**

- **Hide Approval outside the Viewer** option allows approval only in the HTML Viewer and the approval option is disabled otherwise.
- **Allow Force Approval** lets Project Managers Force Approve documents.
- **Allow Force Rejection** lets Project Managers Force Reject documents.
- **Allow Conditional Approval option in Approval setup** allows a conditional approval option in the approval setup. When you do not want to allow conditional approval in approval setup, simply disable this option. Only the Admin can set this system-wide option. When this is disabled, the **allow conditional approval** option will not be available for the users while setting up approval on documents, projects or folders.

Note: Enabling or disabling this option will not influence the approval cycles that are already existing or started.

- **Approved Documents**

- **Allow removing documents with approval actions** lets Project Managers or project members with the **Delete** right delete documents that have already been approved/rejected/commented by at least one person/group.
- **Allow changing attributes of approved documents** lets Project Managers or project members with the **Change Properties** right edit the attributes of already approved documents.

- **Inactive Projects**

- **Allow changing attributes of inactive projects** lets Project Managers or project members with the **Change Properties** right edit the attributes of inactive projects (projects with the **Non Active, Completed, On Hold** or **Canceled** status).
- **Allow changing members of inactive projects** lets Project Managers edit the members' list for inactive projects.
- **Allow document operations on inactive projects** lets project members with the **Change Properties** right edit documents in inactive projects.

When this is selected, project members can:

- download documents (the project history is updated in that case),
- view documents,
- see a document history or the project history,
- copy documents to other projects (but not within the project).

But cannot:

- upload documents to the project,
- start an approval cycle or do approval operations on documents,
- move documents,
- delete documents,
- annotate documents.

Note: Administrators and the Project Manager for the inactive project can perform more document-related actions.

- **Download Link**

- **Allow Project Members with Download permission to e-mail a link for non-authenticated download of a document**, allows Project Managers and members of a project with Download permissions to send a download link for a file within their project to non-WebCenter users.
- **Allow large Document preview (approval e-mail notifications)** adds a preview of the graphics and CAD documents in the approval related notification emails.
- **Allow non-authenticated download of Documents (approval e-mail notifications)** adds a **Download Document** link to the default approval emails generated by WebCenter.
- This link will only be valid for a certain number of days (enter that number in the **The download link will be valid for ... days** field). The default value is 14 days.

Note:

- By default, this option is deselected.
- If you deselect this option after non-authenticated download links have been sent, these download links will become invalid.
- When a non-WebCenter user clicks a link that is invalid, expired or tampered with (for example if the URL was changed), he/she will see a web page stating that the link is invalid.
- Changing the link validity (number of days) will only apply to new links.

3.4.4. Document Type Preferences

Document Types

The Document Types page controls the kind of files WebCenter supports. The document types you enable here are available for selection:

- When uploading a new file.
- In the **Search for** field when searching for documents.

You can edit the **Document Type** preferences in **Preferences > Document Types**.

To enable or disable a specific Document Type, check or uncheck the option in the **Enable** column. Click **Save** to confirm.

Note:

If you disable a document type and you already have documents of that type in WebCenter, they can still be found by selecting **All** in the **Search for** field when searching.

Document Details pages for those document types will still be available, and the documents can still be downloaded and have new versions uploaded.

Other Preferences

On this page you can control the system wide settings for Automatic Document Naming, Default Attribute Category and Start Task for new Documents/Versions. You can either choose **None** or choose a different value.

Note:

These settings are found in each project and template on the **Document Creation** page where you can specify:

- **None**
- **Default** (using the system wide settings)
- **Custom** (defining project/template wide settings)

For each Document Type, you can set up:

- **Automatic Document Name**

Note: Optionally, you can enable the general option: **Enable File Extension Specific Counter**. This will make sure that you have different counters for different types of documents.

- **Default Attribute Category**

You can setup a task to start automatically when you upload a specific file type as a new document or a new version by enabling the following options:

- **Start task for new Documents**
- **Start task for new Versions** (new version of)

To selectively apply the above settings to documents in blank projects, you can enable or disable the options (for all document types):

- **Apply Automatic Naming to Documents in Blank Projects**
- **Apply Default Attribute Categories to Documents in Blank Projects**
- **Apply Default Start Task options to new Documents in Blank Projects**
- **Apply Default Start Task options to new Versions in Blank Projects**

Find and Unlock Locked Documents

Locked documents are documents that users have downloaded and are working on, and want to flag to prevent others from working on them.

The Admin user (or any member of the Admins group) can find locked documents belonging to all users and unlock them so that others may work on them without receiving warnings that they are locked.

This is particularly useful for freeing up documents that have been locked by users who are absent for longer periods of time, or who have left the project entirely.

1. Click **Admin > Project Management > Find Locked Documents**.
2. Either filter for users by entering (part of) their last name in the **Search users by last name** field, or click **Go** right away to see all locked documents.
3. Select the document(s) to unlock by selecting the corresponding boxes.

4. Click **Unlock checked items** .

3.4.5. Notifications Preferences

The **Notifications** page allows you to specify exactly which events in WebCenter should trigger an e-mail notification to the users involved.

For every event or action in WebCenter, you can determine whether it:

- is logged in the project history (select **Include in Project History**).
- triggers an e-mail notification to:
 - the Project Manager only (select **Manager**),
 - all the members involved with the event (select **Involved People**),

Tip: Click on **Involved People** to see a list of involved people for each event.

- all the project members (select **Members**).

You can also set up WebCenter to **Send a reminder to the assignee or an approver when a Task or an Approval is overdue** and **Repeat the reminder every x days until the Task or Approval is finished**.

To limit the number of overdue reminders, you can set the system to only send reminders for **Started tasks** or **Tasks that can be completed** (for example, for tasks having a predecessor needing to be completed before they can be started).

Those options are available when **Send a reminder...** is selected.

3.4.6. Menus

The **Menus** preferences allow you to define what users can see by customizing the WebCenter menus. For example, you can remove certain menus for some users, so they have a simpler user interface to work with (they only see the menus they need to use).

You can assign custom menus to users and / or companies (see [Edit a User](#) on page 263 and [Edit a Company](#) on page 253).

The **Menus** page contains the **Default** menu, and any custom menu you have already created.

Note:

You cannot edit or delete the **Default** menu, but you can use it as a basis for creating custom menus.

From here, you can create/update a custom menu either [through the WebCenter user interface](#) or [using XML](#). You can also [delete a custom menu](#).

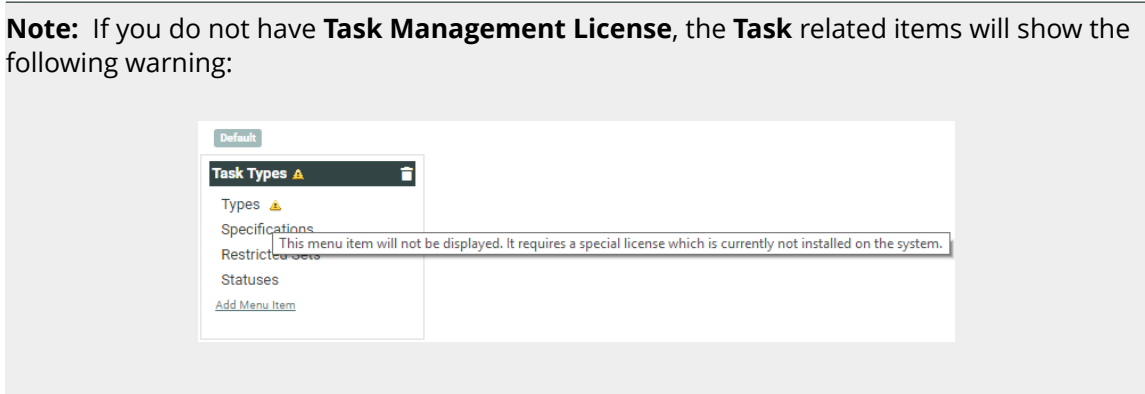

Create a Custom Menu through the WebCenter User Interface

You can create a custom menu for each category of users, to make it more convenient for them.

You will need to:

1. Determine which menus a particular group of users needs, and which menus they don't need.
2. On the **Admin > Preferences > Menus** page, click **Add Menu**.
3. *Create your custom menu.*

Note: If you do not have **Task Management License**, the **Task** related items will show the following warning:

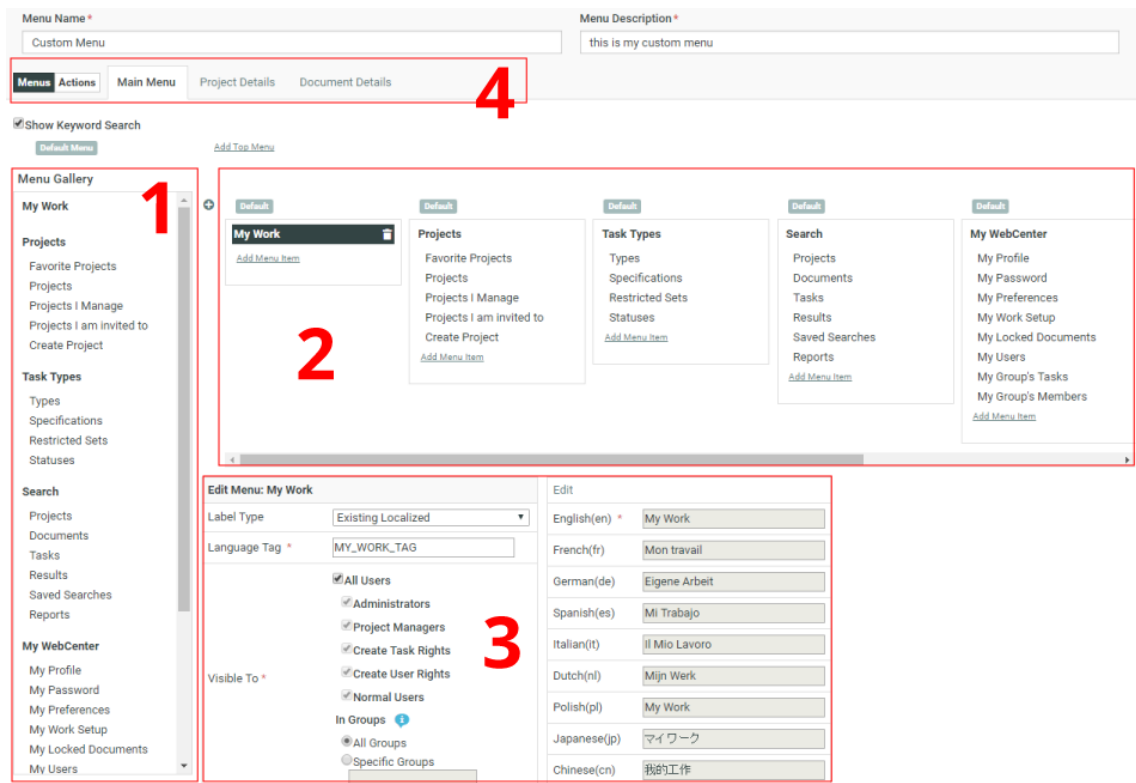

4. Assign the menu to the user, group or company you created it for.
5. Log in to WebCenter as one of the users to which you gave the custom menu, and check whether the menu works.

Create a Custom Menu

1. On the **Admin > Preferences > Menus** page, click **Add Menu**.
2. On the **Add Menu** page, enter a **Menu Name** and **Menu Description** for your new menu.
3. Click the type of menu you want to customize: **Main Menu**, **Project Details** or **Document Details**.

You are starting with a copy of the **Default Menu**.

On the left hand side, you can see the **Menu Gallery** (1) containing the default menu items in bold, and the default sub menu items under them.

On the right side, you can see the **Menu Builder Canvas** (2) (which is a graphical representation of the menu). This reflects any changes you make.

At the bottom (3), you can see and edit the details of the menu or sub menu item currently selected.

At the top (4), there is a menu to switch between different types of pages. The toggle on the left allows you to switch between Menus and Actions.

4. Edit the menu as desired:

- [Add a Default \(Sub\) Menu Item](#) on page 108,
- [Add a Custom \(Sub\) Menu Item](#) on page 111,
- [Remove a \(Sub\) Menu Item](#) on page 114.

Tip: You can also re-order the menus, or the sub menu within a menu, by drag-and-dropping them on the **Menu Builder Canvas**. You cannot drag-and-drop a sub menu to a different menu though.

- 5.** Click **Save** at the bottom of the page.
- 6.** When you are done editing your custom menu, you can click **Return** to go back to the **Menus** page.

Add a Default (Sub) Menu Item

To add a default menu or sub menu item:

1. Drag it from the **Menu Gallery** into the **Menu Builder Canvas**.

Note:

You can add the same sub menu item to different menus on the **Menu Builder Canvas**, but you cannot add the same sub menu item twice to the same menu, or add the same menu twice to the **Menu Builder Canvas**.

To quickly see whether a (sub) menu item is already used in your custom menu, you can select it in the **Menu Gallery**: this highlights where it is used on the **Menu Builder Canvas**.

Tip: After making a change, you will see that the **Default Menu** label above the **Menu Gallery** becomes **Custom Menu**. You will also see a **Revert Menu** link under it. Click this link if you want to cancel all your changes and go back to an unedited copy of the default menu.

2. In the **Edit Menu** area at the bottom, you can change the properties of your (sub) menu:
 - a) To define what the (sub) menu is called:

- If you don't want to translate the (sub) menu (it will have the same name in all languages):
 1. Choose **Simple** as **Label Type**.
 2. In **Label**, enter the name to give your (sub) menu.
- If you want to define a new name in different languages:
 1. Choose **New Localized** as **Label Type**.
 2. In **Language Tag**, enter a new language tag to associate to that menu name in all languages (this language tag is how WebCenter refers to that menu name internally. It must be unique).
 3. In the dialog that opens at right, enter the translations of that menu name in all your WebCenter languages. You need to enter at least the English name.

Note:

Make sure your `customizationConfig.xml` file contains language tags for all the languages you use here (see [Customize the Language Files](#) on page 1004).

If this is the case, your translations will automatically be added to your custom language files. If you didn't have a custom language file for one or more languages in which you add a translation here, these files will be created automatically.

Otherwise, your (sub) menu will use the value you entered in the **Language Tag** field as a **Simple Label** (it will be shown as it is for all languages).

- If you want to use an existing WebCenter string (piece of user interface text) and its translations as menu name:
 1. Choose **Existing Localized** as **Label Type**.
 2. In **Language Tag**, enter the language tag that is associated with the string you want to use in your language files (in your [custom language files](#) if you have any, otherwise in your default language files).

Tip: When you start typing a language tag, the **Language Tag** field shows all language tags starting with the characters you typed; you can select the desired one in the list.

- The dialog that opens at right shows the translations of that string in all your WebCenter languages.

Note: You can edit those translations (click **Edit** and enter the new translations), but then they will be changed on every WebCenter page that uses that string.

b) To define who can see it:

Edit the menu item to limit the **visibility**. Specify the **Visible To > In Groups** as **Specific Groups**.

If you want to limit the menu's visibility to certain groups, select **Groups** and enter the names of the groups that can see the menu, separated by a semicolon (example: GROUP1; GROUP2). You can see this example when hovering on the field.

The screenshot shows the 'Edit Menu: My Work' dialog in the WebCenter interface. The dialog is divided into several sections:

- Language Tag:** Set to 'MY_WORK_TAG'.
- Visible To:** A list of user roles with checkboxes. 'All Users' is checked. Under 'In Groups', 'Specific Groups' is selected.
- Translations Table:** A table with columns for language and translation. The translations are:

English(en)	My Work
French(fr)	Mon travail
German(de)	Eigene Arbeit
Spanish(es)	Mi Trabajo
Italian(it)	Il Mio Lavoro
Dutch(nl)	Mijn Werk
Polish(pl)	My Work
Japanese(jp)	マイワーク
Chinese(cn)	我的工作
Chinese(tw)	我的工作
Thai(th)	งานของฉัน
Czech(cz)	Má práce
Hungarian(hu)	Saját munka
Portuguese(br)	Meu trabalho
Russian(ru)	Моя работа
Turkish(tr)	İşim
Croatian(hr)	Moj rad
[LABEL]({label})	[MY_WORK_TAG:My Work]
- URL Type:** Set to 'Provide URL'.
- URL:** 'mytodolist.jsp'.
- Parent Menu:** 'Top Menu'.

c) To define where a user goes to when clicking it:

- If you want the (sub) menu to link to a specific page (within WebCenter or external):
 - In **URL Type**, select **Provide URL**.
 - In **URL**, enter or paste the URL of the page to link to.

- If you want it to show the results of a (global) saved search:
 1. In **URL Type**, select **Saved Search**.
 2. In **Saved Search**, select the global saved search you want to link to.
- If you want it to use it as a shortcut to create a Project with a specific characteristic:
 1. In **URL Type**, select **Create Project with Characteristic**.
 2. In **Characteristics**, select the characteristic you want to use for the Project.
- If you want it to use it as a shortcut to create a Project from a specific template:
 1. In **URL Type**, select **Create Project with Template**.
 2. In **Project Template**, select the template you want to use for the Project.
- If you want it to show a list of Projects that have a specific characteristic
 - 1. In **URL Type**, select **Project List with Characteristic**.
 - 2. In **Characteristics**, select the characteristic of the Projects you want to show.
- If you want the (sub) menu to show a Dashboard
 - In **URL Type**, select **Dashboard**.
 - In **Dashboard**, select the dashboard from the drop down or **Create New Dashboard**

Note: You can only select a **Parent Menu** when *creating a new (sub) menu*, not when editing an existing one.

3. Click **Save** at the bottom of the page.

Add a Custom (Sub) Menu Item

1. On the **Menu Builder Canvas**, click where you want to add your sub menu (if you want to add a top-level menu, you can click anywhere on the canvas).
2. In the **Edit Menu** area at the bottom, click **Add Custom Menu**.
3. Still in the **Edit Menu** area, define the properties of your (sub) menu:
 - a) To define what the (sub) menu is called:
 - If you don't want to translate the (sub) menu (it will have the same name in all languages):
 1. Choose **Simple** as **Label Type**.
 2. In **Label**, enter the name to give your (sub) menu.
 - If you want to define a new name in different languages:
 1. Choose **New Localized** as **Label Type**.
 2. In **Language Tag**, enter a new language tag to associate to that menu name in all languages (this language tag is how WebCenter refers to that menu name internally. It must be unique).

3. In the dialog that opens at right, enter the translations of that menu name in all your WebCenter languages. You need to enter at least the English name.

Note:

Make sure your `customizationConfig.xml` file contains language tags for all the languages you use here (see [Customize the Language Files](#) on page 1004).

If this is the case, your translations will automatically be added to your custom language files. If you didn't have a custom language file for one or more languages in which you add a translation here, these files will be created automatically.

Otherwise, your (sub) menu will use the value you entered in the **Language Tag** field as a **Simple Label** (it will be shown as it is for all languages).

- If you want to use an existing WebCenter string (piece of user interface text) and its translations as menu name:

1. Choose **Existing Localized** as **Label Type**.
2. In **Language Tag**, enter the language tag that is associated with the string you want to use in your language files (in your [custom language files](#) if you have any, otherwise in your default language files).

Tip: When you start typing a language tag, the **Language Tag** field shows all language tags starting with the characters you typed; you can select the desired one in the list.

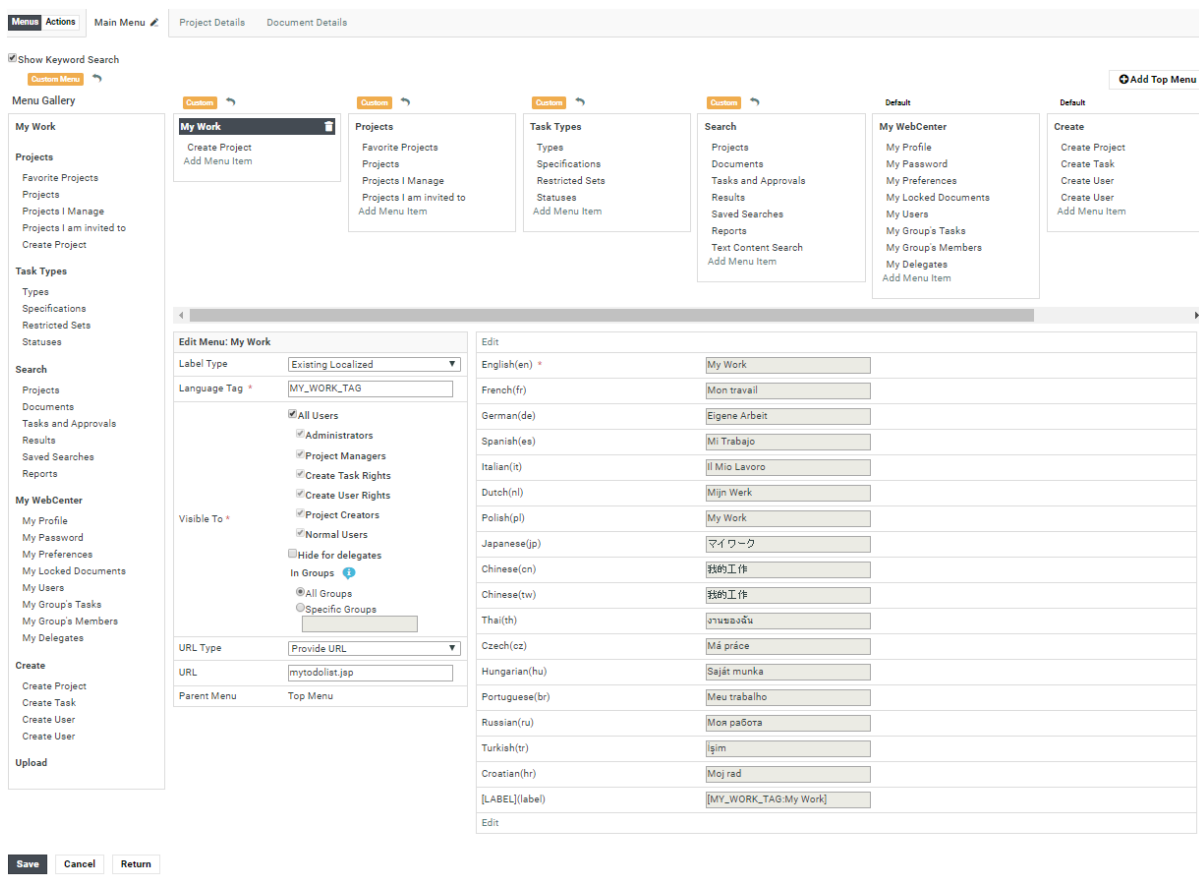

3. The dialog that opens at right shows the translations of that string in all your WebCenter languages.

Note: You can edit those translations (click **Edit** and enter the new translations), but then they will be changed on every WebCenter page that uses that string.

- b) To define who can see it:

Edit the menu item to limit the **visibility**. Specify the **Visible To > In Groups** as **Specific Groups**.

If you want to limit the menu's visibility to certain groups, select **Groups** and enter the names of the groups that can see the menu, separated by a semicolon (example: GROUP1; GROUP2). You can see this example when hovering on the field.

c) To define where a user goes to when clicking it:

- If you want the (sub) menu to link to a specific page (within WebCenter or external):
 1. In **URL Type**, select **Provide URL**.
 2. In **URL**, enter or paste the URL of the page to link to.
- If you want it to show the results of a (global) saved search:
 1. In **URL Type**, select **Saved Search**.
 2. In **Saved Search**, select the global saved search you want to link to.
- If you want it to use it as a shortcut to create a Project with a specific characteristic:
 1. In **URL Type**, select **Create Project with Characteristic**.
 2. In **Characteristics**, select the characteristic you want to use for the Project.
- If you want it to use it as a shortcut to create a Project from a specific template:
 1. In **URL Type**, select **Create Project with Template**.
 2. In **Project Template**, select the template you want to use for the Project.
- If you want it to show a list of Projects that have a specific characteristic
 1. In **URL Type**, select **Project List with Characteristic**.
 2. In **Characteristics**, select the characteristic of the Projects you want to show.

- If you want the (sub) menu to show a Dashboard
 - In **URL Type**, select **Dashboard**.
 - In **Dashboard**, select the dashboard from the drop down or **Create New Dashboard**
- d) To define where to put it in the menu structure:
 - If you want this menu item to be a top-level menu, select **Top Menu** in **Parent Menu**. This will place it at the right of the Menu Builder Canvas, after all the other menus.

Tip: You can re-order the menus by drag-and-dropping them.

- If you want it to be under an existing menu item, select this existing menu item in **Parent Menu**.

Tip: You can also re-order the sub-menus within a menu by drag-and-dropping them.

Note: You can only select a **Parent Menu** when creating a new (sub) menu, not when editing an existing one.

Click **Add** when you are done.

4. Click **Save** at the bottom of the page.

Remove a (Sub) Menu Item

1. To remove a menu or sub menu item from your menu, select it in the **Menu Builder Canvas** and click the grey cross  beside it.
2. Click **Save** at the bottom of the page.

Custom Actions

Just like custom Menus, you can customize **Action** buttons. This feature allows you to remove and re-arrange default Actions for different (groups of) Users. Also, you can add new custom Actions (such as a JavaScript, Create Task, Start Workflow etc.) with custom icons.

There are different types of Actions such as:

- in a table header
- in the header of a Project or Document
- at the top right of pages
- and inside tables (icon-only)

Just like customizing Menu items, you can add or remove them, set a Label and Visibility and modify their display order. You can also specify:

- Action Type
- Priority
- Selection
- Rendering
- Icon

- Icon Color

Note: The available settings depend on the Type of Action that is being customized.

Custom Actions in Different Locations

In the Menu Builder, select **Actions** to customize them. **Menus** and **Actions**. Once **Actions** is enabled, different types of pages become available in the menu:

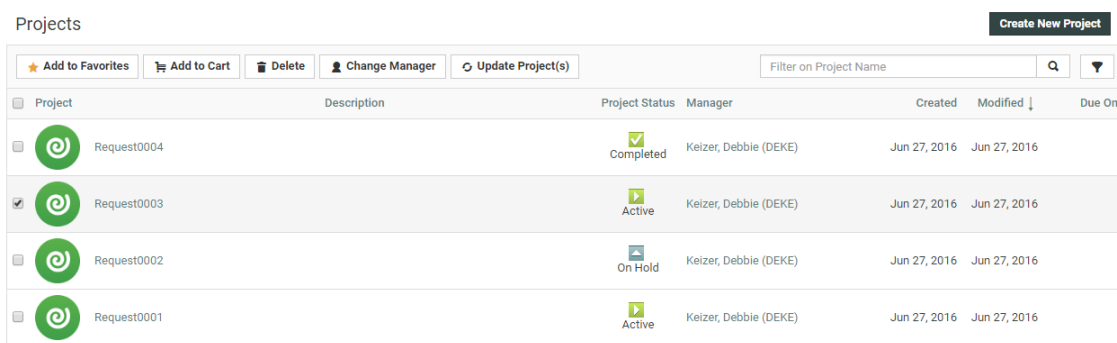

- Project Lists
- Project Details
- Document Details
- Search
- Cart
- My Work

Under every page type, the individual pages or sections that can be customized are listed. Here you can find an overview of the meaning of each of these different sections:

Project Lists

You can customize the Actions displayed in the table header of the following pages: Favorite Projects, Projects I am invited to, Projects I Manage, and Projects.

For each of the pages you can add or remove **Header Actions** and **Table Actions**. The Header Actions are the buttons displayed top right, like **Create New Project** in the example below. The Table Actions are the buttons listed in the table header, such as **Add to Favorites** and **Add to Cart** in this example.

Project	Description	Project Status	Manager	Created	Modified	Due On
<input type="checkbox"/>	Request0004	Completed	Keizer, Debbie (DEKE)	Jun 27, 2016	Jun 27, 2016	
<input checked="" type="checkbox"/>	Request0003	Active	Keizer, Debbie (DEKE)	Jun 27, 2016	Jun 27, 2016	
<input type="checkbox"/>	Request0002	On Hold	Keizer, Debbie (DEKE)	Jun 27, 2016	Jun 27, 2016	
<input type="checkbox"/>	Request0001	Active	Keizer, Debbie (DEKE)	Jun 27, 2016	Jun 27, 2016	

Project Details

In this section Project Detail type pages and sections are listed. The Project Header has **Left Actions** and **Top Actions**. The Top Actions are not used by default, but allow you to move (part of) the buttons on the left to the top right of the page.

Project: Request0001 Active

Upload		Manager: Keizer, Debbie (DEKE)
Upload Multiple Documents		Customer:
<input checked="" type="checkbox"/> Mail link to		Due On:
More...▼		Modified: Jun 27, 2016
		Description:

Project Documents (Table) and Project Bill of Materials (Table) determine the Actions in the table headers on the Project Details Documents and BOM pages.

View and Annotate	Compare in Viewer	Download	Delete Document(s)	More...▼
<input checked="" type="checkbox"/> Documents 1				

Project Documents (Document) and Project Bill of Materials (Document) define the Action buttons that are displayed when you hover over individual Documents listed (typically compact icon-only buttons).

<input type="checkbox"/> Documents 1	Version
<input type="checkbox"/> bluebird.png (122.1KB)	<input type="checkbox"/> 1

Document Details

For now, this item only contains the Document Header. It works in a similar way as the Project Header with Left Actions by default, and optional Top Actions. Note that some of the available Actions still depend on Document Type. For example, the Run as Standard Action will only be shown for CAD Design files.

BlueBottle.png

<input checked="" type="checkbox"/> Mail link to		Document: BlueBottle.png(755.4KB)
View and Annotate		Version: 1
Download		Description:
More...▼		Project: Request0001
		Approval: No Approval Required

Search

It is possible to customize the table header Actions for both Project and Document Search Results.

Search Results

For Document Search Results, Action buttons can also be customized. In case this is already done in the Saved Search setup, WebCenter will combine the two setups. For example, if the Download button is present in both, it is displayed, if it is not present in one of them, it is not shown.

For Search, it is possible to add an extra filter in individual Saved Searches based on **Tag** values defined in the Action configuration. See [Action Settings](#) on page 118 for more details.

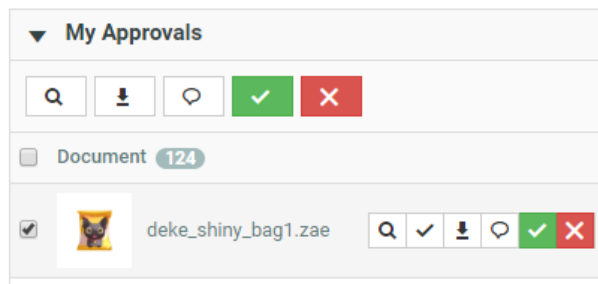

Cart

The Cart Projects and Document pages have table header Actions which can be customized.

My Work

On the My Work page, it is possible to customize the table header Actions for the My Approvals section. The individual Document Actions can be customized for: My Approvals, My Recently Submitted Approvals, and Approvals to Follow Up.

Action Settings

Depending on the Action type and location, following settings may be available:

Priority

Priority determines if and how the Action button is displayed, there are a few options:

- **Primary (always visible)** - this type of button is always visible and has the primary color selected in the Customization (by default a dark blue/grey shade).
- **Secondary (always visible)** - this button is similar to the primary button, but uses the default button color selected in the Customization (by default: white).
- **Default (visible if space available)** - this button is similar to the secondary button, but is only displayed if there is enough room, if not, the button is listed in a More dropdown menu allowing for optimal use of available space.
- **Available (always in "More")** - this option is always displayed in the More dropdown menu.

Selection

The **Selection** setting determines when the button becomes available. You can set it to **No selection required** if it is not needed to select anything to perform the Action, if one or more items are required, select one of the other options (for example: to delete a Document, you need to select at least one item).

Rendering and Icon

The **Rendering** setting can be used to determine whether to show only an icon, only the label, or both. At the top of the settings panel, you can see a preview of your button.

In the **Icon** dropdown you can find a number of icons to choose from. It is not possible to add any additional icons, but new icons will be added in future versions of WebCenter. Use the **Color** dropdown to select one of the standard colors for your icon.

Tag

The **Tag** field is only available for custom Actions in Search. For Search, it is possible to add an extra filter in individual Saved Searches based on **Tag** values defined in the Action configuration.

When the **Custom Actions** setting in the Search Layout Options of your Saved Search is enabled, tags can be entered separated by a comma, by default there is a "default" tag. A * matches all tags. When the checkbox is disabled, no custom Actions buttons will be shown for the Saved Search. When the checkbox is enabled, all custom Actions which do not have a "tag" will be shown as well as all the custom Actions which have one of the tags mentioned in the input field.

Task Settings

For Workflow and Create Task buttons, several settings are available such as **Task Type**, **Start Task** and which fields to show. For more details, see: [Custom Action Types](#) on page 119.

Custom Action Types

With the introduction of the customizable Action buttons, you can not only rearrange and remove the regular Actions, but also add your own custom Actions. Following types are available in the gallery:

JavaScript

The custom JavaScript button has an additional **JavaScript** field (mandatory) where you may copy/paste your own custom code.

It is possible to use fixed variables to reference WebCenter Projects or Documents in this JavaScript code. These variables can be used for example when creating buttons that redirect to specific Project or Document Details pages. An overview:

Variable	Type	How to use
selectedIDs	Array	If a Project list or Document list is available in the action context, the IDs of the corresponding items (for Documents, this is the Document version ID) is available in the variable "selectedIDs".
projectID	String	If a single Project is available in the action context, the ID of this Project is available in the variable "projectID".
docVersionID	String	If a single document is available in the action context, the document version ID of this document is available in the variable "docVersionID".
menuFile	String	Where possible, the current Menu file selection (controlling the display of the primary WebCenter Menu) is available in the variable "menuFile".

Note: It is not guaranteed that JavaScript segments relying on other parts of the browser page DOM or detailed implementation of WebCenter pages will be supported in future versions.

Note: Using other (undocumented) variables is not supported and highly discouraged.

Start Workflow

The custom Start Workflow button allows you to select a **Workflow** Task Type to launch upon clicking the button. Any selected Documents will be added to the Workflow. In a Project context, it is possible to either launch one Workflow per Project or one per selected Document using the **Options** setting.

Create Task

Using the Create Task custom Action button, it is possible to immediately create a new Task from the selected **Task Type**. Use the **Start Task** options to either immediately start the Task, or at a later point in time.

The **Show** setting allows you to enable/disable different fields on the Create New Task page. This setting allows you to hide unwanted fields and elements from the page and reduce clutter. Disable all checkboxes to immediately go to the Task Execution page or create the Task. The **After Creation** setting determines whether the Task Execution page is displayed or not.

Action Type	Create Task
Task Type	Simple Task
Show *	<input checked="" type="checkbox"/> Top buttons
	<input checked="" type="checkbox"/> Task Type
	<input checked="" type="checkbox"/> Status
	<input checked="" type="checkbox"/> Created by
	<input checked="" type="checkbox"/> Allowed Assignee
	<input checked="" type="checkbox"/> Assigned to
	<input checked="" type="checkbox"/> Name
	<input checked="" type="checkbox"/> Description
	<input checked="" type="checkbox"/> Predecessors
	<input checked="" type="checkbox"/> Lead time
	<input checked="" type="checkbox"/> Due date/time
	<input checked="" type="checkbox"/> Estimated
	<input checked="" type="checkbox"/> Start Task options
<input checked="" type="checkbox"/> Completion action	
<input checked="" type="checkbox"/> Bottom buttons	
Start Task	Default
After Creation *	<input checked="" type="checkbox"/> Show Task Execution page

If all buttons are disabled, and enough information is defined in the Action to create the Task, it is possible to create a Task without any additional user input needed and (optionally) redirect to the Task Execution page for supplying, for example, Task Specifications to the created Task (or Workflow).

How to Create a Custom Action Button

Follow the steps below to create a custom Action button:

1. In your custom Menu, use the toggle top left to switch to **Actions**.

2. Select the page/section you would like to customize.
3. Select the Action type you would like to add from the **Action Gallery** and drop it into the location where you want to show it.
4. Make sure to select your Action and inspect the settings in the table below it. You can now change settings such as Label, Visibility, Rendering, etc. A preview of your button is displayed in the header of the settings panel. Also see: [Action Settings](#) on page 118.
5. Once your are done, save your Menu.

Note: To see the Menu changes in effect, any User assigned this particular Menu needs to logout and login.

Update a Custom Menu through the WebCenter User Interface

Note: You cannot edit the **Default** menu.

1. On the **Admin > Preferences > Menus** page, click the name of the menu you want to update.
2. On the **Edit Menu** page, edit your menu as desired (as explained in [Create a Custom Menu](#) on page 107).
3. Click **Save** at the bottom of the page when you are done editing the menu.

Create a Custom Project Details / Document Details Menu through the User Interface

You can create a custom menu item for **Project Details / Document Details** page. For example, you can create a menu item for adding a **Saved Search** using **SmartNames**.

You can also specify the visibility of this menu item for particular **groups** or for certain types of projects.

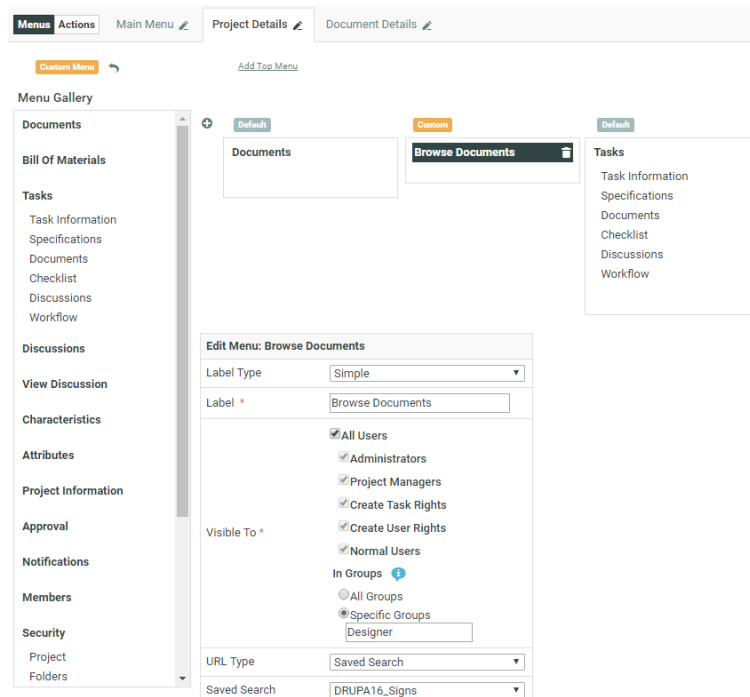

1. On the **Admin > Preferences > Menus** page, click **Add Menu**.
2. On the **Add Menu** page, enter a **Menu Name** and **Menu Description** for your new menu.
3. Click the type of menu you want to customize: **Project Details** or **Document Details**.

In the menu builder, you will see all the menu items of a default **Project Details** or **Document Details** menu.

On the left hand side, you can see the **Menu Gallery** containing the default menu items in bold, and the default sub menu items under them.

On the right side, you can see the **Menu Builder Canvas** (which is a graphical representation of the menu). This reflects any changes you make.

At the bottom, you can see and edit the details of the menu or sub menu item currently selected.

4. Edit the menu item. Select the **URL Type** as:

- **Saved search** if you are configuring a **Saved Search** as the menu item. Select your search from the **Saved search** drop down list below.
- **Attribute Category View** to configure a menu item with a specific **attribute category view**.

Specify the **Name** as the **attribute category view name**.

Note:
The name entered here has to match the custom Attribute Category View name of the Attribute Category (of the current Project or Document).

Your users can edit the attribute values and save them from this custom view.

Note:
From this **Project Details attribute category view**, the users cannot:

- change the attribute category.
- export or import the attribute category.

Read also [Use Case: SmartName Search to find Related Projects](#) on page 233.

5. Optionally:

You can assign a **Project Details** menu item for a certain group of **Projects** having a specific *Characteristic*. This allows you to create menu items (for example, dedicated Saved Searches) visible only in certain types of Projects.

1. *Create a specific Characteristic* for configuring a menu item. You can create characteristics for your custom menu items as well as the default ones.

2. [Create a Custom Project Details menu](#) or select the default menu item to edit.
3. Select the specific Characteristic in the **Project Visibility** field. You can select this from the drop down list.

This menu item will appear in the **Project Details** page only if the specified **Characteristic** was assigned to the **project** or the **template**.

As an administrator, you can switch this on and off in the **Project Details > Characteristics** page.

6. Assign the menu to the user, group or company you created it for.

Create a Custom Menu Using XML

You can create a custom menu for each category of users, to make it more convenient for them.

Note:

Menus are XML files, so you can edit them using an XML editor (you can find various freeware XML editors on the internet, for example XML Marker or Notepad++).

For more details on how to edit the XML files to create custom menus, you can read [Create a Custom Menu](#) on page 1007 in the WebCenter Customization Guide.

You will need to:

1. Determine which menus a particular group of users needs, and which menus they don't need.
2. Download the default menu to use as a starting point (click the **Download Menu** link corresponding to the **Default** menu, then save it to a file when it opens in your browser).
3. In an XML editor, remove the menu items that are not necessary for those users.
This allows you to simplify the WebCenter interface, especially for occasional users. For example, you can create a menu that only contains **My Work** for approval users.
4. Add custom menu items, to link to the WebCenter pages of your choice.
This allows you to make the pages most used by your users more accessible. For example, you can add menu items linking to saved searches, or to project creation from a specific project template.
5. When you are done editing the menu file, save it under a meaningful name.
6. Upload your custom menu:
 - a) click the **Menu Upload** button on the **Menus** page
 - b) on the **Menu Upload** page, browse to your XML file,
 - c) give your custom menu a **Name** and a **Description**,
 - d) click **Upload**.
7. Assign the menu to the user, group or company you created it for.
8. Log in to WebCenter as one of the users to which you gave the custom menu, and check whether the menu works.

Update a Custom Menu Using XML

To update a menu you have created:

1. On the **Menus** page, click the **Download Menu** link corresponding to the menu to update.
2. Edit it in an XML editor (see the WebCenter Customization Guide).
3. On the **Menus** page, click the **Menu Update** link corresponding to the menu to update.
4. On the **Menu Update** page:
 - a) browse to the XML file you edited,
 - b) change the menu's **Name** and / or **Description** if necessary,
 - c) click **Update**.
 This updates your custom menu.

Note: You cannot edit the **Default** menu.

Menu: Visibility Groups

You can decide the **group visibility** of a menu item present in the **Main menu / Project Details / Document Details** page.

For example, you can create a Project details menu item with a custom **Saved Search** using **SmartNames** and make it visible only to a particular group.

Follow the steps below:

- On the **Admin > Preferences > Menus** page, select the menu.
 - Click the type of menu for which you want to edit the visibility: **Main menu** or **Project Details** or **Document Details**.
- At the bottom, you can see and edit the details of the item currently selected.
- Edit the menu item to limit the **visibility**. Specify the **Visible To > In Groups** as **Specific Groups**.

If you want to limit the menu's visibility to certain groups, select **Groups** and enter the names of the groups that can see the menu, separated by a semicolon (example: `GROUP1 ; GROUP2`). You can see this example when hovering on the field.

Customize the Project Details Menu Using Characteristics

You can assign a **Project Details** menu item for a certain group of **Projects** having a specific *Characteristic*. This allows you to create menu items (for example, dedicated Saved Searches) visible only in certain types of Projects.

1. *Create a specific Characteristic* for configuring a menu item. You can create characteristics for your custom menu items as well as the default ones.
2. *Create a Custom Project Details menu* or select the default menu item to edit.
3. Select the specific Characteristic in the **Project Visibility** field. You can select this from the drop down list.

This menu item will appear in the **Project Details** page only if the specified **Characteristic** was assigned to the **project** or the **template**.

As an administrator, you can switch this on and off in the **Project Details > Characteristics** page.

Delete a Custom Menu

To delete a custom menu:

1. On the **Menus** page, click the **Delete Menu** link corresponding to the menu to delete.
2. Click **OK** in the confirmation dialog.
3. If your menu is assigned to users and / or companies, you need to assign another menu to them. In the **Menu Deletion** page:
 - a) Select the new menu to assign to them.

Note: This will assign the same menu to all those users / companies. If you want them to have different menus, you need to edit the users / companies individually from the **Users** or **Companies** page.

- b) Click **Delete**.

3.4.7. My Work Preferences

The **My Work** preferences allow you to define what users can see on their **My Work** page.

Default and Custom My Work Pages

As an Admin, you can define a default **My Work** page, that will be available to all WebCenter users by navigating to **Preferences > My Work > Default My Work Setup**

You can also define custom **My Work** pages for specific users or companies, when editing that user or company (see [Create a User](#) on page 261 and [Create a New Company](#) on page 253).

Users can then customize their personal **My Work** page to a certain extent, by adding or removing predefined sections (using **My Work > Edit My Work Setup**).

Admin Users can define which sections are available for specific groups or user types.

In the **My Work** preferences, you can:

- create a new **My Work** section (to use in the default or custom **My Work** pages),
- change what the default **My Work** page looks like.

About My Work page

A My Work page can be customized using various blocks that are available.

My Work

[Edit My Work Setup](#)

This text can be translated

The screenshot displays the 'My Work' interface. On the left, the 'Projects Report (Graph)' shows a search bar and four colored boxes representing project statuses: Active (1891), Completed (32), Delayed (7), and Start production (1). Below this is a 'Facet List' and three 'Facet Graph' visualizations (two donut charts and one bar chart). On the right, the 'Discussions' section lists messages with dates and project names. Below that, a 'test' section shows a task titled 'Change the Attribute category' with a workflow icon.

Default My Work Sections

WebCenter has the following default sections, that you can use in the default and custom **My Work** pages:

This section...	will show...
My Approvals	a list of documents a user has to approve or reject.
My Recently Submitted Approvals	a list of documents a user has recently approved or rejected.
My Approvals to Follow Up	a list of documents for which a user is Approval Master .
My Tasks	a list of tasks assigned to a user

This section...	will show...
My Recently Handled Tasks	a list of tasks a user has recently handled
My ToDo List	shows Approvals and Tasks to be done by the user

Custom My Work Sections

You can create a My Work section from any html page. You can define which users will be able to see and use the sections you create, and you can even specify the height the section will take in the page. For details, see [Custom My Work Section](#) on page 127.

Custom My Work Section

To create a section to use in **My Work** pages, you need an html page, whose content will be shown in the section.

1. Click **Admin > Preferences > My Work**. The **My Work Sections** page appears.
2. Click **Create New My Work Section**.
3. Give your new section a **Name**.
4. In the **Type** option, indicate if this section will show:

- a HTML page specifically designed for this purpose (**Generic**),

Note: Please contact Esko's Professional Services if you require such a web page.

- a **Saved Search** (a search you have saved, see [To Save a Search](#) on page 558 for more information),
- an **External Web Page**.

Note: We recommend you do not add WebCenter pages as **My Work** sections.

5. If you have chosen to show a saved search, select the **Saved Search** to show.
6. If you have chosen to show an external web page, enter or paste its address in the **External Web Page** field (for example: `http://www.esko.com`).

For saved searches and external web pages, the **URL** field is filled automatically by WebCenter.

7. If desired, you can change the height of the section.

To do this, add `&h=` followed by the desired height in pixels at the end of the **URL**. For example `iframe.jsp?url=http://www.esko.com&h=400` has a height of 400 pixels.

WebCenter calculates the width automatically.

8. In **Scope**, choose which type of users will be able to use this section in their **My Work** page:
 - **All Users**,
 - **Administrators**,
 - **Project Managers**.

Note: You can also change this for the default **My Work** sections.

9. You can use groups to further filter the users that will be able to see the section. In **Role Groups**, choose either:

- **All Users** if you want all users of the type specified in **Scope** to be able to use the section,
- **Specific Groups** if you want to restrict the section's visibility to specific groups (within that user type).

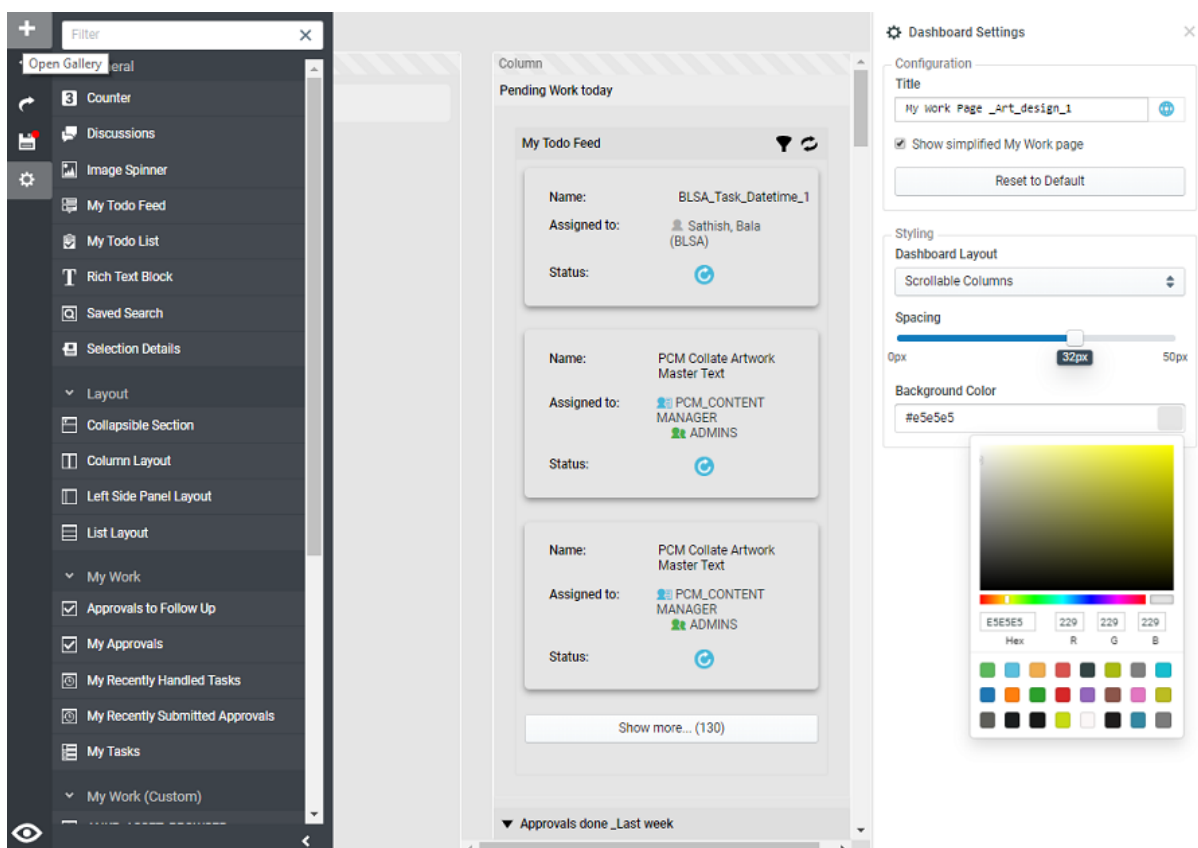

In this case, select the groups which will be able to use this section.

10. Click **Create**.

Edit the Default My Work Page

You can customize and setup **My Work** page for all the users. Admin users can access it from **Admin > Preferences > My Work > Default My Work Setup**.

You can drag and drop the various blocks from the dashboard builder drop-down in the right hand side.

Following options are available in the drop down:

- **All:** This option displays all the blocks that are available.
- **My Work :** All the available blocks of **My Work** Section are displayed. Default blocks available are
 - **Approvals to follow up** Displays the list of Documents and their current Approval status for which the current User is set as their Approval Master
 - **My Approvals** Displays the list of Documents waiting for approval decision from the current user.

- **My Recently Handled Tasks** Displays Tasks that the current user has completed in a given time.
- **My Tasks** Displays the pending Tasks, waiting to be handled by the current User.
- **My Todo list** Displays a merged overview of all Task and Approvals for the current User. This block has the following configurable parameters which are all enabled by default:
 - **Show Tasks:** Displays all the pending tasks.
 - **Show Approvals:** Displays all the pending approvals.
 - **Categorize by Time:** You can specify if the block should have categories by time or no categories.
 - **Maximum Height:** Specify in Pixels or in percentage and by default has no value.

Note: My Work section can only be added once to the Dashboard.

- **Layout:** You can drag the layout blocks to customize the look of the dashboard. This is similar to the customizing your search results dashboard. Read more about layouts at [Configuring the Search Dashboard Layout and Blocks](#) on page 240
- **General**
 - **Discussions Widget:** You can add this to view the current discussions you are part of. You may choose to display Project or Task or Document discussions or all the discussions. You can enable **Always show Mobile View** to view discussions in a compact format.
 - **Rich Text Block:** You can add a block of text and also display the translations of the text in the languages of your choice.
 - **Counter:** You can specify a **Saved Search** and the results of the search will be counted in the Counter. Read more here [Building a Search Based Counter](#) on page 241
 - **Image Spinner:** Read more about this block [Image Spinner](#) on page 246
- **My Work (Custom)**

This section contains all defined custom My Work Sections of the system.

Menu Options in My Work Page

You can perform actions in the **My Work** page using the menu options

- **Undo / Redo:** To perform Undo / Redo actions in the My Work page.
- **Show simplified My Work page:** Enable this toggle in the **Edit My Work Setup** to display the My Work page with no links to Project and Document details page.
- **Reset to Default:** Admin users or the user can revert the **My Work** page to default settings by clicking this button.
- **Save:** Any changes done will be saved.

Tip: To make the page mobile friendly, define minimum widths on columns to ensure that the columns will reflow to a new row and fit horizontally.

Edit My Work Page for a User

Admin user can set up a customized My Work dashboard to any user.

Note: When a user has no custom setup he/she will see the company **My Work** setup or **Default My Work setup**.

Set up a custom **My Work** setup for the user, follow the steps below:

1. Click **Admin > Users > My Work Setup** tab.
2. Click on **Setup Custom My Work** to edit and configure a dashboard for the particular user.
3. You can customize the **My Work** dashboard as described here [Edit the Default My Work Page](#) on page 128
4. Click **Save** to make changes.

Similarly a customized My Work page can be set up for a Company's user. Read more about it here [Set up My Work page](#) on page 255.

3.4.8. Dashboard

Admin users can view the global list of dashboards by navigating from **Preferences > Dashboards**. These dashboards can be used as:

- Menu Items
- Start Page
- Landing Page of a Project or Default landing page of all projects

Create Dashboard

You can create a dashboard by clicking on **Create Dashboard** option. To know more about Dashboard Configuration, read [Dashboard Builder](#) on page 131.

Note: You can find five example dashboards in the list of dashboards. Use **Save As** option to make use of these dashboards. Note that every time the database script are run the dashboards are overwritten.

Import/Export of Global Dashboards

You can import or export one or selected dashboards from the list of Global Dashboard(s).

To export, select the dashboards and select **Export**. This generates an XML/Zip containing the full configuration of the Dashboard that can be used to migrate the Dashboard configuration to another WebCenter Instance.

To Import a dashboard, select **Import** from **Admin > Preferences > Dashboards**. Choose the XML file containing the Dashboards and click **Import**.

Delete Dashboards

You can delete a dashboard by selecting from the list and clicking on **Delete Dashboard(s)** option.

Dashboard Builder

Dashboard Name

Dashboard Name is a mandatory field in the dashboard. Ensure that the name provided is unique.

Note: If Dashboard is named **WELCOME** then it is loaded in the Welcome page and any dashboard named **CONTACT** is loaded on the Contact page.

Context

You can create Dashboards in the context of where it appears, like

- **Project**
- **Document**
- **Task/Approval**
- **Unspecified**

There is an option to change the context of the Dashboard that you are building. Based on the context selected for the dashboard, the gallery is updated with different blocks.

Styling and Layout

There are two layouts available in Dashboard, namely:

- **Default** where the blocks are shown in a list
- **Scrollable Columns** where they allow you to scroll every column separately

You can set the background color of the dashboard.

All layout blocks have the Spacing and/or Padding parameter, which allows you to create visually appealing dashboards.

Conditional Formatting

When the dashboards are created in Project, Task or Document context, the rendering can be formatted using conditions. This works exactly similar to Search Results Formatting and can be read [here](#). Options available for conditional formatting depends upon the context of the dashboard.

Note: This option is not visible when the dashboard is created for unspecified context and in scrollable columns.

Duplicate Blocks

Dashboard blocks can be easily duplicated in the dashboard builder by clicking on the duplicate icon in the top-right of the block. This feature is useful, when you have a block that is already configured and a similar block as the existing block has to be created.

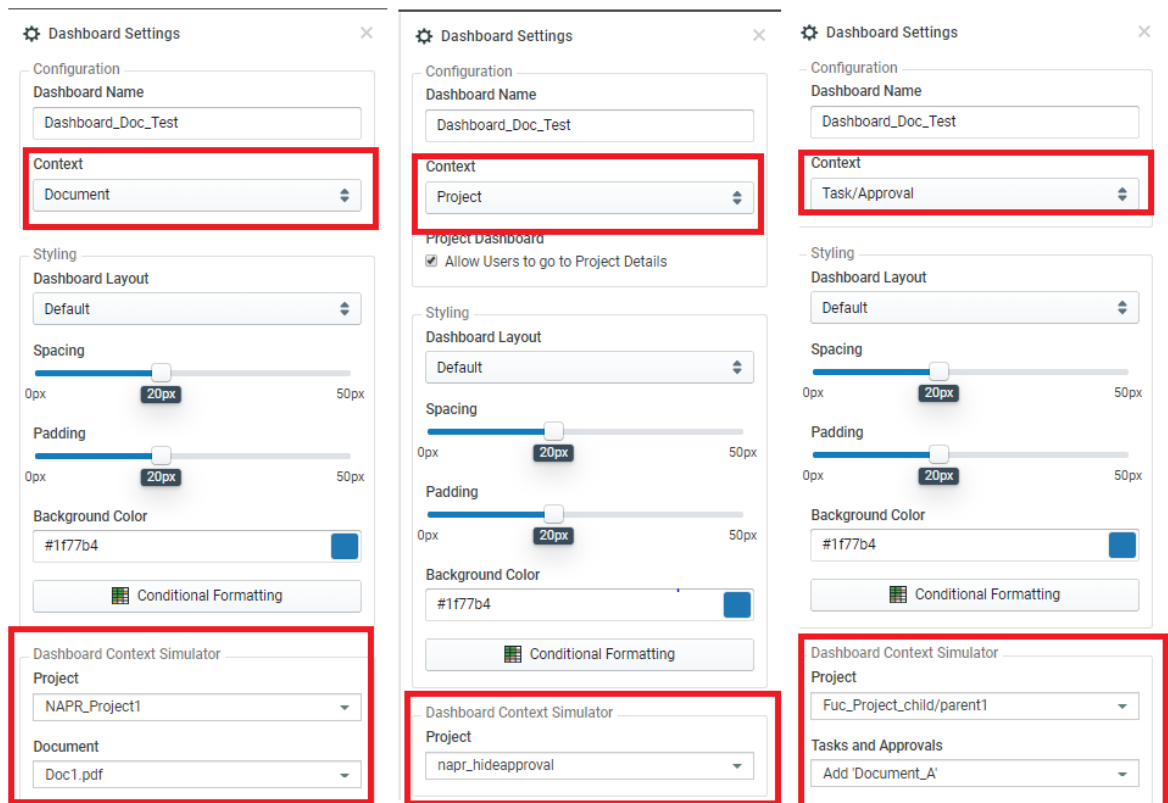

Duplicating also works on all the layout blocks. When layout blocks are duplicated, all the blocks in that particular layout block are duplicated. This allows for fast layout creation in the dashboard.

Drag and Drop

You can now easily configure the dashboard with simple drag and drop operations. Columns can also be rearranged or new columns can also be created with drag and drop.

Dashboard Context Simulator

You can view the Dashboard for a selected Project, Document or Task with this option.

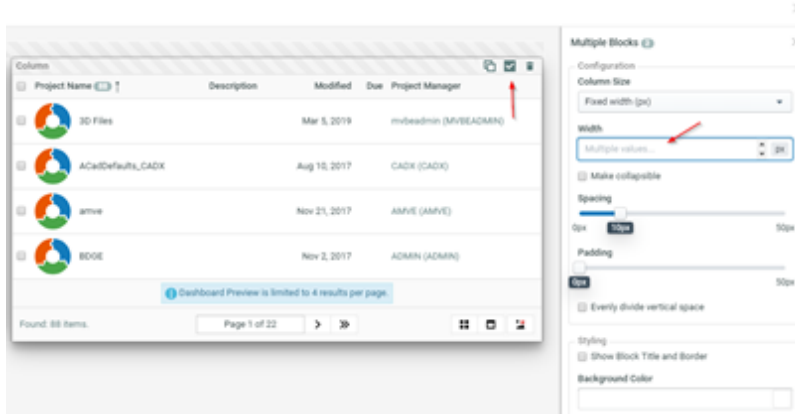

In the **Dashboard Context Simulator** option when

- Project is selected, drop-down lists all the projects from which you can select the project.
- Document is selected, drop down list all the projects in the system from which you can select the document.
- Task is selected, drop down list all the projects in the system from which you can select the task.

Note: This option is not visible when the dashboard is created for unspecified context.

Bulk configuration of blocks

You can select multiple blocks and apply changes to them at once using this option. Select the blocks by clicking on the selection icon in the block and perform **Styling** and **Configuration** actions once. Options that can be configured may vary depending on the blocks chosen.

Delete Blocks

You can delete any block in the dashboard by clicking the  (delete) icon on the right top corner of the block and the block is removed from the dashboard.

Gallery Panel Actions

You can add gallery blocks into the dashboard by clicking on the +. You also have Undo and Redo action in the panel along with save. You can select the ellipsis to view the **Dashboard Settings** or make a copy of this dashboard using **Save As** option.

You can view any dashboard when it is built using the preview  icon in the bottom left corner. In the preview mode, you have the gear icon which returns back to the dashboard builder.

Dashboards Shortcuts

Dashboard Editor Keyboard Shortcuts

- Ctrl + s: Save the dashboard
- Ctrl + z: Undo
- Ctrl + y: Redo

- Ctrl + click: Multi select blocks
- Shift + click: Multi select blocks
- Delete/backspace: Remove all selected blocks
- Ctrl + g: Open the gallery. You can now directly start searching for blocks, press tab to select a block in the gallery, and press enter to add the block to the top of the dashboard.
- Ctrl + e: Toggle between edit mode and preview mode
- Esc: Close the gallery

Dashboard Gallery

Gallery consists of all the blocks that can be added to make a dashboard. It is located in the left side on the Dashboard configuration page. You can open the gallery by hovering on the +.

This lists all the available blocks and it varies upon the context of the dashboard created.

General

This comprises of the blocks which are available irrespective of the context of the Dashboard.

- **Counter:** You can specify a **Saved Search** and the results of the search will be counted in the Counter.
- **Dashboard Block:** To reuse a configuration in different dashboards in the current dashboard.

Note: Use this option sparingly, as this might slower the speed at which the dashboard is rendered.

- **Discussions:** To view the current discussions you are part of. You may choose to display Project or Task or Document discussions or all the discussions.
- **Image Spinner:** Read more about this block [Image Spinner](#) on page 246
- **My ToDo feed:** To show your Tasks and Approvals in a custom way based on the dashboard context. For example, you can create a dashboard for Task and Approvals for Todo items or in a Project dashboard to show pending tasks. Read More [here](#).
- **My Todo list** Displays a merged overview of all Task and Approvals for the current User. This block has the following configurable parameters which are all enabled by default:
 - **Show Tasks:** Displays all the pending tasks.
 - **Show Approvals:** Displays all the pending approvals.
 - **Categorize by Time:** You can specify if the block should have categories by time or no categories.
 - **Maximum Height:** Specify in Pixels or in percentage and by default has no value.
- **Rich Text Block:** You can add a block of text and also display the translations of the text in the languages of your choice.
- **Viewer Block:** You can add this block to view the viewable files in the Dashboard itself. Read more [here](#).
- **Saved Search:** To show a Saved Search where the context of the Dashboard is used to resolve the smartnames of the Saved Search.
- **Selection Details:** To show a Dashboard for each selected item in the Search Results

Layout

You can use combinations of list, left side panel, column layouts and collapsible section to present your blocks in the dashboard. Drag and drop the **Layout blocks** into your canvas to create a interactive dashboards. To Configure your layout blocks available in dashboards:

- Select **List Layout** for a vertical list of blocks and **Column Layout** for a horizontal arrangement. Spacing between these blocks can be specified as well.
- Select **Left Side Panel Layout** to present info in a left side **Column Layout** with an embedded List layout. This pre-defined layout can be modified to suit your needs.
- Select **Collapsible Section** to present info which can also be hidden and expand one or more blocks based on the requirements.
- Select **Column Layout** to display blocks in configurable columns. When the user adds a Column Layout to the dashboard, the layout is preconfigured with 2 columns.

Context based blocks

Dashboard can be created for different contexts like Project, Document or Task and Approvals. There is also an option to create Dashboards with no specified content called Unspecified. The blocks available in the gallery show information based on the context selected for the dashboard. All the fields which can be searched in a Project/Document/Task/Approval Search are available as separate blocks. It is possible to configure conditional formatting on these blocks which behaves the same as in Search. Some of the blocks available are

- **Thumbnail block:** shows the thumbnail of the Project or Document
- **Project Attributes, Document attributes, Task specifications:** these blocks show a view of the attributes category of the Project, Document or Task in read-only mode.
- **Approval setup :** shows the approval setup of a Document. This block is available only for document context.

Action Buttons

Document Actions:This block is available in **Document** and **Task/Approval** context.

Use this block to show **Document Actions** which are configured in the menu builder or in the block itself. All actions which are available on Document Search Results are available in this block.

Task Actions: The block is available in Task/Approval context. You have two options namely:

- **Execute Task:** opens the Task Execution Page
- **Go to Project:** opens the Project

Approval Buttons This block is available only for Document and Task and Approval dashboards. You can configure approve, reject and comment buttons.

Viewer Block

The Viewer block is available for **Document** and **Task and Approval** Dashboards.

You can configure the Viewer block with the following parameters:

- **Height:** Specify the height of the widget in px (pixel) or in % (percentage).
- **Make Collapsible:** Enable this to allow the block to be collapsible.

The viewer block shows basic text selection when the block is used in a search or in combination with a saved search block.

For Graphic files a limited number of tools are available in the viewer:

- Zoom to fit
- Rotate View and
- Current page number/ total number of pages

For documents with multiple pages, the block shows the current page and the total number of pages.

You can navigate to the previous or next page with the back and forward buttons, when the text search matches are on multiple pages.

How to Configure My ToDo feed

My ToDo feed has the following configurable parameters:

- **Show Tasks/Approvals:** These two parameters define the items that are visible in the list.
- **Task Dashboard/Document Dashboard:** The configured dashboards are used to show the entries of the todo list. It is possible to select a different dashboard for tasks than for documents.

Note: Use context specific information blocks to view your tasks and approvals along with Action buttons to perform actions your Todo items.

- **Padding:** Spacing between the cards and the border/frame of the block can be set and adjusted
- **Spacing:** spacing between two cards can be set and adjusted

When you view this block in the dashboard, you can perform the following actions

- **Refresh:** To update the information.
- **Filter:** To filter the items that are visible in the Block.

The Tasks and Documents that are shown in the My Todo Feed are the same as in the My Todo List block.

3.4.9. Reports

You can derive a **Report** of selected parameters of a document derived by querying the database. You can produce Tables, Pie Chart and Bar Chart in these reports and output them in PDF, DOCX, XML, XLS, CSV, TXT, RTF and HTML formats. This feature uses the Jasper Reporting engine to create these reports. You can customize the terminology, look, logo's and the parameters.

Use Reports to:

- calculate averages and compare actuals to targets (KPI's).
- create charts, such as Bar Chart and Pie Chart.
- to create a general report and related sub-reports.

The report is created based on a **report template**. There are built-in reporting templates available to admin users. However, you can upload custom reporting templates as a JRXML file

or as a ZIP file. If you would like to add supporting files such as images and stylesheets, you can create a ZIP with the JRXML file, images and stylesheets.

Using WebCenter Reports, you have the:

- Ability to calculate averages and compare actuals to targets (KPI's).
- Ability to create charts, such as Bar Chart and Pie Chart.
- Freedom on terminology, look, logo's, amount of detail required to be displayed.
- Choice of report output to PDF, DOCX, XML, XLS, XLSX, CSV, TXT, RTF and HTML.
- Ability to create one PDF with a general report and iterate over a set of sub-reports

Note:

- You can create these reporting definition templates in **iReport**. Read more technical details about this in: [Custom Reporting](#).
- You need database access to derive these reports and if you are using WebCenter as a SaaS customer, you cannot generate these reports yourself.
- If a report is generated for a template containing background image in the DOCX format, then the output will not have the background image.

You can access these reporting templates in **Admin > Preferences > Reports**.

Accessing WebCenter Reports

The WebCenter Reports feature can be accessed by an Admin or member of the Admin group.

1. Log in to WebCenter as an Admin user.
2. Click **Admin > Preferences > Reports**.
3. The **Reports** page appears with the list of available reports.

This page displays the report name, report actions, report description, last modified and the user who uploaded the report (Creator). The Reports page also displays **Upload Report**, **Download Report**, **Update Report** and **Delete Report** buttons.

Note: The built-in reports cannot be deleted.

4. Click the desired report name to go to report details page, where you can run the report.

Types of Reports Available

The WebCenter Reports comes with two default reports. The default reports have a typical WebCenter look. However the report definitions can be downloaded and changed in **iReport** to a different look.

Note: Reporting is a separate license in WebCenter. Without this license you can only run the default reports.

The default reports provided are as follows:

- **Approval Statistic (built-in)** report: This report is on duration of approvals. This report has lots of parameters to filter the report on customers, duration and influence on what is shown in the report and how it is displayed.

- **Task Management (built-in)** report: This report is on the duration of tasks. This report comes with many parameters, for example to filter on a task type (showing all CAD Design tasks and disregarding all other tasks).

- **Attribute Category (Built In) Report:** Built-in reports are available for Attribute Category in both PDF and Excel formats.

By default, these reports are not enabled in the **Project's** or **Document's** Attributes page. To enable built-in reports follow the below configuration:

1. Download one of the built-in the reports
 - Sample Attribute Category Excel – built-in report template for XLSX format
 - Sample Attribute Category PDF - built-in report template for PDF format
2. Upload a new report as **Default Attribute Category Report**. You can also rename the report in the name of the attribute category for which report has to be generated.

Download the built-in report and upload new report as name **Default Attribute Category Report** or name the report exactly as the Attribute Category in the required Project or Document for which report is generated.

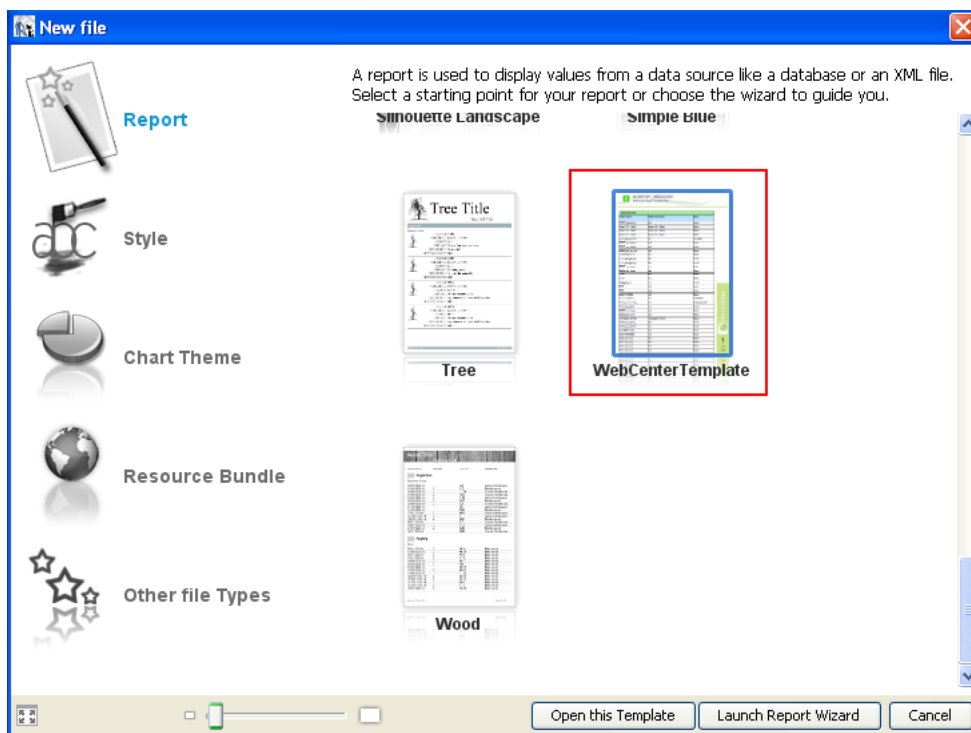

To get a specific project or document attribute category as a built-in report, upload the template ZIP file with the report name same as the project or the document attribute category name. Report name can also contain optional suffix.

Example: If the attribute category name is – Doc Attr Category, then there can be multiple reports with different names such as Doc Attr Category_PDF, Doc Attr Category_Excel, Doc Attr Category_CSV.

Note: To change the template, download the Jasper Report template, update using Jasper Studio and upload back to WebCenter.

You can also create a custom report using **iReport** tool. To create a new custom report, you can start from a blank template, use the template provided by Esko, or just modify the built-in reports. Upload these to WebCenter and then let WebCenter run the report. One report design is typically used over and over again, for example to create a weekly or monthly report.

Note: To learn how to create such reports, read the **CustomReport.doc** document.

Configuring a Report

To configure a WebCenter Report:

1. Click on the desired report name link on the **Reports** page.
2. In the **Reports Details** page that appears, specify the **Report parameters**.

This can be very simple or very complex depending on the amount of parameters foreseen by the report design. Most often, the time span on which to calculate the report is a

parameter. But equally so the report could accept a customer ID (a drop down of customers will be shown) or an option to show more or less detail or what type of charts to use.

The mandatory fields (parameters) are marked by an *.

3. Under Report Output:

- a. Click the **Upload Report to Project** check box, if you want to upload the generated report directly to the required project folder. When it is not selected, the report is generated on the User Interface.
- b. Specify the report **Document Name** and output **Format**. By default PDF is the output format.

Note: XHTML format is not available if the **Upload Report to Project** option is selected.

- 4. In **Report is visible for groups**, select or enter the name of the groups that can run this report. To remove a selected group, click the minus sign in front of its name.
- 5. In case the jrxml defines projectId as a parameter (with uiTypeID set to PROJECT), an additional **Project Report** checkbox appears on the report details page. In case this option is enabled, this report will only be used as a project report.

You can also set which roles in the project(s) can run this report (in addition to the groups you defined). This way it is possible to create a report that can only be run by the CSR or the SALES person but not by other people (for example suppliers and other external people).

In **Report is visible for roles**, select or enter the name of the roles that can run this report. To remove a selected role, click the minus sign in front of its name.

- 6. Click the **Save** button, to save the parameters. The next time you want to run this report, you can use the same parameters. If you want to run the same report with two sets of saved parameters you need to upload the report definition twice.

Running a Report

To run a WebCenter Report:

- 1. Click on the desired report name link on the **Reports** page.
- 2. In the **Reports Details** page that appears, specify the **Report parameters**.

This can be very simple or very complex depending on the amount of parameters foreseen by the report design. Most often, the time span on which to calculate the report is a parameter. But equally so the report could accept a customer ID (a drop down of customers will be shown) or an option to show more or less detail or what type of charts to use.

The mandatory fields (parameters) are marked by an *.

- 3. Click the **Run Now** button. The report is generated as per your specification. The **Report Successfully created** message appears in the Reports Details page.

Note: It is recommended to run **Find Lost Documents** built in report during off peak hours, as it can utilize lot of system resources.

Built In Reports

Built In reports are system reports which can be usually accessed only by Administrators. Administrators can view the report but it is not possible to update, delete or download the built-in reports.

To view the built in reports, navigate to **Preferences > Reports**. Click on the report name to view the report details page. Administrators can modify the **Report Name, Description** and select **Groups** which can be provided access to run the report manually.

Groups which has permissions assigned, can access the reports from **Search > Reports** page.

Find Lost Documents Report

A lost document is a document in the project for which no files are found on the File Store. Either the file has been removed from the File Store or the document is of the URL type.

The Administrators can run this report in the reports page by selecting the **Find Lost Documents**.

On running the report, the page displays an overview of Lost Documents. Number of lost documents count is indicated at the top of the page.

Note: Run this report during the off peak hours, as it utilizes a lot of system resources and may slow down the WebCenter Application.

The Lost Document report is displayed in a tabular form in which the following details of each document is shown:

- Document Name
- Document ID
- Version ID
- Version Number
- File Number

The user can go to the Document Details page by clicking on a Document Name.

Document Project History Report

WebCenter has a built-in report for **Project History Report**. You can run this report from the **Reports** and select **Project History Report**.

On execution, **Search Projects History** page is displayed with an overview of projects. Administrator users can see all the projects, while the other users can see projects they manage only.

Search History Project is displayed in a list with a sequence number, along with

- Project Name
- Description
- Project Status
- Project Manager
- Creation Date
- Modification Date

To view a project history of any project, click the **Project Name**. You can filter the results on **Manager Last Name, Manager Group Name** or **Modified date** or **Project Status**. You can also restrict the number of records displayed in a page.

The order of the results can be changed by clicking on a column header in the results table or by changing the **Sort By** option in the filter section. Select **Print** to print the report.

Sample Attribute Category Report

This is an built-in report that can be run by the admin users.

By running the report, you can download the list of all the attributes and its values along with the document references. This report can be run for both project attribute category or document attribute category.

There are two Sample Attribute Category built in reports based on the way it can be exported:

- **Sample Attribute Category PDF** : Best suited to get the reports in the pdf format along with thumbnails for reference documents
- **Sample Attribute Category Excel**: Best suited to get the reports in sheets separately for each document type

To generate this report for the first time:

1. Navigate to **Reports > Sample Attribute Category (PDF / Excel)**.
2. **Run Report** page is opened.
3. You can select **Upload Report to Project** option and specify the project name, document name and folder in which the report has to be uploaded.

The report is generated in the format selected.

How to get the Attributes Report in the Attributes Page

Download **Sample Attribute Category Excel/PDF (built-in)** report from the **Reports** page. Upload it as a new report with the name as **Default Attribute Category Report** to get the **Attribute Report** icon in the **Attributes** page of all the documents and projects which has attribute category specified.

Note: Attributes Reports can be accessed by any user based on the **Reports** permissions.

In case you want only specific **Project/Document** Attribute Category to get built-in report, upload the template ZIP file with report name same as the **Project/Document** Attribute Category name. The Report name can also contain optional suffix.

This report will show the label of the Attributes as defined in the **Create New Attribute** page. If SmartName or internationalization is used for the attributes, or the attributes is of Document Reference type, then only the attribute names are shown.

Example : If the attribute category name is Attribute1, then the uploaded report should be named as Attribute1XXX

Attributes page in the **Project/ Document** with the specified **Attribute Category** will have the **Attribute Report** icon.

Note: If you want to change the template of the report, then download the Jasper Report template. Update the reports using Jasper Studio and upload back to WebCenter.

Managing Reports

The Reports page also helps you in managing the existing reports. You can **Download Report**, **Update Report** and **Delete Report** using the inline buttons.

Note: The built-in reports cannot be deleted.

Reports

Report	Description	Creator	Modified
Approval Statistic (built-in)-Testing	A test report...	ADMIN	Dec 19, 2013

3.5. CAD Options

Use the **CAD** menu to set options related to working with ArtiosCAD.

WebCenter allows you to:

- create a CAD document from a standard directly WebCenter
- view the CAD documents with folding angles in 3D
- view CAD documents in the Viewer
- search for CAD documents

3.5.1. CAD Download Format

Synchronize with Defaults

WebCenter administrators can download ArtiosCAD files in different formats as specified in **Defaults** of the ArtiosCAD instance running on the Application Server.

On the **CAD > CAD Download Formats** page, you can enable or disable download formats for all users.

Click the **Synchronize** button to import the settings from ArtiosCAD **Defaults**. A successful status message should appear after a few moments, and the list of formats is populated. Select the formats you want to make available for the users.

Note: The three native ArtiosCAD formats (ARD, MFG and ACD) do not require any configuration.

Download formats and users

User and group permissions for the download formats are set in **Users > select user > Download** and **Groups > select group > Download**, respectively. You must set permissions on the formats before users can download documents.

Note: Members of the Admins group are granted all download format permissions by default, and the Change and Use Group Permissions buttons are unavailable when attempting to change permissions for those users.

Non-cached ArtiosCAD Download formats

The WebCenter configuration has been extended with an option to not cache specific download formats to support dynamic ArtiosCAD download formats.

Currently, the CAD Download Formats for a given document version are by default generated and cached in the system when first downloaded by a user. Subsequent users downloading

the same download format get the same cached file. The caching behavior is controlled for every CAD document type and download format.

Examples of dynamic download formats where turning caching off could be needed are Bill of Materials reports and reports that are based on meta-data that can be edited directly in WebCenter.

To turn off the caching for a given document type and download format:

1. Go to **Admin > CAD > CAD Download Formats**.
2. Go to the respective document type and download format and unselect the respective check box.
3. Save the changes to disable the caching and delete any cached data for the selected download type and document format system wide.

There is no Cache option for the ArtiosCAD format (native document) as this format is always available.

3.5.2. Boards

The **CAD > Boards** page shows the types of boards that can be used for CAD designs (paper, corrugated board, folding carton...).

These boards are defined in ArtiosCAD. They cannot be edited, created or deleted from WebCenter. However, you can set the boards' default location(s) and use them in a Restricted Set.

Assigning a Board to a Company or Location

You can assign a specific board to a **Company**, or a **Location** of that company.

1. In the **CAD > Boards** page, browse the Boards tree to find the board you are interested in.
2. Click that board to show the **Edit Default Locations for board ...** page.

Note: You can only assign boards to companies/locations, not boards folders.

3. On that page, select the companies/locations to associate with this board, and click **Finish**.

Tip: If you want to assign this board to all companies/locations, select the checkbox next to **Company** at the top.

The users in these companies/locations will see the board as default.

Creating a Boards Restricted Set

You can create a Restricted Set of boards, so that users can pick from a short list of relevant boards when creating a design.

To do this, click **Create Boards in Restricted Set**, then add boards to the Restricted Set as explained in [Create a Restricted Set](#) on page 292.

Note: The data **Type** is always **Text** in a boards Restricted Set.

3.5.3. Run a CAD Standard from WebCenter

A **CAD standard** is a default ArtiosCAD document, to be customized with **parameters** supplied by the user to make a design. This will be a 2D design, that can be made 3D if the standard has fold information.

In WebCenter, an **ARD document template** is used as the CAD standard, and **attributes** are used as the parameters needed to make the design.

In practice, you create a new document from the ARD document template, filling in the template's attributes' values to give your parameters.

CAD Standard Configuration

You need to:

1. Set up an attribute category containing the attributes necessary to create the design, and their default values.
2. Set up a document template with this attribute category.

Create an Attribute Category

You will need to create attributes that match the CAD standard's parameters in ArtiosCAD. They must have the **same name** as the corresponding parameters, and any parameter required in ArtiosCAD must translate into a **Required** attribute in WebCenter.

Generally, you will use at least **BOARD** (this is always **Required**), and mostly **L** (length), **W** (width) and **D** (depth).

BOARD parameter: Creating different board attributes will allow the usage of different board restricted sets. Attributes will be selected by WebCenter, if the name of the attribute starts with **"BOARD"**.

Other parameters are less standardized. You need the person who built the standard to clearly indicate which parameters are needed.

Here is an overview table of the attributes you will probably need the most:

Attribute	Use case	Values
BOARD	The type of board to use for the design. Used for every CAD standard (this is a Required attribute).	A Restricted Set of Text type. Set your desired values in the Restricted Set.
L, W and D	Length, Width and Depth. Used for most CAD standards.	Prompted values (the user can set what he/she wants) of Distance (in,mm), Distance (in,m) or Float type.

Attribute	Use case	Values
<p>ISSTANDARD</p>	<p>To indicate if an ARD document template should be used to run CAD standards or not.</p> <ul style="list-style-type: none"> • ARD document templates to be used for CAD standards should have YES as ISSTANDARD value. • ARD document templates NOT to be used for CAD standards should have NO as ISSTANDARD value. <p>This should be a Hidden attribute.</p>	<p>A Restricted Set of Text type.</p> <p>The values in the Restricted Set must be YES and NO.</p>
<p>UNITS</p>	<p>To set units other than the user's default units.</p> <p>If no unit is set, the standard will be run in the units set in My WebCenter > My Preferences by the user.</p>	<p>A Restricted Set of Text type.</p> <p>The values in the Restricted Set must be mm and in.</p> <p>Note: Value of the Units attribute is not considered when using distance attributes for L,W and D.</p>
<p>ISCORRUGATED</p>	<p>To indicate whether the resulting design should be corrugated.</p> <p>If this attribute is not present, the design is understood NOT to be corrugated.</p>	<p>A Restricted Set of Text type.</p> <p>The values in the Restricted Set must be true and false.</p>
<p>GRAIN</p>	<p>To indicate the direction of the flute/grain of the design being created by running the standard.</p>	<p>A Restricted Set of Text type.</p> <p>The supported values for this attribute are Horizontal, Vertical and Standard.</p> <p>If the value chosen is Standard, then the created design will have the same flute/grain direction as the Standard that is being used.</p> <p>If no value is mentioned, then vertical is taken as default.</p>
<p>SIDE</p>	<p>To indicate the print side of the design that is created by running the standard.</p>	<p>A Restricted Set of Text type. The supported values for this attribute are Inside, Outside and Standard.</p> <p>If the value chosen is Standard, then the design created will have the same print side as the standard that is being used.</p> <p>If no value is mentioned, then the print side will be Outside.</p>

1. Create the **Restricted Sets** needed by your attributes as listed in the table above. See [Create a Restricted Set](#) on page 292 for details.
2. Create your attributes (the ones listed in the table above as applicable, and any other attribute you may need to run your particular CAD standards).
Assign the relevant Restricted Sets to your attributes. See [Create an Attribute](#) on page 294 for details.
3. [Create an attribute category](#) containing all the attributes you have just created.
4. [Add a Creation View](#) to your attribute category and click [Use Grid Layout](#).
 - a) Make the **BOARD** attribute **Required**.
 - b) If you are using the **ISSTANDARD** attribute, make it **Hidden**.
 - c) Change the **Visibility** of your other attributes as desired.

Tip: You can add use a **Label** to change how your attributes appear to the user (for example, you can show the **L** attribute as **Length**).

Note:

If you want to work with several CAD standards, you can either reuse this attribute category for more designs, or create more attribute categories.

Create an ARD Document Template

You now need to set up an ARD document template using the attribute category [you just created](#).

For this, you need to use an ARD document corresponding to the CAD standard in ArtiosCAD (same default design).

1. Set up your **Document Library** as explained in [Create Document Templates](#) on page 157.
2. Upload your ARD file into the **Document Library**.
3. Link the attribute category you just created to this ARD file.
4. Point to the **Document Library** in:
 - existing projects in which you want to create a design from a CAD standard,
 - project templates that will be used to create projects with designs from CAD standards.

See [Create Document Templates](#) on page 157 for details.

Run a Standard in an Existing Project

To create a design from a CAD standard in an existing project:

1. If your project isn't already linked to the **Document Library**:
 - a) In the **Project Details** page, click **Configure** then **Document Templates**.
 - b) Select **Template**, then select your document library in the list.

Documents 0 Tasks 1 Attributes Project Information Approval Members Security **Configure**

Workflow Connection **Document Templates** Project Creation Document Types Document Creation Project Statuses

Please select the Template or Project that will serve as a Document Library

Do not use a Document Library
 Template
 Project

When the Document library contains ARD files, how do you want to use these ARD files when creating a new Document?

Always run the ARD as a standard
 Run the ARD as a standard when the IsStandard Attribute is set to 'yes'
 Never run the ARD as a standard

Save

c) Under **When the document library contains ARD files...**, select either:

Note: Run a Standard option for CAD documents is available with WebCenter Life cycle Management license.

- **Always run the ARD as a standard** if you want to be able to use any ARD document template in the document library to run a CAD standard
- **Run the ARD as a standard when the IsStandard attribute is set to 1** if you only want to use some ARD document templates to run CAD standards.

These ARD document templates must have the **ISSTANDARD** attribute assigned, with the default value set to **YES** (see [Create an Attribute Category](#) on page 145).

d) Click **Save**.

2. Create a design from your ARD document template:

- Click the **Upload** button.
- Select **New** in the **Source** list and select your ARD document template.
- Fill in the **Attributes** as desired.
For example, specify the **BOARD** to use, and the **L** (length), **W** (width) and **D** (depth) of the design.
- Click **Upload**.

Note: This is only possible through the normal WebCenter upload (see [Uploading a Document via Upload](#) on page 587 and [Copy / Create Multiple Documents](#) on page 589), not the Java applet upload or when uploading documents from other applications like Automation Engine and ArtiosCAD.

Your design is created. You can click its thumbnail to view it in the Viewer.

Run a Standard at Project Creation

To create a design from a CAD standard when creating a project from a project template:

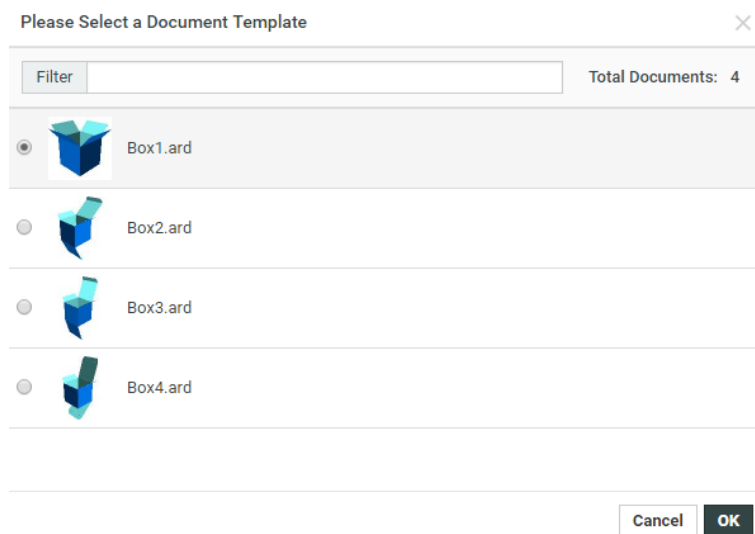

1. If your project template isn't already linked to the **Document Library**:
 - a) In the **Project Details** page, click **Configure** then **Document Templates**.
 - b) Select **Template**, then select your document library in the list.
 - c) Under **When the document library contains ARD files...**, select either:

Note: Run a Standard option for CAD documents is available with WebCenter Life cycle Management license.

- **Always run the ARD as a standard** if you want to be able to use any ARD document template in the document library to run a CAD standard
- **Run the ARD as a standard when the IsStandard attribute is set to 1** if you only want to use some ARD document templates to run CAD standards.

These ARD document templates must have the **ISSTANDARD** attribute assigned, with the default value set to YES (see [Create an Attribute Category](#) on page 145).

- d) Click **Save**.
2. When *creating a project from your project template*:
 - a) Click **New** in the **Documents** section of the **Create Project** page.
 - b) Select your ARD document template from the pop-up and click **OK**.

Tip:

If you have many ARD document templates, use the **Filter** field to filter them alphabetically on the file name.

You can also filter them based on document characteristics if you have created a custom project creation page to do so (see [Create a Project and Run a CAD Standard](#) on page 1016 in the Customization Guide).

- c) Fill in the attributes to use in the **Documents** section.
For example, specify the **BOARD** to use, and the **L** (length), **W** (width) and **D** (depth) of the design.

d) Fill in the rest of the project settings as desired and click **Create Project**.
Your project containing your design is created.

3.5.4. Canvas related Attribute Categories

A **document reference** attribute and two attribute categories are created by default in WebCenter during the installation or upgrade.

These will create a document reference system to contain different Canvas parts saved to WebCenter:

- The default **document reference attribute** named as **CANVAS PARTS**.
- This default empty **CANVAS REFERENCE CATEGORY**. This category will contain the **reference attributes** associated with the **CANVAS PARTS** attribute.
- The default **DEFAULT CANVAS CATEGORY** will contain the the **CANVAS PARTS**. This allows the ArtiosCAD Enterprise client to save managed parts as individual document reference values.

Note:

During an update, these **attributes** will get created if they do not exist yet.

3.6. CHILI

You can edit your documents online using WebCenter - CHILI Publish integration.

3.6.1. Configure WebCenter-CHILI Server Connection

Administrator users can configure the CHILI server connection in the admin section under the 'CHILI' menu, 'CHILI Setup' item.

In this page, the following fields must be specified:

- Address to the **CHILI server URL** example: <http://chili01/CHILI/main.aspx>
- **CHILI Share** example: \\chili01\chilishare
- Select the option **Use HTML5 Editor**, to open the CHILI documents in HTML5 Editor.
- Select the option **View in Preview mode (Document Attribute Category and CHILI view side by side)** to open the side by side view from thumbnail. [View in Preview Mode](#) on page 151

Note: Users can also view the Attributes and the Chili document side by side in the preview tab. This option requires Packaging Content Management license.

- **CHILI Environment Name** – name of the CHILI environment
- **User login/ User Password** – user login and password (defined within the CHILI environment)

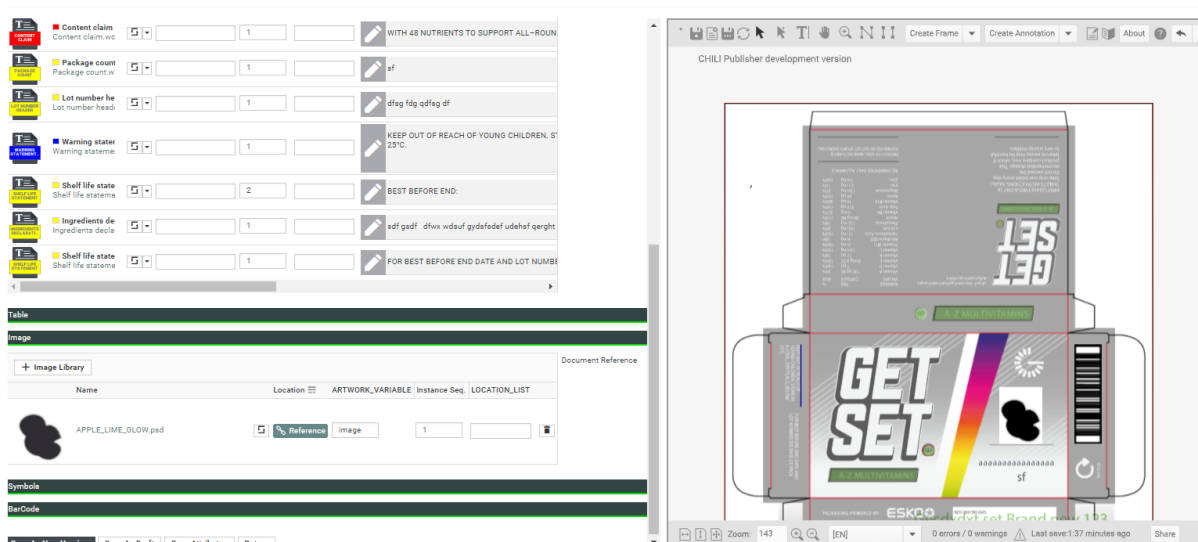

When the admin user clicks **Save**, the configuration is stored in the WebCenter database.

View in Preview Mode

From 18.0.1 WebCenter onwards, to view the preview of Chili documents along with the attributes side by side, enable **View in Preview mode (Document Attribute Category and CHILI view side by side)** option in the Chili Setup.

When you click on the thumbnail of any Chili document, you can preview the chili doc along with its attributes side by side.

You can save the changes to the attributes only without modifying the CHILI Document with **Save the Attributes** option. You can save the changes to draft or as a new version.

3.6.2. Upload a CHILI Package

In the Document Types page, a new type “CHILI” will be added. This document type will only be visible if the right license is purchased.

A CHILI Package has the .zip extension. When uploading a zip file in the single document upload page, you will now get the possibility to select “CHILI Package” as Document Type. If you upload the CHILI package with the extension .chp, it will be automatically recognized as a CHILI package, without having to select it. However, this is not an official CHILI extension. It is a way to make the upload go easier (e.g. it can be used for multiple file upload).

3.6.3. Locking behavior

When a user is editing a CHILI document in the editor, the document will be locked automatically. The document can be unlocked only manually, by saving a new version or by just exiting the editor without saving your changes as a draft. When the editor is opened in read-mode, however, the document will remain unlocked.

When a user has no editing rights and has no specific workspace assigned, the document will be opened in read-only mode. The editor will also be opened in read-only mode when the document is locked by another user or if it's not the latest version of the document. In the read-only mode, the file can still be viewed, but no changes can be made. The save buttons are not shown, but approval buttons will still be shown to approver if an approval cycle is ongoing.

The CHILI administrator is able to set up a customized read-only view. WebCenter will look for a workspace named "Read-Only" on the CHILI server. Only if that workspace is not found, the default CHILI read-only mode will be loaded.

Note: Draft versions are saved as long as the document is locked. When the document is unlocked, the draft version will be removed. To reset the document, the user can simply remove the lock and start the editor again. To save the changes permanently, the user will have to save the document as new version.

3.6.4. Download CHILI Documents

A user may want (or be allowed by the Administrator) to download different kinds of output of a CHILI document. Some will want to download the original CHILI package or the CHILI XML, while others want download a PDF file. An artwork creator will want the XML to update the master Illustrator document.

When the user wants to download a CHILI document, a page with the available formats will be shown. Users can have different permissions for different download formats. The 'CHILI Package' format is the default option in places where an explicit choice of a target Download Format is not available. If a user has none of the available Download Formats enabled for CHILI document type, he will not be able to download a CHILI document from within any Project.

The different download types are also supported in the SDK. A new parameter was introduced for the DownloadDocument.jsp SDK call

downloadtype: Name of the download format to download. If it is not specified, the default download type will be used.

Example:

http://mywebcenter.mycompany.com/WebCenter_Inst/DownloadDocument.jsp?username=myusername&password=YWjjZGVm&docversionid=00002_0000000018&downloadtype=PDF

Note: When a document is being edited (has a draft version), the downloaded version will not contain the changes of the draft.

Setup of different download types for a CHILI WCR Document

In order to maintain a highly secure environment – enabling/disabling CHILI Download Formats is only available for an Administrator user and is done for individual User/Group at a single moment. User settings can be derived from a sum of Groups Download settings for all the Groups that the User is a member of.

When a new Download Type is defined on the system level it is initially disabled for all Users and Groups in the system.

There are two levels of enabling or disabling CHILI download types. You can either do this system wide or per user/group.

If you want to disable or enable a download type system wide, you can go to the page “Admin > CHILI > CHILI Download Types”, where you have a checkbox with the available Download types. A default setup will have three download types pre-installed which are all enabled by default:

- Chili Package
- CHILI XML
- PDF

For the PDF output, PDF Export Settings named 'Default' must be defined at the CHILI server. An additional column is displayed at the 'CHILI download types' page with the name and availability check (icon) of the PDF Export Settings at the CHILI server.

If you want to set it per user or group, go to the user or group section and click on the user/group you want to give download rights. Then go to the download tab. You will see that the section CHILI Package is added, where all download types that are enabled system wide can be enabled or disabled (disabled by default) for that user or group.

For a user, if you click on “Use Group Permissions”, the CHILI download types are also updated with those of the groups the user is in.

3.6.5. Dynamically assign workspaces and constraints to CHILI Documents

CHILI workspaces can be assigned dynamically by matching workspace names with role names. When a user is assigned to a role in the project the CHILI document is in, WebCenter will look if the CHILI server has a workspace with the name of that role and assign that workspace upon loading the editor. E.g. If the user has the roles “Approver” and the CHILI server has a workspace “Approver”, the CHILI editor will be opened in workspace “Approver”.

If no workspace was assigned to the user, and that user has edit rights, WebCenter will look for the workspace name “Default” and assign it to the user. If the workspace “Default” was not found, the editor will open in real-only mode. If a user has multiple workspace/constraint matches, the user will have to select a workspace before the editor opens.

Note: For linked documents, the available workspaces are accumulated.

3.6.6. Loading Assets into the CHILI Editor

An asset is a WebCenter document that is uploaded in the project document library. At the Project/Template > Configure > Document Templates page, an administrator user can select a project or a template to serve as a document library.

For the CHILI document, documents from the document libraries of all projects the current document version is linked to can be used as assets. The documents/folders will be filtered out by the WebCenter security settings. In case of a project document library, the user must have download rights for the document/folder, to be able to use it as an asset. There are no restrictions on using documents from a template document library.

The external assets panel shows a tree structure, where each project/template represents a top level folder. For each document/asset a thumbnail is shown.

To set this up, the CHILI administrator has to add an "External Assets" panel within the workspace and leaves point the "Directory List URL" and "Asset List URL" to the WebCenter SDK with the following calls.

Directory List URL:

```
http(s)://<WebCenter_URL>/<WebCenter_Instance>/GetDocLibraryDirectoryList.jsp;jsessionid=%qs_sessionid%?docversionid=%qs_docversionid%
```

Asset List URL:

```
http(s)://<WebCenter_URL>/<WebCenter_Instance>/GetDocLibraryDocumentList.jsp;jsessionid=%qs_sessionid%?folderid=%id%&documentid=%qs_documentid%
```

Note: We don't support "Search URL" and "Post URL" options. Note that these calls can also be used for image variables pointing to external assets.

3.7. Project Management for Administrators

Most Project Management tasks in WebCenter will be carried out by dedicated members with the Project Manager role.

However, Administrator users have some additional options: they can view and edit all **Projects**, create project and document **Templates**, and **Find Locked Documents** in the system, so they can reset them.

3.7.1. Projects

The **Project Management** page (**Admin > Project Management > Projects**) lets members of the Admins group manage all projects in WebCenter.

For more information about managing projects, see the WebCenter User Guide.

3.7.2. Project Templates

Members of the Admins group can create and configure project **Templates**. Those are pre-configured projects that Project Managers use to quickly and easily create new projects.

You can manage all project templates from WebCenter's **Templates Management** page (**Admin > Project Management > Templates**).

- Click **Create a new template** in the header to create a new project template.

Note: You can also save a project as a template.

- Click the name of an existing template to edit it.
- To delete a template, select it in the list and click **Delete** in the actions menu. Click **OK** to confirm the deletion.

Note:

If you try to delete a template with a custom document creation setting and if this template is being used by other projects / templates, you will get an error message.

Go to the relevant projects/templates configuration tab and select another template before trying to delete.

Create a Template from Scratch

1. Click **Admin > Project Management > Templates**, then **Create a new template**.
2. In the **Create a new template** page, select **Start from a Blank Template** and click **Continue**.
3. Enter the **Template Name** and optionally a **Description**.
4. To use a custom thumbnail, select **Specify New Thumbnail** and Browse for it.
To use the default thumbnail, leave that choice selected.
5. Click **Finish**.

Your template is created. You can now define **Attributes**, **Upload a document to the template**, **Add project members**.

Create a Template from a Project Template

1. Click **Admin > Project Management > Templates**, then **Create a new template**.
2. In the **Create a new template** page, select **Use a Project Template** and click **Continue**.
3. Select the **Template** to use and click **Continue**.

Tip:

- Use the filter to only show certain templates. For Project Manager users and Project Creator users with limited visibility only the templates applicable are shown.
- Click a template to view its details in another window. Click **Close Window** to return to the **Create a new template** page when you are done looking at the template details.

4. Enter the **Template Name** and optionally a **Description**.
5. Choose the **Thumbnail** to use:
 - To use a new thumbnail, select **Specify New Thumbnail** and Browse for it.
 - To use the default thumbnail, leave that choice selected.
 - To keep the thumbnail of the project template you are using, select **Use Template Thumbnail**.
6. You can **Invite Members** and also create a new user to the project. To do this, Select **New Project Members** drop down and scroll down to **Create and Invite New User**.
7. Click **Finish**.

Your template is created. You can now define attributes, upload a document to the template, Add project members.

Note:

- The project template is created with the same folder structure, documents, characteristics, attributes, discussions, members, and security as in the original template.
- Any documents in the template are copied into the new template as new standalone documents, even if they were linked documents in the template.
- Any documents in the template are copied into the new template as new standalone documents, even if they were linked documents in the template.

Save a Project as a Template

1. Create the project as desired, or open an existing project.
2. On the Project Details page, click **More actions** and **Save as Template**.
3. Enter the name of the template and a description in the appropriate fields.

To use a custom thumbnail, click **Specify New Thumbnail** and enter the complete path and filename in the associated field or **Browse** for it. To use the default thumbnail, leave that choice selected.

4. Click **Finish**.

The template is created.

Configure Project Creation Terminology

It is possible to change the terminology used for project creation so that the Project Creation page talks about "Designs" instead of "Documents", or "Client" instead of "Customer", for example...

You can achieve this by customizing the terminology in the attribute category of the project or template used as a basis for project creation.

You need to:

1. Make an attribute category with *custom project creation terminology*.

Attention: Your custom terms will not be automatically translated, and will show **as you enter them** for all languages in which you run WebCenter.

2. *Make a project template* (or a project that will be used to create other projects) using that attribute category.

Users creating projects from this project template will see your custom terminology on the Project Creation page.

Configure Customized Document Rendering in projects

You can configure the **Upload Document** section, when a new project is created from an existing project or a project template. Ensure that the upload document is enabled in the **Project Source** or **Project Template**.

To customize the upload document section in the Project Creation form, navigate to **Projects > Configure > Document Rendering** in the Project Source or Project template.

You can read on how to customize at [Create an Advanced Table Rendering](#) on page 367.

3.7.3. Document Templates

As an Admin, you can create and configure **Document Templates**. These templates will serve as "dummy" documents (placeholders) that have a document type, file format, and attributes already specified. This information will be useful to real-life projects.

Those document templates will be used by Project Managers / other users to create **document placeholders** for future project documents.

For example:

1. You (the Admin) create a Document Library Project containing the document templates, and project templates referring to that document library (see [Create Document Templates](#) on page 157).
2. When creating a project from one of these project templates, the Project Manager will create placeholders from the document templates, to mark where the project deliverables should go.
3. When using the **Upload** function, a project member (with the **Add** right) can also create a placeholder from a document template, to indicate the characteristics (document type, file format, and attributes) of the final document to be uploaded.

Note: This is only possible through the normal WebCenter upload (see [Uploading a Document via Upload](#) on page 587 and [Copy / Create Multiple Documents](#) on page 589), not the Java applet upload or when uploading documents from other applications like Automation Engine and ArtiosCAD.

Create Document Templates

1. Create a Project Template that will contain all your document templates (this will be your **Document Library**).

Having all the document templates in one location makes them easier to manage, and saves disk space.

2. If desired, create a folder to contain your document templates.

Note: If the project in which placeholders are created contains a folder with the same name, that folder will be used as default destination for the placeholders.

3. To create document templates:

- a) Upload a document of the right file format into the **Document Library**.

You can use any document type (enabled in the [Preferences](#)) except Page Lists.

- b) Define attributes for your document template: choose an Attribute category and fill in default attributes values.

Note: When users will create documents from this document template, they will inherit these attributes (and default values).

- c) Repeat for all document templates you want to create.

Tip:

- If you want a document template to always be used when creating placeholders of a certain file type, call it `Default.<extension>`, using the extension of that file type. For example, call it `Default.pdf` so it is always used when users create `.pdf` placeholders (in projects using document templates from the **Document Library**).
- You can also create a generic document template called `Default` (without the extension), that will be used automatically for file types who don't have a `Default.<extension>` template associated. For example if a user wants to create a `.png` placeholder but there is no `Default.png` document template in your Document Library, then the `Default` template will be used.

4. Create a Project Template for each kind of project that will be required by Project Managers.
5. In each of these Templates **configure** the **Document Library** as follows:
 - a) In the **Project Details** page, **Configure > Document Templates**.
 - b) Select **Project** or Template and select your document template library from the drop-down.

- c) If your document library contains ARD files, and you want to use them to [run ArtiosCAD standards](#), select either:
 - **Always run the ARD as a standard** if you want to be able to use any ARD document template in the document library to run a CAD standard,
 - **Run the ARD as a standard when the IsStandard attribute is set to 1** if you only want to use some ARD document templates to run CAD standards. These ARD document templates must have the **IsStandard** attribute assigned, with the default value set to 1. Select **Never run the ARD as a standard** if you are not working with CAD standards.

d) Click **Save**.

Projects created from one of those project templates will keep the project template's link to the document library.

Project Members can then create placeholders from the document templates in the document library.

Note:

If you know that the Project Managers will always use the same set of placeholders in all their projects, you can also:

1. Create a document library Project Template.
2. Add Document Templates to the Project.
3. Go to **Project Details > Configure Document Templates** and select the same Project in the **Templates** list.
4. Project Managers can create projects directly from this Template to have the Document Templates as placeholders.

Note that this approach is less flexible!

3.7.4. Project Creation Settings

As an Admin user, you can configure the **Project Creation Settings** for a project or template. You can find these settings in the project or template's **Configure** section, under **Project Creation**. These settings define what is displayed on the **Project Creation Page** when you create a new project from this project or template.

First of all, you can choose whether you want to **Use Auto Naming** and define the naming scheme.

Furthermore, you can choose what features are displayed on the **Project Creation Page**. You can choose the following options:

- **Set Project Manager:** Show/hide the project manager selection on the project creation page. If you hide it, the project manager will be the same as used in the template or parent project. If you choose to show this section, it will default to the person creating the project.
- **Set Status:** Show/hide the project status selection on the project creation page. If you hide the project status, the new project will be created using the first available active project status.
- **Set Customer:** Show/hide the customer selection. You can make this a required field. Hide this field to use the customer set in the source project or template.
- **Set Description:** Show/hide the description field. You can make this as a required field.
- **Set Due Date:** Show/hide the due date selection. You can make this as a required field.
- **Upload Documents:** Show/hide the documents section. You can make this section required, so that the project creator has to add at least one document.

Note: You can configure the document upload section in the source project or the project template. Refer to [Configure Customized Document Rendering in projects](#)

- **Assign Roles:** Show/hide the role assignment section. You can decide for each role whether it is required to assign a group or user to it and/or whether you can assign multiple users or groups to this role.

- **Invite other members:** Show/hide the members section to enable/disable adding additional members to the project.

Note: When the Admin Users or the User creators assign Roles, deactivated users are shown in the drop down who can be activated and added to the project. User creators have access to only activate the users they created, whereas admin users can activate any deactivated users.

- **Set Attributes:** Show/hide the attributes section. You can show or hide the creation view of the project attributes of the source template or project.
- **Select Thumbnail:** Show/hide the project thumbnail section. If you hide this section, the thumbnail of the source project or template will be used.
- **Set Planning (Tasks):** Show/hide the task planning section. You can make these fields required.
- **Default Planning Method:** You can set the default planning method to **Forward** or **Backward**. Even if the Set Planning section is not displayed, the setting you choose here will be used for the new project.

3.7.5. Document Creation Settings

As an Admin user, you can configure the **Document Creation** settings for a project or template. You can find these settings in the project or template's **Configure** section, under the **Document Creation** tab.

When a project manager creates a project based on a template or an existing project, you can add **Documents** using the Default options or Custom options.

You can create a **custom** document creation set up in your template. In this setup, for each row in the configuration, a link is added to the specified section in the same order.

- **Default**

The default document creation options will be:

- **Browse**
- **Copy**
- **New** (when a template library is configured)

Note: **New** document creation is only possible if a **Document Template** library is linked in this template. Read more in: [Create Document Templates](#) on page 157.

- **Another Template's Document Creation Setup**

Use this to copy a setup from a template with a custom document creation set up.

- **Custom**

When you select this, you will see a list of customizable options:

Source	Where the document will be sourced from.
Label	The link description. You can create a custom label, such as Upload a graphic file.

	<ul style="list-style-type: none"> • Standard • Simple • Translated
Details	<p>Additional information such as:</p> <ul style="list-style-type: none"> • Allowed Extensions • Document Template Selector <p>Here you can select the already specified document templates. Read also: Document Templates on page 157</p>
Operation	<p>The operation depends upon the Source button. For example, if you have chosen Project+Folder, the operations would be Copy, Move or Link the document</p>
Sections	<p>The configured upload source is made available in these sections. By default, all the options will be available and enabled. You can deselect the sections to disable some of the locations.</p> <ul style="list-style-type: none"> • the Project Creation Documents • the Project Creation Bill of Materials • Bill of Materials • Upload (Copy or Create Multiple Documents)
Target Folder	<p>The destination folder</p>

To add a new source type, click **Add Document Source**. The document sources in the list can be deleted by clicking the delete icon.

You can configure:

- a simple **Browse** link for the user to upload a document.
- **Document Templates** from the template library. This will serve as a place holder with pre-configured settings such as attribute categories. Read more about templates in [Document Templates](#) on page 157.
- **Current Project**
- **Saved Search:** Use this option to allow the user to select a file from a saved search. When the user clicks the document reference as a link (with a custom **label**), saved search results will appear in a pop-up with all the configured options.
- **Asset Management System:** Use this to allow selecting a file from the configured Asset Management Systems. Read more in [Configure Asset Management Connections](#) on page 407

If you want to delete a template with a custom document creation setting, make sure that it is not being used by other projects/templates for document creation. If it is being used, you have to select another template in the relevant projects/templates before attempting deletion.

3.7.6. Document Types

As an Admin user, you can configure settings for each of the **Document Types** for a project or template in **Configure > Document Types**. These settings define what happens when you add documents to your project.

The settings are organized per **Document Type**. Per type you can set the following options:

- **Automatic Document Naming:** Use this setting to enable/disable autonaming for a specific document type. Choose **None** to disable autonaming. Choose **Default** to use the system wide autonaming settings or choose **Custom** to enter a specific naming scheme for this project or template.
- **Default Attribute Category:** Use this setting to assign an attribute category to a specific document type. Choose **None** to not use a default attribute category. Choose **Default** to use the system wide settings or choose **Custom** to select a specific attribute category.
- **Start Task for new Documents:** Use this setting to start a task of the specified type when adding a document to the project. The task is automatically started, assigned to the uploader and the uploaded file is linked to the task. Choose **None** to not start a task upon upload. Choose **Default** to use the system wide settings or choose **Custom** to select a specific task type.
- **Start Task for new Versions:** Use this setting to start a task of the specified type when adding a new versions of a document to the project. Choose **None** to not start a task upon upload. Choose **Default** to use the system wide settings or choose **Custom** to select a specific task type.

3.7.7. Create Project Thumbnails Automatically from Documents

As an Admin user, you can configure a setup to create automatic thumbnails from the document images.

When a new graphics or CHILI document is being uploaded to a Project or Template, the user will have an option to check if the document image needs to be taken as the Project Thumbnail.

If this option is checked, the Project thumbnail will be set as the document image after **checking and registering**.

1. Create a text **Attribute** called **Make Project Thumbnail**.

2. Set **Values** to **Restricted Set**.

Create the check box by entering **Yes** and **No** as values of the restricted set. The values are case sensitive.

3. Create an **Attribute Category** and include **Make Project Thumbnail** in the attribute.

4. Create a **Project Template**.

5. In the project template, go to **Configure > Document Types**.

6. Specify the **Default Attribute Category** as the Project thumbnail Attribute category for the desired document types.

The user has to select **Make Project Thumbnail** during the upload of documents to use this feature.

Attributes:

Name	Value	Type
Make project thumbnail	<input type="checkbox"/>	yes or no

Note: When multiple documents in a project have the attribute **MAKE PROJECT THUMBNAIL** set, each upload overwrites the previous thumbnail in the natural sequence they happen. In case of multi-document upload at the same time, thumbnail can be set from any of the document based on the sequence they are returned from OBGE.

If the documents are published from **Automation Engine**, (when the view files are generated on AE and not on the OBGE), then the project thumbnail will not change.

Changing the project thumbnail on upload is guaranteed to work, only if the upload is through WebCenter.

3.7.8. Deleted Projects and Templates

Admin users can view the list of deleted projects or templates in the system by navigating to **Project Management > Deleted Projects and Templates**.

The list is by default sorted by modification date showing the most recent deleted project first but sort can be performed on any other columns as well. The filter section at the top allows searching for particular projects. You can click on the project name to see the history of the deleted project/template containing all the events logged during the life cycle of the project/template, for example who deleted the project. The deleted projects and templates are only shown until the cleanup tool is run.

3.7.9. Project Statuses

The **Project Status** feature allows you to review the current project standing. This feature can be accessed by an Admin user or a member of the Admin group, Project Managers and an User.

An administrator can add statuses in WebCenter. This works similar to task statuses (whereas the statuses are not shared). A status has a name, an icon and a type. The types are Non-active, Active and Completed. The WebCenter has the functionality to limit the actions possible in not-active and completed projects. It is most typical to add active statuses, for example: **Briefing, Design, Prepress, Printing**. An administrator can limit the statuses for a project and this can be done for every project separately.

The project status is displayed in the project header (and in available other locations such as search):

Note: This can be set as read only. Read more at [Prevent direct changes to Project Status](#) on page 170

The Project Manager can perform following:

- Set the Project Status.
- View Project Status.
- Search Project Status and Filter projects based on Project Status.

An administrator can limit the statuses for a project and this can be done for every project separately. Go to a project or a template as an administrator and click on the **Configure** tab. By using **Add Project Statuses** and Remove Project statuses (select with the check boxes and take remove from the action drop down), you can get a specific set of statuses.

An Administrator can link milestones to project statuses to see the timeline of projects in a [calendar view](#) by setting up a date/time attribute for project statuses. Each active status can have a date/time attribute linked and the same date/time attribute can be used multiple times with different offsets. The linked date indicates the intended end of the project phase, but will not trigger an automatic project status change. The actual date will depend on the related attribute value in the project context.

The administrator can decide the sequence of the statuses. This sequence is purely used for sorting. When the projects are sorted based on Project Status, this is the sequence used. The sequence is system wide.

Apart from showing the Project Status in many project overview pages (and also in the search results), the project statuses can be used in the Workflows. For example: To decide different operations or assignees depending on the current project status.

Note: By using the **Set Project Status** node in Workflow, you can set the status for the current project.

In the following example, let us consider five statuses allowed for this project. The Project Statuses are set as 01 - Briefing, 02 - Concept, 03 - Artwork, 04 - Prepress and 05 - Closure. The WebCenter has many more statuses, but only these statuses are allowed for this project. The statuses are in this sequence in the entire system.

Note: You can only decide per project whether you can have these statuses, but you cannot change the sequence of the statuses per project.

Project: Lumi+ Purple **03 - Artwork (In Progress)**

Viewing a List of Project Statuses

The available Project Status can be viewed in the **Project Status** page. In the Project Status page, you can add, edit and delete the Project Status. You can also choose or add an icon, a color for the Project Status and decide the sequence of the statuses.

1. Click **Admin > Project Management > Project Status**. The Project Status page appears.

Project Statuses

<input type="checkbox"/>	Display Order	Name	Language Key	Active	Color	Icon	File
<input type="checkbox"/>	1	01 - Briefing In Progress		Active	Esko Green	Briefing In Progress	Select Icon <input type="button" value="Choose File"/> No file chosen
<input type="checkbox"/>	2	01 - Briefing At Risk		Active	Orange	Briefing At Risk	Select Icon <input type="button" value="Choose File"/> No file chosen
<input type="checkbox"/>	3	01 - Briefing On Hold		Active	Red	Briefing On Hold	Select Icon <input type="button" value="Choose File"/> No file chosen

Adding a Project Status

You can add a new Project Status through the **Project Status** page. You can also choose or add an icon, a color for Project Status and decide the sequence of the statuses.

1. Click the **Add Status** button on the **Project Status** page.

- In the **New Status page**, type the **Name** of the status and select the **Project Status type**.

You can add multiple statuses at a time. When the new status is marked as Active, it is added just behind the previous active status. When the new status is marked as Non Active or Completed, it is added at the end of the Project Statuses list with no rules applied.

New Statuses

Clear this Form

#	Name	Project Status Type
0	<input type="text" value="Project Started"/>	Active ▼
1	<input type="text" value="Project In Progress"/>	Non-active ▼
2	<input type="text" value="Project Discussion"/>	Active ▼
3	<input type="text" value="Project Testing"/>	Active ▼
4	<input type="text" value="Project Completed"/>	Completed ▼
5	<input type="text"/>	Select ▼
6	<input type="text"/>	Select ▼
7	<input type="text"/>	Select ▼
8	<input type="text"/>	Select ▼
9	<input type="text"/>	Select ▼
10	<input type="text"/>	Select ▼

- Click the **Save** button to make changes. The Project Status page appears with the new status.

Note: The new status will get a default color and no icon added to it. This can be changed in Project Status page.

Editing a Project Status

You can edit the existing or newly added Project Statuses through the **Project Status** page. In the Project Status page, you can change the Name, Language key, Sequence number, Add Icon and Set Color.

Project Statuses

+ Add Status		Delete								
Display Order	Name	Language Key	Active	Color	Icon	File				
<input type="checkbox"/>	1	01 - Briefing In Progress	<input type="checkbox"/>	Active	Esko Green		Briefing In Progress	Select Icon	Choose File	No file chosen
<input type="checkbox"/>	2	01 - Briefing At Risk	<input type="checkbox"/>	Active	Orange		Briefing At Risk	Select Icon	Choose File	No file chosen
<input type="checkbox"/>	3	01 - Briefing On Hold	<input type="checkbox"/>	Active	Red		Briefing On Hold	Select Icon	Choose File	No file chosen
<input type="checkbox"/>	4	01 - Briefing Complete	<input type="checkbox"/>	Active	Dark Green		Briefing Complete	Select Icon	Choose File	No file chosen
<input type="checkbox"/>	5	02 - Design In Progress	<input type="checkbox"/>	Active	Esko Green		Design In Progress	Select Icon	Choose File	No file chosen
<input type="checkbox"/>	6	02 - Design At Risk	<input type="checkbox"/>	Active	Orange		Design At Risk	Select Icon	Choose File	No file chosen
<input type="checkbox"/>	7	02 - Design On Hold	<input type="checkbox"/>	Active	Red		Design On Hold	Select Icon	Choose File	No file chosen
<input type="checkbox"/>	8	02 - Design Approval	<input type="checkbox"/>	Active	Light Blue		Design Approval	Select Icon	Choose File	No file chosen
<input type="checkbox"/>	9	02 - Design Complete	<input type="checkbox"/>	Active	Dark Green		Design Complete	Select Icon	Choose File	No file chosen
<input type="checkbox"/>	10	03 - Artwork In Progress	<input type="checkbox"/>	Active	Esko Green		Artwork In Progress	Select Icon	Choose File	No file chosen
<input type="checkbox"/>	11	03 - Artwork At Risk	<input type="checkbox"/>	Active	Orange		Artwork At Risk	Select Icon	Choose File	No file chosen
<input type="checkbox"/>	12	03 - Artwork On Hold	<input type="checkbox"/>	Active	Red		Artwork On Hold	Select Icon	Choose File	No file chosen
<input type="checkbox"/>	13	03 - Artwork Approval	<input type="checkbox"/>	Active	Light Blue		Artwork Approval	Select Icon	Choose File	No file chosen
<input type="checkbox"/>	14	03 - Artwork Complete	<input type="checkbox"/>	Active	Dark Green		Artwork Complete	Select Icon	Choose File	No file chosen

Type the sequence number in the **Display Order** column to change the sequence number. The change in sequence number appears only after saving the changes.

The language string key has to be added to the XML formatted language key file (wcstrings_<2 character ISO language code>.xml for English: wcstrings_en.xml) for all used languages. By default the language (en) has to be added.

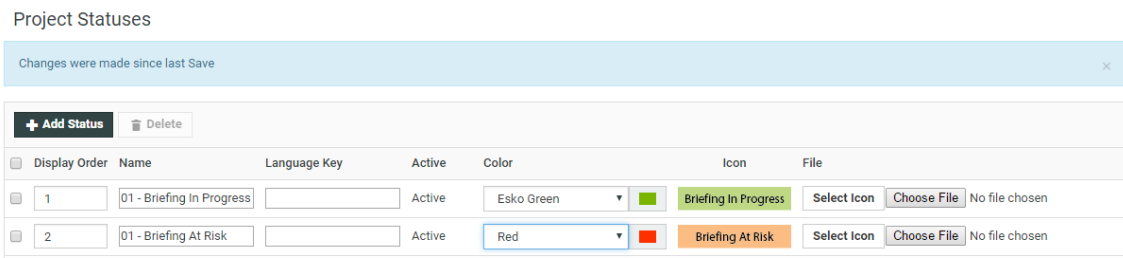

Note: The language key field is not mandatory. If you want all languages to follow the same names (Not translated stage names), you leave the language key field empty.

Type the **Name** of the Project Status to change the Project Status name and click the **Save** to make changes.

The new status will be set to Esko Green as default color. You can select a **Color** for a dropdown for each project status. This color will be used in the calendar-view of the project overview.

Note: You cannot add your own new color.

Once you select the required color from the drop down list, click the **Save** button to make changes. Here, the Color is changed to Red.

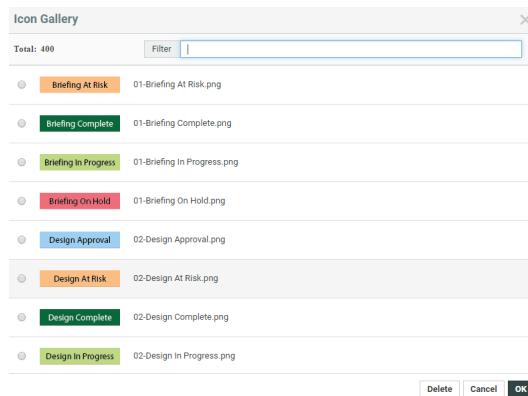

You can change an icon for the existing Project Status in the Project Status page. The Project Status icon can be selected from the Icon Gallery or you can also upload an icon. WebCenter allows JPG, JPEG, GIF, BMP and PNG file types as icons.

Note: The UI is optimized for an icon height of 16 pixels. Icons will be placed in overviews without any scaling.

Click the **Select Icon** button, to select the required icon from **Icon Gallery**.

In the **Icon Gallery** window, select an icon via the radio button and click the **OK** button. The gallery allows filtering of icons by its name.

Click the **Browse** button to upload an icon of your choice. The icons can be re-used for other statuses.

Note: You can change the icon of the built-in Project Statuses. When no icon is set, the name of the status is used instead.

Deleting a Project Status

You can delete a Project Status and this status will be marked as deleted/obsolete in the WebCenter database. When a project status is marked as deleted, it will no longer appear in any of the locations where a Project status can be selected. The Projects and Templates having the deleted status will still keep this status. You can however no longer change projects to the deleted status. To delete a Project Status,

1. Select the required Project Status and click on **Delete** in the **Actions** menu.
2. Click the **OK** button to confirm the deletion.

Customizing a Project Status

An Administrator can set allowed statuses for Templates or for Projects. By doing this an Administrator can limit the number of Project Statuses to be used for a specific project. When adding a new project status to the system, this status will be also added to all projects and templates. When a project is created from a template or from another project, it inherits the allowed statuses from its source. This happens only once and does not happen when the template changes later.

1. Log in to WebCenter as an Admin user.
2. Click the **Admin > Project Management** and select **Projects** or **Templates**.
3. Click the required Project or Template link from the list.
4. Click the **Configure > Project Statuses**. This displays a table with the current allowed statuses for this Template or Project.
5. Select the required Project Status from the list and then click the **Add Project Statuses** link.

Note: By default a blank Project will get the list of all statuses as allowed statuses.

6. Click the **Save** button to make changes.

Note: The Project Status cannot be re-ordered here, the order is inherited from the system order.

You can remove allowed statuses for a template or project by selecting the status and select **Remove** from the **Actions** menu.

Searching based on a Project Status

You can search for projects based on their Project Status. Choose **Search** from the menu bar and select Project or Tasks and Approvals. On the (advanced) Project Search page and the Task Search page, the list box will contain the list of all the Project Statuses.

In addition to all individual project statuses, the list also contains the following:

- Show All (default): show all projects (or tasks of all projects).
- Show All Active: show only projects or tasks of projects with an active status.
- Show All Not Active: show only projects or tasks of projects with a non-active status.
- Show All Completed.

You can also search on **Project Status Started, Project Status Due, Project Status Completed, Project Status Duration, and Project Status Time Left** in the **Project Search** page.

Filtering based on Project Status

In **Favorite Projects, Projects I Manage, and in Projects I am Invited to**, you can filter on all Project Statuses individually. You can also use the filters to look for a combination of statuses: Show All, Show All Active, Show All Not Active, Show All Completed.

Setting a Project Status to Active or Non Active

An Administrator can set a project to Active by giving it an Active status. Whether a status is active or not is determined when the status is added.

If a project has been set to a Non Active status, by default the permissions for all members are masked with the View and Download permissions, so that these two permissions are still enabled if and only if they were enabled already, while all other permissions are disabled.

However, whether certain actions can still be performed in non-active projects, also depends on the security settings for the system. An Admin user can change these settings on the **Security** page (**Preferences > Security**). It is possible to allow or disallow changing attributes, changing members and document operations in inactive projects.

Prevent direct changes to Project Status

As an Admin user, you can prevent project status changes by the project manager. When this option is enabled, the project status becomes read-only in the header of a Project.

To prevent direct change to Project status, navigate to **Projects > Configure > Project Statuses** in the Project template and disable the option **Project Status can be modified by Project Manager**. All the projects (also previously) created from the template will adhere to this setting.

By default, the option is checked in the template, and allows Project Managers to change the Project Status.

However, the Project status can still be changed:

- when a task is completed and the task is configured to change the project status on completion
- when a workflow node changes the Project Status
- by admins via an SDK call changing the project status
- by admins in a saved search allowing to change the project status.
- if the project is not created from a project template.

3.7.10. JavaScript Rule Action

Admin Users can use the **JavaScript Rule Actions** to execute JavaScript from a rule without a workflow. In the **JavaScript Rule Actions** you can **Add** a rule, Edit or delete the rules.

Add JavaScript Rule Action

You can customize **Rules** to perform specific actions. This can be done by adding rules which are written and executed in JavaScript.

To add a rule in JavaScript:

1. Click **Admin > Project Management > Add JavaScript Action Rule** .
2. A **Edit JavaScript Rule Action** window is opened on selecting this option.
3. Enter the name for the rule, description and the script. Save the Rule to view the list of JavaScript Rules.
4. To edit an existing rule, double-click on the **JavaScript Rule Action** from the list. To delete the rule, click once to enable the delete icon on the row selected.

View JavaScript Rule Action

1. Click **Admin > Project Management > Find Locked Documents**.
2. Either filter for users by entering (part of) their last name in the **Search users by last name** field, or click **Go** right away to see all locked documents.
3. Select the document(s) to unlock by selecting the corresponding boxes.

4. Click **Unlock checked items**.

3.7.11. Delete View Files

View files (that make files viewable in the WebCenter Viewer) take a certain amount of disk space. If necessary, Admin users can delete those view files.

Note: You can only delete view files per project (for all of the project's documents at once), not per document.

1. Use the [Search](#) to find the projects whose view files you want to delete.
2. Select the projects whose view files you want to delete, and click **Delete View Files** in the actions menu .

Confirm your choice by clicking **OK**.

Note: When deleting view files, Viewer annotations, document metadata and thumbnails are kept.

You can see that the view files have been deleted on each document's **Documents Details** page.

Regenerate View Files

Users can regenerate documents' view files as needed provided that:

- they have the **View** permission on those documents,
- those documents' view files can be regenerated.

Note:

Most view files can be regenerated, except for:

- page lists coming from Automation Engine,
- documents uploaded via Automation Engine with the **Upload only view files** option.

If you need to regenerate the view files:

1. Go into the project whose view files you deleted.
2. Select the documents for which you want to regenerate view files.

- 3. Click **View and Annotate** in the actions menu.

3.7.12. Configure a Landing Page for a Role

Administrators can configure the start page of a Project per Role in the Project Template. This means that when a particular Role-User come into the Project Details, he or she will see the specified **Landing Page** first. This feature allows you to configure different start pages for different types of users(Roles).

To configure **Landing Page** per Role:

- Go to **Project Template > Details > Configure > Landing Page** section. Click **New Landing Page**.

Role	Landing Page	Details
<input type="checkbox"/> Legal	Documents Page	Folder name or empty for root folder
<input type="checkbox"/> Marketing	Attributes Page	Attribute Category View or empty for Default view
<input type="checkbox"/> Technical	Tasks Page	

Save

- Specify the **Role** and the **Landing Page**. Choose from the following pages.

Options	Description
Documents	Specify the folder in the Details section.
Attributes	Specify the Attribute Category View in the Details section. Note: If you leave this section empty, the user will see the Default View .
Saved Search	Specify the name of the Saved Search in Details . Note: The Role-user will be directed to the Saved Search which is plugged into the User's <i>Project Details</i> menu.
Approval Page	Details section is read-only.
Tasks	Details section is read-only.
Bill of Materials	Details section is read-only.
Dashboard	Choose the dashboard that you require as landing page. You can also create a new dashboard from this drop down.

- The Landing Page configuration is copied when you copy a Template or Project.

- When you **export** your template, the landing page configuration is included in the XML.

3.7.13. Configure Rules in a Project

What is a Rule?

You can configure a **Rule** to execute specific **Actions** based on one or more Trigger events. The Rule sets reside in Project Templates and will be applicable in all Projects created from them, including the previously created ones. This administrator feature lets you establish communication between Child and Parent Projects or between any two Projects. See an example use case at the end of this chapter.

Note:

You need the **WebCenter Task Management Advanced** or **WebCenter Life Cycle Management** license to be able to define Rules.

To set up **Rules**, go to **Project Template > Configure > Rules** tab.

Triggers

A **Trigger** is an event that happens in the system (for example, the Child Project Status changes to **Completed**). A successful Trigger condition will execute a Task based **Action**.

You can specify multiple triggers and actions in a Rule. When one Trigger event(as specified in the Rule) happens, the system evaluates the Rule and executes the corresponding Action(s).

See the supported Triggers below:

- **Project Status Change:** The **Action** is executed when the Project Status changes.
- **Project Attribute Change:** The **Action** is executed when the specified Project Attribute changes. You can specify the attribute from a drop-down.
- **Project Due Date Change:** Any change in the Project Due Date will trigger the specified **Action**.
- **Date/Time Reached** trigger lets you define an exact time stamp to execute the Rule. When the server time passes the Trigger time, the Rule will be executed. There are 2 options:
 - Specific Date: the actions will be executed on the specific date and time
 - Date in Project + Offset: the actions will be executed on the selected Project Due Date or Date/Time attribute plus or minus an offset of days and/or hours.

Note: The calculation is done in working days/hours.

Actions

- **Start Task:** This action launches a Task in the same Project where the Rule is configured. Specify the **Task** by selecting it from the drop-down.
- **Execute Javascript:** This action launches a specified **JavaScript Rule Action**. You can specify one from the **Javascript Rule Actions** configured in the system.

It is possible to configure multiple actions by clicking on the '+' sign. Use 'x' to remove existing actions.

Example

See the example of a Project Template's Rule below. This Rule gets executed when the specified Date/Time Reached.

Edit Rule

Rule Name *

Enabled

Description

Order

When any of these Triggers occur

-

Perform Action(s)

-

Warning: Calculating date/time triggers can potentially take a while. This rule will be applied in 4 projects.

The Javascript Rule Actions are configured in **Admin > Project Management > JavaScript Rule Actions**. See the example script below.

```

var children = API.getProject().getChildProjects();
if(children.length > 0){
    var atRisk = false;
    var inDelay = false;
    for(var i = 0; i<children.length; i++){
        var child = children[i];
        if(child.getStatusName() != 'Completed'){
            atRisk = true;
        } else if(child.getStatusName() == 'Non-active'){
            inDelay = true;
        }
    }
    if(atRisk){
        API.getProject().getAttribute("mvbe Campaign State").setValue('At risk');
    } else if(inDelay){
        API.getProject().getAttribute("mvbe Campaign State").setValue('In delay');
    } else {
        API.getProject().getAttribute("mvbe Campaign State").setValue('On schedule');
    }
}

```

```
}
```

Two days before the milestone, this Rule will get executed. Depending on the child Projects' statuses, the Program Project's status will be updated.

3.8. Advanced Search Setups in WebCenter

3.8.1. Advanced Searching

There are advanced search features using which you can design and create dedicated search pages. You can:

- Save a **Search** with advanced settings.
- Find assets which were stored in WebCenter with certain **Attributes** or with a certain project criteria. This will help you to:
 - Find, collect and download pictures for a certain product line. You can also send these as [download links](#).
 - Search according to criteria to find required Packaging types: for example Carton Boxes.
 - Search based on **Project Status**. For example, you can find all projects with a status **Initial design**. Display the Project Status as text, icon, color or both. Select your Project Status setting as **Show Color Label** to get the project status bar in your search.
- Perform bulk operations.
- Refine **Search Results** using a search parameter panel. Using this, users can limit the list of items to be searched.
- Define the sequence of columns in results.
- Create dedicated **Global Saved Searches** for Users. Global Saved Searches are accessible to all users and hence advanced search option access can be given judiciously to users. You can customize these as **Asset Browsers** which can be incorporated into the menu.
- Create Saved Searches with [Projects Calendar View](#) on page 196.
- You can search by selecting multiple options in drop downs or even type the text to search.
- If an action has been done as delegate of another user, it is shown in the corresponding field in search results. For example, in the field **created by** for a task search.
- Click on any of the gear icon in the date/time fields to **Show Time** except for attributes and search is either sorted or filtered on this. For Project Status, gear option gives the configuration options like Automatic or Label and Icon, Only Icon, Only Label, and Color

Label. For **Pending Approvers**, gear option gives configuration option to **Show Assignee details (original Group /Role)**.

3.8.2. Creating Advanced Saved Searches

Normal and keyword searches may be saved for future use as a **Saved Search** and can be plugged into menu items (of the main menu or Project details menu), **My Work** and as a document source during project creation and in document referencing.

To access saved searches, click **Search > Saved Searches**. Shown below is a sample Saved Searches page.

Searches can be saved as:

- a **Personal** search visible only to the individual user.
- a **Global** search visible to all WebCenter users.

Note:

1. For each Global Saved Search, an Administrator can determine a set of Groups/ Companies/Locations whose members can view this Saved Search.
2. It is not possible to set Visibility for Personal Saved Searches.

Saved Searches can be configured with advanced *Drilldowns* and extensive and visually enhanced *Dashboards*. You can plug these

- To execute a Saved Search, simply click its name from the **Saved Searches** page. Or select it from the Search window in the menu bar.

- To edit a saved search, click **Edit Search**.
- To **Make Search Personal**, click
- To **Make Search Global**, click
- **Smart Names** enabled Searches do not have the **Make Search Personal** option.
- To create Global Saved Searches dedicated to a company or group, click **Edit Visibility** link. In the next window, select the **Available Groups, Available Companies/Locations** to whom you want to give the exclusive visibility. In this case, if you assign the visibility to a group, a company or location, the search will be visible to either the group or the company or both.

- Visible to all
- Visible to selected Groups and Companies

Available Groups

Please select or start typing... ▾

Available Companies/Locations

Please select or start typing... ▾

All Locations ▾

Add

Note:

If you select a company without specifying any of its locations, all the company locations will be able to access the saved search.

If you remove the **Available Groups/Companies /Locations**, the visibility settings will be modified.

- To delete saved searches, select them and click **Delete**. Use **Select All** and click **Delete** to delete all of them.

Search Panel Design

The saved searches can be setup for Projects, Documents and Tasks and Approvals. These saved searches can be edited by an administrator. The administrator decides for each saved search (and for each operation) whether these operations are allowed or not.

All users can design searches via the Search Results options. However, administrators get an extra check box **Search Panel Design**.

In the Search page:

1. Select the **Search Panel Design Options**. The **Visibility, Label, Row, Column** will appear in the search page.

Additionally, the check boxes in the View column will become drop downs when enabling this option.

Search for Documents

Fill in one or more fields. Prefer less fields? Try Keyword Search.

Here:

Column	Description
Visibility	Determines whether the criterion will appear in the saved search top panel. The available values are Hidden, Available and Visible.
Label	A label is the name of the criteria as it needs to appear. A label can be given regardless of the setting of visibility. The label will automatically applied to the column header in list layout and will be visible in grid layout too. If the field is left empty then, the label will be the same as the criteria and not different to other localized languages.
Row and Column	Position where the criteria will appear. Row and column are filled in automatically but can be changed by the user. The second criteria can have the same values for row and column. For example: If the Project Name criteria has the value Row 1 and column is 2, the criteria will appear in column two of the UI.

For example; when the **Visibility** is set to **Visible** for **Approval Completed**, the following results page appears.

When your users use this search (for example as an asset browser), they can use the design panel to further refine the criteria.

Internationalize Labels for Search

Search labels can be also be translated to other languages. To find or create new translated labels, select the blue global icon in the **Search Panel Design** options. A **Find or Create Translated Labels** window is opened.

You could find translations for search labels or create a new label in the language you want it translated.

Setting Search Result Layout Options

You can configure advanced searches for Projects, Documents and Tasks and Approvals. Using **Show Result Layout Options**, you can configure the search results interface for the users. You can also enhance these searches with [Dashboards](#) to display the search results in a graph/chart/counters.

The available options are different depending on whether it is a Project / Document / Task search. Some of the options available commonly are

- You can use **Use a custom Search Title** to modify or rename the Search Title while viewing the results. The custom search title field is translatable which is indicated with the blue globe icon.
- **Limit cell height (expand by request)** which is enabled by default limits the height of the results shown. You can turn off this option to view all the content of the cells.
- You can get the **Larger Thumbnail on Hover** in the search results page by hovering on the search result row. Optionally you can also disable this action. You can also enable the larger thumbnail on click for which a button is displayed in the right corner of the image.
- You may choose to hide the button to show/ hide the thumbnail in the results by choosing **Show "Hide Thumbnail" Button**.
- You also have an option to choose whether the thumbnail display will be as per the **Default (User Preferences)** or **Show Thumbnail** or **Hide Thumbnail**. This option is available for only Projects and Documents search.
- Enable **'Show as Grid/List/Cards' Button** to show this button for Documents and Projects Search results.
- Choose the units to be used when exporting to Excel in the **Save Search Results** option. You choose to export the results in either Metric, Imperial or Use User Preferences. You can also configure the order of search results. Read more about [Configured Order](#) on page 188
- Choose whether to **Show clear this form** button in the search results layout.
- Allow Changing Attribute Category, where-in the Change Attribute Category will show up in the actions bar for Projects and Document Searches
- Display Labels in grid layout.
- Setup [Show Drilldown using a Saved Search](#).
- You can enable or disable **Save this Search, Save Search Results** and **Search** buttons to customize your searches.

Configuring Initial Search Results Style

For Document and Project searches, you can also configure **Initial Search Results Style**. Select from:

- Default (determined by the User's Preferences)
- List
- Grid
- Card
- [Focus Layout](#)

The selected view style will be applied on the Search Results page instead of the default user preference.

Note: Users can change the view of the search results by clicking the Show as Grid/List/Cards/ Focus buttons if these are not disabled.

Project Search Layout Options

To select your options for project, go to **Search > Projects > Show Result Layout Options**.

Document Search Layout Options

In **Document** searches, you can configure [Individual Result Actions](#) and Display options. To allow an operation or a display option, keep it enabled.

If the option **Show Cart** is enabled in a Saved Search, the cart will be displayed in all the locations where the Saved Search is used.

- Saved Search configured in **My work, Document Details** and **Project Details**

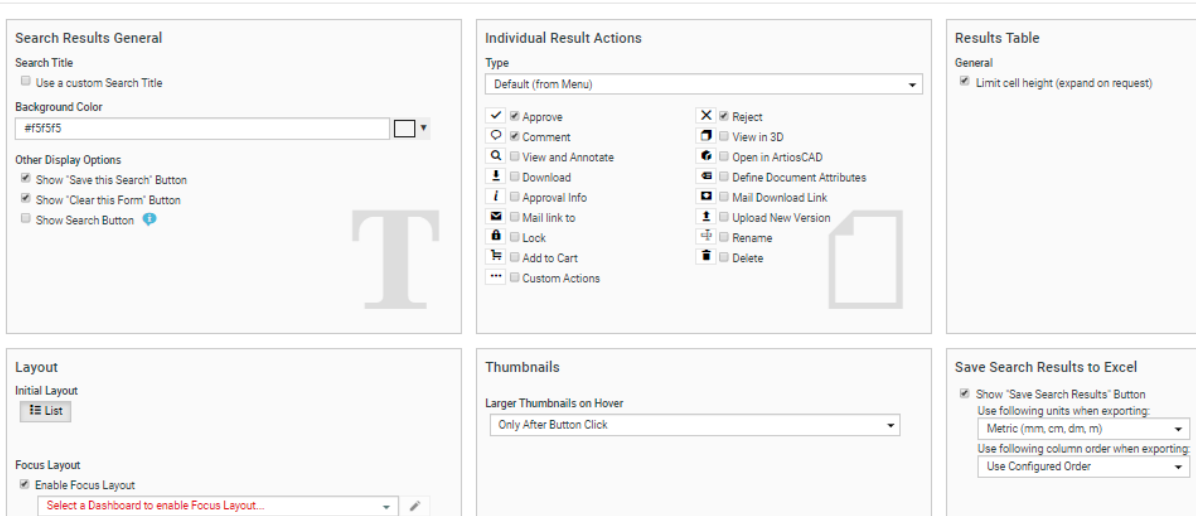

- **Cart** will not appear in Searches used as **Document Source**.

Tasks and Approvals Search Result Layout options

Navigate to **Search > Tasks and Approvals > Show Result Layout Options**.

You can also configure [Individual Result Actions](#) .

Result Layout Options

Custom Actions in Search

When you configure custom **Action** buttons for Searches. You can enable or disable those **actions** in specific Saved Searches.

This can be done by defining a **Tag** for the **Action** defined in the custom menu.

To have Custom Actions in Saved Searches:

- [Create Custom Search Actions](#)
- Specify a **Tag** for the custom Search Action. Save the menu and apply to the User(s).

- Create a Search. In **Result Layout** options, enable **Custom Actions** and specify it with the exact **Tag**.
- In the Search Results page, you will be able to see the custom Action that you configured.

Persistent Search Results

From WebCenter 18.1.1, Search Results selection is now persistent and the selection is kept while you remain on the Search Results page. You can navigate to another page of the search results, or re-sort, or filter from the design panel, or use facets, or add available columns, and so on. The selection is available while you remain on the same WebCenter page and do not execute any other actions on the selection.

The number of items selected is indicated in a counter in the header. You can view the thumbnails of the selection by clicking the counter. Next to the thumbnail, it is also possible to view either the

- Document Name and Project Name for Document
- Project Name and Project Description for Projects
- Task Name and Project Name for tasks (only available if a search dashboard is configured)

The items are added in the persistent selection section as in the order in which you select the items. So,

When you select a new item to add to the persistent selection, it is added to the front of the list. When multiple items are selected, the items are added in front of the list and ordered the same way as they were on the page.

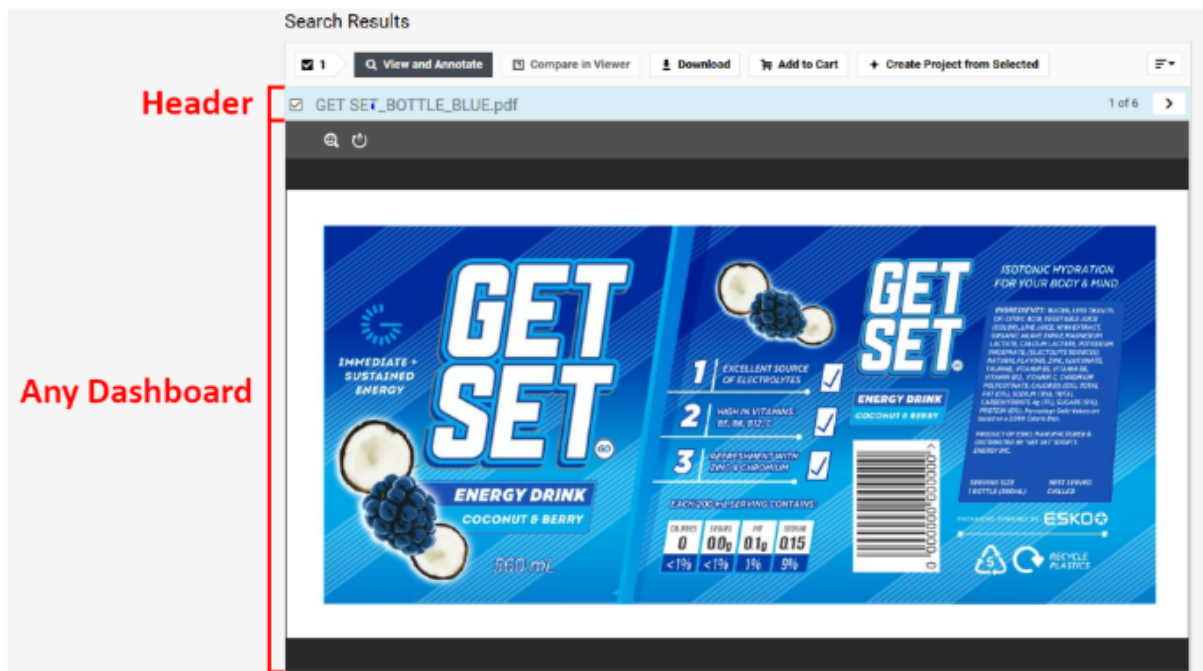

Each item can be removed individually from the Selection or you can remove all.

Focus Layout

From WebCenter 18.1.1 onwards Focus layout option is available to show results of **Document, Project** or **Task and Approval** Search. Focus layout provides a more better visual representation and an immersive experience of the images in the search results.

When Focus Layout is used to display the **Search Results**, the results page displays a single item at a time. You can select the viewed result with the check box in the top left. In the top right, you can navigate through the results or can go directly to a result by providing the number. The selected search results can be viewed when the selection counter in the header is expanded. Read more about [Persistent Search Results](#) on page 184 .

When enabling the Focus layout, dashboard can be created newly or can be selected from the existing dashboards.

Focus layout utilizes the full screen for a single search result, allowing you to view the individual search result items without opening a Document details or the Viewer window.

This can be combined with persistent selection and Viewer dashboard block, to click through a set of search results and decide which ones to include and which ones to omit for a specific operation.

Focus Layout is enabled by default for Document searches, whereas for the Project and Task and Approval search, it has to be specifically enabled by the Admin user.

Individual Result Actions

You can configure standard document operations like      in the document or Task and Approval **Search Results** page. For example, from this page, you can send download links for the selected documents.

Note: In Tasks and Approvals Search Result page, the Document actions are only available for approvals. The actions apply to the document on which the approval is setup.

There are two options to configure namely Default and Custom.

- Admin users can see the check boxes available in the **Default (from Menu)** like Approve, Reject, Comment, View and annotate, Define Document Attributes, Lock and so on

You can navigate from go to **Search > Documents** and click on the **Show Result Layout Options** link.

Select the option you require to be displayed in your search result.

Individual Result Actions

- Icon and Label

Note: You can configure the search results layout options for:

- Document Search Results
- Saved Searches used in custom project/document menu items
- Saved search based **My Work** page

These actions will not work in the Saved Searches used as document sources in Project Creation and Document References.

Show Additional Project Search Criteria

You can use the **Show Additional Project Search Criteria** option as a advanced search for Documents, Tasks and Approvals in saved searches.

Project Name 6

Show Additional Project Search Criteria

After selecting **Show Project Search Criteria** option, the following options appear:

Using these you can search on project features when searching for **Documents or Tasks and Approvals**. Any of the project property or attribute can be used as a search criterion for Document searching and for Task and Approvals searching.

For example, you can search for the tasks in projects of a certain customer and what is the progress currently going on for a customer. You can also use the Project start date, completed date etc to arrive at the duration and filter on the other fields.

Configured Order

The order of columns for search results saved to excel files are now configurable by the admin user.

To enable this, choose the **Configured Order** in the **Use following column order when exporting** drop-down.

When you choose this option, the order of the columns in the excel file saved is the same, as the order of the columns in the **Search Results** page. This configuration is the default for all the new searches.

Note: All the saved searches that were created in WebCenter Versions 16.1 or earlier will have **Use System Order** by default and their order can be reconfigured.

Define Search Result Options

You can define which fields needs to be displayed for each search result. By entering numbers, you can change the sequence of the columns or the sequence of the information in the grid cells. You can choose to make the view of the field in the results either Available, Visible or Hidden

Note: When you enter an existing number, all others shift to upward numbers. In case of list layout, this information will be displayed in columns.

Search Results Options				
View	Column Order	Editable	Sort	Order
Visible	1		<input checked="" type="checkbox"/>	1 ▲
Hidden ▼			<input checked="" type="checkbox"/>	2 ▼
Hidden ▼			<input checked="" type="checkbox"/>	4 ▲
Visible ▼	2		<input checked="" type="checkbox"/>	3 ▼
Hidden ▼			<input checked="" type="checkbox"/>	5 ▲
Hidden ▼			<input type="checkbox"/>	

Note:

Click on any of the **Gear** icon to **Show Time** for the date / time fields. For Project Status, **Gear** icon gives the configuration options like **Automatic** or **Label and Icon**, **Only Icon**, **Only Label**, and **Color Label**. For Pending Approvers, **Gear** icon allows you to configure **Show assignee details (original Group /Role)**.

Link Visibility of Available filters and Columns

In the **Result layout options** page, **Link visibility of Available filters and columns** option is available. When this option is enabled, and both the design panel item and the column are set up as being **Available** for a certain field, making one of them visible will make the other one visible as well. Hiding the field in design panel or column will cause both of them to be hidden. When a column is configured as visible or hidden instead of available, showing or hiding a filter in the design panel from the search results page will not affect the columns shown.

Note:

In List view, a + icon appears on the right side of the table.

In Grid and Card view, a “More…” link is shown to add or remove information.

Set Attribute Value on a Search Result

The administrator can set the attribute columns to be editable when you run a search. By this, the user can then select a number of projects or documents (depending on the type of search).

The administrator needs to determine what columns can be edited. This is done in the Search definition panel.

Fill in one or more fields. Prefer less fields? Try [Keyword Search](#).

Select a number of projects or documents and click on the Edit button. A dialog box appears asking for a value. These values adapts to the type of the attribute. When the value is provided and **Start** is clicked, you will see feedback about the progress and success of the operation.

Set Attribute ✕

Set eskoBrand to

Advanced

Start

Status	Document	Comment
	CHILI-DA-DC GET SET demo for Drupa 2016 TOTA.mov	
	GET SET - BOTTLE_ORANGE.ai	
	GET SET - FRIDGE PACK.ai	

Start

Note: When the attribute could not be set on a project or document, the feedback shows a failure icon and gives the reason (No permission to set attribute, project is non-active, etc).

By clicking on **Advanced**, the dialog changes to accept different values for each project or document.

Note: Here, failure happens per item. So when selecting 20 items and the first fails, the rest is still attempted.

Sorting Search Results

You can sort the **search results** in the **List / Grid** view based on sort-enabled search columns.

In the List Layout:

You can click on the primary sort field header ↑ / ↓ to switch between ascending and descending. All sortable fields will have the sort icon next to their header text.

To change the primary sort field, click on the sort icon next to it.

- Up arrow ↑ in the column header indicates that the results are sorted on this field in ascending order. To sort the results in the reverse order, click ↓.
- Down arrow ↓ indicates that results are sorted on this field in descending order. To reverse the order, click ↑.

In the Grid Layout:

If the search results are in the **grid layout**, you will see a drop down with sortable fields instead of the sort icons.

For example, sorting by **Name / Reversed Name** will make the name field in the ascending or descending order.

Note:

The configured *sort fields* will be applicable in both the **grid** and **list** layouts.

You can navigate to the page number you want by typing the page number in the footer. If there is only one page to show the results, then there is no footer shown.

Task and Approval Search

In the **Tasks and Approvals** search you can

- Configure a search for **Tasks and / or Approvals** by choosing whether you want to search **All Approvals** or **All Manual Tasks** or **All Workflow Tasks** from the **Type** drop down. You can also choose any of the manual tasks or workflow tasks from the drop down or a combination of all the above.
- search for **Task Description** or **Task Type Description** in their respective fields. There is also an option to search on the **Status** of the Approvals or Tasks or a combination using multi-select.
- search for **Task Created** or **Task Estimated** or **Task Created By** or Approvals by **Approval Master** or **Stage Approval Status** or **Final Approval Status**.
- Search on any **Specification**. Select any of the Specification from the drop-down to refine your search.
- Filter the Specifications based on a Task Type. To filter, select a **Task Type** and enable **Filter task specifications by selected Task Type** option.
- search tasks based on the document uploaded within the tasks or search for the document to approve for approvals.

How to find the duration taken and time left for Tasks and Approvals

You can search to find the duration taken for Tasks (both Manual and Workflow) and also for Approvals. You can choose/ filter the search with the following fields

- **Started:** Start date of the Task or Approval
- **Due:** Due date of the Task or Approval

- **Completed:** date the task or approval was completed
- **Duration:** the time (duration) between the start date and the completed date. When the task is still ongoing, it is the time between the start date and the current time.
- **Time Left:** the time between the due and the completed. When the task or approval is yet to be completed, this is the time between the due date and the completion date.

When the time left is a positive number, then the due date is not reached yet. If the search yields time left as a negative number, then the task or the approval is overdue.

Note:

1. **Both Duration** and the **Time Left** do not consider weekends(Saturday and Sunday). You can also switch the weekend days to Friday and Saturday.
2. You can configure to get either the time in days or in hours.

Reporting on Approvals

The main use case for approval search is reporting. In the search, you can find all the pending, and also all completed approvals. Approvals can be searched for each Approver in an approval stage.

For example, if a user and a group have to approve then two rows are displayed, each with details about who (of the group) completed the approval, and whether it was rejected or approved, and the duration. This is very useful information for reporting purposes.

3.8.3. Projects Calendar View

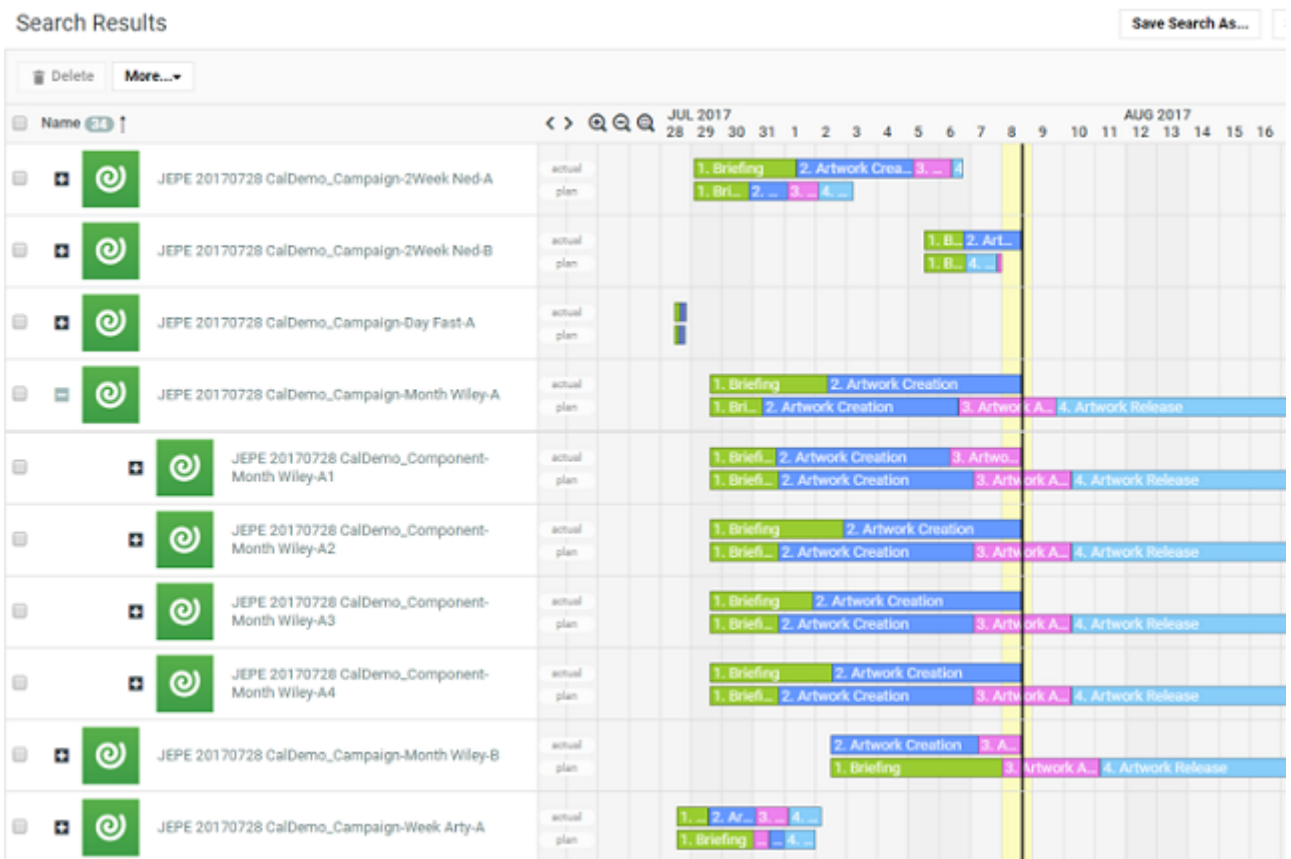

What is Project Calendar View?

The Calendar View is another feature of project search. Status changes in the project history are displayed as project stages in a calendar. The picture below shows an example.

This creates a quick dashboard overview of your projects and helps you to prioritise which projects need your attention.

Why should you use Project Calendar view

- To show the Actual Vs Planned status of the project
- View the Project status of the child projects as a drill down
- Due dates are set up as attributes which you can configure at the Project page

To view the project feedback, project status history option must be enabled in **Admin > Preferences > Notifications > Include in Project History**. Enable **Project Status change**. Click **Save**.

Note:

1. Calendar View is enabled for Projects in List Mode only
2. To be able to use some of the calendar view functionality, you need the **Lifecycle management license**.

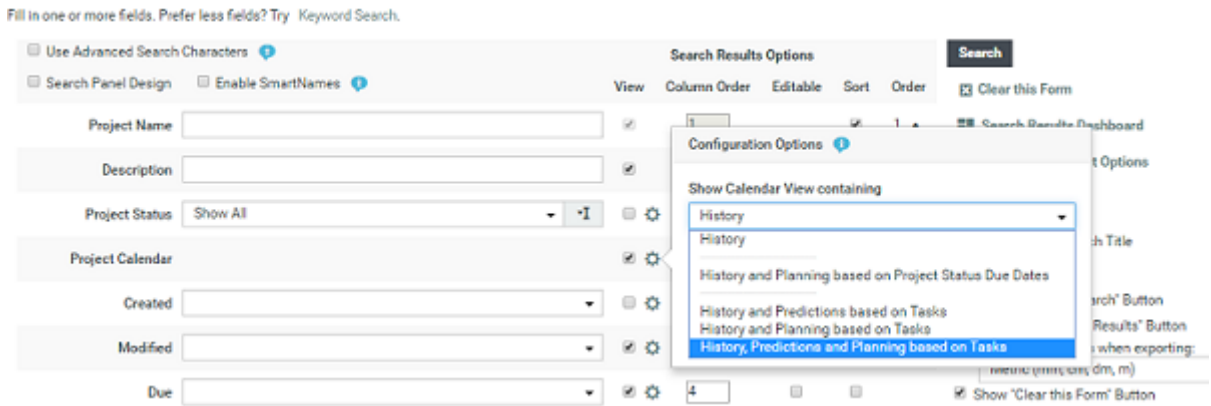

You can view the status of the projects along with the labels in the search results. This view also shows the planned vs actual status of the project status.

How Can you Set Up a Search with the Calendar View?

1. Go to **Search > Projects**.
2. Select the **View** check box **Project Calendar** to view in the Search results page.
3. Click on the gear icon to open the Configuration options for the Project Calendar. You can configure the **Project Calendar** options to display your project status in a dynamic way. **Configuration options** allow you to choose multiple options, which can provide information on the current status of your projects and predict the future state. You can set the status based on the task completions or on the date of the project statuses. Read more on [Set up a Search with a Project Calendar](#) on page 198.

4. Specify the width (in pixels) for the calendar column (minimum is 200px but you get better results with 500px). Decide whether to also show the project status icon (which will then appear at the left of the calendar).
5. Click **Search** to view the **Project Calendar**.

Note that the calendar is displayed in the column defined for the project status. By changing the column order for this column, you will move the calendar in the search result. In most cases the best result is obtained, if the calendar is the last column and if there are not too many preceding columns.

Set up a Search with a Project Calendar

To set up a Saved search with Project Calendar option, in the search page.

1. Click on the gear icon in the **Project Calendar** row to open **Configuration Options**
2. Choose the options from **Show Calendar View Containing** drop down options. Options in the drop down are
 - **History:** shows past statuses (history)
 - **History and Planning based on Project Status Due Dates:** shows past statuses, planning based on the milestones that are linked to the project status and the originally planned timeline (in gray)
 - **History and Predictions based on Tasks** shows past statuses, predictions based on the tasks
 - **History and Planning based on Tasks** shows past statuses, due dates based on the tasks or the lead time depending on which one is the latest.
 - **History, Predictions and Planning based on Tasks** shows past statuses, due dates based on the tasks or lead time and the originally planned time line (in gray).

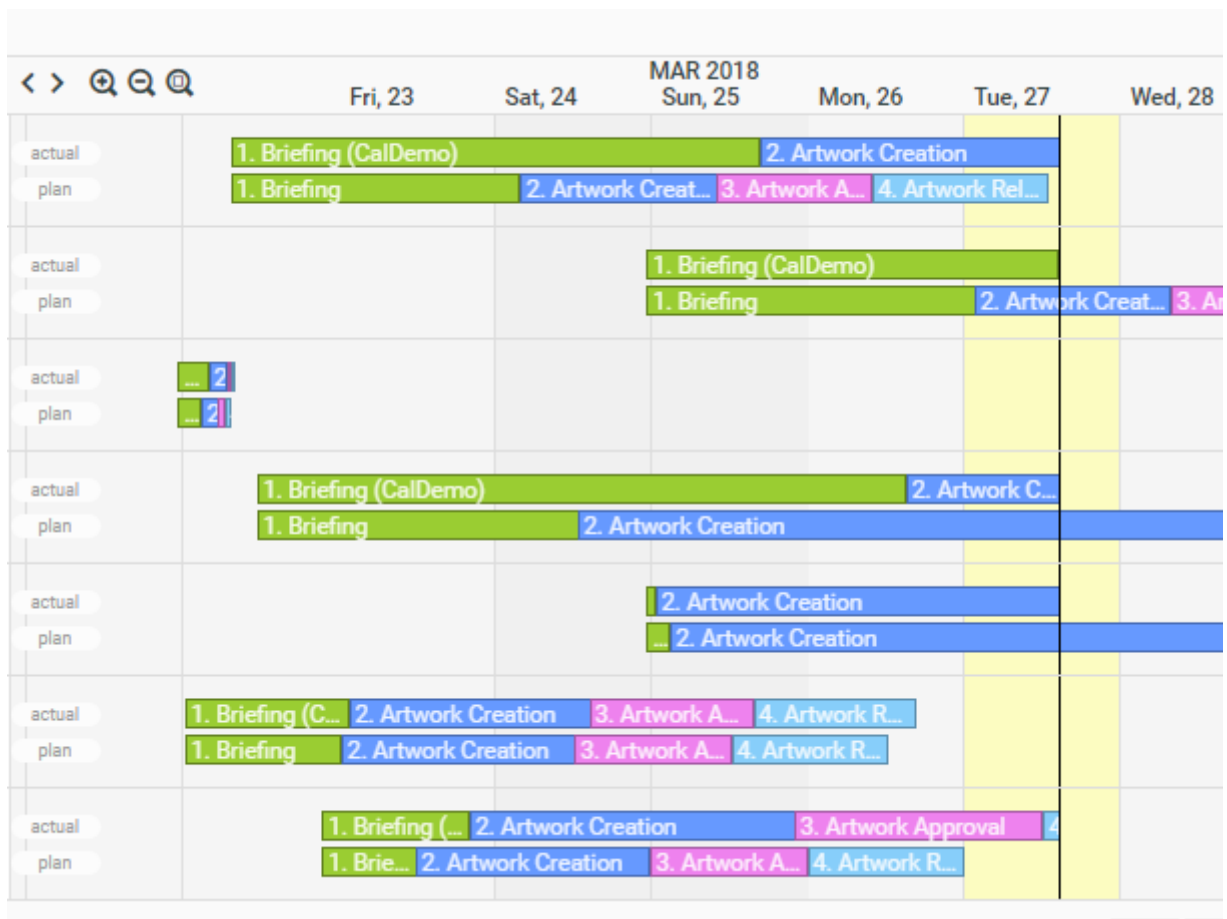

Note: The last three options are available with the task management license only.

3. You can select the **Apply Forward Planning to calculate Predictions** option, when you choose the **History Predictions and Planning based on Tasks** or **History Predictions based on Tasks**. In such a case, forward planning is done based on the start date and the next due dates are calculated based on lead times.

When this option is not chosen, then backward planning is done where the due date is considered and the other due dates are calculated backwards based on lead times given.

4. Select **Show Project Due Date** to display the project due date in the search results.
5. Specify the **Calendar Column Width** in the box for the calendar column (minimum is 200px but you get better results with 500px).
6. **Labels Shown on Project Status Bars** gives options to display the labels in the Project Calendar view. You can choose the labels to display **Label shown on Project Status Bars** from the drop down list as one of the below:
 - Number of Project Status
 - Number in order of Appearance
 - No label or
 - Status Name configured
7. Select **Search** to view the search results.

In the **Search Results** page, Project Statuses of the project is shown over timelines.

The timeline can contain 2 bars:

- **Actual:** Displays the actual state of the project now.

For values in the past this bar will always be there and will show the Project Status History.

For values in the future it can also show predictions based on tasks. Predictions based on tasks show the due dates of the tasks or the lead time depending on which one is the latest or which one is first when using forward planning. When calculating the date with lead times, week days are taken into account.

- **Plan:** Shows the planned project status of this project.

Planning based on tasks shows the due dates of tasks that have an effect on the project status.

Planning based on milestones shows the values of date attributes in the project that are linked to the project statuses.

Using the Basic Calendar View

In the basic **Show Calendar View** only 1 line is displayed and it stops at the vertical 'today' line.

- The vertical black line is always on 'today'. So the current status of the project can be seen from the color where the black line cuts through the status line.

- You can zoom the calendar view with the + and – buttons or with the scroll wheel. This changes the time scale from months to weeks to days or reversely.
- You can pan the calendar view by using the arrows (just before the + and – icons) or by dragging also.
- Clicking the magnifier icon resets the view.
- The colors are as defined in the project status setup. (Admin/Project Management/Project Statuses).
- The number displayed corresponds to the project status index (same statuses have the same number in all projects).
- The small red vertical line indicates the project due date (if set).
- The color changes on the date where the project actually changed status.
- You can hover over any of the status blocks to get more information (name of the status, start and end date, status type, calculated delay).

Using the Calendar View with Predictions

Note: Calendar view with prediction is only available if the user has the task management license.

In order to use this feature, your projects must have Tasks configured to set Project statuses.

- The first part of the project line (till today) works as in the basic view.

- The second part (after today) shows a prediction of the project based on the project tasks (rescheduled based on their current status). The estimated due date is based on the task predecessors, task due date and lead time.
- A lighter version of the project status color is used to draw this part of the bar. For each project status, it will look for a task completing this project status. Then it will determine from predecessor logic which tasks need to be completed to complete this task, and how much time this will take in total. For not started statuses, this will be the length of the block. For started statuses, it will first subtract what is already consumed and only add the remainder (potentially nothing) to the block. This way the time line is extended.

Using the Calendar View with Planning

When using this view, you will see 2 lines for each project, a colored line and a grey line.

- The colored line behaves identical to the 'calendar view with predictions'.
- This grey line shows the planned project time line based on the project tasks. For each project status, it will look for a task which completes this project status and for this task, it will take the due date. This will determine the end date for the grey block of this project status (the begin date is simply the end date of the previous status).

Notes:

- Subtasks are left out of the calculation.
- In case multiple tasks are set the same project status, one (merged) stage is shown only. This situation is best avoided.
- In case no project status history is available, nothing is shown.
- 'Completed' Project Statuses are not shown in the calendar view. When a project has been put to completed, and was started again later, there will be a gap in the history bar.

Project Status History Settings

In order to be able to show the project feedback, the project status history option must be turned on.

When loading the page, the following tests are made:

- If the global settings for the 'Project status change' include in project history is turned off, a message box with a clear message is shown.
- If project specific settings for the 'Project status change' include in project history is turned off for some projects (and the global settings is on), a warning icon with a clear tooltip message is shown next to the project name.

3.8.4. Search on Project Duration

Duration Reporting for a project

You can search for projects based on the Start date, Due date, Completed date, Duration and Time Left of the project. You can save the searches and add it to the dashboard to have an instant view of the progress of all the current projects.

Field Name	What it means
Started	The start date of a project is the first time the project was set in an active status.
Completed	The last date the project was set in a completed status
Due	The due date is shown in the project details.
Duration	The time between the start date and the completed date. Only active statuses are considered to calculate the duration of the project. When the project is not completed, the duration is the time between the start date and the current date/time.
Time Left	This is the time between the actual completion date and the Due Date. When there is no due date, the time left is not shown as it is not relevant. When the project is in progress, the Time Left is the time between the due date and the current date. When the current date/time is still before the due date, the project is not overdue. In this case, the time left is a positive number, indicating that there is still time remaining before we reach the due date. When the current time is after the due date, the project is overdue. In this case, the time left is a negative number, indicating how much the project is overdue.

How to find Project Status Duration

You can also find the Duration metrics on the time spent in a given stage of the project. Projects statuses can reoccur multiple times and you can compute the duration of time in each of the given status.

Project Status Started

Prepress Creation Started this week

Prepress Approval Started this week

Select Project Statuses that you want to search on

You can filter each selected Project Statuses based on the duration criteria

Project Status Duration

Prepress Creation Duration >= <= 2 days 6

Prepress Approval Duration >= <= 7 days 7

Field Name	What it means
Project Status Started	The start date of a project Status is the first time the project was set in the selected status.

Field Name	What it means
Project Status Completed	The completed date of a project Status is the last time the project was in the chosen status before it was changed to a new status.
Project Status Duration	The project status duration is the time that the project spent in the selected status. It is the sum total of all the time the project was in a particular status. When the project went into the selected status multiple times, the duration is the accumulated time the project spent in the selected status. In this field, you can filter on the duration in days of the selected status.
Project Status Time left	It is the time the project was in the Project Status. When there is no due date, the time left is not shown as it is not relevant. When the project is still ongoing, the Time Left is the time between the current date with the Project Status Due . When the current time is before the Project Status Due , the project is not overdue yet. When the current date is after the Project Status Due , the project is overdue. In this case, the time left is a negative number, indicating how many days the project status is overdue.

For example: Let us assume that

Day 1: Jan 01 00:00 till Jan 02 00:00 => Project was in StatusA.

Day 2: Jan 02 00:00 till Jan 03 00:00 => Project was in StatusB.

Day 3: Jan 03 00:00 till Jan 04 00:00 => Project was in StatusA.

Project Status Started of StatusA is Jan 01 00:00 (first time project was in StatusA)

Project Status Completed of StatusA is Jan 04 00:00 (last time project was in StatusA)

Duration of StatusA is 2 days and Status B is 1 day

3.8.5. Asset Browser

Asset browser is a user-friendly feature to search and find assets in a large collection of WebCenter assets. You can customize the Asset Browser into the WebCenter Menu for easy access. In addition, you can create more than one Asset Browsers in the same WebCenter with different names for different sets of users for easy browsing.

For example, a project manager can benefit from an Asset Browser which will collect Project Templates and a printer will benefit from one that points to finished Projects which are ready to be printed.

You can create a menu item which can be named "Assets" or "Repository" or simply "Search" or "Browse". This menu will be linked to a highly configured **Global Saved Search** which will function as your **Asset Browser**. One Asset Browser can be linked to one **Attribute Category** as in saved searches. However, this **Attribute Category** can have multiple **Cascading Dropdowns** resulting in multiple independent trees in the same asset browser. Read more in about Saving Searches as Asset Browser in [Setting Up an Asset Browser](#) on page 205.

A customized graphical Asset Browser will help you to visually browse through projects and graphical assets previously stored in WebCenter. To achieve this, you need to classify assets using custom attributes with graphical icons (Attribute Value Images). Read more about graphical labeling of attributes in [Setting Up a Graphical Asset Browser](#) on page 210

You can set up a graphical browser or a tree browser and both. Technically, the Asset Browser has all the features of Saved searches which is enhanced with Tree and Graphical browsing through Cascading Attributes. Read more about Cascading Attributes in [Lists](#) on page 337

What You Need to Know about Asset Browsing

Concepts Used in this Section

Concept	Definition
Asset	Any digital file including pictures, graphics (PDF, Illustrator, ...) and Office documents stored in the WebCenter. For example a piece of packaging design that is uploaded to WebCenter.
Asset Browser	A user-friendly way to find assets in a large repository. Read more in Asset Browser on page 203
Repository	A part of WebCenter which is considered to contain assets. WebCenter as a whole is a repository but by filtering you can pin-point to the specific section of the repository. You can achieve this by filtering on: <ul style="list-style-type: none"> • certain document types • range of projects based on project characteristics or naming conventions • both documents and project range.
Saved Search	Highly configurable Saved Searches from WebCenter 12 onwards. Read more in the following sections from the WebCenter User Guide. Advanced Searching on page 176
Tree browser	This tree is built based on your Cascading Attributes which you can put in the left panel to browse through the assets.
Search Parameter Panel	A panel appearing at the top of the search results of Asset Browser which you can use to further refine your search.

Organizing Assets in WebCenter

You can use the Asset Browser to its full extent by organizing Assets in WebCenter. You can upload the assets in bulk during the early stage of the WebCenter deployment which will grow with new designs and documents. For conducting effective search via an asset browser, you

need to specify **Attributes** (metadata) for your assets while uploading them to WebCenter. You need to:

- define **Attributes**.
- assign those attributes to **Attribute Categories**
- assign the right attributes from this **Attribute Category** to the assets(documents) while uploading.

From WebCenter 12 onwards, you can assign these Attribute categories automatically to uploaded documents. This is done by:

- using default Attribute Categories using **Document Types**.
- using document templates with **Attribute categories**

Read more about this in [Autonaming Projects / Documents](#) on page 442

When you store assets in specific projects you should ideally:

- have at least one project template created for projects specifically meant to store assets. This helps in setting up **Security, Roles, Autonames** and default **Attribute Categories** which will aid in better organization.
- not store too many documents in one WebCenter Project. Since Projects only have one level of folders, project browsing gets slow when there are too many documents or too many folders in the project. Asset Browsing will be easier when they are stored with pre-determined metadata in a set of projects.

Note: You do not have to specifically create “asset projects”. It is possible to design an Asset Browser for entire WebCenter site.

Creating Asset Browsers

Setting Up an Asset Browser

1. Save a Search using your own search settings.

Asset Browser is essentially a highly configured Saved Document Search. Therefore, the features of Saved Searches are available in the Asset Browser. You can:

- Set the **Saved search** to be **Global** or **Personal** as an administrator.

Note: You should use the **Global** setting for Asset Browsers. **Personal** searches does not serve the Asset Browsing function since they can only be used by admins who create them.

- Filter on almost any property or attribute of documents in advanced ways.
- Define a drill-down (parameter) panel to appear at the top of the search results.
- Assign the saved search to a menu item.
- Assign which document properties or attributes will be displayed in the search results and in what sequence.
- Set the sorting order of the results.
- Set a preference on how many search results will appear per search result page.
- Define what operations can be done in the saved search results.

- Define layout settings of the search results (grid versus list, number of results, thumbnails or no thumbnails).

Read more in the following sections from the WebCenter User Guide.

[Advanced Searching](#) on page 176

[To Save a Search](#) on page 558

[To Search Content](#)

2. Add Cascading Attributes to the Saved Search. You need to follow the steps below.
 - a) Log in as an administrator
 - b) Create Cascading Attributes. Read more in [Lists](#) on page 337. Create an attribute category with these Cascading attributes with which you want to customize browsing and displaying.
 - c) Go to **Search > Saved Searches**. Choose and edit the **Saved Search** from the previous step. If you did not save the Search, go to **Search > Documents** and restore the previous settings (within the same session) or start over.
 - d) Click on the **Attributes** link. Add the Attributes from the Attribute Category that you want to assign to this search.

Note: Only the Cascading attributes from the **Attribute Category** are available for tree browsing in Asset Browser.

: Avoid Using the same **Attribute** in different **lists** used in the same Asset Browser as it leads to unpredictable results.

- e) Enable **Search Panel Design**. In the **Search Panel Design**, you should set these attributes to be **Visible/Available**

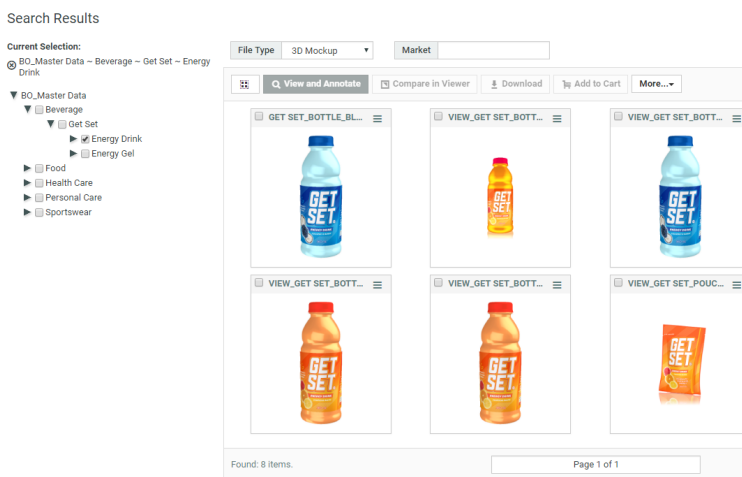

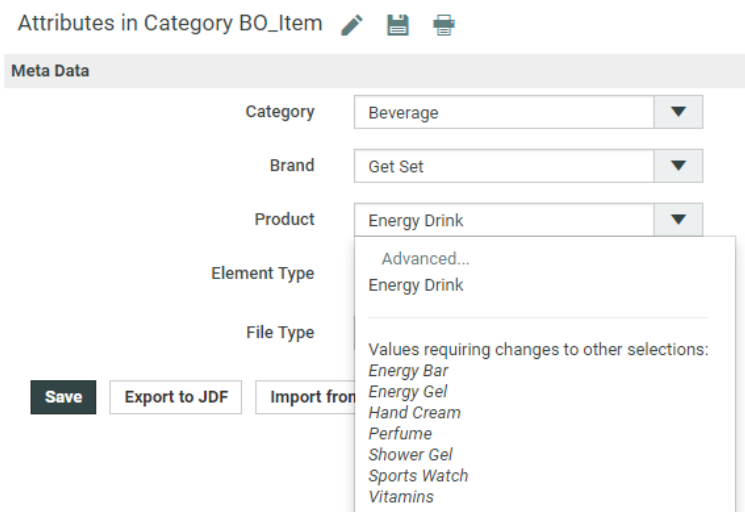

Tip: The tree view in the Asset Browser requires the **attributes** to be set to **Visible** or **Available** in the **Search Panel Design**.

You will have a top panel with Visible/Available Attributes to refine the search. Selecting a value for one Attribute will limit the values for other Attributes.

Note: If the Attributes appear but not as dropdowns, check whether the **Attribute Category** is correctly configured. Assign it to a document to test whether the cascading effect works.

3. Create a Browsing Tree using Cascading Dropdowns.

A cascading attribute can be shown as a tree or as a set of mutually dependant attribute dropdowns where choice of one from a dropdown limits the choice available in other dropdowns.

You can choose from any of these two options or both views together. Read below some remarks about these options.

- The tree view takes more space and loads slower
 - The tree view allows multiple selection
 - The tree view can be restricted using the **depth** parameter
 - Dropdowns in the top panel can also be restricted
 - The tree view can be shown in a graphic way (using thumbnails). This takes even more space on the screen but creates a beautiful user experience provided you have good image representations.
- a) Go to **Search > Saved Searches**. Choose and edit the **Saved Search** from Step 1. If you did not save the Search, go to **Search > Documents** and restore the previous settings (within the same session) or start with a new Search.
 - b) Click on **Show Result Layout Options**. This opens a panel with additional options.

Document operations:

- View
- Open in ArtiosCAD
- Download
- Define Attributes
- Approval Info
- Mail Link To
- Upload New Version
- More actions

Other display options:

- Show "Save this Search" Button
- Show "Save Search Results" Button
- Show "Hide Thumbnail" Button
- Show "Show as Grid/List/Cards" Button
- Show Labels in Grid/Card Layout
- Set Labels in Grid Layout in bold

Initial Results Display:

Advanced Functions:

- Allow Changing Attribute Category
- Custom Actions
- Show Search Button i
- Show Cart i
- Show Project Creation Link i
- No Template Specified
- Fixed Template
-
- Template from Characteristics Path

i Lists to be shown in left tree panel:

	Type	Name	Depth	Height
✕	list	<input type="text" value="Demo_Sheet Brand"/>	<input type="text"/>	<input type="text"/> px
✕	list	<input type="text" value="Demo_Sheet Packaging"/>	<input type="text"/>	<input type="text"/> px
✕	list	<input type="text" value="Demo_Sheet Product"/>	<input type="text"/>	<input type="text"/> px

Add List

Tree panel width: px

Image Area Style: i

Allow Changing Image Area Style via Dropdown

c) Enter the list names that you have configured in the Listmanager project.

Note: You can add lists to the tree panel by clicking on **Add List** or remove them by clicking on the - icon. Use the arrows in the second column to move the lists up or down.

d) Set the properties for each list. These properties are applicable when a left tree panel is selected.

Depth	<p>If you leave it empty, all the columns from lists.xml will be available.</p> <p>If you need four columns out of five columns from your lists.xml, enter 4</p>

Height	<p>You can set a maximum height for the tree here.</p> <p>If you leave it empty, the tree will take as much space as it requires.</p> <p>If the tree height is bigger than your entry in this setting, a scroll bar will appear.</p> <p>Note: You can enter 1000 pixels or less for the best user experience. However, it can vary depending on the size of the user monitor.</p>
---------------	--

e) Set the browsing style for Tree browsing and Image browsing by modifying the following fields.

Tree panel width	Default Tree panel width is 300 pixels which you can increase or decrease depending on your requirements.
Image Area Style	<p>For a browsing tree at the left hand side, choose Left panel only (no images)</p> <p>If you want to browse through an image panel at the top, choose Top panel only (no tree to the left)</p> <p>If you want both tree browsing and image browsing, choose Left panel and image panel</p>
Allow Changing Image Area Style via Dropdown	If you want the user to change the browsing style, enable this option.

4. Save/Run this search.

If you have save it as a **global saved search**, all WebCenter users can run this asset browser from their saved search lists or from the menu if you have customized a menu item for this Asset Browser.

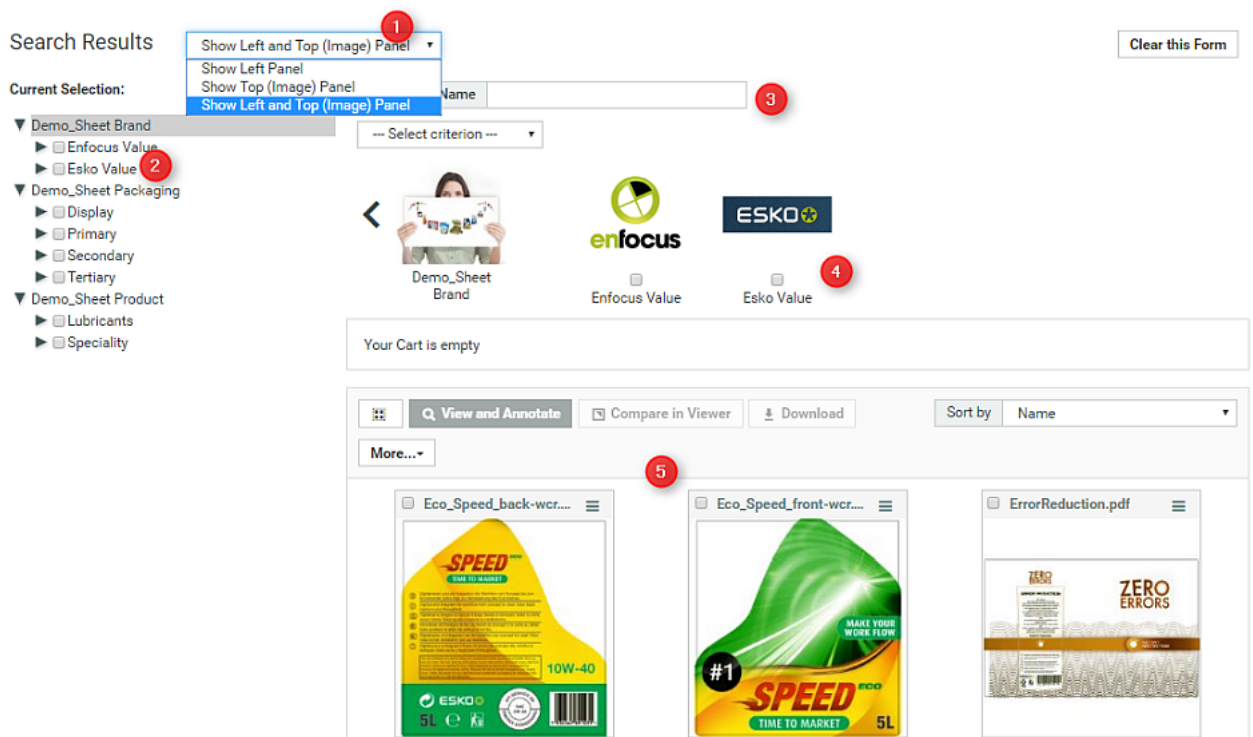

Note:

You can restrict access to the Asset Browser by:

- deleting **Saved Searches** item from the **Search** menu for the restricted Users.
- deleting the menu item assigned for the Asset Browser.

When you run the search, you will get a tree in the search results. This tree will have branches according to the columns in the lists (Cascading Attributes). You can see in the screenshot below:

- 1. The user can choose from three options. This is only available when you have enabled **Allow Changing Image Area Style via Dropdown**. See the explanation above.
 - **Show left Panel**
 - **Show Image Panel**
 - **Show left and image(top) panel**
- 2. Tree Panel. This shows the information from the **lists**
- 3. Search Parameter Panel where you can refine your search using Attributes or document properties.
- 4. Image Panel
- 5. Search Results

Setting Up a Graphical Asset Browser

As already mentioned, the tree panel to the left can be replaced with a panel of images at the top. Alternatively, you can choose to have both at the same time which will give you synchronized results.

These images are a representation of the attributes. From WebCenter 12 onwards you can configure an image label for an attribute.

1. Create images for each value of **Attributes** and **lists**.

Note:

- For the best user experience, use .jpg images. It does recognize .gif,.jpeg and .png.
- The name of the **Attribute** (or **lists**) and the image should be entirely the same including the case of the letters. Extensions should be specified in lower case.
- The images appear as 100x100 pixels. If you add images exactly of this size, best performance is assured. If the sizes vary, it will be adjusted to fit into 100x100 appearance. Therefore, the image appearance will vary depending on your browser's capacity to scale images. For instance, Internet Explorer does not give good results for .png images if they are differently sized.

2. Add these images to WebCenter\WebServer\tomcat\webapps\WebCenter_Inst\custom\AttributeValueImages.

If more than one WebCenter instance is used, you have to copy this setup to each instance.

AssetDemo Show Top (Image) Panel

Brand: Document Name: Sub Brand:

Packaging: Packaging Sub Type: Product Type:

Variant:

Search

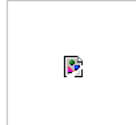

Current Selection:

Brand

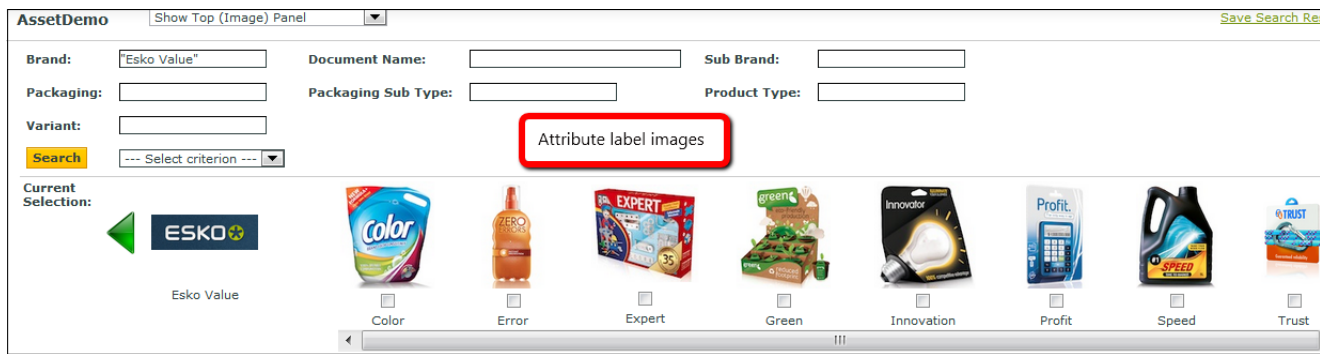

Packaging

Product

These images correspond to the lists (cascading dropdown lists).

Your cart is empty

Note:

Make sure that you have an image for each list used. In the above example screenshots above, this is Brand.jpg, Packaging.jpg and no image attached with Product.

Use a .jpg for the lists since list images will be frequently used. As mentioned earlier, WebCenter is optimized for .jpg. When some attribute value has no fitting image, the list image will be shown instead.

Removing the Search Button from the Asset Browser

If you keep the **Search** in the asset browser, for every search modification in the Asset Browser, you have to click it to refresh the results. You can remove this button from the Asset Browser to improve the user experience.

By removing the **Search** button, you can:

- save on screen space in the Asset Browser
- any change in the search criteria from the browsing tree or the search panel will update the results.

You can accomplish this by editing the Saved Search created for the Asset Browser:

1. Go to **Search > Saved Searches > Edit Search**
2. On the right hand side of the page, click on **Show Result Layout Options**
3. Disable the **Show Search Button** option.

Document operations:

- View
- Open in ArtiosCAD
- Download
- Define Attributes
- Approval Info
- Mail Link To
- Upload New Version
- More actions

Other display options:

- Show "Save this Search" Button
- Show "Save Search Results" Button
- Show "Hide Thumbnail" Button
- Show "Show as Grid/List/Cards" Button
- Show Labels in Grid/Card Layout
- Set Labels in Grid Layout in bold

Initial Results Display:

Advanced Functions:

- Allow Changing Attribute Category

i Lists to be shown in left tree panel:

Type	Name	Depth	Height
<input checked="" type="checkbox"/> list	<input type="text" value="Demo_Sheet Brand"/>	<input type="text"/>	<input type="text" value="px"/>
<input checked="" type="checkbox"/> list	<input type="text" value="Demo_Sheet Packaging"/>	<input type="text"/>	<input type="text" value="px"/>
<input checked="" type="checkbox"/> list	<input type="text" value="Demo_Sheet Product"/>	<input type="text"/>	<input type="text" value="px"/>

Add List

Tree panel width: px

Image Area Style: i

- Allow Changing Image Area Style via Dropdown

Customizing the User Menu with the Asset Browser

Assigning a Menu Item for the Asset Browser

You can create and assign a **Menu** Item for easy access to your Asset Browser. The procedure is similar to assigning a menu item for **Saved Searches**. Read [Add Custom Menu Items](#) on page 1011 from WebCenter Customization Guide for details

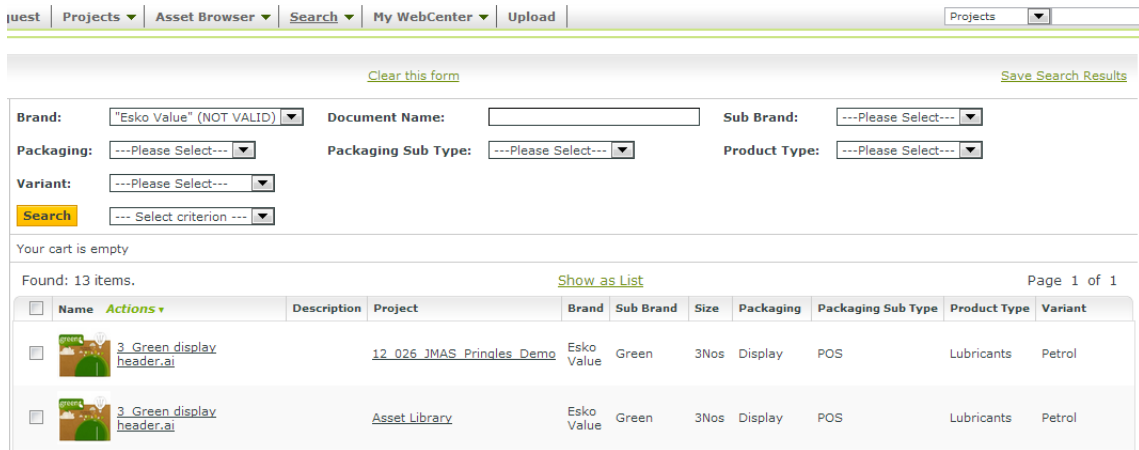

1. Go to **Admin > Preferences > Menus**. Download the XML file or create a new XML file and add the following code under the NON_ADMIN.

```
<menuitem>
<name>AssetDemo</name>
```

```
<labeltag>Asset Browser</labeltag>
<url>dosavedsearch.jsp?searchName=AssetDemo</url>
</menuitem>
```

2. Assign the scope of this menu to the (set of) users or to a Company/Location. Read more in [Add Custom Menu Items](#) on page 1011
3. Save this XML and upload as a new menu.

This results in the following Menu Item named **Asset Browser**. The search results are directly available by clicking on this item. The name of the page is the same as the name of the **Saved Search**. In this example, the page appears as AssetDemo instead of "Search Results"

Assigning Submenus to Dedicated Asset Browsers

You can customize your Asset Browser further by creating submenus for different asset browsers with a more dedicated and simplified user interface. This will help you to navigate easily between the asset browsers(saved searches. You do this by adding a submenu to the asset browser’s menu item which is explained in [Assigning a Menu Item for the Asset Browser](#) on page 213.

1. Set up dedicated Asset Browsers for your assets. These are **Saved Searches** called Brands and Packaging in this example.
2. Update the XML file with the similiar fragment as in the example below. You can see that there are submenus for the set of Asset Browsers created in the previous step.

```
<menuitem>
<name>Asset Browser</name>
<url>dosavedsearch.jsp?searchName=AssetDemo&actionMenu=Asset Browser</url>
<labeltag>Assets</labeltag>
<menuitem>
<name>Brands</name>
<labeltag>Brands</labeltag>
<url>dosavedsearch.jsp?searchName=Brands&actionMenu=Asset Browser</url>
</menuitem>
<menuitem>
<name>Packaging Types</name>
<labeltag>Packaging Types</labeltag>
<url>dosavedsearch.jsp?searchName=Packaging&actionMenu=Asset Browser</url>
</menuitem>
</menuitem>
```

Note:

- This will result in submenu which folds out and permanent links on the top left below the main menu bar. The second one is caused by `&actionMenu=Asset Browser`.
- Check the spelling as every character is important.
- This code addition is not necessary if you use one menu item for a single Asset Browser alone. Example in [Assigning a Menu Item for the Asset Browser](#) on page 213.

3. Upload this XML to a new menu or update a previous menu in **Admin > Preferences > Menus**
4. Assign this menu to a set of **Users** or a **User**. You can also assign a menu item to a **Company/Location**. This versatility helps you to restrict the access to specific **Groups** and **Users**.

Clicking on **Brands** under **Assets** will bring you to the saved search called Brands. You can save this with simpler settings or with a graphical asset browser according to your preference. It is possible to give different names to the **Saved Searches** and the submenu items.

Advanced Options in Asset Browser

Configuring the Cart in the Asset browser

You can configure the Cart in the Asset Browser which can assemble the assets selected from the Asset Browser. From the Cart, you can:

- start the viewer
- download the assets
- start a new project with these assets
- modify the assets.

You can do several rounds of searching and browsing to add documents one by one to the Cart and then proceed with the actions listed above. The Cart has to be configured by the administrator while determining the settings of the Asset Browser (the **Saved Search**).

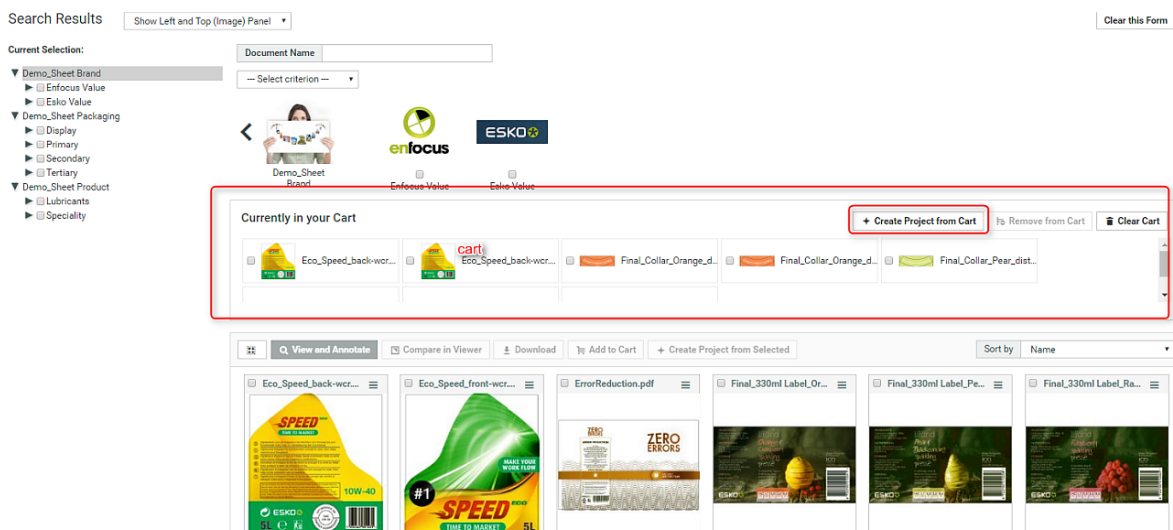

1. In the Search Settings, click on **Show Result Layout Options** which will open the **Advanced Functions**.
2. Enable **Show Cart**.

Advanced Functions:

- Allow Changing Attribute Category
- Allow sending Download Mail for Multiple Documents
- Custom Actions
- Show Search Button 
- Show Cart 
- Show Project Creation Link 
- No Template Specified
- Fixed Template
-
- Template from Characteristics Path

3. Save the search.

The next time you access the Asset Browser, the **Cart** will appear within a few seconds. You can now add your selections to the cart.

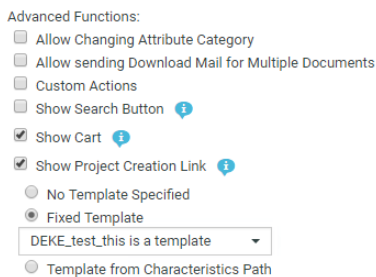

Read more about using the Cart in [Using the Cart from the Asset Browser](#) on page 563 .

Configure Project Creation from the Asset Browser

Your Packaging Projects often involve modification of existing packaging or creation of new packaging with recurring elements. You can use a project template for these recurring elements. Asset Browser will help you to browse for these templates and existing packaging projects while setting up new Projects. You can either collect the relevant items to the Cart and start a new Project directly or start Project creation from the **action list** menu. Follow the steps below to configure this feature.

1. In the Search Settings, click on **Show Result Layout Options** which will open the **Advanced Functions**.
2. Enable **Show Project Creation Link**.

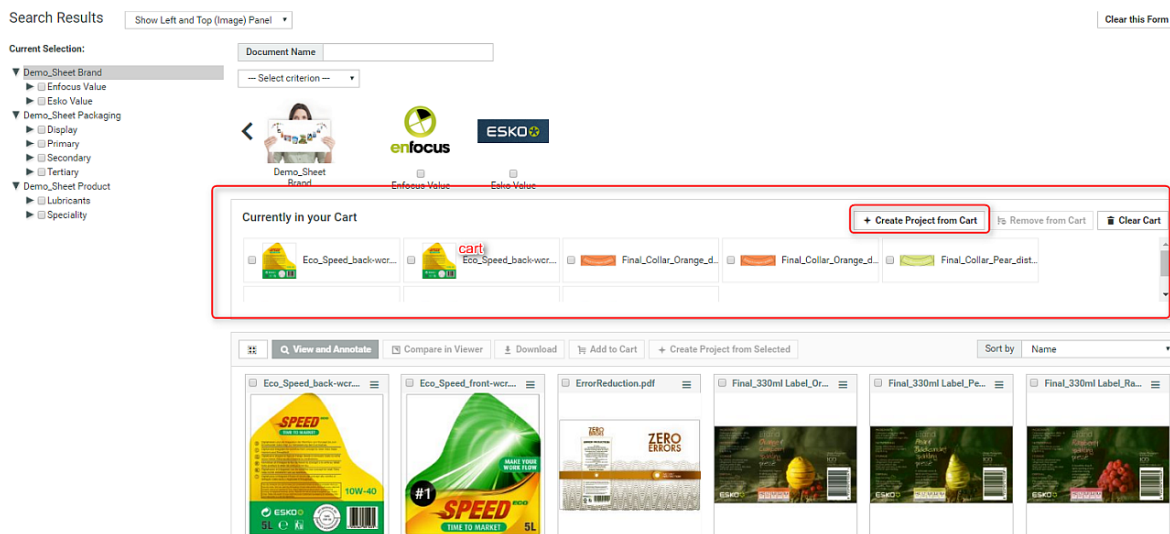

This will add a link to the search results **action buttons (Create project from selected)** and to the Cart **CartCreate project from cart**.

3. You can choose the template for the project creation from Asset Browser. For this, enable the **Fixed Template** option and select the template from the dropdown list.

Option	Result
Fixed Template	Select the template from the dropdown list.
Template from Characteristics Path	You have to specify the path. For example, <code>projects \modificationTemplates</code> . Note: Follow the correct spelling and letter case. Note: Projects can have multiple characteristics. The same template can appear in multiple asset browsers together with other sets of templates.
No Template Specified	This will result in the standard project creation user interface.

4. Save the search under the same name.

You can either use **Create Project from Selected** link or **Create Project from Cart** to create projects from your selected assets(either from the selection or from the Cart. This will lead to project creation user interface depending on the template choice made in the steps above. When creating the project, the selected assets will be copied to the new project.

Tips and Tricks

Tip:

In certain cases you might want to have your assets attached with different **Attribute Categories** to be shown in your Asset Browser. For instance, when you have graphical designs attached to one **Attribute Category** and photographs attached to another **Attribute Category**. If you want your Asset Browser to show these two types of assets, you can create a third **Attribute Category** combining these two **Attribute Categories**. You can create your Asset Browser attached with this **Attribute Category**. You can refine your Search Results from the Browsing Tree or using Search Panel.

It is a good practise to name this combined **Attribute Category** with the name of the Asset Browser for future reference. However, this is not mandatory.

Remarks

- You might experience slow searching in Asset Browser if you use older versions of Internet Explorer. Consider upgrading or using quicker browsers like Google Chrome and Firefox on PC and Safari or Firefox on Mac.
- If the same value for an **attribute** exists in different **Attribute Categories**, the image label will be the same in the Asset Browser. For example if you have attribute named "lemon flavor" for Brand A and Brand B, you cannot have two different images for Brand A and Brand B.
- You cannot search for empty **attributes**. If you are doing a complex search with multiple checkboxes from the browsing tree with one of them without a value, the Asset browser does not give intuitive results.
- Attribute values or list names should not contain disallowed characters for the Windows Operating system file names when setting up a Graphical Asset Browsing. Avoid the double quote as well.

Troubleshooting

Problem: The asset browser works fine on on WebCenter Instance but not on another WebCenter Instance

- You need to copy all of the setup to each WebCenter Instance:
 - Migrate the ListManager Project or Template.
 - copy the images to `webinstance\custom\AttributeValueImages`

Problem: You get a message box with “No Search Panel Exists for attribute xxx”

The chosen attribute is not set to **Available** or **Visible** in the **Search Panel Design**.

3.8.6. How to Search for Document Reference Attributes

1. To search for **document references**, click on:
 - the [attributes](#) link from the **Search Projects /Search Documents** page.
 - the **task specifications** link from the **Search Tasks and Approvals** page.You will get the **Search Attributes / Search Specifications** page.
2. Choose your **Attribute Category** with the reference to the document you are looking for.

3. For each of your **Document Reference Attributes**, you can specify the search criteria as:

Options	Description
Empty	to search for projects / documents where the document reference attribute has no document attached to it. <div style="border: 1px solid #ccc; padding: 10px; margin: 10px 0; text-align: center;"> Attributes... CAD_REFERENCE is Empty </div>
Matches	to search for a specific document by its name.

Options	Description
	<p>Note: supports wild cards and special characters</p>
<p>Select</p>	<p>to select a specific Document from a specific Project folder.</p> <p>This option gives you a Select Document Reference pop-up where you can specify:</p> <ul style="list-style-type: none"> • a Project • the Folder • the Document • a single Version or a Revision. If you specify a revision, all the versions of this revision will become selected. The default is Any version. <p>Note: You can select the Project and Folder to specify the location of the document. But the search will locate all the versions of the same document located in different projects as well.</p>

Search for Reference Documents

Use **Reference** field to search on all document reference attributes or specifications in the **Project / Task and Approval** searches.

You cannot make it viewable or sort on this field. If you want to make the referenced documents visible you will need to do this by making specific document reference attributes visible.

Note: It is not possible to search with **Empty** option.

It is recommended to use the SmartName **Document Version ID** rather than the SmartName **Document Name**. The **Document Version ID** SmartName uniquely identifies the document version, when it is searched in the **Matched** mode.

Searching for Reference and Reference By

Use **Reference** field to search on all document reference attributes in the **Document** search.

When using the **Referenced by**, the resulting Documents will only contain a specific Document if the latest version of said Document is referenced by the selected Document (Version).

You cannot make it viewable or sort on this field. If you want to make the referenced documents visible you will need to do this by making specific document reference attributes visible.

Note: It is not possible to search with **Empty** option.

It is recommended to use the SmartName **Document Version ID** rather than the SmartName **Document Name**. The **Document Version ID** SmartName uniquely identifies the document version, when it is searched in the **Matched** mode.

You can search or create saved searches for Documents with reference attributes. You can search for a specific document used as a reference either by name or its project and location.

In both the Reference and Referenced by options, you can use

- **Select/Matches:** to search for the documents that are referencing a given document (version)
- **Select/Matches (any level):** to search for the documents that are referenced by a given document(version)

Find an example below where both options are explained.

The arrows show the relation between the documents (E.g. Doc4 has a document reference to Doc2)

Reference

- Select "Doc1" in this field and it will return Doc2.
- Select (any level) "Doc1" and it will return Doc2 and Doc4.

Reference by

- Select "Doc4" this will return: Doc2 and Doc5.
- Select (any level) "Doc4" this will return: Doc1, Doc2, Doc3 and Doc5.

Both the Reference and Referenced by support "Any level" searching for Document References. It is possible to turn the "Any level" searching off in the search crawler settings.

When using the **Referenced by**, the resulting Documents will only contain a specific Document if the latest version of said Document is referenced by the selected Document (Version).

E.g. Document A references both Document B (version 1) and Document C (version 1 whilst latest version is version 2) => when searching for "Referenced by" Documents of Document A only Document B will be found.

3.8.7. Searching Documents

In **Search for Documents** page, you can filter the search to a specific document type. When a document type is selected from the drop down, all additional parameters configured for the selected document type becomes visible.

Search Documents by Version Count and Approval Version Count

As a Project Manager or Admin user, you may want to find the number of versions of a Document existing in WebCenter (Version Count) or want to filter for certain count of Document versions on which approval cycle has started at least once (Approval Version Count).

To search the **Version Count** or **Approval Version Count** in the Document Search,

- check the field in the view and specify the column order
- enter the criteria in the respective field along with filtering conditions like greater than, equal to or lesser than for Version Count and with filtering conditions like greater than, equal to, and variance for Approval Version Count.

Search results shows the Documents along with the number of versions and number of approval cycles.

Searching on Documents

Search by Document Size

Users can search for documents which are of a certain size range using **Version Size**.

Version size will only show the size of the version of the document shown in the results. The size of the previous version of the document is not shown.

The **Version Size** criterion is available for all document types. You can search, sort and facet on the size of the document version (in bytes).

Search by Document Created Date

You can search the documents based on the creation date in a range or in the specified previous number of days and make it hidden or visible or available in the results.

Folder Search

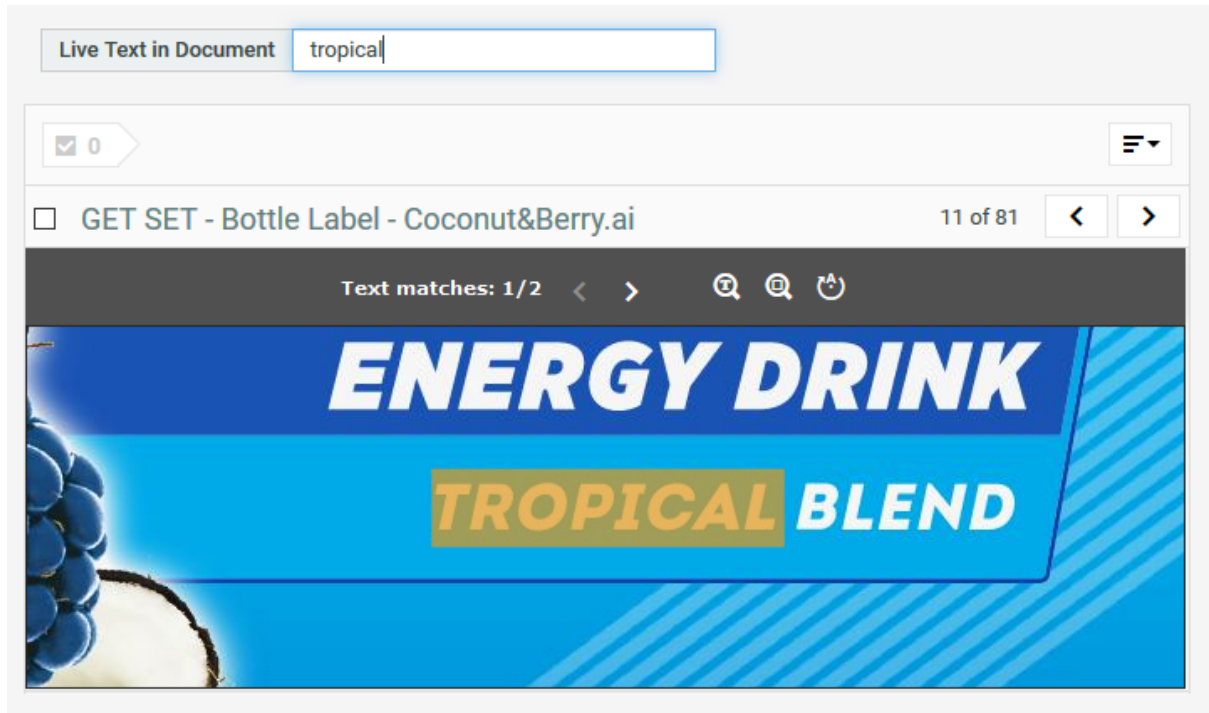

Read more on folder search [here](#).

Live Text in Document

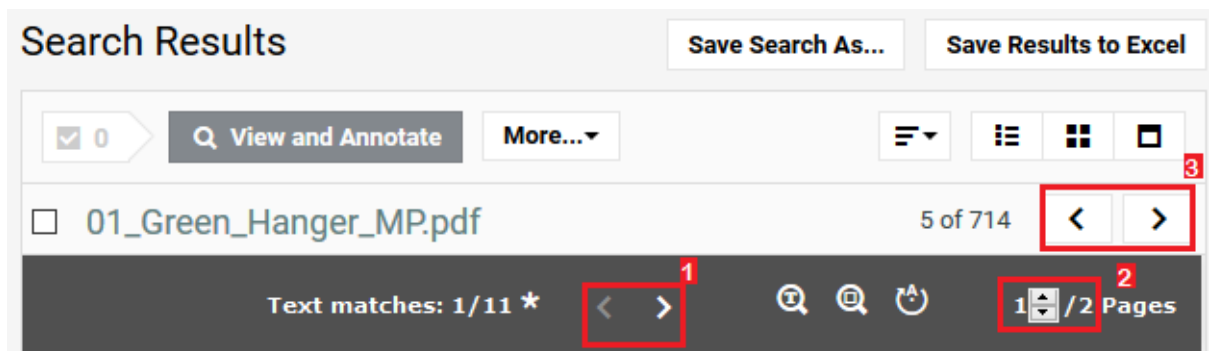

From 18.1.1 onwards, you can search for a text within a pdf document or a AI file using this **Live Text in Document**. This field is available for search, based on the setting in the [Search Crawler configuration](#) set by the Admin user. This search does not find results for the text present within an Image or outlined text.

When the search results are shown as a *Focus layout* with a viewer block, the matches for the searched text are highlighted in the document. You can navigate through the matches to see where the searched text occurs. The number of instances of the text occurring in the document are shown in the header.

Note: This field does not support right to left text used in languages like Hebrew, Arabic.

You can navigate through the matches to see where the searched text occurs.

1. Navigate through the text matches within the document
2. Navigate through the pages within the same document
3. Navigate to the next document in the search results

The number of instances of the text occurring in the document are shown in the header. When multiple pages contain a match for the searched text, it is indicated with an asterisk and navigating through the matches will also navigate through the different pages. By hovering over an arrow, you can also see the number of pages containing a match.

Search for Live Text in Document only works on left to right text. For example, text in Arabic or Hebrew are not supported yet.

Search Document by Reasons for Rejection

You can search on documents for **Reasons for Rejection**. You can either search for the current version of a document or search for all versions of the document.

Both the fields has 3 modes and a text field where you can enter any text. You can search for:

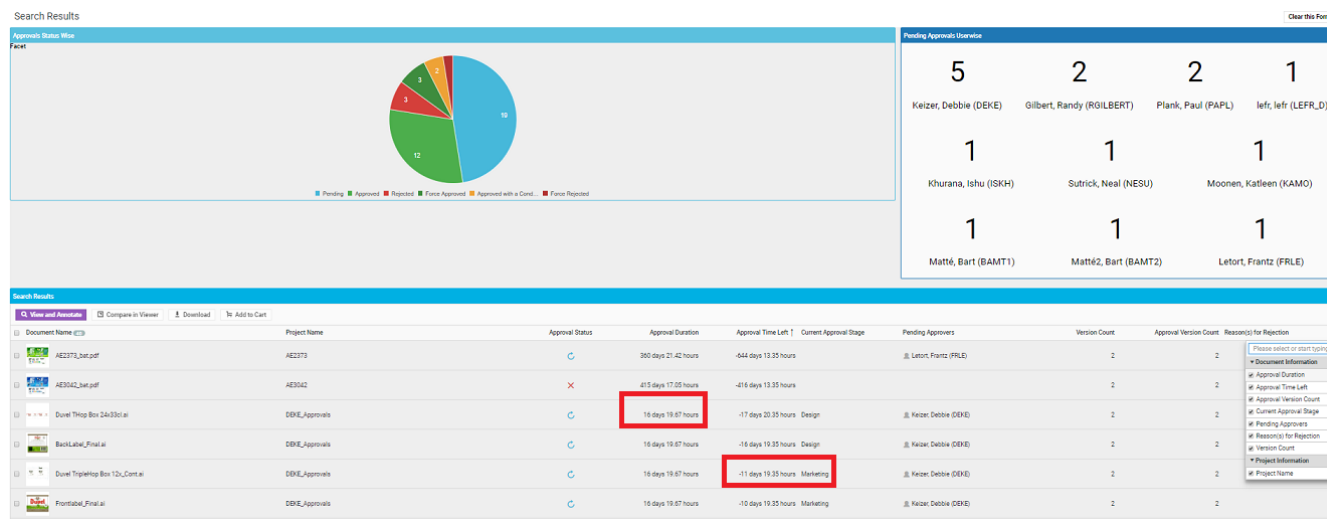

- Both Category and Reason (default)
- Only Category
- Only Reason

When searching in **Both Category and Reason**, this specific reason can be found by using the same format as shown in the search results: "reason (category)" or "reason" (if there is no category).

Note: The results are sorted on the **Category** and then on **Reason**. Reasons without a category are displayed after all the reasons that have a category.

Document Duration

Duration Metrics for a document are related to the Approval cycle(s) on the document.

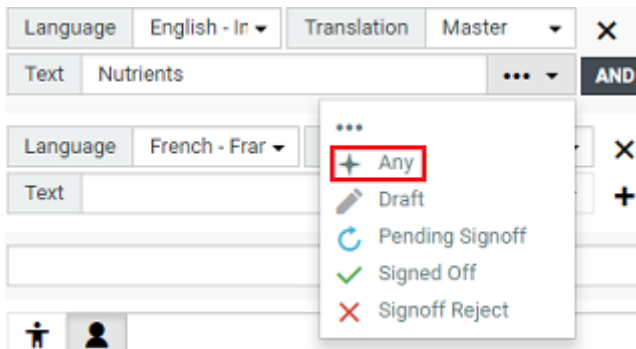

Some of the fields you can use to know the metrics of a document approval are

- **Start date** which is the start date of the approval cycle of the document
- **Due date** which is the due date of the approval cycle of the document
- **Completion date** which is the date and time the document reached an approved status
- **Approval Duration** is the time between the start date and the completion date when the documents are already approved. When the document is not approved yet, it is the time from the start date until the current date and time.
- **Time Left** is the time in days that is still left until the due date. When the documents are approved before the due date, the **Time Left** is positive and shows the number of days

- Actual **Text** from statements. Type the word in the **Text** field.
- **Text Element Status:** Click ... and select the status from the drop- down. For example, you can search for Signed-off statements with a particular text piece.
- A combination of Text Statements' criteria

You can add new rows for additional search criteria by clicking +. When you have multiple rows, you can use either **AND** or **OR** operation to refine the Search.

You can also ignore the search criteria mentioned and only display the results by choosing *** icon or you can choose the **Any** option to show results of text documents in any of the status.

In the example screen shot, the **Search** will find all Master Statements with *Nutrients* in its content **AND** with French- France as Translation.

Configuring Text Content Documents Search Results

The Search Results page shows all Text Content Documents that match the specified criteria. Each **statement** row selected to **View** is represented as a single column in the Results.

Search Results Save This Search Save Search Results

Name	Description	Project	Element Type	Document Status	Master: English - United States	Version Author
Content claim.wcc	Briefing_deketest (01)		Content claim		WITH 26 NUTRIENTS	Keizer, Debbie (DEKE)
Content claim.wcc	Briefing_KADA Test (01)		Content claim		WITH 24 NUTRIENTS	Conway, Antony (ACON)
Content claim.wcc	Drupa16_BO Library		Content claim		WITH 24 NUTRIENTS	Conway, Antony (ACON)
Content claim.wcc	PCM Text Library		Content claim		WITH 24 NUTRIENTS	Conway, Antony (ACON)

Found: 4 items. Page 1 of 1

Note: You can save Text Document Searches in Excel. The document statuses are not included in the Excel export.

Search Results Options

To customize the Search Results, select your criteria in the **Search Result Options** fields. The **Document Name** is selected by default. Read in: [Search Result Options](#) on page 554.

Search Panel Design

As an Admin, you can setup a Text Content Search with a [Design Panel](#) just like other document saved searches. The users can select individual text statement criteria in the Panel to filter the search results.

Note:

- If no **Statement** language is selected from the language drop down, you will not be able to view it as a separate column. The results will then match Text statements of any language.
- If the language chosen for the text has the directionality right to left or a custom font, then the text is also rendered right to left or in the custom font in the search results.

Saved Search for Text Content Search

To view My Saved Searches, go to **Search > Saved Searches**, you can view the saved search in the table under **Text Document Searches**. Saved Search for Text Content Document behaves exactly like any other document saved in the WebCenter.

Note: Only an Admin can modify the visibility of a Global Search.

Search Document by Folder

You can now search and display the folder where a document resides. Folder Search is useful to set up searches, to find certain types of assets. For example, when you have to search for pack shots in a certain folder in the project. You can either select the root folder, or search with the name of the sub-folder.

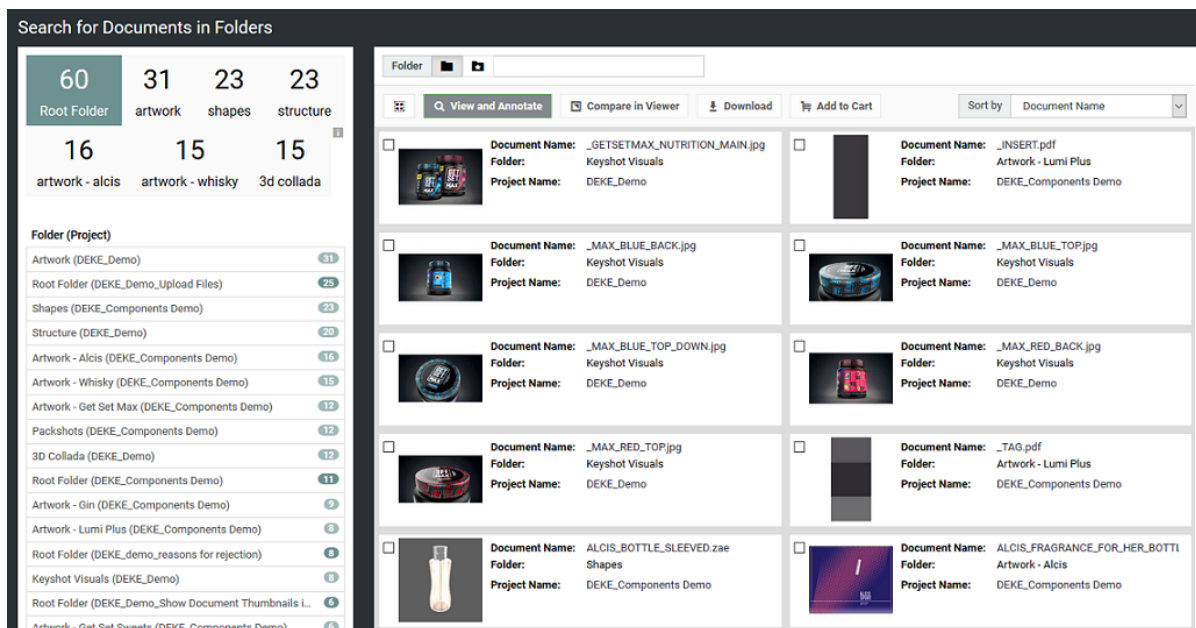

There is a new filter on the document search where you can specify the folder to look for. You can either search in the root folder or the name specified.

You can facet the search results for folders in three ways namely:

- **Grouped by Folder Name**

When searching the system for documents, you can group all the folders by name when you facet on the results.

- **Individual Folders**

When searching the system for documents, you can have the folders shown individually when you facet on the results. In this case, the project name will be appended because you can have multiple folders with the same name in different projects.

- **Project Context**

When searching for documents and faceting on the folders within a project context, this facet option will mimic the folder structure of the project, meaning all folders are listed, even when they are empty, and the ordering is the same as on the project documents page.

Search on non Latest version of the document

In WebCenter 18.1.1, we added a new option to search index documents which are referenced to earlier versions.

To enable this feature, **Admin users** must select **Index all currently referenced Document Versions** in the **Search Crawler Setup** page. The index is rebuilt wherever the option selection is changed in the setup.

This option is only useful, when you have the older versions of the documents which are referenced and it would occur when a document reference with the "**Selected Version**" option is used.

When this option is turned on, the Document search setup page has a new field, **Version Used In**.

A screenshot of a web interface showing a dropdown menu. The label 'Version Used in' is on the left. The dropdown is open, showing three options: 'Project' (highlighted in blue), 'Document Reference only', and 'Document Reference or Project'. A small downward arrow is visible on the right side of the dropdown box.

Following are the options that can be chosen when you search for a document based on the version used.

- **Project** is the default option selected and the search returns versions of the documents that are linked into a project or are the latest version of a document revision.
- **Document Reference only** option limits the search to referenced document versions that are not the latest in any Project or Revision.
- **Document Reference or Project** returns any version in a project or referenced by any other document.

Note: Only versions referenced from a document reference in Documents are taken into account and not if a version is referenced from a document reference in a project.

Search on Approval Status

You can search for more than one Approval Status by selecting multiple statuses in the **Approval Status** field and you can also search on **Approval status completed** field.

With the Approval Status field you can also search for documents where the approval is stopped or not set up yet.

A screenshot of a search filter configuration interface. It consists of several rows, each with a label on the left and a dropdown menu on the right.

- Approval Status:** The dropdown is open, showing three selected items: 'Pending', 'All Rejected', and 'Approved with a Condition'. There is a plus icon and a dropdown arrow on the right.
- Approval Status Completed:** The dropdown shows 'today'. It has a checked checkbox and a gear icon on the right.
- Approval Started:** The dropdown shows 'today'. It has an unchecked checkbox and a gear icon on the right.
- Approval Due:** The dropdown shows 'before today', 'this week', and 'last week'. It has an unchecked checkbox and a gear icon on the right.
- Approval Completed:** The dropdown shows 'this month', 'last month', and 'last year'. It has an unchecked checkbox and a gear icon on the right.
- Approval Duration:** The dropdown shows 'this year', 'last year', and 'more options...'. It has an unchecked checkbox and a gear icon on the right.

3.8.8. Search on Pending Approvers

Pending Approvers

You can make the **Pending Approvers** column visible. This column shows all the approvers who still need to approve. You can also sort, facet, and filter on **Pending Approver**. There is a configurable option to show the assignee details of the **Pending Approver**.

3.8.9. Searching for Parent or Child Projects

It is possible to search for Projects which are related in a Campaign or Program. This is very useful in creating Saved Searches that can be used in the context of a Program or Campaign.

It is also possible to use these Project criteria in the Document and Task searches.

You can use the fields: **Parent Projects** or **Child Projects** to specify a name criterion.

Tip: Use SmartNames to use Saved Searches in the context of a Program or Project. If you set the **Parent Project** as the [Project id], your results will list all the Child projects of the current project. See more in: [SmartNames in Search](#) on page 232

Note:

- The search results depend on the view permissions of the user.
- It is possible to save the Parent and/or Child Projects in Search results to Excel if that option is selected.

If you specify the **Parent Projects** field as `campaign_`, the search will look for Projects with a Parent Project with "campaign_".

Searching in Parent Projects

When you are searching for Projects who has a certain Parent, you have three options:

- **Search only in Direct Parent Projects:** Use this option if you want to search in Projects that are one level higher in the Program structure.
- **Search in all Parent Projects:** This option lets you search in all Parent Projects directly above and in all higher levels in the Program structure
- **No Parent Projects:** Use this when you have to search in Projects that are at the top of the Program structure, or the Projects which do not have parents.

Searching in Child Projects

When you are searching for Projects with certain child Projects, you have three options:

- **Search only in Direct Child Projects** to search in Projects that are one level below in the Program structure. The second(and deeper) level Projects will not be considered in this search.
- **Search in all Child Projects** lets you search in all Child Projects from all levels.

- **No Child Projects:** Use this when you have to search for Projects that do not have Child Projects.

3.8.10. SmartNames in Search

Administrators can create **Saved Searches** with **SmartNames**. SmartNames are variables that will refer to a value when placed in the **right context**.

Read about the SmartName [here](#).

Note: These searches will resolve only in the context of the **Project / Document** and will not be useful as a general [search](#).

When you plug in these searches into a project / document, these SmartNames will resolve with values retrieved from that context. For example, if you create a **saved search** for finding the related projects, your users will be able to view the search results within a project tab. Read more in: [Use Case: SmartName Search to find Related Projects](#).

You can also use SmartName searches as the document sources in [Document Reference Attributes](#) and Project Creation.

These SmartName searches will display different results in different projects/documents as the context of the SmartName changes.

Using SmartNames in Saved Searches

A SmartName is a variable that will refer to a value when placed in the right context (For example, within a project or in the context of a document).

To create a SmartName powered search:

1. Go to **Search > Documents** or **Search > Projects** or **Search > Tasks**.
2. Enable **SmartName**.

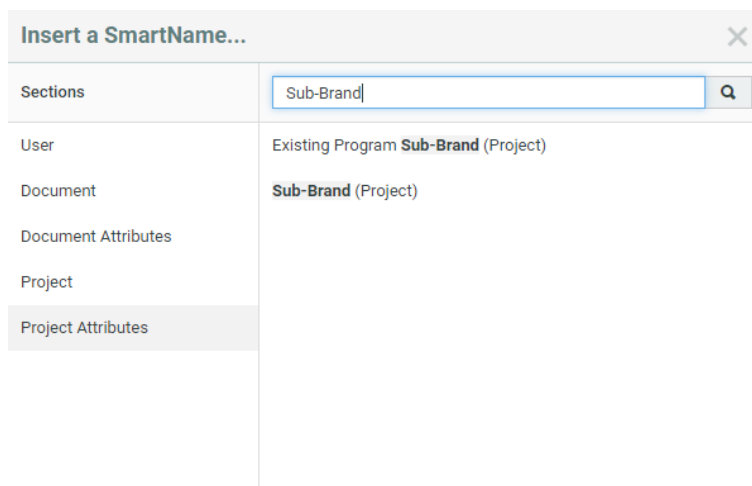

All your search fields will display the SmartNames **+[]** icon.

3. Click on the **+[]** icon in the field where you want the SmartName configured.

For example, Project Name can indicate the group of projects it belongs to. In this case click **+[]** in the **Project Name** field.

4. In the SmartName dialog, choose the SmartName.

5. Save the search. Your SmartName search will appear in the list of **Saved Searches**.

Note: SmartName enabled searches can be saved only as **global** searches. These searches will be visible only to the **ADMINS** group. You can change the visibility of the search by clicking the **Edit visibility** button. Read more in [Creating Advanced Saved Searches](#) on page 177.

You can plug these searches into the relevant projects where the SmartName will get resolved. Your search results will then list the results based on the context.

Note: If a SmartName gets resolved into multiple values (a multi-value Project Attribute), your search criteria will be all of those separated by the OR separator.

Remember: If you execute a SmartName search from the **saved searches** page, you will not get valid results.

Save as Global when SmartName Context is enabled

Note: SmartName enabled searches can be saved only as **global** searches. These searches will be visible only to the **ADMINS** group. You can change the visibility of the search by clicking the **Edit visibility** button. Read more in [Creating Advanced Saved Searches](#) on page 177.

Use Case: SmartName Search to find Related Projects

When you have a group of Projects under a Packaging Project / Program, your projects share **attributes**. You can use these common parameters (in the search) to display the related

projects / documents. This is also useful when you have derived-projects created using the **Create Project** node.

Depending on your business needs, you can customize a SmartName powered search and plug this as a tab in the **projects** details page. For example, you can display all the derived-projects in one tab and all the related projects in another by plugging in **SmartName saved searches** in these custom tabs.

Tip: You can configure this as a dedicated *menu* item for the **Project Details / Document Details** page.

SmartName Searches in Project Details / Document Details

To use your SmartName powered searches as a dedicated tab of the Project / Document details page, *create a custom menu item*.

You can link this custom tab to a **saved search** with SmartNames. The SmartNames will resolve to values derived from the current Project (for Project Details Menu Items) or Project and Document (for Document Details Menu Items) context.

The user / group / company with this menu will have a custom tab displaying the search results based on the SmartName criteria.

Use a SmartName Saved Search as a Document Source

You can create custom **Document Sources** using dedicated SmartName searches. You can use these as sources in:

- Project Templates with *Document Creation Settings* on page 160.
- Documents or Projects assigned with *Document Reference Attributes*

When the user uses this source during Project creation or to add documents to a task within the Project, the Saved Search configured as the document source is executed from the current Project / Document context.

Setting up a SmartName Saved Search as a Document Source

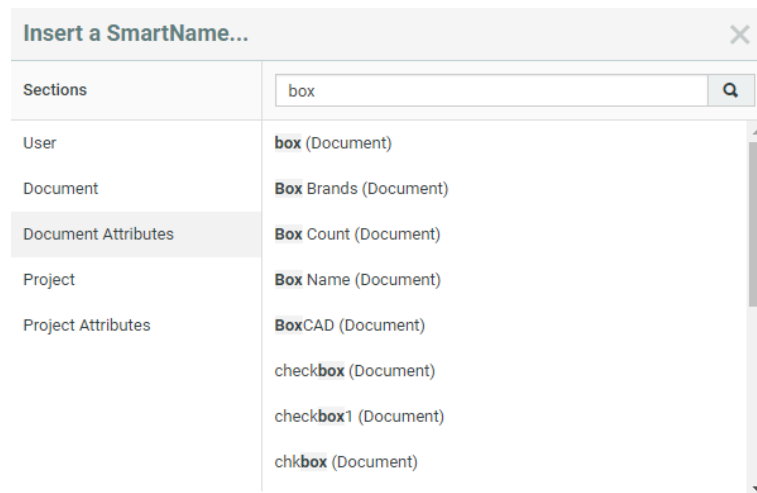

1. Go to **Search > Documents**.
2. Enable **SmartName**.

All your search fields will have a SmartNames + icon next to it.

3. Click on the **attributes** link.
4. Click the + icon next to the attribute from your attribute category.

As an example, if you want to setup a document source for a Customer, from the library of your CAD files:

- specify the customer related attributes as the SmartName search criteria.

Tip: Configure [Search Layout](#) options to get an advanced layout.

The selected attribute(s) will appear in the search form.

Tip: The above example will work only in a document assigned with a document reference attribute (category). If you would use this as a document source in project creation, use the [Box Brands (Project)] as the SmartName.

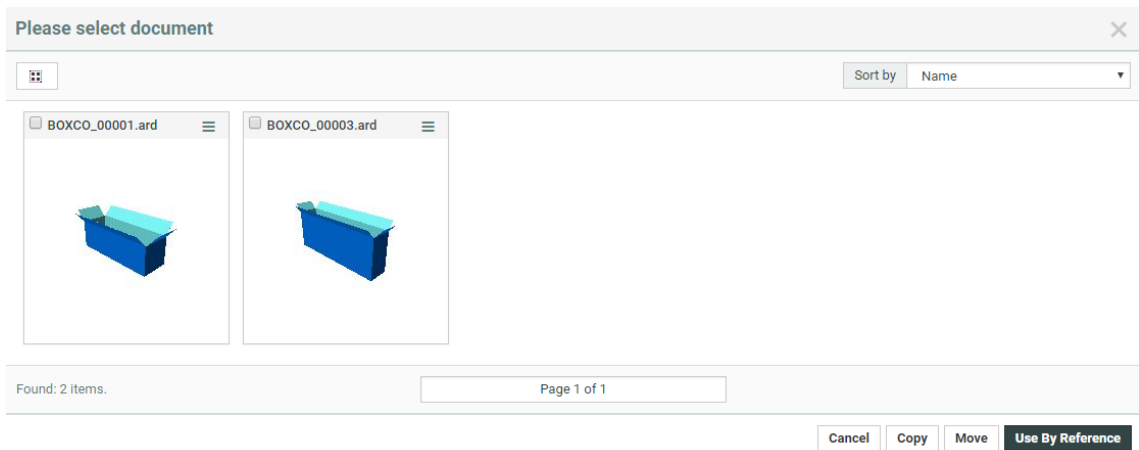

5. Save the search.

Tip: If you want to limit the scope of the search within a library of documents (a repository project), specify the project name as another criteria.

You can add this search as a document source in:

- [Document Creation Settings](#) on page 160 of Projects / Templates.
- Document sources in [Document References](#) on page 353

When the user clicks a custom link to add a document as a [document reference](#), the result will be a pop-up with the saved search results. You can configure the [search result layout](#) settings to configure the features in the document source pop-up.

3.8.11. Drilldown Searches

You can use Project search based **drilldowns** to set up a:

- Drill-down into all levels of Projects. This feature allows the Program Manager to explore project data beyond the overview. If you have a nested structure (Project / Grouping / SKU / Components) in your Program, an expand button lets you access the next level.
- Drill-down into Components (documents) or Tasks

Use Case: Program Search

1. The parent Search with Programs. This example shows a [Search Results Dashboard](#) on page 237 with **counters**.

2. The second level of Drilldown which executes the **Saved Search** specified in the parent search. This search contains a **Dashboard** with a **Facet Graph**. [Configuring a Drill down Search](#) on page 237
3. The third level of **Saved Search** with a **Document Search**.
4. The expand button to execute the drilldown.

Configuring a Drill down Search

To create a drill down view, you need a **Project Search** or **Document Search** with the **Drill down** option turned on. As a result, the parent search will have an expand button in every row of the results table.

When you click on the expand, it will execute the Saved Search or display the associated child Projects or Documents in the Search Results page.

Note: Drilldown expand buttons are only shown in the List view of the Search results.

1. To set up a Search to show a drilldown of child Projects or related documents:
 - a) Search for your Programs (Parent Projects) or Documents.
 - b) Enable **Show Drilldown using Saved Search** in the **Show Results Layout Options**.
 - c) Save the search with all the advanced settings you want. Read more in: [Creating Advanced Saved Searches](#) on page 177
2. To create multiple levels of **Drilldown** searches:
 - a) Create Searches for all your sub-levels and save them. Optionally, configure [Dashboards](#).
 - b) Specify the **Search Criteria** for your parent search.
 - c) Enable **Show Drilldown using Saved Search** and specify a **Saved Search** from the drop-down.
 - d) Create further levels using the same steps.

To configure the layout of the drilldown in the search results, choose any of the three options for the **Layout, Selection and Actions**. Read more about it [here](#).

Note:

- The Dashboard Facets will display the data based on the specified Saved Search. Clicking on a Facet(Graph/List/Counter) section will refine the search results of child search.
- It is recommended to use Document Version ID SmartName than the Document Name SmartName, since Document id is unique.

3.8.12. Search Results Dashboard

WebCenter search dashboard organizes and create a visual representation of your data along with tables. It is built using a set of smaller components (blocks) with specific information. The admin has to configure each of these blocks in a Saved Search.

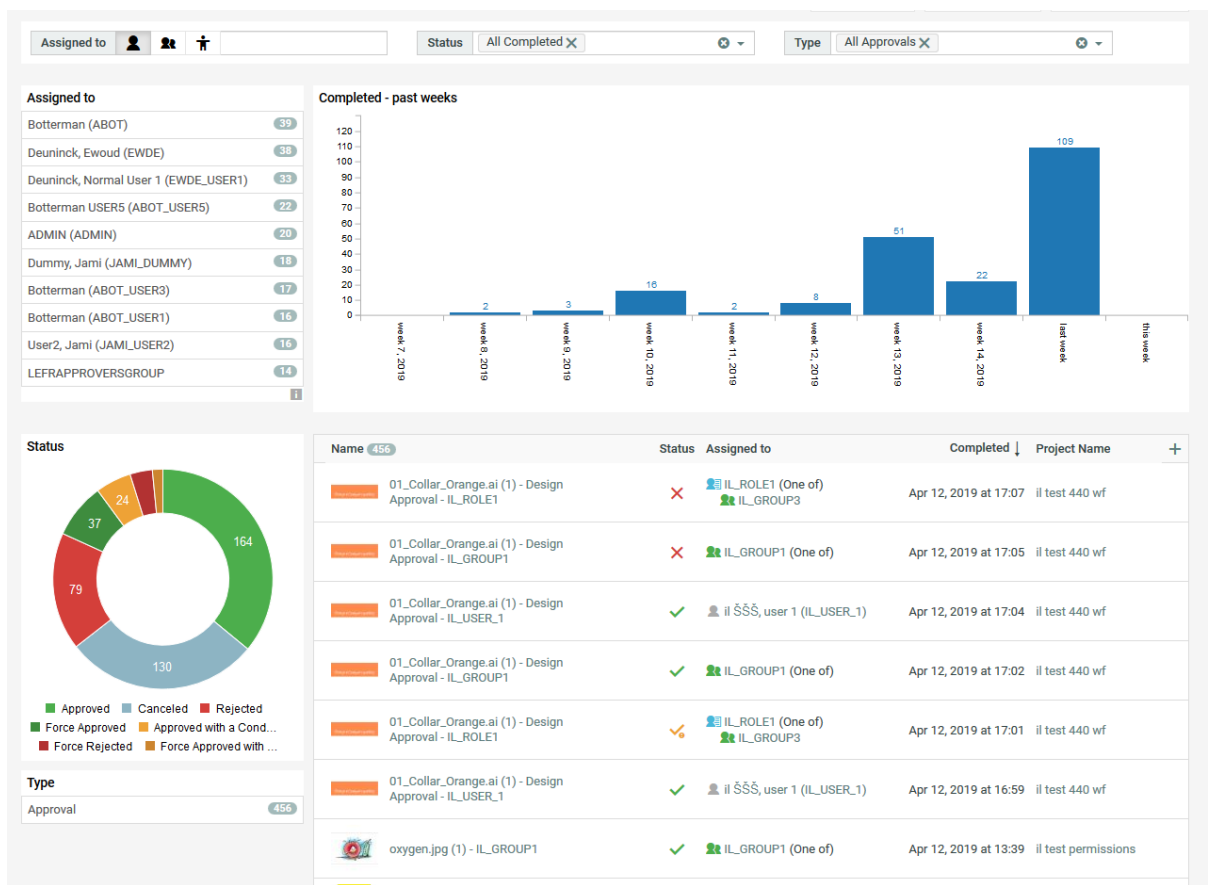

You can decide the layout and configure it with the components that suit your user's interest. To configure a **Search Results Dashboard**, you can simply drag each component into your canvas from a gallery. You will have live editable preview as you configure each of the dashboard component. Each of these components can accommodate specific settings and search criteria.

All the search-specific blocks like facets, results table, asset browser, cart, design panel will show a preview with real data instead of just a placeholder. When editing the configuration or dragging in new blocks, the search will rerun to load the new data and the preview will be updated.

You can configure **Dashboards** with **Project/Document/Task and Approvals** searches.

Once setup, you can use **Dashboards** on your user pages such as:

- **My Work**
- **Menu**
- **Project Details** with context aware *SmartNames*
- **Drill-down** overviews of Projects/Programs
- **Asset Browsers**

Note: Live preview is not available when the dashboard is configured with SmartNames in it.

Types of Dashboard Blocks

Dashboard Blocks

A **Dashboard** consists of several building **blocks** that can show information as graphs, counters or tables. These are interactive and you can use it to refine the displayed data. You can configure several such **Blocks** in a **Dashboard**.

Type of Blocks

General	<ul style="list-style-type: none"> Rich Text Block Selection Panel Counter
Layout	<ul style="list-style-type: none"> Collapsible Section Column Layout Left Side Panel Layout List Layout
Search Facets	<ul style="list-style-type: none"> Facet Bar Chart Facet Counter Bar Facet Donuts Chart Facet Horizontal Bar Chart Facet List Facet Pie Chart
Search General	<ul style="list-style-type: none"> Search Details Search Design Panel Cart

- **Asset Browser Side Panel**
- **Asset Browser Image Panel**

Configuring the Search Dashboard Layout and Blocks

To configure a **Dashboard**, you can utilize any of the building blocks depending on your requirements. You can make a visual representation of your search results using various faceting blocks. You can see how your configuration will look like when you start building your **Dashboard** live.

- From the **Project/Document/Task and Approvals** Search page, click on **Search Results Dashboard**.
It opens up a canvas with a gallery on the left hand side. The gallery displays all the available *blocks*.

Tip: Search Result Dashboard now supports Internationalization. You can define translations for Block titles, Counter Labels and Rich Text fields.

- Arrange your **Layout** blocks.
 - a) Drag **Layout blocks** into your canvas. You can use combinations of list, left side panel, column layouts and collapsible section to present your blocks.
 - Select **List Layout** for a vertical list of blocks and **Column Layout** for a horizontal arrangement.
 - Select **Left Side Panel Layout** to present information in a left side **Column Layout**. This pre-defined layout can be modified to suit your needs.
 - Select **Collapsible Section** to present info which can also be hidden and expand one or more blocks based on the requirements.
 - Select **Column Layout** to display blocks in configurable columns. When the user adds a Column Layout to the dashboard, the layout is preconfigured with 2 columns.
 - b) Add **Rich Text Blocks** to add any Text message/ information to your users.
- Determine the dimensions of your **Layout** blocks
 - a) Specify **Spacing** to define space between **Layouts**. This is optional and use it if you want to separate the **layout blocks**.
 - b) To style your **Column Layout**, you define the width, minimum width and maximum width of individual columns. If you leave the **Width** as empty, the columns will fill according to the available space.
 - c) Fill each of these **Layout blocks** with the **Search** and **Facet** type of blocks.
- Configure the **Facet blocks**. To configure a Facet Graph, List or Counter Bar, specify the **Facet** field (Search criterion) to facet on and the maximum **number of facets** to be displayed.
Read more about Facet fields in: [Facet Settings](#).
 - a) Drag your **Facets** into the **Layout** block.

- b) For any **Facet** block, you can select the **Type** from Bar Chart, Horizontal Bar Chart, List, Donut Chart, Counter Bar and Pie Chart (default).
- c) Use **Customize Value Order and Colors** [Customize Labels and Colors](#) on page 242 to configure custom labels and color definitions for **Facet Graphs**, **Facet Lists**, and **Facet Counter Bars**.
- d) Specify the dimensions of your graph or chart (**width** and **height**). This is an optional step and if the sizes are not specified the graph fits to the available space.
- e) For **Facet Counter Bars** (Facet and Search Based Counters), you can specify the **Style** to adjust the display size.
- f) Optionally, specify a **Block Title** and enable **Show Block Title and Border**. This will enable a color picker from which you can specify the **Border color**.

You can add **Search Results**, **Search Panel**, **Cart Asset Browser Side Panel** and **Image Panel** to your **Dashboard** layouts.

Building a Search Based Counter

You can use a **Counter** block to display the total count of a Saved search.

To configure counters for your dashboard follow the steps below:

- Specify a Global **Saved Search**. In the counter display, the dashboard will show the count of this particular search.
You can use a SmartName based search in a counter. If the SmartName cannot be resolved, the counter will show a -.
- Add a **Label**. If you did not specify a label, the counter displays the Saved Search's name.
- Specify a **Background Color**.
The default color is green and you can change the color by typing a hex value or picking a color using the color-picker.
- Select a **Style** from the drop-down: Extra small, Small, Small Left Aligned, Default, Default Left Aligned, Large, Large Left Aligned and Large No Label.
You can configure several of these counters in a column layout to create an interesting overview. Read more in: [Program Dashboard with a Drill-down View](#) on page 458.

Note: Enable or disable the **Run Search on Click**. This option is enabled by default. If this option is on, you can click the counter to view the search results in the current window.

Customize Labels and Colors

How to Customize Labels and Value in Search Results

This option enables to configure the labels and color definitions for the **Facet Counter Bars**, **Facet Graphs** and **Facet Lists**.

When any facet block is configured, there is an option to **Customize Labels and Colors** to modify the labels and colors for the values selected. This can be used for string and status fields.

Note: Date and user fields cannot have custom values. For example, if you are configuring **Roles** in a facet list, then this option is not visible.

If this option is enabled, a new section appears in the configuration panel. A table is displayed in which custom labels and color definitions can be configured. Click **Add Value** and a new row is added to this configuration table.

To Add Value

To customize the labels and colors for the facet values, you can either select the values from the drop-down list, input fields or even a range of values based on the facet chosen. For each value, a custom label and color can be defined in the row. You can reorder rows by drag and drop. To delete the row, you can click delete button at the end of the row.

Faceted fields like project status, approval status that have predefined colors that denotes a status, do not allow color customization.

Enable **Only display currently defined custom values and order** to restrict the display of only the customized values. In that case, the option **Maximum number of facet values** is ignored and **Number of values** field and the corresponding drop down becomes invisible.

Facet Settings

Facet blocks (see [Types of Dashboard Blocks](#) on page 238) allow you to visually represent your specified search field (Facet). You can use the cascading drop-downs of available fields to specify the Facet.

The Number of Facets (**Number of Values**) field determines the maximum number of facet values displayed in the graph/ chart/counter bar/list. The facets with the most number of results get priority in the chart/graph/list/counter bar display.

Facet Settings- Project Search Fields

1. Project Information has the following fields in the drop-down:

- Attribute Category
- Completed
- Created (date)
- Customer/Location (company/location)
- Due (date)
- Manager Location (company/location)

- Modified (date)
 - Project Creator
 - Project Manager
 - Project Template
 - Project Status
 - Salesperson
 - Started
 - Time Left
2. To facet on a Role, select it from the Roles drop-down.
 3. To facet on an Attribute, specify it from the Attributes drop-down (Text attributes, Text restricted set attributes, Numeric and Date Attributes).
 4. You can facet on the Project Status Duration, Project Status Started, Project Status Completed, Project Status Due Date and Project Status Time Left. You can read about it here.

Facet Settings- Document Search Fields

1. **Document Information** Facet has the following criteria:

- Approval Completed
- Approval Due
- Approval Duration
- Approval Started
- Approval Status (status only)
- Approval Status Completed
- Approval Time Left
- Approval Version Count
- Attribute Category
- Author's Location (company/location)
- Created
- Current Approval Stage
- Folder
- Modified (date)
- Pending Approvers
- Version author
- Version Count
- Version Size

Note: When you select **Version Count**, you can specify the range of the values and customize the label names and the display colors.

2. **Document Attributes:** You can specify the attribute from the Attributes drop-down with Text attributes, Text restricted set attributes, Numeric attributes and Date attributes.

When you choose numeric attributes, range of values has to specified and labels can be customized for display. The range and the label are displayed in the same order.

3. **Specific Document Information** You can also add specific document meta data based on the document type searched for and display in the search dashboard. When you search for text content documents, you can show for Document Status and Element Type.

Facet Settings- Task and Approval Search Fields

1. **Task Information** Facet can be of the following criteria:

- Approval Master
 - Assigned To
 - Assignee's Location (company/location)
 - Completed (date)
 - Completed by
 - Due
 - Duration
 - Final Approval Status
 - Modified (date)
 - Reason(s) for Rejection
 - Stage Approval Status
 - Started
 - Status
 - Task Created (date)
 - Task Created by
 - Task Estimated
 - Time Left
 - Type
2. You can also Facet on Task Specifications. The Specifications (Numeric, Text, Text restricted set and Date) are listed in the adjacent drop-down.

Note:

- When you select a **Date** criterion, you can specify the time in the past or future days, weeks and months when applicable.

Facet Search: Viewing Search Results

Facet List

A **Facet List** presents the search information in a List. All possible values for the faceted field (the search criterion specified) are presented in a list form in the descending order of the number of occurrences (displayed in the list as a badge).

Project Status	
Status	
Active	2116
Wait for Files	113
Non-active	46
Nightcrawler	39
CalDemo Completed	37
Completed	34
PRMA_Initial	27
PRMATest	26
SAH_STATUS_ACTIVE_1@1	13
SAH_STATUS_ACTIVE_2	10

Facet Graphs

Facet Graphs present the data based on the Facet Field as a graph like bar or vertical bar chart or as donut chart or pie chart. All possible values will be presented as separate sections in the graph. There is priority for the values with the number of occurrences if there is a specified value for the Facet Field. Read in [Facet Settings](#) on page 242.

Facet Counter Bar

The Facet Counter Bar lists the number of occurrences of the faceted field in a horizontal bar and similar to the Facet List, the counters appear in the descending order.

You can specify the **Style** to adjust the alignment and size of the counter bar.

Note: The number of values of the faceted field is restricted by the **maximum values** set in the [Dashboard Facet settings](#).

Refining Search Results using AND/OR Operations

To refine the search results to one particular value (of the Field/Criterion), simply click on the item (or section) in the List. The results will be refined and you will see 'x' icon to deselect. You can either use 'x' or click on the value again to deselect it.

By default, this is an **OR** operation. To display a results of all the selected 'values' of a particular **Field**, you can simply click on all of them and switch the operation to **AND**.

When you click on a list/counter/graph item or section, by default, search uses an **OR** operation to refine the results. For Facet Fields (**Attributes/Specifications/Roles**), you can switch to the **AND** operation to combine these sections.

Note:

- The **Information Fields** (Project, Task and Document information) do not show an operator.
- The Date and Time Fields show only **OR** operator.

Important: Clicking on a section would automatically update your search results if the **Show Search Button** option is turned off. If this option is on, you have to select a section and then click **Search**.

Default Colors

If you are faceting on project statuses or document approval statuses, the appropriate colors are used for the count badges, graph sections and counters.

Image Spinner

Image Spinner allows you to display selected images in a Dashboard. This can be a display of your relevant artworks or any relevant images.

See the settings of this block below:

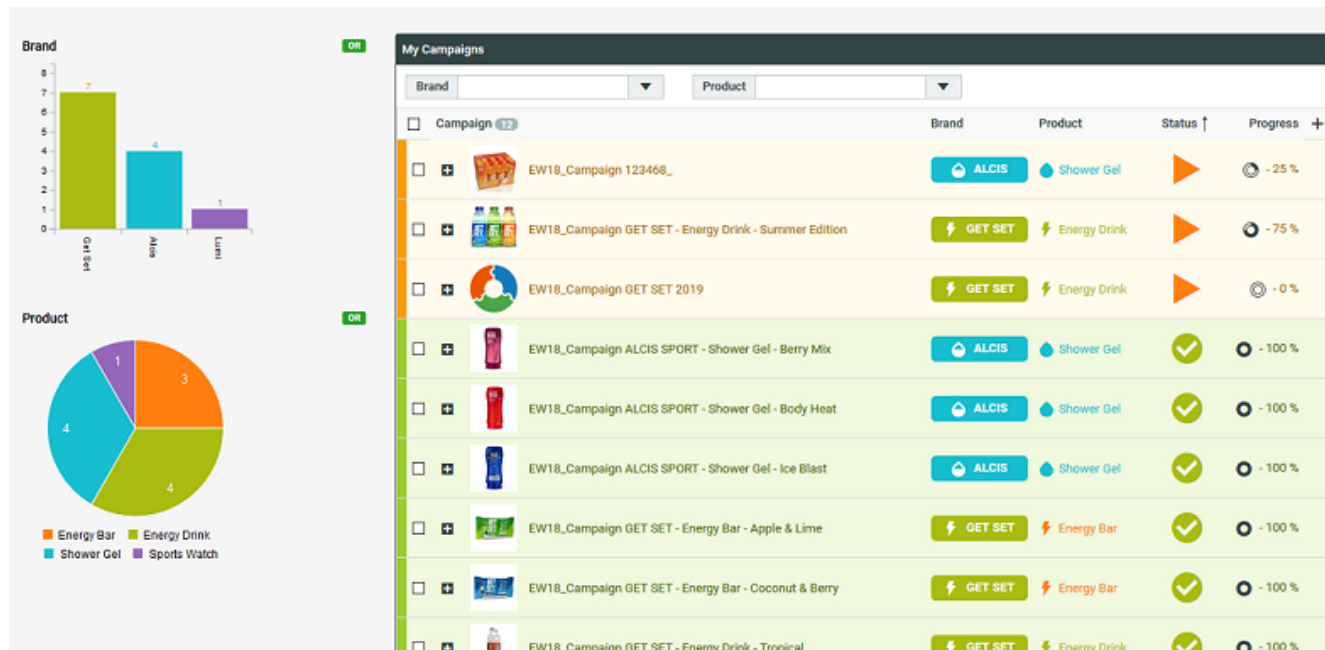

- **Saved Search:** Select a **global saved search** of graphical documents (pdf, ai, png, jpg, jpeg). The first 25 images will be displayed in the **image spinner**.

Note: It is possible to use a SmartName based Search. However, make sure that these SmartNames are resolvable to prevent an empty **image spinner** block.

- **Horizontal & Vertical resolution of the images:** Specify a resolution value for the image. The value can range from 1 pixel to 5000 pixels.
- **Scale image to width of block** (Default option): When this option is on, the images are always completely visible. If the option is off, the images are shown according to their size.
- **Seconds:** Specify the duration of display for each image in seconds in this field.

3.8.13. Search Results Formatting

Search Result Formatting framework makes it simple to present result data in an attractive and clearly communicating form.

Admin users can setup **Search Results Formatting** by navigating from the Search setup page for Projects or Documents or Task and Approval Searches.

This opens a pop-up with two tabs, namely **Fields** and **Row/Card**. The default selected tab is **Fields**.

Choose the **Row/Card** to set up a styling rule in the Search results or you can set up the rules specific to each field by using the **Field** tab.

1. Select **Add Rule** to add a new rule to the field chosen with a defined condition.

This adds a row to the table and allows selecting:

- A Condition
- An Operator
- A Value
- A Style
- Apply to Fields (only for Fields tab)

The first three columns determine when the rule for styling should be applied.

Rules created can be reordered by drag and drop and the order determines the required sequence.

2. Select a field based on which you want to create the rule for styling from the **Condition** drop down. The list displayed may vary based on whether it is a **Project or Task and Approval** or **Document** Search.

Document search will have fields related to Document Information like **Approval Completion Date, Document Name, Description, Last version Comments** along with Document Attributes, Project Information related fields, Roles and so on.

3. Based on the field chosen for the **Condition**, relevant operators are available in the **Operator** drop down. For example if any date related field is chosen for Condition, then the operator will have options like Is after, Is empty, Is Before and so on.
4. Again based on the operator used, only the relevant fields are shown. If the Condition field is a date and if the operator chosen is **Is after**, then the relevant date fields are shown in the drop down with an offset option.
5. In the Style field, you can either **Create New Style** or Import an existing style with the saved searches. If you want to create a new style, click on **Create New Style** to open the pop up window. Styles can also be *imported* from another saved search for consistency and efficiency.

You can edit an existing style by clicking on the edit icon and click **OK** to make the changes to the same style or you can **Save as New Style**.

Test Text

1. **Style Name** is a required field by default. You can provide a unique name to the style you are creating.
2. Select the background color for the style from the color picker tool.
3. Select **Use Background Color Label** in the check box to use a background color only for the label. This option is only available for field styles.
4. Choose a text color for the style from the color picker tool.
5. You can either choose **No border** or **Right** or **Left border** for the field or the rows of search results.
6. Specify whether you want to have **Both Icon and Value** or **Only Icon** or **Only Value** to be displayed for the fields in the search result. If you choose any of the icon options then another drop down is displayed with the available icons. When an icon is chosen, you get additional options to choose the color and the Icon Size also. In case you choose **Value Only** or **Icon and Value** option, you get an additional field for entering a **Fixed Text** which will be displayed in the field.

Import Styles

You can select the **Import Styles** to reuse any existing style in the saved searches.

1. On selecting this option, you get a drop down of all the available saved searches with styles. Choose the saved search which has the requisite style.
2. You will get an additional drop down to choose from all the styles already created in this **Saved Search**. Styles available for field is displayed when you choose this option in the **Fields** tab and styles available for rows are displayed when you choose this option in the **Row/ Card** tab.

3.8.14. Setting Up Project Operations in Saved Searches

Updating Due date, Manager or Status

The Project Manager, Due date and Project status properties can be modified from Project search results or a saved Project search results.

Note:

All actions are restricted to current permissions on the individual projects involved.

Search For Projects

Fill in one or more fields. Prefer less fields? Try [Keyword Search](#).

	<input checked="" type="checkbox"/> Use Advanced Search Characters	<input type="checkbox"/> Search Panel Design	Search Results Options			<input type="button" value="Search"/>
			View(List)	Column	Order	Order

[Clear this form](#)
[Save this search](#)
[Show Result Layout Options](#)

1. In the main menu, go to **Search > Projects**.
2. Type the parameters you would like to use to filter the search results.
3. Enable the **Editable** check-boxes for **Project Status**, **Due** and/or **Project Manager**.

Use the **Editable** column to enable bulk operations on projects. You can modify the following parameters of several projects at once:

- **Due date**
- **Project Manager**
- **Project Status**
- **Attribute Category or Project members/permissions**

- **Project Role assignments**

The bulk operations can be done from the **Search Results** page or from **Saved Search Results** page.

Note: These bulk operations are always limited to current permissions on the projects involved.

When you enable the **Editable** items, you get an Edit  button next to the selected items in the **View** List.

4. Now **Save** the **Search** or click **Search**.

Note: For each **Editable** item, a corresponding option will be created in the table actions bar.

Updating Attribute Category or Project Member / Permissions

You can setup Project **Search Results** to allow bulk updating of:

- the Project Attribute Category
- Project Members
- Project Permissions

1. In the main menu, go to **Search > Projects**.
2. Type the parameters you would like to use to filter the search results.
3. Click **Show Result Layout Options** to see advanced search options.
4. Enable **Allow Changing Attribute Category** and / or **Allow Changing Project Members**.
5. Now **Save** the **Search** as **Global**.

Updating Roles

1. In the main menu, go to **Search > Projects**.
2. Type the parameters you would like to use to filter the search results.
3. Add one or more Role Search Criteria by clicking the **Add Role Search Criterion** link.
4. Enable the **Editable** check-boxes for **the role or roles that you want to make editable**.
5. Save the **Search** as **Global**.

Detach Child Projects

You can configure **Detach Child Project(s)** operation in a Saved Search. Program Managers can use this in a contextual Saved Search configured in the Parent Project's details. The use case is that the Project or Program Manager can select existing Child Projects displayed in the search tab and detach them from the Parent Project.

Note: The action is only available to the users with **Change Permissions** of the parent and child project.

- Create a global [Saved Search](#) to search on child Projects. Enable the **Search Result Layout** option **Allow Detaching Child Projects**.
- Apply the Saved Search into the Project Details menu of the Parent Project Manager.
- To detach child Projects, go to the Child Projects tab with the saved search, select child Projects and click **Detach Child Project(s)**.

3.9. Managing Companies

Entering Company and Location information lets you further refine projects and users when they are created.

3.9.1. Create a New Company

1. Click **Admin > Companies > New Company**.
2. Enter the information about the new company (**Company Short Name, Company Legal Name, Phone...**).

Fields with asterisks next to them are required to have information in them.

3. Do you want the users of this company to see custom menus instead of the default WebCenter menus?

Custom menus allow you for example to simplify the user interface, so the users only see the menus they need to use. See [Menus](#) on page 106.

Note: Users linked to a company will always see the menu assigned to the company, when the **Default** menu is assigned to them as a user.

- If yes, choose the menu to assign to the company in **Menu**.
- If no, leave **Default** in **Menu**.

4. Click **Create**.

A status message saying the company was created successfully appears at the bottom of the page. You can create an additional company by filling out the form again and pressing **Create**.

3.9.2. Edit a Company

1. Click **Admin > Companies**.
2. Either type in a **Filter** or click **Go** to see the list of companies.
3. Click the name of the company to change.
This opens the **Edit Company** page.
4. In the **Name and Menu** tab, you can change:
 - the **Company Short Name**,

- the **Company Legal Name**,
- the **Menu** that the users of this company will see (see [Menus](#) on page 106 for information about menus).

Click **Save** to save your changes before switching to another tab.

5. In the **Locations** tab, you can edit the company's location(s):
 - click a location to edit its details (**Location Name, City, Country...**),
 - to delete a location, select it and click **Delete Location(s)** in the actions menu,
 - to add a location, click the **New Location** link and fill in the new location's details.
6. In the **My Work Setup** tab, you can change what the company users will see on their **My Work** page. Click on **Setup Custom My Work** to customize the **My Work** page displayed for the selected company's users. Else the default My Work page is displayed for the users.
 Read more on how to set up **My Work** page for Companies here [Set up My Work page](#) on page 255.

3.9.3. Merge Companies

You can merge two or more companies using the **Merge Companies** option in **Admin > Companies**.

1. Select the source company / companies which has to be merged.
2. Choose the **Merge Companies** field, to open the **Merge Selected Companies** pop-up window.
3. Choose the target the company from the **Merge to Company** drop down.
 A warning message will be displayed when the source company / companies has one or more locations in common with the target Company. The source company locations will be renamed to <location_name>_<company_legal_name>.
4. Click **OK** to merge the companies.

3.9.4. Delete a Company

If the company you delete has users assigned to any of its locations, WebCenter issues a dependencies warning.

You must reassign the users to another location or delete the users before you can delete the company. There is no dependency check if there are no users assigned to any location.

If the company is only assigned as a customer, it will be deleted when you confirm the deletion.

Note: Attempting to delete multiple companies will stop on the first company that has dependencies. To delete the rest of the companies, reselect them and delete them.

1. Click **Admin > Companies**.
2. Either type in a **Filter** or click **Go** to see the list of companies.
3. Select the checkbox of the company to delete.
4. Click **Delete Company** in the actions menu.

5. Click **OK** to confirm the deletion. The company is deleted.

3.9.5. Add Locations

1. Click **Admin > Companies**.
2. Either type in a **Filter** or click **Go** to see the list of companies.
3. Click the name of the company for which you want to add a location.
4. Click the **Locations** tab. The current locations for the company are displayed.
5. Click **New Location** at right.
6. Enter the appropriate information and click **Add Location**. The new location is created.

3.9.6. Edit a Location

1. Click **Admin > Companies**.
2. Either type in a **Filter** or click **Go** to see the list of companies. Click the name of the company for which you want to edit a location.
3. Click **Locations** on the menu. The current locations are displayed.
In the location list, you can merge the two or more locations of the same company. Read how to [Merge Locations](#) on page 255 here.
4. Click the name of the location to edit.
5. Change the information as desired and click **Change**. The information is changed and a confirmation message appears.

3.9.7. Merge Locations

You can merge two or more locations of a company using the **Merge Locations** option.

1. Navigate to **Locations** tab in Company details page, to view the locations of a company.
2. In the location list, select the source location(s) that you want to merge.
3. Choose **Merge Locations** to merge the selected location(s) to a target location.
4. In the **Merge Selected Locations** pop up window, choose the target location from the **Merge to Location** drop down and select **OK** to merge.

3.9.8. Set up My Work page

Admin users can set up customized **My Work** page for all users in a company.

1. Navigate to **Companies** and select the company for which you want to set up **My Work** page.
2. In the company details page, open **My Work Setup** tab.
3. Click on **Setup My work** to open the **My Work** page in edit mode. If it is al

4. Follow the steps given here [Edit the Default My Work Page](#) on page 128 and **Save**.

3.9.9. Delete a Location

If the location you delete still has users assigned to it, WebCenter issues a dependencies warning. You must reassign the users to another location or delete the users before you can delete the location.

Attempting to delete multiple locations will stop on the first location that has dependencies. To delete the rest of the locations, reselect them and delete them.

1. Click **Admin > Companies**.
2. Either type in a **Filter** or click **Go** to see the list of companies. Click the name of the company for which you want to edit a location.
3. Click **Locations** on the menu. The current locations are displayed.
4. Select the location(s) to delete by selecting the checkbox next to the name.
5. Click **Delete Location(s)** in the actions menu.
6. Click **OK** to confirm the deletion.

3.10. Managing Users

3.10.1. Licensing and Users

WebCenter supports two types of licensing models. You can have counted licenses in the [Named User License Model](#) on page 258 or [Concurrent License Model](#) on page 256 where you can have licenses that are taken up during a log-in sessions.

Concurrent License Model

In this model, you can create as many users as you want. The number of users who may use the system at the same time is determined by your **Concurrent Licenses**. The licensing model distinguishes between three types of users: guaranteed users, concurrent users, and editor users.

Types of Users in Concurrent License Model

Guaranteed users

A guaranteed user can always access WebCenter, regardless of how many concurrent users are logged on at the time.

Concurrent users

Any other user who does not have guaranteed access can log on to WebCenter as long as the maximum number of concurrent users are not exceeded.

Note:

For every three guaranteed users you create, one concurrent user license is blocked permanently.

For example, if you have 25 concurrent licenses for 100 non-guaranteed (concurrent) users, 25 concurrent users can log in at any time.

If you give 25 users guaranteed access, these users will take up 8 concurrent licenses. This means that only 17 concurrent users (out of 100) can log in simultaneously, because 8 concurrent licenses would be permanently blocked by those 25 guaranteed users ($25 \times 0.333 = 8.333$).

Editor users

These are ArtiosCAD Enterprise users. They have guaranteed access but do not take away concurrent licenses.

You will have a fixed number of editor users, determined by the license you have purchased. When that number is reached, you cannot set more users to be editor users.

Generally, your system will either have guaranteed and concurrent users, or editor users.

If you have editor and concurrent users, and all your concurrent access licenses are in use, a concurrent user will not be able to access WebCenter, even if you have editor licenses left (a concurrent user cannot use an editor license to log in).

Advance SSO

The Advanced Single SIGN ON is also a license for the concurrent license model. From WebCenter 18.1, license file received will have the Advanced SSO feature by default.

Multiple Guaranteed Sessions

You can allow **multiple open sessions** (such as the SDK user or Automation Engine user) as guaranteed sessions for a User. However, every three such sessions will block a concurrent license reducing the number of available concurrent access.

Workflow Connections

Your workflow connections connected through tunnel clients will block one concurrent license each.

What if the user limit is exceeded?

When the limit of users with concurrent access is reached, no concurrent user may log in until another user logs out.

To prevent users from blocking access for others, there is a configurable time limit of 30 minutes of inactivity. After any users (guaranteed or not) have been inactive for that amount of time, they are logged out automatically, thereby allowing other users to log in.

Note: The Admin user can always log in, even if the user limit is reached.

Check the Licensing Status

- Click **Admin**.

The **Users** page opens by default.

The Users page shows:

<u>Active Users</u>	390		
<u>Total Users</u>	391		
<u>Currently Logged in</u>	3		

License Type	# Purchased	Assigned	Remaining
Admin/Project Manager Users	250	86	164
Project Creator Users	300	116	184
Regular Users	500	184	316
Integration Sessions	5	<u>Sessions Assigned: 0</u> <u>Workflow Tunnels: 0</u>	5

- To see the users who are currently logged in, click the eye icon.
 Users who simply close browser windows do not actually log off until their sessions expire due to inactivity (usually after 30 minutes). Users should always click **Log Off** when they are done using WebCenter.
 - To forcibly log off a non-guaranteed user to make more concurrent licenses available, click **Log user off** next to that user’s licensing status. Use this with caution as it may result in data loss. It would be prudent to try contacting the user in question before using this command.

Named User License Model

A **Named User License** is an exclusive licensure of rights assigned to a single software user. This License model lets you pay for the number of users you want to create in WebCenter. This means that the purchased number of licenses (per type of users) limit the number of users that can be created.

You can view the number of licenses per user type on the **Admin > Users** page.

Types of Users (Named User Licensing Model)

Regular Users

These are the users who use the non-admin pages of WebCenter. The **WebCenter Regular user limit** determines how many regular users can be created in the system.

Project Creator

These are regular users but can also additionally create projects. They have no other rights on the project after creation. When the licenses of regular users are exhausted, the project creator licenses can be used for regular licenses.

Example:

When you have to create regular users and the number of regular users licenses has been used up, you can use the remaining Project creator license for these extra users.

License Type ⓘ	# Purchased	Assigned	Remaining
Admin/Project Manager Users	250	86	164
Project Creator Users	300	Assigned to Project Creators: 116 Assigned to Regular Users: 81	103
Regular Users	100	⚠ 181	0
Integration Sessions	5	Sessions Assigned: 0 Workflow Tunnels: 0	5

Note: You can hover over the warning symbol to see the number of Project Creator Licenses used for Regular Users.

When there is no license for Regular Users, the licenses for Project Creator and Regular users are combined in the overview page.

Admin or Project Manager Users

These are users who will function as Administrators or Project Managers. The **WebCenter Admin/PM user limit** (as per your license pack) determines the maximum number of Admin and Project Manager users in the system.

Integration Users

For your integration use cases (e.g. for the SDK or Automation Engine), you can allow Multiple Open Sessions for a user. The maximum allowed guaranteed sessions is determined by the WebCenter SDK session limit module.

Named users have guaranteed sessions and is determined by the **WebCenter SDK session limit** module. You can allow **Multiple Open Sessions** (for SDK or Automation Engine) for such a user.

The session limit licenses can be split over multiple users (without an upper limit), but the total number of guaranteed sessions cannot exceed the WebCenter SDK session limit.

Each of your workflow connections connected through tunnel clients will block one integration session license.

Note: There is an upper limit for the number of simultaneous sessions (maximum 5) for Admin / Project Managers and Regular Users.

What if the user limit is exceeded?

When adding more sessions to an Integration user, the system checks your session limit to see if this is feasible.

You cannot create a new User of a Type when the limit has been reached. The limit also applies when you try to change a Regular User to Admin or Project Manager. You will get a **License Violation** error if the limit has been reached.

Note:

- Check the [Troubleshooting Tool](#) if you run into License limit related errors. This page has a License Check[WCR121_TST_700] test with more details about the current status.
- The System Administrator (ADMIN) can always login to verify and correct licensing issues.

Check the Named User Licensing Status

1. Click **Admin** to open the **Users** page.

The Users page lists the number of **Purchased**, **Assigned** and **Remaining** license per user type.

License Type 	# Purchased	Assigned	Remaining
Admin/Project Manager Users	20	19	1
Regular Users	100	7	93
Integration Sessions	10	Sessions Assigned: 7 Workflow Tunnels: 0	3

- **Integration Sessions** (Assigned) is the sum of all the guaranteed sessions and workflow connections. This number cannot exceed the number of Integration Session licenses.
- **Admin/Project Manager Users** (Assigned) is the total number of Admin Users and Project Managers in the system.
- **Project Creator Users** (assigned) is the total number of Project Creator Users in the system
- **Regular Users**(Assigned) is the total number of regular users.

Note: In case the regular users licenses are exhausted then Project Creator Users licenses are used instead of regular users

2. To see the users who are currently logged in, click **Show Logged in Users** (the eye).

The following default users are not counted against the Purchased licenses.

1. ADMIN - the admin user, user with user name "ADMIN"
2. CADX user
3. CLEANUP user
4. WORKFLOW USER

3.10.2. Users, Groups and Roles

Basic concepts

Access to projects and documents is controlled by user and group permissions.

User

Everyone who logs in to WebCenter is a user. Users log in using a username and password assigned to them by an Administrator.

Group

A Group is a logical set of users connected by a common element of your choosing, such as function or location. You can assign tasks to groups, you can set up groups as approvers or even as project managers.

Role

A Role is a placeholder object that project managers can use in their projects or templates to set up approvals, assign tasks to, use in workflows, etc., without being forced to use specific users and groups just yet. Upon project creation, or even later in the process, the project manager can assign the role(s) to the actual user(s) and/or group(s). This provides more flexibility in setting up templates/projects.

Default users

One user, admin, and two groups, Admins and Users, are created by default in WebCenter. Members of the Admins group are WebCenter system administrators and can perform any function.

3.10.3. Create a User

1. Click **Admin > Users > New User**.

Step 1: User Info in the **Create New User** wizard appears.

2. Type the basic user information into the appropriate fields (**Username, First Name, Last Name...**).

Note: Required fields are indicated with an asterisk *.

3. Do you want to use LDAP authentication (single sign-on) for this user?

- If yes, enable the **Use LDAP to Authenticate User** option. This will allow the user to use his regular Windows network user name and password to log on to WebCenter.
- If no, provide the user's initial **Password** and confirm it.

Enable the option **Require the user to change the password at first login** to force the user to choose a new password when they first log on to the system.

4. Do you want this user to see custom menus instead of the default WebCenter menus?

Custom menus allow you for example to simplify the user interface, so the users only see the menus they need to use. See [Menus](#) on page 106.

- If yes, choose the menu to assign to the user in **User Menu**.
- If no, leave **Default** in **User Menu**.

5. Does the user need guaranteed access?

- If yes, enable the option **User Has Guaranteed Access or is an ArtiosCAD Enterprise User**.

Note: You can also use this option to make editor users, if you license allows it (see [Licensing and Users](#) on page 256).

- If no, leave the option disabled and proceed to the next step.

For more information on guaranteed access and its licensing implications, see [Licensing and Users](#) on page 256.

6. Does the user need multiple open sessions with guaranteed access?

- If yes, enable the option **Allow Multiple Guaranteed Sessions**.

Note: You can allow multiple open sessions (such as the SDK user or Automation Engine user) as guaranteed sessions for a User. However, every three such sessions will block a concurrent license reducing the number of available concurrent access.(see [Licensing and Users](#) on page 256).

7. Does the user need special permissions in WebCenter?

If the user needs...	Select the option...
no special permissions	Normal User
Project Manager permissions, but only for projects and users belonging to his or her own company	Project Manager with Limited Visibility of Companies and Groups
Project Manager permissions on the complete system	Project Manager with Full Visibility
Project Creator with permission on the complete system	Project Creator with Full Visibility
Project Creator permissions in restricted mode	Project Creator with Limited Visibility

8. Does the user need the ability to create new task types in WebCenter? (only if the user is a **Project Manager**)

- If yes, enable the option **User Can Create Task Type**.
- If no, leave the option disabled and proceed to the next step.

9. Does the user need the ability to create new users? (only if the user is a **Project Manager**)

- If yes, enable the option **User Can Create User**, then click **Continue**.

Note: A Project Manager creating users will have less options than an Admin: for example he / she will not be able to give the new user LDAP (network) sign-on or guaranteed access.

- If no, click **Continue**.

Tip: You can keep track of users created by other users: the **Owner** column of the **Users** page shows who created each user.

10. In **Step 2: Assign to a Company**, optionally select a company to which you want to assign the user. Note that this can be very important to filter the content and users the new user will be able to see.

11. If you:

- are creating a **Normal User** or a **Project Manager with Full Visibility**, the wizard is complete. Click **Finish** to create the user.
- are creating a **Project Manager with Limited Visibility**, click **Continue** and proceed to the next step.

12. In Step 3: Assign Visible Companies, select the companies that this user should be able to see, then click **Continue**.

The selection you make here filters the list of users in the next step so that this Project Manager can never see users from the companies you did not select in this step. By default, only the company of the Project Manager himself (the one you selected in the previous step) will be selected.

13. In Step 4: Assign Visible Groups, select the groups the user should be able to see, then click **Finish**.

Only groups containing members that belong to one of the companies you assigned in the previous step will show up in the list. In addition, some groups may be set to be visible to all users (such as the ADMINS group).

3.10.4. Editing Users and their Preferences

Edit a User

1. Click **Admin**.
2. On the **Users** page, filter the list of users if desired, and click the User Name of the user to edit.

The **Profile** page appears.

3. Make the required changes:

To edit the user's...	You should...
User info (including authentication details)	edit the fields on the Profile Page. Read also Edit User Authentication Settings on page 264.
Menu	choose a different menu in the User Menu list.
User Type	select the appropriate role from the options: <ul style="list-style-type: none"> • Normal User • Project Creator • Project Manager
Visibility	Select the visibility for the user from the options: <ul style="list-style-type: none"> • Limited Visibility of Companies and Groups

To edit the user's...	You should...
	<ul style="list-style-type: none"> • Full Visibility
Privileges	<p>Also specify if:</p> <ul style="list-style-type: none"> • User Can create Task Type • User Can Create User • User Has Guaranteed Access or is an ArtiosCAD Enterprise User
Company or Location	<ol style="list-style-type: none"> 1. Click the Company/Location link at the bottom of the Profile page. 2. Select a new company and click Finish.
Visible Companies or Locations (only applies to Project Managers and Project Creators with Limited Visibility)	<ol style="list-style-type: none"> 1. Click the Visible Companies or Visible Locations links. 2. Make a selection of visible locations and/or companies and click Finish.
<p>Allow Multiple Sessions</p> <p><i>The licensing and users overview page will explicitly show the number of guaranteed sessions and the number of licenses blocked.</i></p>	<p>Enable this option to allow the user to login concurrently multiple times.</p> <p>Tip: Use this if you have heavy SDK integration with simultaneous tasks. This is also useful if you have a lot of shared users (e.g. for an external company).</p> <ul style="list-style-type: none"> • Specify the Maximum Open Sessions allowed for the user. <p>Note: This has an impact on your concurrent licenses. Every three such sessions take up one concurrent license. For example, if your integration user has 30 sessions, this will take up 10 concurrent licenses. Do not use this option for normal users.</p> <p>The admin users have the same number of multiple sessions as any other user. You can change this by setting a different Maximum Open Sessions.</p>

4. Click **Change** to confirm.

Edit User Authentication Settings

An Administrator or a Project manager with rights can manage the SSO authentication details at the user **profile** page.

Go to **Admin > Users**. Select the **User** and go to the **Profile** page.

3. Click the **Password** tab.
4. Type a new **Password** and Confirm it.
5. Click **Change** to save the changes.

Change a User's License Status

1. Click **Admin**.

The Users page appears.

2. On the **Users** page, filter the list of users if desired, and click the User Name of the user to edit.
3. Select or deselect the **User has guaranteed access** option and click **Change**.

Note: Changing users' licensing is effective immediately.

Alternatively, to change many users' licensing status in a single operation:

1. Select the users on the User page.
2. In the actions menu, click **Grant Guaranteed Access** or **Remove Guaranteed Access** as desired.

Set the Preferences for a User

1. Click **Admin**.

The Users page appears.

2. On the **Users** page, filter the list of users if desired, and click the User Name of the user to edit.
3. Click the **Preferences** tab.
4. Configure the Preferences as needed. For more information on the settings and options, see [General Preferences](#) on page 90.

Copy Preferences to Users

Use this to quickly copy previously defined preferences to one or several users.

1. Click **Admin**.

The Users page appears.

2. Select the user(s) whose preferences you want to change and select **Apply Preferences** in the actions menu.
3. In the **Apply Preferences** popup, select the preferences to change, and deselect the preferences to keep.

Other Preferences are the user preferences not mentioned above (for example: show thumbnails or not, search results layout, etc.).

4. Select who you want to copy the preferences from: in **Take Preferences From**, select another user, or select **Default** to use the default settings for the preferences you selected.
5. Click **OK**.

Edit a User's Group Memberships

1. Click **Admin**.
2. On the **Users** page, filter the list of users if desired, and click the User Name of the user to edit.
The **Profile** page appears.
3. Click the **Groups** tab.
4. To add the user to one or more groups, select those groups (use Ctrl+click to multiple-select) in the **Available Groups** list and click the >> button.
5. To remove the user from one or more groups, select those groups in the Current Groups list (use Ctrl+click to multiple-select) and click the << button.

The changes are effective immediately.

Set Available Download Formats for a User

1. Click **Admin**.
The Users page appears.
2. On the **Users** page, filter the list of users if desired, and click the User Name of the user to edit.
3. Click the **Download** tab.
4. Select or deselect the download formats you want to enable.

Note: User permissions for download formats take precedence over group permissions for download formats.

5. Click **Change**.

Note:

Alternatively, you can click **Use Group Permissions** to make the user inherit the download formats from his or her group membership(s).

3.10.5. Deactivating Users

An administrator user or a project manager with create user rights user can deactivate users. You may want to use this feature when you no longer need a user in the system or when you are inviting an external collaborator to an approval cycle temporarily. You can also do this when you need to free up *named user licenses*.

Deactivated users cannot log in, become project members or stay as task assignees. This means that you cannot start a task or an approval cycle that has a deactivated user as its assignee or approver respectively.

The deactivated users are still in the Users list with a clearly marked **Deactivated** label. This allows you to keep track of what they did or reactivate them if there is a need. Click Deactivate User(s) after selecting the users you may want to delete.

Note:

- A project manager with create user rights can only deactivate the users he created.
- The user deactivation and activation events are logged in the User Management History.
- Admin User or PM users with **Create User** rights can deactivate users in bulk in the **Users** overview page, by selecting the users and clicking **Deactivate user(s)**.

The deactivated users will not receive notification or overdue e-mails even if they are included among the expected recipients of a Notification message (for example, deactivated Project members).

Deactivate Users

You can deactivate users either manually or automatically after a specified duration.

- To **deactivate** a user manually:
 - a) Go to **Admin > Users > User > Profile** page.
 - b) Disable the **Active User** option.
 You will see a message warning you about pending approvals or tasks or if the user is currently logged in. To know more details about the pending work, click on the displayed message.
 - c) **Save**.
 As soon as you save, the deactivation happens even if the user is logged in or has pending work.

Note: It is not possible to deactivate:

- the built-in users (ADMIN, CADX, WORKFLOW, CLEANUP) that don't take up any licenses.
- the currently logged in user.

Warning: The manually deactivated users can be reactivated only after 24 hours.

- To set up **automatic deactivation**,
 - a) Go to **Admin > Users > User > Profile** page.
 - b) Select from the following options and **save**.

Options	Description
Deactivate after X working days	Specify the number of working days from the current date. You will see a message with the predicted date of deactivation.
Deactivate at a specified date	Pick a date using the date picker. Note: You can only set this up for active users.
No automatic deactivation	The default option.

The automatic deactivation happens on the calculated/specified date after 23:59:59 server time.

- To create deactivated users, disable the **Active User** option in the user creation form. For example, you could create a deactivated user as a Template user.

Tip: You can create deactivated users with different deactivation dates as template users. Use these as template users to create different types of approver users (with varying deactivation periods).

Reactivate Users

To reactivate users, use any of the two ways listed below.

- From the User Profile page, enable the **Active User** option.
- Select deactivated user(s) in the **Admin > Users** page and click the **Activate User(s)** action button.

Warning: The manually deactivated users can be reactivated only after 24 hours.

3.10.6. Delete a User

When deleting a user, WebCenter checks for dependencies, such as being a Project Manager or being an Approval User on an ongoing Approval Cycle, before deleting the user.

If there are dependencies, WebCenter asks you whether you want to view them (with links so you can remedy the dependencies) or cancel the deletion.

Note: Attempting to delete multiple users will stop on the first user that has dependencies. To delete the rest of the users, reselect them and delete them.

1. Click **Admin**.
2. Select the checkbox next to the name of the user to be deleted. To delete more than one user at a time, select additional checkboxes of users to delete.
3. Click **Delete User(s)** in the actions menu.
4. Click **OK** to confirm the deletion.
5. If there is a Delete Dependency confirmation, choose the desired option and click **OK**.

Users cannot be deleted until any dependency issues have been resolved.

3.10.7. Create and Invite a User from the Approval Page

Project Managers can create and invite users in the context of an approval page. This allows you (as a Project Manager) to add an external reviewer to the **Approval cycle**. If the user is not in the system, you can add a new user and invite him or her from the approval page. It is possible to create and add users from any approval page (document's, project's or folder's).

Note: These users will be created as Regular Users. The only exception is when an Administrator user creates a user using an Admin User as the **Approval User Template**.

If you have used up all your Regular User licenses, you will not be able to **Create and Invite User** from the approval page. Read about Named User License model in [Licensing and Users](#) on page 256.

- Click **Add Approver > Create and Invite New User**.

User Info in the **Create and Invite New User** wizard appears.

- Type the user's e-mail address. The fields (**Username**, **First Name** and **Last Name** will be filled in automatically from the e-mail address. You can change these fields, if necessary.
 - Username is filled with the part before @ of the e-mail address.
 - First Name is taken as the part before the last dot.
 - Last name is filled with all characters after the last dot (or all the characters before @ if no dots are present).
- Optionally, assign to a **Company** and **Location**. Note that this can be very important to filter the content and users the new user will be able to see.
- If you want the user to log in with a link sent from the approval page, follow the process below:
 - a) Set up a [Token](#) based single sign-on instance and keep it active.
 - b) Specify a User as **Approval User Template**. Also remember to allow [link authentication](#) in the user profile.

To allow a User to authenticate via a link, configure [Token Authentication](#) on page 422 and allow this type of authentication in the User profile page.

Note: You need to disable all the other types of authentication to make the link authentication active.

Whenever the token-authenticated user receives a notification with a link, the link contains a token to authenticate without user credentials. This permits the users added to the approval cycle to log in using the approval links from the notification mails.

- If your **default approval user template** has no [Token Authentication setup](#) or you have not defined a user as the **template**, you need to specify and confirm a password in the **Create and Invite User** wizard.
- If there are Roles as members of the Project(with view rights to the folder or document where the approval is being set up), it is mandatory to assign the user to a role. Select the **Role** in the **Assign to a Role** field.
- Click **Create and Invite User**.

A new user is created and invited to the Project. You will be able to see this user in the Approvers list as well as in the Users list.

- If you enabled link authentication, the user will log on to the system using a link from the notification e-mail. The user will be able to see and approve the document/folder or project.

- If you specified a password, the user would need to know the password to be able to log in.

3.10.8. Managing User Memberships in Projects

View a User's Project Memberships

1. Click **Admin**.
2. On the **Users** page, filter the list of users if desired, and click the User Name of the user to edit.
3. Click the **Projects User is in** tab.

The list of project for the user is displayed. You can filter the list of projects if needed, using the Show Projects, Manager Last Name, and Manager Group Name fields and the Modified list. Fill in the filter criteria and click Go.

Note: This does not show Projects for which the user is the Project Manager or those Projects in which the user is a member by means of belonging to an invited Group.

4. You may uninvite the user from any of the Projects shown in this list by selecting the Project(s), and clicking **Uninvite** in the actions menu. The user must not be an Approver in an active Approval Cycle.

Invite a User to Multiple Projects

1. Click **Admin**.
2. On the **Users** page, filter the list of users if desired, and click the User Name of the user to edit.
3. Click the **Projects User is in** tab.
4. Click **Invite to Projects**.
5. Select the projects you want to invite the user to, and click **Continue**.
6. Select the permissions the user needs in the project and click **Finish**.

Uninvite Users from Multiple Projects

Note: If the user is an Approver in an ongoing Approval Cycle in a selected Project, the entire removal action is canceled. You must stop the Approval Cycle and then perform the removal.

1. Click **Admin**.
2. On the **Users** page, filter the list of users if desired, and click the User Name of the user to edit.
3. Click the **Projects User is in** tab.

The list of project for the user is displayed. You can filter the list of projects if needed, using the Show Projects, Manager Last Name, and Manager Group Name fields and the Modified list. Fill in the filter criteria and click Go.

4. Select the Projects you want to uninvite the user from.
5. Click **Uninvite** in the actions menu.

6. Click **OK** to confirm.

3.10.9. Login Tracking

To get a simple overview of User Logins for a specified time period, click the **Admin > Users > Login Tracking** option.

- Specify the time units (**Detail Overview** in **days / hours / weeks**).
The overview table will display the time in the units you specified here.
- Select the **View** as **graph / table**.
- Select the time period by specifying the dates.
- Click **Search**.

You can use **Save to Excel** to export the login overview. You can view more details by clicking on Switch to **Advanced View**. Read in [Advanced Login Tracking](#) on page 272.

Read also [Failed Logins](#) on page 272 and [License Usage](#) on page 272

Failed Logins

Failed Logins column gives the count of the number of login attempts that were denied because of insufficient licenses. This count is measured during the period you specified.

License Usage

In the Login Tracking page, you can see the statistics regarding:

- used and free editor licenses
- used and free concurrent licenses

for the specified time period. You will see a warning next to the progress bar if there was at least one **Failed Login** due to shortage of licenses.

Advanced Login Tracking

The advanced page shows a list of individual User sessions (or Failed login attempts) that were active during the specified time period.

To view the successful login details, select **Show Login Sessions**. You can view the failed logins by opting to **Show Failed Logins**.

Use the custom filtering to limit the information to what you are looking for. For successful **login sessions** you can filter on:

- **Single Sign-On Instance**
- **Login Method**
- **Logout Method**
- **User** : You can type the
 - User Name
 - First Name

- Last Name
of the target User.
- **Company**
- **Location:** Use this filter to view the login statistics associated with one Company and in a specific location

Note: To show the system user sessions (“SYSTEM” and “CADX”), enable the option **Show sessions from system users**. This option is turned off by default.

If you are viewing **Failed Logins**, you can filter on:

- **Single Sign-On Instance**
- **Login Method**
- **Login Failure Cause**
- **User** Type any of the following:
 - User Name
 - First Name
 - Last Name

To see login attempts from unregistered users, enable **Show anonymous login attempts**.

Tip:

Use **Sort by** to sort the table based on the selected column.

To export the table as a .XLS file, click **Export to Excel** link.

3.10.10. Delegation

Delegation is the assignment of responsibility or privileges to another user to complete his / her work.

For example, when a Project Manager (P1) has planned a personal time off and wants to delegate his user account to another Project Manger (P2). In this case, the P1 is the delegator and P2 acts as a delegate of P1. P2 can perform and manage the work on behalf of P1.

You can configure a delegate for a specified time period or permanently. Actions performed by the delegate P2 will be tracked in the respective project history.

Delegation can be done only to users who are in the same hierarchy or above. An admin user can delegate only to another admin user and not to a normal user. Potential Delegates as per the User Access Level are

User Access Level	Can delegate to
Admin User	Admin only
Project Manager (with Limited and full visibility)	Project Manager or Admin User
Normal User	Normal User or Project Manager or Admin User

Delegation Restrictions

To ensure that your user(s) delegate to a limited list of users, you can use the **Delegation Restrictions** either as a system wide settings *Delegation Preferences- System Wide* on page 101 or per user.

The Administrators can specify the user level setting which overrides the system wide settings in that case. Admin users can place restrictions on delegation for a specific user based on various factors like

- **System Default**
- **No Delegation** is possible if you choose this option. This prevents your users from delegating their work.
- **All Visible Users** allows to delegate any user who are visible in his or her list.
- **Only Users in the same** allows you to restrict the choice to delegate, within the same company or location or group.

For example, you can specify that delegation is restricted within the members of a Company. This would mean that you cannot pick a user who is not part of the same Company as your delegate.

- **Any of the following Users or Groups** allows you to choose the delegates from a group(s) or any users with the **Add** button.

Note: All the delegation restrictions are copied when the option **Delegation Restrictions** is selected in **Apply Preferences**.

Your user's Delegation

As an Admin user or as a Project Manager who has a set of users, you can view, create or modify the delegation setup of your users. To do that, use the **Users > Profile > Delegation** page.

When a user assigns a delegate, the delegate can perform all the work actions. The delegate has to log-in on behalf of the delegator, to perform the tasks, approvals and permission settings.

Note:

1. You cannot delegate a deactivated user's work or delegate to a deactivated user.
2. A user can be the delegate to more than one user but cannot be logged in as more than one delegate at the same time.
3. Delegation works only in one level. The work delegated to a user cannot be delegated to his delegates.

Setting up Delegation for your Users

As an Admin user or as a Project Manager who has a set of users, you can view, create or modify the delegation setup of your users. To do that, use the **Users > Profile > Delegation** page.

1. If you are an owner of users, go to **My WebCenter > My Users > *Name* > Delegation** page. As an administrator, you can use the **Admin > Users > *Name* > Profile > Delegation** page.
2. To add one or more delegates for your user, select a user from the drop-down and click **Add Delegate**.

3. Optionally, if you are an admin and like to configure a specific restriction for a user or to add a custom list of users and group as potential delegates, you can edit the **Delegation Restrictions**. If you do not edit this field, the global *Delegation Restrictions* setting will apply.

You can revert to the global setting by selecting **System Default**.

The **My Delegates** section of your user will list the delegates authorized to act on his or her behalf. You can add new delegates here.

Add Delegate

You can delegate your work to a specific user or users. Follow the steps below to add delegates.

1. To add one or more delegates, go to **My WebCenter > My Delegates**.
2. Select a user from the drop-down and click **Add Delegate**.
To inform your colleague about the delegation, enable the **Notify new/modified delegates** option.
3. If this is a temporary delegation until your return to work, specify a **Start Date** and an **End Date**. There is also a comment field to leave your notes.
If you leave the **End Date** empty, the colleague can act as your permanent delegate.

My WebCenter > My Delegates page lists all your delegates and the respective time periods for which the delegations remain active.

Note: You can modify the delegation fields or delete a delegate from **My WebCenter > My Delegates** page.

3.11. Managing Groups

3.11.1. Create a New Group

1. Click **Admin > Groups > New Group**.
2. Enter the name of the group.
3. Choose who will be able to see this group: **All Project Managers, Administrators Only**, or **Selected Project Managers**.
4. Click **Continue**.
5. In **Step 2: Select Group Members**, select the members of the group by checking the checkboxes to the left of their names.
6. Is this new group visible to every Project Manager or only to Administrators:
 - If yes, click **Finish**. The group is created.
 - If no, click **Continue**. Then, in **Step 3: Assign group visibility to project manager(s)**, select the Project Managers that can see this group and click **Finish**.

Project Managers with Full Visibility are unavailable, as they can see all groups. By default, group members can see the group but you can still de-select the group members so that they don't know this group exists.

3.11.2. Add Users to a Group

1. Click **Admin > Groups**.
2. Click the name of the group to edit. Click **Add Users**.

When adding new members to a Group, you can filter on First Name, Last Name, User Name, Email of the User, Name or the legal name or the Company of the user or the Location of the User. You can add all active members in one go using **Select All Active Users** () option.

Attention: Members of the Admins group can perform any task and are not bound by any security restrictions and hence it is important to cautious when adding users to groups. **Deactivated Users** can be activated and added to the group by the admin users.

The list of users who are currently not members of the group is displayed.

3. Select the user(s) to add to the group.
4. Click **Finish**.

3.11.3. Remove Users from a Group

1. Click **Admin > Groups**.
2. Click the group to edit.
3. Select the user(s) to remove from the group.
4. Click **Remove** in the actions menu.
5. Click **OK**.

3.11.4. Copy or Move Users Between Groups

1. Click **Admin > Groups**.
2. Click the group to edit.
3. Select the users to copy from the group.
4. In the actions menu, click:
 - **Copy users** if you want to copy users from one group to another.
 - **Move users** if you want to move users from one group to another.
5. Either filter or click Go to show the list of groups.
6. Select the new group(s) into which the users will be copied or moved.

7. Click **Finish**.

3.11.5. Rename a Group

1. Click **Admin > Groups**.
2. Click the group to edit.
The ADMINS and USERS groups cannot be renamed.
3. Enter the new name of the group in the **Group Name** field and click anywhere else on the page.
4. Click **OK**.

3.11.6. Change the Group Visibility

1. Click **Admin > Groups**.
2. Click the group to edit.
3. Click the **Visibility** tab.
4. Select the desired visibility choice: **All Project Managers/Creators**, **Administrators Only**, or **Selected Project Managers/Creators**.
5. Depending on your visibility choice, proceed as follows:
 - If you chose **Selected Project Managers/Creators**, you will be prompted to select the individual Project Managers who should be able to see this group. Click **Change** when you have made your selection.
 - If you chose one of the other options, go directly to the next step in this procedure.
6. Click **OK**.

3.11.7. Set Group Download Formats

Configure the available download formats in WebCenter Preferences (**Admin > Preferences > Download Formats**) before setting group download permissions.

1. Click **Admin > Groups**.
2. Click the group to edit.
3. Click the **Download** tab.
4. Select or deselect the download formats you want to enable.

Note: User permissions for download formats take precedence over group permissions for download formats.

5. Select or deselect checkboxes to grant or deny permissions as desired.

6. Click **Change**.

3.11.8. View Group History

Actions performed in the group including its creation, are recorded in the **History** tab of the group. You can access this from **Admin > Groups**. Now, select and open the **Group** for which you want to view the history and navigate to the **History** tab.

You can view the following actions in the **History** tab.

- Group Created
- Group Information changed (Renaming of the group/ changes to visibility setting of the Group)
- User added or removed from the group
- Group View Rights changed (changes to the list of Project Manager's/ Project Creators who can view the Group)
- Group Manager Changed

Note: When the Group is deleted, you can view the event history in **Admin > Group > View History**. This page lists the events of all the groups and it can be filtered on date and users.

3.11.9. Setting Group Notifications

As an administrator or a Group manager, you can set up notifications individually for every group member or to a single group e-mail address.

1. Click **Admin > Groups**.
2. Click the group to edit.
3. Click the **General** tab.
4. Select your preferred way of sending notifications or disable them altogether.
 - **Send notifications to everyone in the group:** When this option is selected, a group event will trigger notifications to all of the group members' e-mail addresses according to the individual language settings.
 - **Send notifications to a group e-mail address.** Specify the following info:
 - **Group e-mail address**
 - **Group-email language**
 If this option is chosen, a single e-mail notification is sent to the specified Group e-mail address.
 - **Do not send notifications to this group:** Select this to deactivate email notifications altogether.

5. Click **Save**.

3.11.10. Managing Group Memberships in Projects

View a Group's Project Memberships

1. Click **Admin > Groups**.
2. Click the group to edit.
3. Click **Projects**.

Invite a Group to Multiple Projects

1. Click **Admin > Groups**.
2. Click the name of the desired group.
3. Click **Projects**.
4. Click **Invite to projects**.
5. Either filter or click **Go** to show the list of all projects to which this group is not invited.
6. Select the projects to which the group is being invited.
7. Click **Continue**.
8. Set the project permissions that this group will have in the projects to which it is being invited. The same permissions will apply to each project.
9. Click **Finish**.

Uninvite Groups from Multiple Projects

If a user in the group is an Approver in an ongoing Approval Cycle in a selected Project, the entire removal action is cancelled. You must stop the Approval Cycle first, and then perform the removal.

1. Click **Admin > Groups**.
2. Click the name of the desired group.
3. Click **Projects**.
4. Either filter or click **Go** to show the list of all Projects to which this group is invited.
5. Select those Projects from which the group is to be uninvited.
6. Click **Uninvite** in the actions menu.
7. Click **OK** to confirm the removal.

3.11.11. Overview of My Group's Tasks

My Group's Tasks lets the **Group Manager** quickly view the tasks assigned to their group or group members. It also allows to assign, re-assign, or distribute the tasks among the group members.

If a group member is ill or not available, the Group Manager can re-assign the task to an other group member. A Group Manager can also monitor the progress on a selected Group or

Group Member. Using the filter options, the Group Manager can have a quick overview of the workload.

Group Task Manager

Every department has a Department Manager. In WebCenter Department Manager are referred to as **Group Manager**. A group can have any number of Group Managers including 0. Group Manager is always part of a group.

A Group Manager likes to view the tasks assigned to a selected group or group members, which will assist him in distributing the tasks and also get a quick view on the current status of a task.

The **My Group's Tasks** feature allows Group Managers to:

- View task assignments for a selected group and the workload overview.
- View tasks assigned to a group member and the workload overview.
- Re-assign any task assigned to a group member.
- Review the task overview filtering on status and due date.

Assigning a Group Manager

The **My Group's Task** page can only be accessed by a Group Manager. Only a member of ADMINS can turn a group member into a Group Manager.

1. Log in to WebCenter as an Admin user.
2. Click **Admin > Groups > Groups**.
3. Search for the required Group Name or click the Group Name from the list available.
4. Select the **Group Manager** check box for the desired group member.
You can assign multiple Group Managers to one group. The same user can also be Group Manager to multiple groups.

Using My Group's Tasks

To access **My Group's Tasks** feature, log in as Group Manager. Click **My WebCenter > My Group's Tasks** to view the **Group Tasks for Group** page.

Viewing Task Assignments

You can view the tasks assigned to a selected group and also for a group member within the group.

1. The task list for assigned group appears.

Note: If a Group Manager manages or is assigned to multiple groups, WebCenter displays the list of managed groups. You can only view the tasks for one group at a time.

2. In the **Tasks assigned to** drop-down list box, select the group or group member for whom you want view the task assigned.
3. A task list assigned to the selected group or group member appears. Also in the list are:
 - Task Name

- Project Name
- Assigned to
- Status
- Lead Time
- Due Date
- Created Date
- Started Date
- Estimated Date
- Task Documents

Viewing a Workload Overview

During editing/re-assigning, the Group Manager can have an overview of number of tasks assigned and how many are overdue. The Task Count is the number of assignments assigned to a group member. The Task Count displayed is based on the filtering criteria and tasks with past due-date always appears. The non-active projects do not appear and are not counted.

1. The task list for assigned group appears.

Note: If a Group Manager manages or is assigned to multiple groups, WebCenter displays the list of managed groups. You can only view the tasks for one group at a time.

2. The workload overview appears for the selected group.

Search Tasks		Sort by	Due Date	Status	All but Completed
Members	Task Count				
DEKE_DEPENDENCIES	Before:	1	(1 overdue)	After:	1 (1 overdue)
ArtiosCAD, ArtiosCAD (ARTIOSCAD)	Before:	0	(0 overdue)	After:	0 (0 overdue)
deke_user2 (DEKE_USER2)	Before:	0	(0 overdue)	After:	0 (0 overdue)
il, pm (IL_PM)	Before:	61	(61 overdue)	After:	61 (61 overdue)
Keizer, Debbie (DEKE)	Before:	138	(138 overdue)	After:	138 (138 overdue)
prma (PRMA_USER2)	Before:	0	(0 overdue)	After:	0 (0 overdue)

If the task is past the due date, it appears in red.

Reassigning a Task

A Group Manager can re-assign a task to a group or a group member. A task can be re-assigned only to a group member within the same Group. In addition to this when the task is reassigned, the WebCenter UI displays the previous assignee in **Previous** column.

1. **Note:** Ensure to log in as **Group Manager**.

1. The task list for assigned group appears.

Note: If a Group Manager manages or is assigned to multiple groups, WebCenter displays the list of managed groups. You can only view the tasks for one group at a time.

2. Select the new assignee in the **Assigned** to drop-down list box. This list contains group and group members name.
3. WebCenter shows changed tasks with a yellow background indicating the change.

Note: Even if a task is not initially assigned to a group, the Group Manager has all the rights to re-assign the task to a group member.

4. Click **Save** to commit the changes.

Filtering Based on Task Status and Due Date

A Group Manager manages multiple tasks at a time and this might lead to delay. Using the **Search Tasks Status**, one can see tasks in a more specific status.

For example, you can filter the tasks which are in Completed or In Progress status. By filtering the task, a Group Manager need not re-assign completed tasks or tasks which cannot start because a predecessor is not complete.

Similarly the tasks can also be filtered by **Due Date**. This gives a Group Manager a quick view of the task for the required time line. Using this information Group Manager can view what is due this week or this month to make the required planning.

1. **Note:** Ensure to log in as **Group Manager**.

1. The task list for assigned group appears.

Note: If a Group Manager manages multiple groups, WebCenter displays the list of managed groups. You can only view the tasks for one group at a time.

2. In the **Search Tasks Status** drop-down list, select the desired task status.
3. In **Due Date**, select the required due date and then click **Go**.

Note: To set the Due Date filtering, setting a task status filter is not necessary. The Due Date changes to completion date, if the task status is filtered to completed.

The following are the default due dates settings available:

- All
- Today
- Next 3 days
- Next week
- Next 2 weeks
- Next month
- Next 3 months
- Overdue
- Week overdue, all the tasks which are overdue for less than five days.

Filtering Based on Column

By clicking a column header, the Group Manager can view tasks for a selected group in ascending or descending order.

For example, if **Due Date** is selected then the tasks for the selected group appears with the earliest due date. Similarly if **Due Date** is clicked again, then the tasks for the selected group appears with the latest due date.

1. Log in as **Group Manager**.
2. The task list for assigned group appears.

Note: If a Group Manager manages multiple groups, WebCenter displays the list of managed groups. You can only view the tasks for one group at a time.

3. Click a column header, for example **Due Date**, to sort on this column. The sorting is indicated by an arrow. For example, if Due Date is selected then it would appear as:

Due Date ↑
Jan 29, 2013

3.12. Managing Roles

3.12.1. Roles

A **Role** is an assignment that you can create in WebCenter to be used later on in Projects. You can assign a **Role** to **Project Templates, Projects, Tasks** and **Approvals**. You can set up project permissions, approval settings and tasks for a **Role** within a project or template.

You can assign these Roles to real users and groups when needed. When you assign a Role to a real **User** or **Group**, you are assigning the Role's settings.

You can create versatile Project Templates using **Roles** which will help you to reduce the number of Project Templates.

Roles are created as global. This helps the Project Managers (or Selected Project Managers) to use the Roles effectively in individual projects and templates. You can invite these **Roles** as in the case of **Users** and **Groups**.

Roles are effective after real members (**Groups, Users**) are assigned into each of the **Roles**. A project Role assignee will be treated like a standard project member. Once you assign the **Role** to a project, these take over the role's security setup, approval setup and task assignments.

- the notifications will be sent out correctly
- the task will be shown in the respective members' to-do list

- the necessary access rights will be assigned to the members to perform the task (depending on the Role)
- the approval notifications will be sent out correctly.

You can employ multiple assignments of a single **Role**. For example, you can invite a "Designer" **Role** to all the Projects requiring a designer either after creating a Project or via the Project Template with assigned Roles.

You can use **Roles**:

- **To combine with Workflows:**

The tasks assigned to **Roles** will be picked up by the users or groups who are assigned to these Roles either at the beginning or later during the project execution. The project manager can decide who will get assigned to the **Roles**. Since WebCenter keeps track of Role assignments:

- the notifications will be sent out correctly
- the task will be shown in the respective members' to-do list
- the necessary access rights will be assigned to the members to perform the task (depending on the Role)
- the approval notifications will be sent out correctly.

- **In Project Templates:**

Features associated with **Roles** will be inherited from Project Templates during project creation. Adding **Roles** (instead of user **Groups** or individual **Users**) to your Project templates makes them more versatile.

Note: Although the Roles are defined for entire WebCenter, the assignment of Roles is done per project and is independent of the User. Therefore, you can assign the same user or group to a "Designer" Role in one project and restrict the access for the same User/Group in other projects.

Read more in [Creating a Role](#) on page 284

3.12.2. Creating a Role

1. Click **Admin > Roles > New Role**.
2. Specify the name of the **Role**
3. Determine the visibility of the Role by selecting from **All Project Managers**, **Administrators**, or **Selected Project Managers**. Click **Continue**

Subsequent step depends on whether you selected **Selected Project Managers** visibility in this step.

Choice	Steps
Selected Project Managers	You should select which Project Mangers are allowed to see the Role
All other	The New Role is created.

You can view these roles in the list of Project Members even after being **resolved**.

3.12.3. Renaming a Role

1. Go to **Admin > Roles** . This will lead you to the tab named **General** of Role Management page. You can see the list of available **Roles** in this tab.
2. Click on the name of the Role. Role names will be visible as links.
3. Enter the new name of the role in the **Role Name** field and click anywhere else on the page.

3.12.4. Changing the Role Visibility

1. Go to **Admin > Roles** . This will lead you to the tab named **General** of Role Management page. You can see the list of available **Roles** in this tab.
2. Click on the name of the Role (visible as a link) for which you want to change the **Visibility**.
3. Go to the **Visibility** tab and change the visibility.

You will have to choose from three **Visibility** choices: **All Project Managers, Administrators Only** and **Selected Project Managers**.

Options	Description
Selected Project Managers / Creators	You will be prompted to select the individual Project Managers or Project Creators. Click Change when you have made your selection.
All Project Managers/ Creators and Administrators Only	You will be asked to confirm the selection. Click OK .

3.12.5. Deleting Roles

1. Go to **Admin > Roles**. This will lead you to the tab named **General** of Role Management page. You can see the list of available **Roles** in this tab.
2. Select the **Roles** from the list of Roles by toggling the respective check boxes.
3. Click on **Actions > Delete Role(s)** from the list header.

Note: You will be warned if this Role is associated with an existing Project or Approval cycle.

3.12.6. Converting Empty Groups to Roles

Previous versions of WebCenter made use of empty **Groups** to create roles. From WebCenter 12 onwards this is replaced by **Roles**. However, you can also convert any empty **Group** that

serves as **Role** into a full fledged **Role**. This will ensure that any reference to such empty **Groups** will be retained and shifted to the new **Role** that is created during this process.

To convert an empty group to a role you need to follow these steps:

1. Go to **Admin > Groups**.
2. Select those **Groups** which you need to convert into **Roles**.
You can use **Show** filter to filter out all the non-empty groups.
3. Go to **Actions** menu. Select **Convert Group to Role** action link in to execute the conversion into a **Role**.

You will be re-directed to a page detailing how many of the selected empty groups were converted and how many were not.

Note: The conversion can fail when:

- a non-empty **group** is selected for conversion. Only empty groups can be converted into roles.
- a **role** with the same name as the selected empty group exists. Role names must be unique.

3.12.7. Delegating Roles: Setting up Roles to Assign Roles

Project Managers and Project members (with permissions) can assign a Role within their Projects. The Project Manager or Member can do this from the **Manage Roles** page.

1. Click **Admin > Roles**.
2. Select the **Role** you want to assign permissions to.
3. Click the **General** tab.

Role: CSR

Roles | New Role | **General** | Visibility

Role CSR

Tip: * indicates required field

Role Name: *

Role is Visible by : <All Project Managers>

Role can invite following roles : Sales; CSR; Printer

Save

4. Click on the **Roles can invite following roles** link. This will open **Manageable Roles** page.

Role can invite the following roles drop down will contain all the Roles present in the system.

Role: **MANAGEMENT**

Roles | New Role | General | Visibility | **Manageable Roles**

Roles Managed by Role *MANAGEMENT*

Role can invite the following roles:

- DESIGN
- FINANCE
- MARKETING

Save

Role can invite the following roles list depends on the visibility rules. See below.

Admin and PM with full visibility	PM with limited visibility	Normal user
All Users and Groups	Visible Users and Groups	<ul style="list-style-type: none"> Users from his own company (all locations). Users and Groups present in the same Project (through individual or role assignments). Groups the user is member of.

5. Save.

After setting up this configuration, the Project Member in that specific Role can invite other Roles.

The same Project Member in different Roles can have individual configurations in **Role can invite the following roles** list. In this scenario, the list of Roles that this Member can assign will be the sum of these individual lists.

3.12.8. View Roles History

You can view the changes that are made to the Roles in the **History** tab. You can access this in the. **Admin > Roles**. Now, select and open the **Role** for which you want to view the history and navigate to the **History** tab.

- Role Created

- Role Information Changed (renaming of the Role/ changes to visibility setting of the Role)
- Role View Rights changed (changes to the list of PM's/ Project Creators who can view the Role)
- Group Converted to Role. History of the group is transferred here and all details can be viewed now in the Role History

Note: When the Role itself is deleted, you can view the event history in **Admin > Roles > View History**. This page lists the events of all the roles and it can be filtered on date and users.

3.13. Discussions

Discussions helps users to communicate with each other better and enables to seamlessly interact at various levels like project, document or at task level. Discussions facilitates WebCenter users to have conversations, which facilitates collaboration and faster decision making.

You can start a discussions in WebCenter, in a **Project, Task** or at a **Document** level.

You can view the conversations in the **Project** or **Task** or at the **Document** level in the **Discussions** Tab. **Discussions** can be with all the members or private conversations with few or one member of the project.

Admin users have permission to view, edit the members, and delete the messages or the discussions itself in any of the project, or task or document. Admin Users, Project Managers of the Project where the discussion is in and the owners of the Discussion can make the discussion read only.

All members of the Project can start a new discussion. Read more on how to start a discussion or post a message in a discussion [Start a New Discussion](#) on page 815.

3.13.1. Global Discussions

Admin users can communicate to all the users in the WebCenter using Global discussions. It is an one-way communication and can also be made read-only. By default, global discussions are for everyone but admin users can also restrict the audience by selecting the targeted users, roles or groups.

You can start a global discussion on either **My Discussions** page or in the **Discussions** widget on **My Work** page. Based on the setup of notifications, a notification is sent when a discussion is started or a message is posted.

Note: You can use the  read-only toggle button, to make an existing discussion read only.

3.13.2. Enabling Discussions in Task Type

To start Discussion in a Task, **Task Type** chosen for the task should have the field **Allow Discussions** enabled. Either Admin users or Project Managers with **Create Task Type**

permission can do so. Refer to the steps here to create a task type [Create a Task Type](#) on page 822.

To Enable Discussions in a Task:

1. Open any **Task Type** and enable **Allow Discussions** in the **Discussions** tab.
2. You can choose the Discussion contexts from the drop down list.
 - **Current Task** : Discussions are created in the current task and are visible in the task.
 - **Parent Workflow**: Discussions created on the tasks of the parent workflow are visible in all the tasks of the parent and the child workflows.
 - **Root Workflow**: Discussions created on the task of the root workflow are visible in all the tasks of the related workflows or the workflow with this setting.
 - **Project**: Discussions created in the task are Project Discussions and are visible in the task.
3. Choose **Show Discussions of Documents linked to the Task** to view the discussions that happen at the document linked to this task.

Note: Once the task is completed, discussions are in read-only mode.

3.13.3. Copying Discussions from Project / Template

As an Admin user, you can create default templates of discussions and messages which are inherited to projects that are created from the template.

The discussions can be copied optionally, when a new project is created from another project.

Note: Notifications are not sent for discussion events triggered on a project template level.

Copying Discussions from the Project Template

When you create a Project based on a template, the new project is created with the discussions that were defined in the template. This will also include the users and messages in every discussion that is copied.

All Project, Document and Task Discussions from the source Template/Project are included in the target project.

Copying Discussions from another Project

Project Manager users can specify to **Copy Discussions**, when a new project is created from **Copy Project from another Project** option.

Copy setup from an Existing Project

- Copy Project Manager
- Copy Members
- Copy Approval Settings
- Copy Folders
 - Including Documents
 - Including Bill of Materials
- Copy Attributes
- Copy Characteristics
- Copy Tasks From Source Project ▾
- Copy Security Settings
- Copy Notifications
- Copy Discussions

Cancel OK

Note: When **Copy Discussions** is enabled, Project discussions will be copied to the newly created project. Document and Task discussion will be copied, if the **Including Documents** and **Copy Tasks** options are also selected.

3.13.4. Deleting a Discussion or message

Admin users have the option to delete some of the discussions and messages that may not be required or redundant. For security reasons, this option is available only for Admin users and Project Managers.

1. To delete, open the discussion and click the delete button in the Action bar.
2. To delete a message, hover over the message and click the delete button.

Tip: Depending on the notifications set up for discussions, an email notification is sent when a message or a discussion is deleted. You can set up notifications when a member is added or deleted from a discussion. Project history is updated when any changes are made to an existing Discussion or a message in the Discussion.

3.14. Project and Document Characteristics

Characteristics are descriptive tags that can be assigned to projects or documents to make them easier to find.

Characteristics are hierarchical. This means there can be different levels of characteristics for various product lines so that you can drill down through the information to find the exact characteristic desired when searching the database.

For example, you could create a master characteristic for Electronics, and then various sub-characteristics for types of appliances, entertainment equipment, or computers, and so forth. They are presented in a tree format - main categories with expandable branches. The characteristics tree configures the available characteristic names as well as how they are organized.

3.14.1. Create a Characteristic

1. Click **Admin > Characteristics**
2. Do you want to add a primary characteristic (a main category) or a secondary characteristic?
 - To add a primary characteristic, select the option button next to **Root** at the top of the tree and then click **New Characteristic**.
 - To add a secondary characteristic, select the option button for the characteristic under which to add the new one, and then click **New Characteristic**.

There can be up to 17 levels of characteristics or at most 256 characters for the entire characteristics path from the root characteristic to the deepest-level characteristic.

3. Enter the name of the characteristic in the **Name** field.
4. Click **Create**. The new characteristic appears in the list.

3.14.2. Edit or Delete a Characteristic

When deleting a characteristic, WebCenter checks if the characteristic or any of its child characteristics are assigned to any Projects or documents. If such a dependency is found, you are prompted to remove the dependency and delete anyway, or cancel the deletion.

1. Click **Admin > Characteristics**
2. Do one of the following:
 - To edit a characteristic, click its name in the tree structure. Type a new name in the **Edit Characteristic** page and click **Change** to confirm.
 - To delete a characteristic, select it in the tree and click the **Delete Characteristic** link.

If there are no dependencies, it is deleted immediately. Note that any sub-characteristics of the selected characteristic will also be deleted.

3.14.3. Export/Import Characteristics

When exporting a project or project template, the project characteristics are exported along with other project information. Upon import, the characteristics are restored on the target system. When the characteristic does not exist on the target system, it gets created automatically.

- In the source location, to Export **Characteristics**, go to **Admin > Projects**.

Select the Projects that you would like to export. Click **Export** to start a download of a XML file containing the characteristics.

Save this on your computer

- In the target location, to import **Characteristics**, go to **Admin > Projects > .**
Select **Import from File** and choose the XML file which was downloaded earlier.

3.15. Project and Document Attributes

Basic concepts

Attributes are a way to assign user-configurable fields and their values to documents and projects. They can be:

- **Prompted** so that the user has to set a value each time it is used,
- **Calculated** from an ArtiosCAD formula,
- restricted to a group of preset values (a **Restricted Set**).

The Restricted Sets must exist before you can use them when creating an attribute.

Attribute Categories group attributes together for convenience. An attribute must be put into an attribute category before it can be used; however, the same attribute can be in multiple categories.

You must create an Attribute Category before adding attributes to it.

3.15.1. Restricted Sets

Create a Restricted Set

1. Click **Admin > Attributes > Restricted Sets > New Restricted Set**.

2. Enter information in the fields as appropriate:

- **Name:** the name of the Restricted Set, up to 35 characters.
- **Type:** the data type of the Restricted Set. There are eight allowed types: **Area, Date and Time, Distance, Float, Integer, Text, Text (Right to Left), Volume, and Weight**.

A **Float** is a number containing a decimal point and an **Integer** is a whole number.

The labels in parentheses after the name of the type indicate the units of measurement used in Imperial and Metric systems.

- **Value:** an entry for the restricted set. Text values can be up to 255 characters long.

Click **Add** to add the value to the set and clear the **Value** field. Enter as many values as desired, clicking **Add** after each one.

Tip:

You can sort the **Values** list using  and , or click the **Sort** button to sort it alphabetically (for **Text Type** Restricted Sets).

You can also select one or more values and click **Remove** to remove them.

3. Click **Create** to create the Restricted Set.

Edit a Restricted Set

1. Click **Admin > Attributes > Restricted Sets**.
2. Either filter or click **Go** to show the restricted sets.
3. Click the name of the restricted set to edit.
4. Change the name, or add and remove values as desired. You cannot change the type.

Note: If you remove a value, the next time you access a project using the deleted value, you will be prompted to change it.

5. Click **Change** to make the changes.

Delete a Restricted Set

WebCenter checks if a Restricted Set is being used before deleting it. If it is in use, you will be prompted to either clear the restricted set from the attribute using it, or to cancel the deletion.

1. Click **Admin > Attributes > Restricted Sets**.
2. Either filter or click **Go** to show the restricted sets.
3. Select the checkbox of the restricted set to delete and click **Delete Restricted Set(s)** in the actions menu.
4. Click **OK** when asked to confirm the deletion.
5. If the restricted set is not being used, it is deleted immediately.

Export / Import Restricted Sets

You can **Export** and **Import** restricted sets .

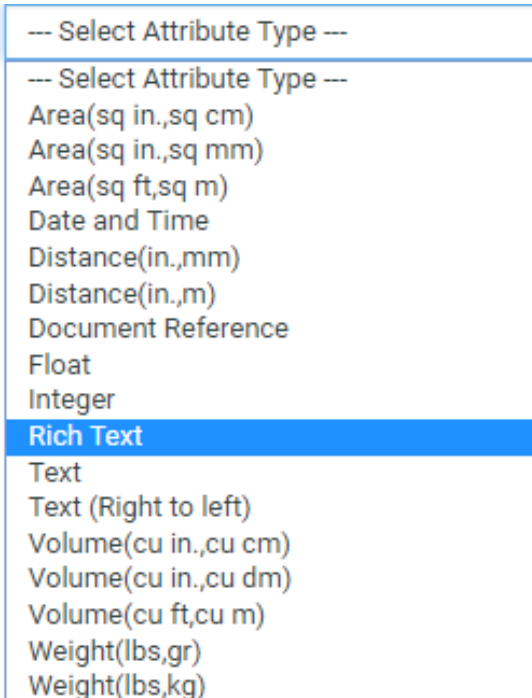

- To **export**, go to **Admin > Attributes > Restricted Sets**:
 - a) Click on the **Import** link.
 - b) Browse to a previously saved XML file.
 - c) Select **Actions > Export**.
This will start a download of an XML containing the Restricted Set.
 - d) Save this on your computer.
- To **import**, go to **Admin > Attributes > Restricted Sets**:
 - a) Select the **Restricted Set** to export.
 - b) Select **Actions > Export**.
 - c) Click the **Import** button.
If the restricted set exists, it will be overwritten with the new values. If it does not exist, it will be created.

Note: This is similar to exporting / importing attribute categories and task types. The exported category will contain the exported restricted sets in the same XML file. While Importing this in a new system, the restricted sets and attribute categories will be created.

3.15.2. Attributes

Create an Attribute

1. Click **Admin > Attributes > New Attribute**.
2. Enter information in the fields as appropriate:

In the field...	Fill in the...
Name	name of the attribute (for example, <i>Billable</i>).
Label	text of the label which has to be displayed. To get the translated text of the label in the other languages chosen, select the blue icon to open Find or Create Translated labels on page 296.
Description	description of the attribute contents (for example, <i>Indicates whether work on this project should be billed by finance</i>).
Type	<p>the type of the attribute. You can select from the drop down.</p>  <ul style="list-style-type: none"> -- Select Attribute Type -- -- Select Attribute Type -- Area(sq in.,sq cm) Area(sq in.,sq mm) Area(sq ft,sq m) Date and Time Distance(in.,mm) Distance(in.,m) Document Reference Float Integer Rich Text Text Text (Right to left) Volume(cu in.,cu cm) Volume(cu in.,cu dm) Volume(cu ft,cu m) Weight(lbs,gr) Weight(lbs,kg)

In the field...	Fill in the...
	<p>Document References are attribute-links pointing to different document sources. When you select this option, you will have more options. Read more in Create a Document Reference Attribute on page 355.</p> <p>Floats are numbers containing a decimal point (e.g. 3.1415) and integers are whole numbers (e.g. 42).</p> <p>Date and Time attribute added in the project attribute category allows to link a date/time to the project status.</p> <p>Text (Right to Left) attribute allows text to be written right to left always and this feature is available in 18.0.1 onwards.</p> <p>Rich Text attribute type allows you in entering long and/or rich text. You can:</p> <ul style="list-style-type: none"> • add set of least 16 different colors. • set the text bold and italic. • use bulleted and numbered lists. • Heading up to four levels and also add tables. <p>In the Preview you will see the Rich Text editor. Click the Show Rich Text Controls link to view the broad pallet of text options. The Project Managers with change properties rights can add content from a document to the Rich text editor window. Here, the text (also Chinese, special characters), font types, bullet types, color, tables and headings are preserved. From WebCenter 18.0.1, there is also an option to change the text direction using the buttons  (right to left or left to right).</p>
<p>Values</p>	<p>choose either:</p> <ul style="list-style-type: none"> • Prompted if you want to allow the user to enter any value. • Calculated if you want to use an ArtiosCAD formula to calculate the attribute value (enter the ArtiosCAD formula in the field). <div style="border: 1px solid #ccc; padding: 5px; background-color: #f9f9f9;"> <p>Note: You should set Calculated attributes to read-only as their values are automatically updated from ArtiosCAD and should not be changed by WebCenter users. To set the value of the calculated attributes during upload, ensure that you have a default attribute category with the calculated attributes for the ArtiosCAD documents.</p> </div>

In the field...	Fill in the...
	<ul style="list-style-type: none"> • Restricted Set to limit the possible values. <div style="border: 1px solid #ccc; padding: 5px; margin-top: 5px;"> <p>Note: To choose a Restricted Set, it must be created before defining the attribute (see Create a Restricted Set on page 292). Make sure that the Type of the Restricted Set is the same as the attribute type.</p> </div> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 5px;"> <p>Note: For Document Reference attributes, you will have only Prompted as the value.</p> </div>

3. Select **Attribute is also a task specification** if you want to be able to use the attribute as a task specification.

For more information about task specifications, see [Basic Concepts of Task Management](#) on page 820".

4. Click **Create**.

Find or Create Translated labels

Where will you find this option

This option may be found, when you

- Create an Attribute or a document reference
- Create or edit a Search using **Search Panel Design**

How to Create new translated label

You can either search for translations or create a new label in the language you require.

Edit an Attribute

1. Click **Admin > Attributes**
2. Click the attribute to edit.
3. Edit the attribute as desired (change the **Name, Description...**).

Note: You cannot change the attribute type.

4. Click **Change** to make the changes.

Copy and Paste Attributes

Attributes can be easily copied between attribute categories between two views in the same categories or between attribute categories and task type specifications. This can be done within the same WebCenter system or between different WebCenter systems.

To copy your selection of attributes in any view to the clipboard by either using keyboard shortcuts like Ctrl/Cmd+C, Ctrl/Cmd+X, Ctrl/Cmd+V, or by using a context menu (right click).

Note: Copy and paste of attributes is possible only in Grid Layout and this feature is not supported in the Header view of the Attribute Category.

When pasting the content in a cell, all settings including labels, rules, styles, document reference rendering configurations and lists are copied.

There can be conflicts detected when you paste the copied cells into another location. Following are the possibilities that may arise:

Conflict Detected	Action that can be performed
Target cells are already occupied	Choose to overwrite or cancel the operation
Copied cells are already existing in the new location	Choose to replace the existing one or skip the conflicting cells or cancel the operation
When the copied attribute has rules / styles that are already existing in the new location	Choose to <ul style="list-style-type: none"> • overwrite the rule/ style • keep both the rules/ styles. Copied rules/ styles gets a number added to its name • Use the existing rules/Styles or • cancel the operation
When a list entry is already assigned to a different set of attributes in the destination category	Choose to <ul style="list-style-type: none"> • overwrite the list • keep both the lists • merge values or • cancel the operation
When the copied Form property (Task execution or project creation view) already exists in the destination	Choose to <ul style="list-style-type: none"> • overwrite the selection • Skip the action
	<p>Note: When a form property is placed in a view where it cannot be placed, it will be ignored</p>

Delete an Attribute

When deleting an attribute, WebCenter checks if the attribute or any of its child attributes are used in any projects. If it is, you are prompted to remove it from the project and delete anyway, or cancel the deletion.

1. Click **Admin > Attributes**
2. Select the attribute to delete and click **Delete Attribute(s)** in the actions menu.
If the attribute is not being used, it is deleted immediately.

3.15.3. Attribute Categories

An attribute category is a set of attributes which are used together and is a way to apply attributes to a project or a document.

Attribute categories contain:

- attributes you selected
- lay-out elements (ruler, table, spacer, title)
- styling
- custom labels
- rules
- buttons (potentially automatically executed on events)

Create an Attribute Category

1. Click **Admin > Attributes > Attribute Categories > New Category**.
2. Enter the name of the Attribute Category to create, for example *Shipping Instructions*.
3. Click **Create**.

Once you have created the attribute category, you can add attributes to it, define views, etc.

To do this, click the **Attribute category was created successfully. Edit ...** link (see [Add Attributes to an Attribute Category](#) on page 298 for details).

Rename an Attribute Category

1. Click **Admin > Attributes > Attribute Categories**.
2. Click the attribute category to rename.
3. Type the new name in the **Edit Category** page.
4. Click **Save**.

Note: Click **Save As Copy** if you want to duplicate the attribute category under the new name, while keeping the original category as it was.

Add Attributes to an Attribute Category

1. Click **Admin > Attributes > Attribute Categories**.

The **Edit Category** page shows two columns: the available attributes (that you can add to the category) at left, and the attributes that are already in the category at right.

2. To add attributes to a category or remove them from it, use the chevron (<< or >>) buttons to move them between the two columns.

Note:

Moving attributes between columns takes effect immediately.

Attributes you have added to the category have an * in the left column.

Tip: Use the search field to filter the available attributes list, and the  and  buttons to change the order of the attributes in the category.

You can see a **Preview** of your attributes under the columns.

3. Click **Save** when you are done.

Attributes Views

You can use different layouts for the same **Attribute Category** in different locations or pages by creating custom **Attribute Views**. A View created for a particular context can have custom layout for that context. This way, different places in the user interface can show different levels of details of the attributes.

For example, you can choose to show very few attributes during **Document upload** using a **Creation View**. See more examples below.

You can use special Attribute Views such as Project Creation Form view to create request forms in WebCenter. You can completely customize these forms with your business terms without any default terminology from the application.

You can have multiple **views** for an **Attribute Category**. Essentially, these are subsets of the category with different layouts (if you have configured it that way).

You can configure the following views:

- Default view: used in project attribute details page and document attribute details page. You cannot delete this view.
- Creation view: used in the project creation and upload document pages.
- Header view: used in the headers of project details pages and document details pages
- BOM view: used in the Bill of Materials tab of projects
- Task Type views: For each task type you can define a view which will be used in the task execution page for documents attached to this task.
- Viewer Views
- Project Creation Form View
- Task Execution View (for Task Specifications)

Default View

When adding attributes to a category, only the **Default View** of the category exists at first (you can add other views). The **Default View** is the view that will be shown in the project or document details (on the **Attributes** page).

Documents (3) | Tasks (0) | Discussions (0) | Characteristics | **Attributes** | Project Information | Approval | Notifications | Members | Security

Show Attributes in Category Package Information [Change Category](#)

Name	Value	Type

Save

Export to JDF file:

Import from JDF file:

Note:

- Users can edit attributes in the default view if they have **Change Properties** right on the project (for project attributes) or on the folder containing the document (for document attributes).
- When editing attributes, they **must** fill in attributes that are **required** (they have a red *).
- They cannot edit attributes that the Admin made **Read Only**.

Creation View

If you have added a **Creation View** of the attributes, users see it when they:

- create a project with attributes,
- create a document placeholder from a document template with attributes,
- upload one or multiple documents with attributes.

Description:

Product name: Choc' Ice Cream

Country: Belgium

Length in inches or mm: 220 mm

Number of Spot Colors: 2

Note:

- If you haven't added a header view, users will **not** see attributes in the project or document header.
- Users cannot edit attributes in the header view.

Task Type View

If you have added a **Task Type View** of the attributes, users see it on the task details page for documents attached to a task of that specific task type.

Viewer View

You can create dedicated **views** to allow your users to view the active document's **attribute category** in the Viewer.

If you have configured your **attribute category** with such Views, your users can view this in the *Attributes widget*.

For example, you can create **attribute category** based checklists for different **roles / groups**. When a **user** from that **role** or **group** views the documents with that **category**, this attribute checklist will be visible in the viewer. Read more about this use case in: <https://wiki.esko.com/pages/viewpage.action?pageId=170047115>.

As an another example, you can use this to view your document references in the Viewer. If you have more than one CAD document references associated with your graphics file, you can create a Viewer view for these attributes with specific *source* and *rendering* configurations. Your user will then be able to change a reference from the Viewer and save this configuration.

Note: Only the users with **Project / Folder** level **Change Properties** permissions can change and save attributes from the *attributes* widget.

Read also: [Add Viewer Views](#) on page 303.

Add Attributes Views

- To add a creation view:
 - a) Click **Add Creation View** in the **Edit Category** page.
The attributes in the category are copied from the default view to the creation view.
 - b) Use << to remove any attributes you don't want to show in the creation view.

Note:

You cannot add attributes to the creation view if they are not already in the default view.
To add more attributes to the creation view, switch the **Current View** to **Default**, add the attributes, then switch it back to **Creation**.

- c) Use a grid layout if desired (see [Use a Grid Layout](#) on page 311 for more information).
- To add a header view:
 - a) Click **Add Header View** in the **Edit Category** page.
The attributes in the category are **not** copied from the default view to the header view.
 - b) Use >> to add attributes to the header view.

Note:

You cannot add attributes to the header view if they are not already in the default view. To add more attributes to the header view, switch the **Current View** to **Default**, add the attributes, then switch it back to **Header**.

Note: You cannot use a grid layout for the header view.

- c) Click **Save** to save all your views.

Add Viewer Views

You can create dedicated **views** to allow your users to view the active document's **attribute category** in the Viewer.

If you have configured your **attribute category** with such Views, your users can view this in the *Attributes widget*.

For example, you can create **attribute category** based checklists for different **roles / groups**. When a **user** from that **role** or **group** views the documents with that **category**, this attribute checklist will be visible in the viewer. Read more about this use case in: <https://wiki.esko.com/pages/viewpage.action?pageId=170047115>.

As an another example, you can use this to view your document references in the Viewer. If you have more than one CAD document references associated with your graphics file, you can create a Viewer view for these attributes with specific *source* and *rendering* configurations. Your user will then be able to change a reference from the Viewer and save this configuration.

Note: Only the users with **Project / Folder** level **Change Properties** permissions can change and save attributes from the *attributes* widget.

To create a Viewer View:

- Click **Add View** in the **Edit Category** page. You will get a pop-up to type in the **view name**.
- Type the name of the View. You can create a general `Viewer` view for all users or views dedicated to a particular **role / group**.

You can create the following **views**:

- `Viewer` for a general Viewer view of the attributes.
- `Viewer [Role]` with the specific **role** name as a suffix. This view will be visible in the **Attributes** widget of the Viewer when a member of that **role** opens the document.
- `Viewer [Group]` with the specific **group** name as a suffix. This view will be visible when a member of that **group** opens the document.

Note: It is important that you name your **views** exactly as above

You will be switched to the newly created **view**. All your attributes from the **default view** will be copied into the new one.

- Use << to remove any attributes you don't want to show in the **Viewer** view.

Note:
 You cannot add attributes to these views if they are not already in the default view. If you need more attributes in the Viewer view:

1. Select the **Default** view in the **Current View** drop down.
2. Add **attributes**.
3. Switch to the **Viewer** view in the **Current View** drop down.

The attributes added to `Viewer`, `Viewer [Role]` or `Viewer [Group]` will be visible in the Viewer.

- If your Viewer view is for *document reference attributes*, create specific *source* and *rendering* configurations.
- **Save.**

If your Attribute Category View(s) are...	and your User Role / Group is...	The Viewer will have...
Only Default	Any	No widget
Viewer	None	Viewer View
Viewer, Viewer Designer	None	Viewer View
Viewer, Viewer Designer	Designer	Viewer Designer View
Viewer, Viewer Designer, Viewer Legal	Legal	Viewer Legal View
Viewer, Viewer Designer, Viewer Legal	Designer and Legal	Viewer Designer View / Viewer Legal View + selector to switch between the Views
Viewer, Viewer Designer, Viewer Legal	Marketing	Viewer View

[Viewing Attributes](#) on page 727

Edit the Terminology for Project Creation

It is possible to change the terminology used for project creation so that the Project Creation page talks about "Designs" instead of "Documents", or "Roles" instead of "Placeholder Groups", for example...

You can achieve this by customizing the terminology in the attribute category of the project or template used as a basis for project creation.

You need to:

1. Click the attribute category to use on the **Attribute Categories** page.
2. [Add a Creation or Header view](#) to your attribute category and click **Save**.
3. Click **Edit Terminology**.
4. In the **Edit Terminology** pop-up, fill in the custom terms you want use instead of the default project creation terms.

For example, fill in `Designs` in the **Documents** field if you want to show "Designs" instead of "Documents" on the project creation page.

Any field left blank will still use the default term.

✕
Edit Terminology

Change terms in all Project Creation Forms where this Attribute Category is used

Default Term	New Term
Details	<input style="width: 90%;" type="text" value="Set Project Details"/>
Name	<input style="width: 90%;" type="text"/>
Requestor	<input style="width: 90%;" type="text"/>
Project Manager	<input style="width: 90%;" type="text" value="Project Owner"/>
Status	<input style="width: 90%;" type="text"/>
Customer	<input style="width: 90%;" type="text" value="Division"/>
Location	<input style="width: 90%;" type="text"/>
Description	<input style="width: 90%;" type="text"/>
Due Date	<input style="width: 90%;" type="text"/>
Bill Of Materials	<input style="width: 90%;" type="text"/>
Documents	<input style="width: 90%;" type="text" value="Attachments"/>
Document Template	<input style="width: 90%;" type="text"/>
Members	<input style="width: 90%;" type="text"/>
Role	<input style="width: 90%;" type="text"/>
Invite Members	<input style="width: 90%;" type="text"/>
Attributes	<input style="width: 90%;" type="text" value="Enter Request Details"/>
Section Sequence	<input style="width: 90%;" type="text"/>

Example: GABDM = Gen. Details | Attrs | BOM | Docs | Members

Cancel
OK

Attention: Your custom terms will not be automatically translated, and will show as **you enter them** for all languages in which you run WebCenter.

5. Optionally, you can specify **Section Sequence** if you want to alter the order of the sections. To do that alter the sequence of the GABDM (**General Details, Attributes, Bill Of Materials, Docs, Members**) in the way you want.
 - The system does not accept wrong combinations such as other letters, too many letters or repetitions.
 - If less letters are given, the system will order these sections first and then put the others in the normal sequence.
 - Section sequence is not applicable to project creation view since it displays the attribute category

In the Task Specifications of a Task Type, it's also possible to edit terminology, though more limited; it is not possible to change the section sequence. The edit terminology link is available in the Default view and the task execution view

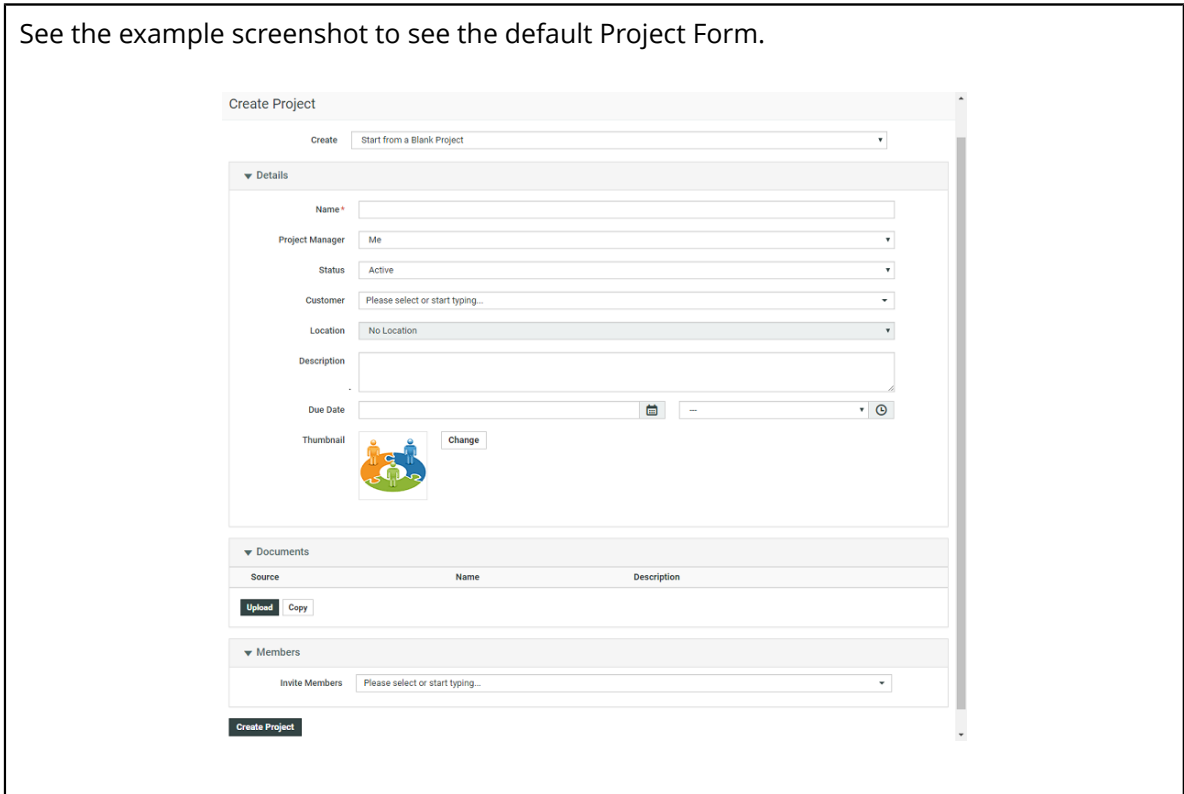

If you configure the Project Creation form to have less sections than GABDM, these are simply taken out. For example, if you specify GABDM, but have configured the Project creation with no Documents section, you will have the following in that order:

- General details
- Attributes
- Bill of Materials
- Members

Project Creation Form View

You can fully customize your Project Creation form in WebCenter. This way you can have a uniform customized look for the entire project creation form. You can combine **attributes** with project properties in an Attribute Category with a **Project Creation Form View**.

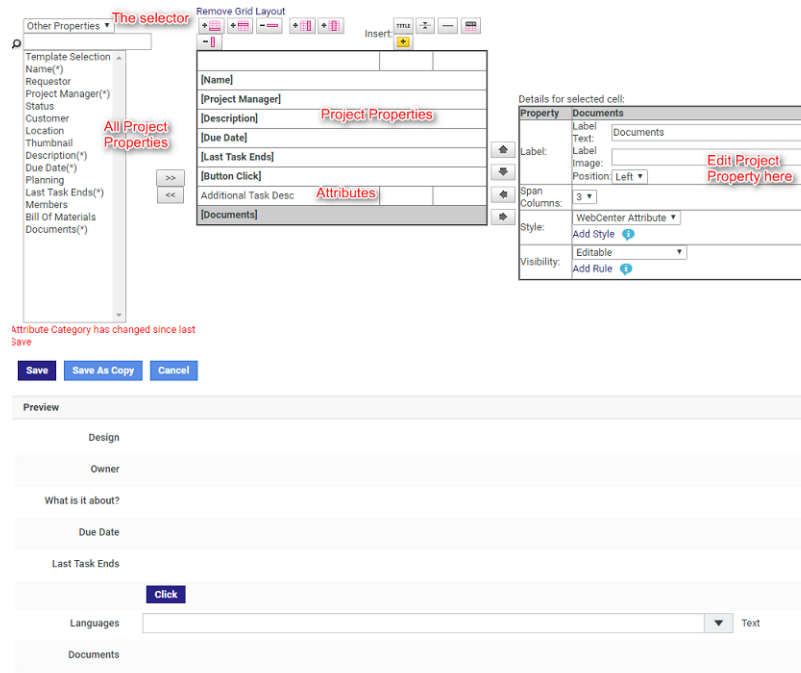

When you add this special view, this category will load default Project Creation Properties just like **attributes** in their default order (as in a default Project Form).

The following **Project Properties** are available in this view and you can customize all of them. The fields from all sections are included in this view but without section titles (Members, Bill of Materials, Documents).

- **Template selector** on top of the Project Creation form
- **ProjectName**
- **Requestor**
- **Project Manager**
- **Thumbnail**
- **Customer**
- **Planning (backward or forward)**
- **LastTaskEnds (Date for Planning)**
- **Status**
- **Description**
- **Location**

- **Members**
- **Bill of Materials**
- **Documents**

In the attribute selector pane, you will see both the attributes and the project properties. You can use the selector to toggle between **Attributes** and **Project Properties**.

When the Attribute Category (with Project Creation View) is assigned to the Template or the Project, the new custom form fields will appear during project creation.

Notes

Use caution when customizing Project Property fields:

- When you remove **ProjectName** from the Attribute Category View, make sure that you have configured **Autonaming** in the Project Template.
- Make sure that **Project Details > Configuration > Project Creation** page is in line with your Project Creation view:

Show	Feature	Required
<input type="checkbox"/>	Set Project Manager	<input type="checkbox"/>
<input checked="" type="checkbox"/>	Set Status	<input type="checkbox"/>
<input checked="" type="checkbox"/>	Set Customer	<input checked="" type="checkbox"/>
<input checked="" type="checkbox"/>	Set Description	<input type="checkbox"/>
<input checked="" type="checkbox"/>	Set Due Date	<input type="checkbox"/>
<input checked="" type="checkbox"/>	Upload Documents	<input type="checkbox"/>
<input checked="" type="checkbox"/>	Assign Roles	<input type="checkbox"/>
<input checked="" type="checkbox"/>	Invite other Members	<input type="checkbox"/>
<input checked="" type="checkbox"/>	Set Attributes	<input type="checkbox"/>
<input checked="" type="checkbox"/>	Select Thumbnail	<input type="checkbox"/>
<input checked="" type="checkbox"/>	Set Planning (Tasks)	<input type="checkbox"/>
	Default Planning Method Backward ▾	
<input type="checkbox"/>	Change Bill of Materials	<input type="checkbox"/>

- The **required** fields should be configured as **Visible**. Read more in: [Project Creation Settings](#) on page 159
- Make sure that the **Set Attributes** is enabled. If this field is disabled, the Project Creation Form will not load (when using Project Creation Form view).
- If some fields are disabled in this page, but added to the Project Creation Form view, they are not available during project creation.
- Planning fields are available only when the Project / Template has tasks. Also if the label of the field **LastTaskEnds** is not custom, the value will change to “First Task Starts” when planning is set to **Forward**.
- The **Requestor** field is available when there is a REQUESTOR role.

Add Project Creation Form View

Create the [Attribute Category](#) that you want to assign to the Project or Template from which your users will create Projects.

To modify the Project Creation Form, you have to **Add Project Creation View** to this Attribute Category.

To add a Project Creation Form view:

- Click **Add Project Creation View** in the **Edit Category** page.
The existing attributes (if any) and all default **Project Properties** are added to this view.
- Use << to remove any **Project Properties** or **Attributes** you don't want to show in the Project Creation Form. Read the notes in: [Project Creation Form View](#) on page 306 before you do this step.

You can also drag these Project properties and place them between the Attributes in the Attribute Category. When you remove properties, they don't appear in the Project Creation Form.

Name
DEKE_DSR_Form

Save Save As Copy Cancel

Note:

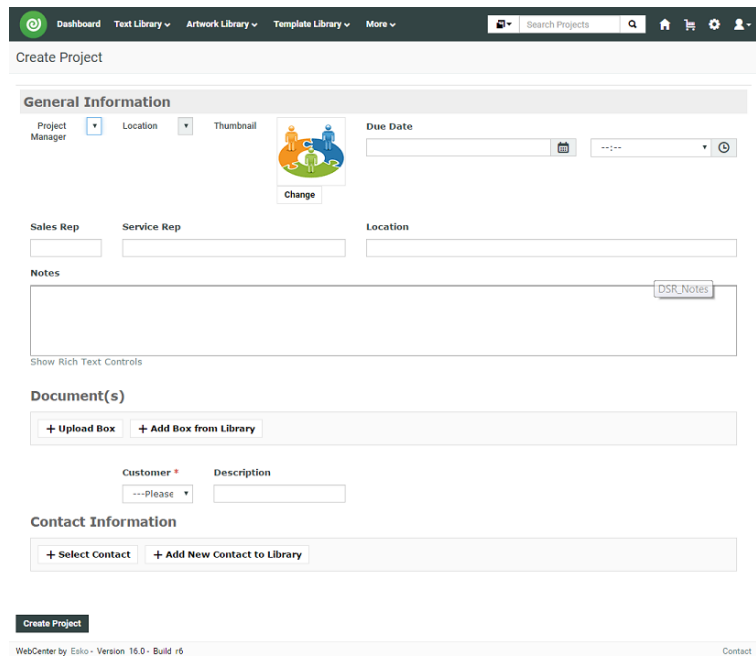

You cannot add attributes to this creation view if they are not already in the default view. To add more attributes to the creation view, switch to the **Default** view, add the attributes and switch back to **Project Creation Form View**.

- Use a grid layout if desired (see [Use a Grid Layout](#) on page 311 for more information). Grid layout gives you the possibility to customize your **Project Properties** with advanced features.

Keep the following in mind when customizing Properties:

- You can show and hide fields or sections based on attribute values
- You cannot specify them as Read-Only or Required
- You can customize the label or image including their position (left or top).
- You can add Style to these Properties
- You can define the Column Span for them.
- **Save.**

When Project Creation Form View is defined in a Project's or Template's Attribute Category, the custom view is loaded when a user creates a Project (based on that Project or Template). When this view is loaded, the whole page will look like one continuous form. See the result of the example configuration:

Configuring Preview for Attribute Category

Preview the Attributes in the document

You can view the preview of any documents in the **Preview** tab of the document, which is enabled by default to all users.

When you navigate to the Preview tab of the document, a dashboard is loaded with two blocks displayed side by side, namely

1. Attributes block on the left side and
2. Preview block on the right side

Configure Preview Block

To configure the preview block to render, following attributes have to be created and configured:

Create Attributes	For
PREVIEW_TYPE	This text type attribute is to specify which type of preview user wants to see. It can hold value from a restricted set, which contains values CHILIPreview and StaticPreview.
PREVIEW_DOCUMENT	This document reference type of the attribute can hold a single HTML or Chili document to create preview.
LOCALE_#	Attributes to specify the locale index to prepare locale mapping for the languages. Create as many Locale attributes as per the number of languages you require.

In the **Preview > Attributes** , choose either of the following:

- **CHILI Preview:** This preview is applicable for Chili documents. When you enable this option, Chili viewer loads in the Preview block.

Note: You can view the Attributes and the Chili document in the preview mode, only if the option is enabled in the Chili set up. Read about Chili Setup [here](#). Admin user has to add the menu option for the required user groups.

- **Static Preview:** When this type is selected then the Preview block loads a HTML file and the values can be simultaneously updated.

Update Preview Block with Attribute values change

When any update is made to the attributes, the matching text/image placeholders in the preview block are updated in real time.

You can update the values for the Chili document along with the attributes and save either as new version of the document or retain it as a draft.

Delete an Attribute Category

WebCenter checks if an Attribute Category is being used before deleting it. If it is in use, you will be prompted to either clear the category from the projects or documents using it and delete the category, or to cancel the deletion.

1. Click **Admin > Attributes > Attribute Categories**.
2. Select the attribute category to delete and click **Delete Category** in the actions menu.

If the attribute category is not being used, it is deleted immediately.

Use a Grid Layout

Adding a grid layout to your attribute category allows you to customize the way your attributes will be shown to users.

It also provides more advanced features, like making an attribute required (users have to fill it in) or read only.

1. Click **Use Grid Layout** in the **Edit Category** page.

This shows extra options and buttons on top of your attributes column, and a **Details** table at right, containing information and extra options for the selected attribute.

2. Select **Alternating background** if you want your rows to have an alternating background color.
3. Select **Show also Attribute types and Restricted Set Types** if you want the types of the attributes / attributes restricted sets to be displayed after each attribute (like *Business Unit* in the example above).

When checked, pages having this attribute category or task specification layout will not keep the session alive. This allows you to fill out long forms without having to log in repeatedly.

4. Optionally enable **Keep Session Alive when user is inactive** to avoid getting timed out when there are signs of inactivity.

As long as the user is working on the form, the session will be kept alive. However, if the browser detects that the user is inactive, it stops keeping the session alive. When this flag is turned on, the session will be kept alive even if the user is inactive.

5. Add or remove columns and rows as desired:

- Click  to add a row at the bottom of the table.
- Select a row and click  to insert another row before it.
- Select a row and click  to remove it.
- Click  to add a column at the right of the table.
- Select a column and click  to insert another column before it.
- Select a column and click  to remove it.

Note:

6. If you want an attribute to be displayed across several columns, select it and enter the desired number of columns in **Span Columns** in the **Details** table.

Preview

Product name	
Country	Length in inches or mm
--- <td>Number of Spot Colors</td>	Number of Spot Colors

- You have the option to have a cell to span over multiple rows. You can increase or decrease the row in the **Row Span**. You can increase or decrease the row span for cells to have better layout.

8. Format your grid as desired:

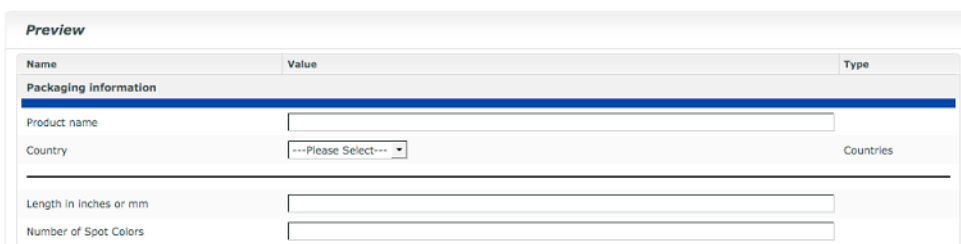

- To add a **Title** row, click  then fill in the **Title**, choose the number of **Columns to span** and the title **Style** in the pop-up that opens.
- To add a **Spacer** bar, click  then fill in the bar's **Height** and **Color** in the pop-up that opens.

Note:

- You can use color names or hexadecimal codes.
- If you don't enter a **Height**, the bar will have a default height.
- If you don't enter a **Color**, the bar will be white.

- To add a **Ruler**, click  then choose the number of **Columns to span** and fill in the **Height** and **Color** in the pop-up that opens.
- To add a **Header Bar**, click .

The example below has a **Header Bar** on top (showing **Name**, **Value** and **Type**), then a **Title** (Packaging information), a blue **Spacer** bar, and a black **Ruler** after two attributes.

The image shows a preview of a table with the following structure:

Name	Value	Type
Packaging information		
Product name	<input type="text"/>	
Country	<input type="text" value="---Please Select---"/>	Countries
Length in inches or mm	<input type="text"/>	
Number of Spot Colors	<input type="text"/>	

Note: You can edit the formatting (color, height...) in the **Details** table at right when you select the cell.

9. You can change how an attribute will appear to the user by giving it a **Label** (in the **Details** table).

For example, you could use a label to show *Manufactured in:* instead of *Country*. This is particularly useful if the users are not familiar with your attributes, or if you are using generic attributes for different purposes.

If you set the labels on top for at least an entire column, you will have a nice form layout.

10. Select the **Position** of the Label as either **Left** or **Top**.

By default, the **Label** will be placed on the left side in the grid. But you can place it on top of the value to modify the form appearance.

A single cell will contain both the Label and the Value. Within this cell, you can manage alignment via the style options.

Component Type

11. If you are using Date time Attribute, then you have an option to hide the time and display only the date by checking the box **Hide Time**.
12. You can also format individual attribute cells using **Styles** (see [Define Styles](#) on page 316).
13. If you are using Date time Attribute, then you have an option to hide the time and display only the date by checking the box **Hide Time**.
14. If desired, change the visibility of individual attributes: select a cell and choose the **Visibility** parameter to use:
 - Choose **Editable** if you want the users (with the right permissions) to be able to edit this attribute.

- Choose **Required** if you want to make it mandatory for users (with the right permissions) to fill in this attribute.
If a user doesn't fill in a **Required** attribute during project creation for example, he / she will not be able to save the project.
- Choose **Read Only** if you don't want **any** user to be able to edit this attribute.
- Choose **Hidden** if you don't want to show this attribute to users. The values will be deleted in this case.
- Choose **Hidden (Keep Values)** if you don't want to show this attribute to users but keep the value.

Note: You can also use visibility **Rules** to determine when an attribute will be hidden / required / read only... See [Set Visibility](#) on page 317.

15. Click **Save** when you are done.

Define Styles

Define styles to further customize your attributes layout.

1. Select the cell of the attribute to customize.
This show the **Details** table at right.
2. Click **Add Style** to define a custom style.

Note: You can also use one of the predefined styles (**WebCenter Attribute** or **WebCenter Title**) if you want your attributes to have the default WebCenter look.

3. Define your style: enter a **Style Name**, a **Background Color** (use the color name or the hexadecimal code), choose a **Font Family, Font Style, Font Weight, Font Size, Font Color**.

The 'Edit Style' dialog box includes the following fields and options:

- Style Name: [Text Input]
- Background Color: [Color Picker]
- Alignment: [Left] (Dropdown)
- Font Family: [Verdana] (Dropdown)
- Font Style: [Normal] (Dropdown)
- Font Weight: [Normal] (Dropdown)
- Font Size: [] pt
- Font Color: [Color Picker]
- Width: [] px (Dropdown)
- Height: [] px
- Column Width: [] px (Dropdown)
- Label and value have different styling
- Buttons: Cancel, OK

You can fix the **Column width** of the first column to keep the titles aligned.

Set the **Column width** lower than what you want as there is some margin for the columns. The total table takes the full width of the allowed/available space (depending on the browser). Therefore fixing the width of one column has an effect on the other columns.

Tip: Do not fix the width of all columns as it will lead to unpredictable results.

Click **OK** to update the style for the attribute..

You can see your style applied to the attribute cell in the **Preview**.

To apply it to another attribute cell, select the cell then select the style in the **Details** table.

You can edit or delete the style using the links in the **Details** table.

Set Style based on Rules

You can define styles for **Attributes** based on the rules set up.

This allows flexibility to display different styles based on the parameters defined in the rule. Rules can be set up with JavaScript or an Attribute value for both Styles and Visibility Rules. Style rules can be set up in the same way as visibility rules, except for the then and else section, where styles should be selected instead of visibility.

For example,

```
if (return att["Attribute1"] + att["current"] + att["Attribute3"] < 100) then the cell  
is green, else, the cell is red.
```

Note: You can create a rule based on the value of the **Current Attribute**. In a style rule, **Current Attribute** is used to actually execute.

Note: Once you have defined a style in the **Default** view, you can use it in the **Creation** view, and vice-versa.

Set Visibility

If you want an attribute to be hidden or required or read only, depending on a condition, you should define a visibility rule for this attribute.

A rule makes the visibility of an attribute depend on one or more other attributes or a JavaScript snippet.

1. Select the cell of the attribute for which you need a visibility rule.

This show the **Details** table at right.

2. Click **Add Rule** to define a new visibility rule.
3. In the **Edit Rule** pop-up that opens, give your rule a name (choose a name that indicates what the rule does).

4. Define your rule.

For example, you want the attribute `Number of samples` to only be visible (and filled in) if the `Sample Needed` attribute is set to `Yes`.

- a) You need to first define the condition: **If The value of attribute** `Samples Needed` = `Yes`.
- b) Then define what happens when this condition is fulfilled: **The cell is:** `Required`.
- c) Then define what happens when it is **not** fulfilled: **Else, the cell is** `Hidden`.

Area in sq ft or sq m	Length in in
Brand	Country
due date	Comments
Samples Needed	
Number of samples	

5. You can edit the Visibility rules and Styles rules based on Java Script rules. Instead of choosing an attribute value, you can add a JavaScript code snippet to create a rule for visibility or styles. This allows more flexibility and can have customized rules apart from the attribute values. Read more on how to set [Edit Styles / Visibility based on Java Script rules](#) You can also add chain rules for styles, where the conditions can be linked based on rules. Read more about [Chained rules](#).

6. Click **OK** when you are done defining your rule.

The **Preview** is updated to reflect the result of your rule.

Note:
 The **Preview** is interactive: in the example above, you can choose `Yes` for the `Samples Needed` attributes in the **Preview**, and see the `Number of samples` attribute displayed. You can choose `No` (or nothing at all) and have that attribute hidden.

To apply the rule to another attribute cell, select the cell then select the rule in the **Details** table.

You can edit or delete the rule using the links in the **Details** table.

Note: Once you have defined a rule in the **Default** view, you can use it in the **Creation** view, and vice-versa.

Note:

You can create more complex rules by clicking the **And** link to add more conditions. Choose **AND** if **both** conditions should be fulfilled, or **OR** if **at least one** of them should.

You can define very complex rules if necessary.

In the example below, a warning message is made visible (but read only) when somebody requests more than 10000 samples or asks for more than 4 spot colors.

The warning message itself can be a title or an attribute (that you can use in several attribute categories).

Note: You can add styles to based on the result of your rules set. Read for detailed explanation [#unique_1249](#)

Style Rule based on Attribute Value

For example, If <Attribute Value (choose from the drop down) = X > then the style = (**Style Name A**, else **Style Name B**) where Style Name A and Style Name B are predefined

Change Cell Details for Multiple Cells

In the grid layout, when you click on a non-empty cell, details are shown to the right of the grid. You can change the details of multiple attributes by choosing the cells using CTRL /CMD and SHIFT keys or selecting individual attributes holding the CTRL key.

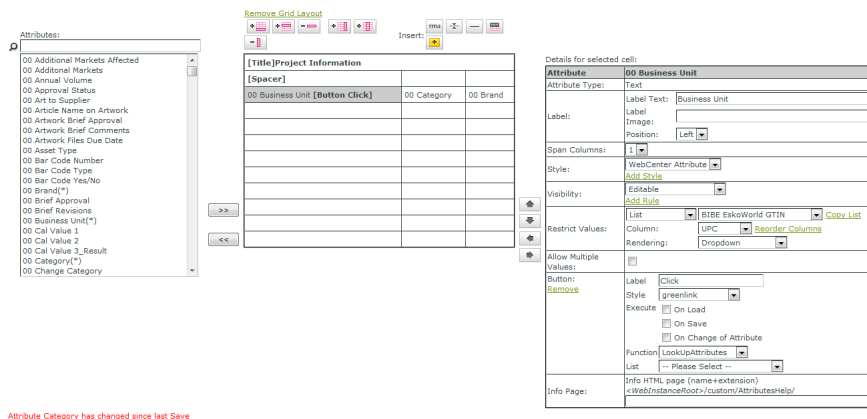

When multiple attributes are selected, only the details that are relevant for the selected cells are shown.

When the values of all the selected attributes are the same for an option, it is displayed in the details. A blank value is shown if the selected cells have different values. When selecting a value, and it is applied to all the selected cells.

Enhancing Attributes with Advanced Features from Grid Layout

You can enhance the attributes from the **Grid layout** view. You can restrict values to available cascading attributes, create multi-value attributes, add label images and add HTML help to the attributes.

- Click **Use Grid Layout** in the **Edit Category** page.
- You can add [LookUp Attributes](#) on page 321 button next to your Attributes in your form.
- Click on any of the attributes. Its details will appear on the right side.

- **Label Image:** You can add a representative image as a label image. Read more in [Create Image Label for an Attribute](#) on page 327.
- **Restrict Values:** You can restrict values to **list** containing [Cascading Dropdowns](#) as **columns** and select their **rendering**.
You can also [create check boxes, radio buttons and image selectors for text type list attributes](#).
- **Allow Multiple Values:** You can allow more than one value to an **attribute**. Read more in [Create a Multi-Value Attribute](#) on page 329.
- **Info Page:** You can provide additional information in an HTML page. Read more in [Create HTML Information for an Attribute](#) on page 330.

LookUp Attributes

You can use **LookUpattributes** button to fill multiple attribute fields based on one or more input attributes without a cascading dropdown. You can configure the list in the details of this button. You do not have to restrict individual attribute values to a list when using this button.

You can create a better user experience with this feature if a lot of properties must be loaded for something already well-known / unique. The typical example is loading product details or component details when you enter the product code. In this case, when you type the code and click the button, you will get all its details filled.

When you have partial / non-unique information, use [Cascading Dropdowns](#).

1. [Create and add attributes to an Attribute Category](#).

2. Select your **attribute** in the [Grid Layout](#).

3. Click on the LookUpAttributes  button to add it next to the selected **attribute**. You will see the **Button** details in the **Details of selected cell** table.

Button: Remove	Label	click		
	Style	buttonprimary	▼	
	Execute	<input type="checkbox"/> On Load		
		<input type="checkbox"/> On Save		
		<input checked="" type="checkbox"/> On Change of Attribute	 NAPR_ATT4	▼
	Function	LookUpAttributes	▼	
	List	ALL_LANGUAGES_1	▼	
	Add Input Attribute Add Output Attribute			

4. Modify the **button**'s details.

- You can specify the **Label** text you want to display next to your button.
- Pick a **Style** for the button to change its look.

Note: If you choose **Hidden**, you can **Execute** the button :

- **On Save**
 - **On Load**
 - **On Change of Attribute** where you need to specify the attribute
- Select a **list**.

Note: You can use the *lists created on the WebCenter database. Cascading dropdowns placed on Web Server are not supported.*

- Set **Function** to **LookUpAttributes**.
 - Add one or more **Input Attributes**. Select the attribute from a list of attributes in your category and match it to the right **list Column**. Click on **Add Input Attribute** to add more.
 - Enable **Exact** to only allow exact matches. For example, if the input attribute is country name and if you type Belg, you can get Belgium if the **Exact** is off. If this is on, you will find country details only if you type Belgium entirely.
 - Add all the **Output Attributes**. Select the attribute from a list of attributes in your category and match it to the right **list Column**. Click on **Add Output Attribute** to add more. This will correct your (typed) input attributes to the official value. If you type Belg and click the button, the entry value will be Belgium. This will also add the other details associated with this attribute.
5. You can now test the button and **save**.

Check Unique Values

This feature allows you to create a unique name for a component. It helps to create names which are different from existing names.

However, this is not useful if you are creating pure numbers (where you expect auto-numbering). Use auto-numbering in such cases.

Note:

This function does not guarantee that the values are unique throughout the system.

1. *Create and add attributes to an **Attribute Category**.*
2. Select your **attribute** cell in the *Grid Layout*.

Note: This function does not work for date attributes or rich text attributes. You will be warned if you use any of these types.

3. Click on the **Add button**  icon to add it next to the selected **attribute**. You will see the **Button** details in the **Details of selected cell** table.

<p>Button: Remove</p>	<p>Label <input style="float: right; margin-left: 10px;" type="text" value="Check if Unique"/></p> <p>Style <input style="float: right; margin-left: 10px;" type="text" value="buttonprimary"/></p> <p>Execute <input type="checkbox"/> On Load <input type="checkbox"/> On Save <input type="checkbox"/> On Change of Attribute</p> <p>Function <input style="float: right; margin-left: 10px;" type="text" value="CheckUniqueValue"/></p>
<p>Info Page:</p>	<p>Info HTML page (name+extension) <input style="width: 100%;" type="text" value="<WebInstanceRoot>/custom/AttributesHelp/"/></p>

4. Modify the **button**'s details.

- You can specify the **Label** text you want to display next to your **attribute**.
- Pick a **Style** for the button to change its look.
- Set **Function** to **CheckUniqueValue**.

5. Now **save**.

Note: This function is difficult to test via the preview because the checks are done based on the current project, document or task. In the preview, you have no document, project or task.

In a project attribute category, it checks whether the filled out value already exists for another project in the system. If yes, you will be warned that it is not unique. The function will force you to choose another value before you can save the attributes or create the project (during project creation).

In a document attribute category, it checks whether the filled out value already exists for another document in the system.

Note: This function does not check the versions of the current document. So multiple versions of the same document may share the same attribute value.

In a task type, it checks whether the filled out value already exists for another task of any task type.

Note:

This verification happens when you click the button or when you save the checked attribute. This check will not happen if you change the attribute in any of following ways:

- via a system integration (WebCenter SDK)
- via Automation Engine
- when changing a group of attribute values via the project saved search operations
- when setting the attribute via a workflow
- when setting the attribute via ArtiosCAD

The check button must be in the visible view. This way you can have a check which only happens during creation or in a task type view.

Note: A unique value for a task does not guarantee that this value does not exist for a project. So this function is not of use while using **automatically set project attribute values from task specifications**.

Create JavaScript Button

A JavaScript button allows you to create a powerful additional functionality within a WebCenter form.

Warning: This is an advanced feature and we recommend that only Esko solution architects and advanced administrators use this.

Use this to:

- execute a calculation within the form
- copy information from a project to a document created in the project
- automatically fill out values for attributes (which are specified as read-only)

Note:

The JavaScript operation is done within the form. However, this may not be automatic in all cases. For example, when you copy project attribute values to documents, the JavaScript execution happens once. When the project attribute is changed, the document attribute will not be synchronized until the button is clicked again. This avoids issues related to full synchronization.

Read JavaScript examples in the [Esko Knowledge Base Article](#).

Button: Remove	Label	Brand
	Style	buttonprimary
	Execute	<input type="checkbox"/> On Load <input type="checkbox"/> On Save <input checked="" type="checkbox"/> On Change of Attribute <div style="display: inline-block; border: 1px solid #ccc; padding: 2px; margin-left: 5px;"> Brand </div> Add Attribute
	Function	JavaScript
JavaScript Code	<pre>if (att[BrandValue] != "XYZ") att[Marketing] = "No";</pre>	

In the screen shot, you can see a simple script in the **JavaScript Code** field.

dcreff["Document Reference Attribute Name"] could be used to access the attributes of a referenced Document.

- Do not return a value but set the value of att['MyAttribute']

- All attribute names must be surrounded by single quotes
- All attribute names are case sensitive
- Use the attribute name. This can be different from the attribute label visible in the form
- The property `att` is case sensitive.
- Technical info: `att` is an associative JavaScript array containing a copy of the current values for all placed attributes. At the end of the execution, (only) the changed values are copied back into the form.

Note:

- Use this only if you know JavaScript and its use. Consult your Esko Solution Architect in case you need JavaScript operations.
- The function is protected against misuse by only allowing to change attributes contained in the current attribute category. This also shows message boxes. The function cannot change any other data in WebCenter (for example it cannot execute web calls).

Advanced JS Button features

JavaScript Buttons can be programmed to access attributes of the referenced Document.

- `docref["Document Reference Attribute Name"]` could be used to access the attributes of the Attribute Category of a referenced Document.

This operator returns a JavaScript object with following properties:

`count`

Number of documents referenced by the selected Document Reference

`docbyname("Name of the Document")` or `docbypos(Position of the document)`

Returns a JavaScript object representing the Attribute Category of the selected Document.

Properties of the Attribute Category object of the selected Document:

Property	Description
<code>att["attribute name"]</code>	Get the value of the specified attribute.
<code>setatt("attribute name", "value")</code>	Set the value of the specified attribute
<code>prop["reference property name"]</code>	Get the value of the referenced property
<code>setprop("reference property name", "value")</code>	Set the value of the referenced property

For example, the sample scripts below, shows how to push an attribute value to an attribute in the attribute category of all the referenced documents.

Button: Remove	Label	Click
	Style	buttonprimary
	Execute	<input checked="" type="checkbox"/> On Load <input checked="" type="checkbox"/> On Save <input type="checkbox"/> On Change of Attribute
	Function	JavaScript
	JavaScript Code	<pre> var boxes = docref["docRef"]; var price = att["Price"]; for(var i=0; i < boxes.count;i++) { var box = boxes.docbypos(i+1); box.setatt("Price",price); } </pre>

All the documents being referenced, are gathered using docref["docRef"] and stored in the boxes variable.

The for loop iterates over all these documents and for every document it updates the "Price" attribute in the attribute category.

- Another operator that was introduced for this functionality is "parent". It allows you to work with the parent Attribute Category (Category from where current Document is being referenced).

It returns a similar JavaScript object as "docref" with the following properties:

Property	Description
att["attribute name"]	Get the value of the specified attribute.
setatt("attribute name", "value")	Set the value of the specified attribute
docref["Document Reference Attribute Name"]	allows to go to the Attribute Category of a referenced Document
parent	allows to go to the parent Attribute Category (Category from where current Document is being referenced)

For example, the sample script below shows how to push an attribute value to a parent attribute category.

Button: Remove	Label	Click
	Style	buttonprimary
	Execute	<input checked="" type="checkbox"/> On Load
		<input checked="" type="checkbox"/> On Save
		<input type="checkbox"/> On Change of Attribute
	Function	JavaScript
JavaScript Code	<pre>var newVal = "My new value"; parent.setatt("text",newVal);</pre>	

Using both operators in combination makes it possible to iterate over the whole tree of Attribute Categories of referenced Documents.

Note:

1. It is not possible to change the value of Document reference attributes
2. It is not possible to access / change attributes that are not loaded on the page at the time the JavaScript Button is executed.
3. The expected result of the JavaScript logic should not be dependent on the order in which the JavaScript Buttons are executed.

Create Image Label for an Attribute

You can create Project request forms or Order forms with graphical labels by setting image labels for specific **Attributes** in an **Attribute Category**. You can use this feature to make the form visually attractive and user friendly. In addition, you can add graphical (packaging) symbols and warnings to aid the user while filling in the forms.

1. Add the label images to the following folder on the WebServer: WebCenter\WebServer\tomcat\webapps\WebCenter_Inst\custom\AttributeLabelImages.
Create a new folder `custom` if it does not exist yet and create a folder named **AttributeLabelImages** under this folder.

Note:

- For the best user experience, use .jpg images. It does recognize .gif, .jpeg and .png.

2. Open your **Attribute Category** and select the **Attribute** for which you want to give an image label.
3. In the cell details, enter the correct image name including the extension in the **Label Image** field and save your attribute category.

Packaging Symbols

Packaging Code	Barcode type	Barcode	Approved for Use?
* <input type="text"/>	* <input type="text" value="---Please Select---"/> ▾	* <input type="text"/>	* <input type="text" value="---Please Select---"/> ▾

Required Legal Disclaimers / Warnings

[Show Rich Text Controls](#)

Tip: In case you wish to display a check box for the **attribute**, make sure you use an **attribute** with a **restricted set** containing only the values Yes and No.

Note: You can either have a text label or an image label, but not both.

Create a Multi-Value Attribute

There are situations when you are creating a new Project or filling in a Form, more than one value needs to be added as an **attribute**. For example, if you are producing a packaging that is intended for more than one market, you need to specify those markets as values in the respective attribute field. You can use a multi-value attribute for this purpose.

- Open your **Attribute Category** and select the **Attribute** for which you want to give more than one values.
- In the **Details for the selected cell** table (in the **Grid layout**), enable **Allow Multiple values**.

Move Grid Layout

Insert:

PR_TASK_ATT1	NAPR_TEXTATT_2
res_8155	MAKE PROJECT THUMBNAIL
or_yes_no	napr_rich1
or_docref_latest_version	NAPR_TEXTATT_3 [Button Click]
PR_ATT4	Text
PR_ATT6	

Attribute	NAPR_TASK_ATT1
Attribute Type:	Text
Label:	Label Text: NAPR_TASK_ATT1
	Label Image: Danger.jpg
	Position: Left
	Custom Unit Label
Span Columns:	1
Span Rows:	1
Style:	WebCenter Attribute
Style Rule:	No Rule
Visibility:	Editable
Restrict Values:	Restricted Set: NAPR_REST Rendering: Dropdown
Allow Multiple Values	<input checked="" type="checkbox"/>
Info Page:	Info HTML page (name+extension) <WebInstanceRoot>/custom/AttributesHelp/

In your Project (as a form), you will have the particular attribute with an option to select more than one (or all) values in its response field. See an example below.

Note:

Simple text attributes were limited to 255 characters until WebCenter 14. There is no character limitation from WebCenter 14 onwards. This allows for unlimited attribute values for a single multi-value attribute.

Create HTML Information for an Attribute

When you design Project request forms or new Order forms, you might want to provide additional information to the user who is filling in the information.

From WebCenter 12 onwards you can provide additional information as HTML help or information. This is especially useful when technical fields need to be supported with extended HTML help.

There will be an information  icon that is added next to the attribute name or attribute image label. When the user clicks on this icon, a pop-up HTML page with the information will appear.

1. Create an HTML file with the additional information you want to provide along with the attribute. You can create textual information as well as images to explain the attribute.
2. Place this HTML file in the AttributeHelp folder (`WebCenter\WebServer\tomcat\webapps\WebCenter_Inst\custom\AttributesHelp`).
3. Open the **Attribute category** and select the **attribute** for which you want to provide HTML help or information.
4. In the cell details, enter the correct file name (of the HTML file) in the **Info Page** field and save your **Attribute Category**.

Details for selected cell:

Attribute	w2p-Finishing
Attribute Type:	Text
Label:	Finishing
Label Image:	
Span Columns:	1
Style:	WebCenter Attribute Add Style
Visibility:	VisibilityRule Add Rule Edit Rule Delete Rule
Allow Multiple Values:	<input type="checkbox"/>
Info Page:	Info HTML page (name+extension) <WebInstanceRoot>/custom/AttributesHelp/ sheet-and-roll.html

If you have an HTML information page linked to an **attribute**, you can see an information icon next to the attribute in the form that you created. When you click on the information , you can see a pop-up window with the information to help the User.

[Create Project](#)

Check box, Radio button and Image selector in your Attribute Category

You can decide the **rendering** of choices for a **restricted set** (text) and for **list** attributes (text). The default **rendering** is a drop down with the options. You can show the options as :

- simple radio buttons or check boxes
- radio buttons or check boxes with images

This allows your users to see the options more clearly than in the case of a drop down.

Create Radio buttons and Check boxes

When you have a few options as the value for an attribute, you can present the options via radio buttons or check boxes instead of a drop down.

Note: Avoid doing this when you have a lot of options to select from. The form will load slow.

1. *Create and add attributes to an **Attribute Category**.*
2. Select your **attribute** in the *Grid Layout*.
An item **Restrict Values** will be visible in the **Details** section.
3. Select the **Rendering** as **Radio / Checkboxes**.

Details for selected cell:

Attribute		00 Business Unit
Attribute Type:	Text	
Label:	Label Text:	Business Unit
	Label:	
	Image:	
	Position:	Top
Span Columns:	1	
Style:	WebCenter Attribute	
	Add Style	
Visibility:	Editable	
	Add Rule	
Restrict Values:	List:	BO Brands Copy List
	Column:	Segment Reorder Columns
	Rendering:	Radio/Checkboxes
	Columns:	6
	Alignment:	Distribute over Width
	Labels:	Below
Allow Multiple Values:	<input type="checkbox"/>	
Info Page:	Info HTML page (name+extension) <WebInstanceRoot>/custom/AttributesHelp/	

In the Attribute Category Preview, you will see a set of checkboxes or radio buttons depending on the items in the restricted set or valid items in the list column.

You will get Radio buttons for a single-value attribute.

You will have check boxes for a multi-value attribute. Select the **Allow Multiple Values** option for this.

Note:

This is optimized for non-cascading type of restricted sets. You may also use them for cascading dropdowns with limited values. Avoid using it when more than two attributes cascade.

Do not use this option for **lists** with thousands of rows.

4. Select the **Column** numbers, **Alignment** and the **Label** position.

You get the best user experience when the number of columns equals the number of allowed values or one of its dividers. If you restrict it to one **column**, you will get a vertical array.

Product Details

Business Unit [Select All](#) [Deselect All](#) [Show All \(remove cascading filter\)](#)

- Air
- Auto
- Beauty
- Health
- Home

By default the columns will be aligned as per the **Distribute over Width** option. You can choose to align to the **left** or **right** depending on the appearance you prefer.

Create Image Selectors

You can use images just like [Radio/Check boxes](#).

1. [Create and add attributes to an Attribute Category](#).
2. Select your **attribute** in the [Grid Layout](#).
An item **Restrict Values** will be visible in the **Details** section.

Restrict Values:	Restricted Set:	FC_Sizes
	Rendering:	Images
	Columns:	6
	Alignment:	Distribute over Width
	Labels:	Below
	Height of Images:	100 pix
	Height of Cell:	pix
	Image Type:	jpg

3. Select the **Rendering** as **Images**.

- The images must be placed on `webinstance\custom\AttributeValueImages`. You can use the same images used in the Asset Browser as selectors.

Note: The image names are case sensitive.

Tip: You can create Push Through Configurations to access the AttributeValueImages, AttributeLabelImages and AttributesHelp on the Web Server. This way your users do not have to access the web server to customize the attributes.

- **Height of Images:**
You can resize the images by adjusting the height. By default, resizing is always done proportionally and to 100 pixels. You can get high quality images when you create images with the sizing specified here.
- **Height of Cell:**

The grid of images can take a lot of screen space. If you want to limit the space use and use a scroll bar, limit the height of the cell. In this setting, the cell will have a fixed height and a scrollbar when the needed size to show all images extends to given height.

- **Image Type:**

You can choose the **Image Type** as **automatic** to display any of the image types. However, we recommend that you select an **Image Type** in this field.

Troubleshooting

- **When you do not see any images at all :** Verify the path where the images are located. If you have multiple web server instances, you must have the images on each instance (or at least on the instance where you try).

Note: Do not put your images for image selectors in the `AttributeLabelImages` folder.

Check the extension of the images.

Note: The name and the extension are case sensitive.

- **When some images are missing:**

Verify if there are any special characters. Avoid all the special characters (comma, %, ...etc) except space.

Check leading and trailing spaces and number of spaces in the names.

Restrict Attribute Values to Previously Selected Values

To setup a practical way to make a final selection from a previously made/calculated list of candidates, a new function has been introduced.

It applies to attribute categories or task specifications with a grid-layout having a first multi-value attribute (attribute A) and a second simple text, non-restricted set attribute (attribute B).

The result is Attribute B is restricted to the selected values of attribute A

This can be set up only by administrators and used by all users who can edit attributes.

Usage:

Select Attribute B in the grid layout. In the cell details, set the Restrict Values selector on Attribute. This will display a dropdown with candidates for attribute B (this list is all plain-text multi-value attributes).

Restrict Values:	Attribute ▼	-- Please Select -- ▼
Allow Multiple Values:	<input checked="" type="checkbox"/>	<div style="border: 1px solid black; padding: 2px;"> -- Please Select -- Board Country </div>

Select one of the candidates. This results in a behavior as shown in the below example: Final Country (which is attribute B) is restricted to the selected values for Possible Country.

Possible Country

Denmark
 France
 Germany
 Ireland

Final Country

---Please Select---
 ---Please Select---
 Denmark
 France
 Germany
 Ireland

Details/Limitations:

- This function only works in grid layout
- Attribute A and B must both be plain text attributes. Attribute A can be a restricted set or a plain text attribute (typically linked to a cascading dropdown).
- Attribute A must be multi-select
- Attribute B cannot be a restricted set or linked to a cascading dropdown
- Attribute B can still be multi-value, so you can select multiple values from the selected values of attribute A
- In search, attribute B is NOT shown as a dropdown, so it behaves as a simple text
- The dropdown only appears when the attribute is editable, else the selected value(s) is/are simply displayed as for a plain text attribute
- Auto-select: When attribute A has only 1 value selected, this value is automatically selected for attribute B.
- Auto-deselect: When attribute B has a value and attribute A's values are changed so that the value for attribute B is no longer a selected value for attribute A, the value for attribute B will be de-selected. In case attribute B is multi-value, this logic is applied to each value separately.
- It is allowed that attribute A is itself restricted by yet another attribute.
- This function works identically for task specifications
- It is allowed to set visibility rules on both attribute A and attribute B
- When attribute A is taken away from the attribute category or if it is deleted from the system, attribute B becomes a plain text attribute. All set values are however remembered (even if they are multi-value, they will be displayed in their base form "value 1 | value 2").

- When no values are selected for attribute A, nothing is displayed for attribute B (no empty dropdown either).

3.15.4. Lists

Cascading Dropdowns contain a set of dependent attributes. The choice of one attribute limits the choice of other attributes in these Dropdowns.

These attributes will be visible as a drop down while building your forms and projects. This allows you to customize and build intelligent forms. Using these, you can:

- retrieve relationships among values (for example, brand-sub brand roles).
- auto-fill the values depending on the relationship (if you select a brand, a brand description will be filled in).
- do smart filtering (if you select a brand, you can filter the products that are available under the brand).
- use in advanced searching (Asset Browsing). Read more in [Asset Browser](#) on page 203.
- **Look Up attribute values** buttons in attribute categories and task type specification forms.

You can create Cascading dropdowns as:

- [Lists](#) on page 337 based on WebCenter Database.
- [Cascading Dropdowns](#) based on [Excel sheets placed on the web server](#).

Note: We recommend that you reconfigure the attribute categories and task types to use the database **lists**. The Excel sheet based cascading dropdowns will become obsolete eventually.

Lists

Lists contain a set of dependent attributes imported into WebCenter. The Lists data is added to the WebCenter database and maintained in a WebCenter Project or Template. Therefore, you can modify this data from WebCenter interface.

Also, you can control the access to this data by setting project permissions.

Note: This works in the same way as the List Data imported from Excel sheets. However, you can use larger data sets with these Database Lists. Read more about Lists from Excel sheets in [Cascading Dropdowns from Excel Sheet](#) on page 344

Adding a new List

- Upload your Excel (either .xls or .xlsx) or XML document to a project or template named **ListManager**. If this project does not exist yet, create a new project named **ListManager**. In this project, you can create folders for different departments, setup approval cycles to approve your lists before it is fully configured.

Note: If you are uploading your lists to the **ListManager** template, only your administrators can see the lists.

- Go to the **Admin > Attributes > Lists** page.
- Click **New List**.
You will see the **New List** configuration page.

- **General List Information:** Specify the **List Name** and a **Description**
- **Input Source Properties:**
 - Specify the **Input Source Type**. It can be either **Excel** or **XML** document. The **Select Document** drop down will list the Excel or XML files uploaded to the ListManager project.
 - **Excel:** Select the input Excel file from the **Input Source Type** drop down. Specify the **Sheet Name** of the Excel sheet containing the List data.
 - **XML :** Select the input XML from the drop down and specify the **XML Main Node**.
 - a) You may enable the **Flush existing list data before updating the list** option to clear the old data from the List before updating with new data.
 With this option on, whenever you upload a new version of the Excel / XML input document, the data from the List will get deleted before the List data gets updated.
 - b) You can enable the **Database user name and password are required when deleting data from list** as a security measure.
 If you have enabled this, you have to specify a database user who has the permission to change the database schema. The database SA (System Administrator) user can also change the schema.

Important: We recommend that you enable this option to avoid accidental deletion of Lists and List Data.

- **Log File Folder:** Select this from the drop down listing the folders in the **ListManager** project.
 This folder will contain the log files associated with individual Lists. The respective log files gets updated when you add or modify List data. You can also set permissions for this folder so that only your administrators can access the logs.
- **Database info:**
 - **Create new database table for storing the data:** Select this when you want a new database table for your list.
 When this is selected, a WebCenter database table is created whenever you create a new List. You need to specify the database user credentials to be able create new database tables.

Note:
 If you check the **Use the built-in 'webcenter' database user account to create the database table**, the SA user has to give the database **Create Table** rights to the default 'webcenter' user account. In this case, you do not have to specify the database SA user credentials for creating new list tables.
 - **Use an existing database table for storing the data:**
 Specify an existing table in the WebCenter database for storing the List data. The columns in this database table and your List need to match. You do not have to specify database user credentials to use an existing table for creating lists.
 - **List Properties:** You can configure your **Input Columns** in the **List Properties** table.
 - Specify the columns relevant for the List here by selecting or deselecting.

By default, the column names of the database table will be the same as the input column names. You may also change the Column names.

Note: The List column names should be unique.

- You can select a particular column as **Unique Identifier**. When you enable this, each value in this List column has to be unique (for example, Product Names). It is possible to select more columns as **Unique Identifiers** (for example, Product Name-Product Variant combination).

Tip:

If you have selected more than one **Unique Identifier** columns, the combination of the values in these columns have to be unique. For example, in the case of Product-Variant combinations, you can have the same Product name repeated for each of its Variants.

Note: When you are updating the list, make sure that the new data matches the **Unique Identifier** column. If the new data does not match the identifier values, new rows will be created. This does not apply if you have enabled the **Flush existing list data before updating the list** option.

- Click **Create List**.

The Lists are displayed in the Lists overview page. Clicking on a specific List will lead to the [List Details](#) page. You can *inspect your List data* here.

Note: If you update the source XML or Excel document, the List Data will get updated.

Purging Lists

The document linked to a list can have newer versions created. When there are more than thirty thousand (30000) new versions of the document that is linked to the list, the older versions of the list up-to 20000 (that is 1 to 20000) are purged. This is to make space for the newer versions to be stored.

Note: Document versions can be linked into different projects. When purging, WebCenter will check if any of the purged versions of the document is linked into a project. Documents versions that are linked into a project are not purged.

Inspecting List Data

- Go to the **Admin > Attributes > Lists** page.
The Lists overview page displays all the existing Lists. The source document and the creator's name is also listed in this page.
- Click on the name of the List you want to inspect.
- In the [List Details](#) on page 340 page, click **Show List Data** to see all of your list data.
You can filter on a list column with a specific value to make the inspection easier.
- Click **Return to List Overview** to return to the general **Lists** overview page.

List Details

The List Details page contains an overview of the following :

- General List information
- Input source properties:
 - Use the Excel/XML **Document** link is to view the document’s action history.
 - You can also access the **Log file** from the respective link.
- List properties

You can:

- [inspect a list's data](#) by clicking on **Show List Data**
- [delete a list or its data](#)

Unique Identifier

You can select a particular column as **Unique Identifier**. When you enable this, each value in this List column has to be unique (for example, Product Names). It is possible to select more columns as **Unique Identifiers** (for example, Product Name-Product Variant combination).

Tip:

If you have selected more than one **Unique Identifier** columns, the combination of the values in these columns have to be unique. For example, in the case of Product-Variant combinations, you can have the same Product name repeated for each of its Variants.

Note: When you are updating the list, make sure that the new data matches the **Unique Identifier** column. If the new data does not match the identifier values, new rows will be created. This does not apply if you have enabled the **Flush existing list data before updating the list** option.

Deleting a List or List Data

You can remove an existing **List** completely from the system or remove only the **List** data.

1. Go to the **Admin > Attributes > Lists** page.
2. Click on the **List Name** from the **Lists** table.
This will lead you to the List configuration page.
3. Choose either the **Delete List Data** option or **Delete List** option.
4. Enter the **Database User name** and **Password** if required.
If you are deleting one of the Lists, you always have to enter the database user credentials.

Note: If you are deleting the List Data, you have to enter the credentials only if the **Database user name and password are required when deleting data from list** option was enabled while creating the List.

5. Click **Delete List** or **Delete List Data** to confirm.

Note:

The deletion does not check if the List being deleted is in use by any of the attribute categories. This will result in malfunctioning of the features using that attribute category.

To restore the affected attribute category, create a List with the same name as the deleted List.

To restore your deleted List Data, update the corresponding input file in the Listmanager project with a new version.

Using Lists as Cascading Dropdowns

You can use **Lists** in the same way as the [cascading dropdowns from Excel sheets](#).

1. [Add and configure your List](#).

Go to **Attributes > Attribute Categories** or Task type specification form and click on any text attribute field.

Note:

- Make sure you are in **Grid Layout**.
- Bring a text **attribute** into one of the cells.
- Make sure that it is not a **restricted set**. You cannot view the lists of cascading attributes in the **restricted sets** category.

An item **Restrict Values** will be visible in the **Details** section. You can see the cascading attribute lists based on the web server (if any) and the database lists as **lists**. These are now available for use in your **Projects** and **Forms**

Note: You cannot re-use a column of a list in more than one attributes belonging to one attribute category. [You can replicate the list temporarily to add the same column to another attribute of the same attribute category.](#)

2. Do this for multiple attributes that are required and you will see the cascading behavior. When you select a value for one attribute, the other attribute values are restricted to what is allowed according to the List data.

Replicate List Data in an Attribute Category

If you have to use the same list data multiple times for multiple attributes, you can copy the list to these attributes. If you need two bar code selectors for your packaging component, you will need two fields in the form with the same drop down.

1. [Add and configure your List](#).

2. In the Admin mode, go to **Attributes > Attribute Categories** or Task type specification form and click on any text attribute field.

An item **Restrict Values** will be visible in the **Details** section. You can see the cascading attribute lists based on the web server (if any) and the database lists as **lists**. These are now available for use in your **Projects** and **Forms**

3. Select the **List** from the **Lists** drop down. Click **Copy List**.

This way, you will get a second cascading drop down configuration without duplicating the data on the database. You will get a new entry in the list drop down with the same list name with **(2)** as suffix. You can do this multiple times and the suffix changes accordingly.

4. Add more attributes to the category and select values from the replicated Lists.

Note: These copies are only available in the attribute categories where the List was replicated. If you save the attribute category without linking any attributes to the copied Lists, they will be removed.

Configuring List Columns in an Attribute Category

You can customize the list columns in an attribute without changing the database list. You can:

- change the order of the columns in the cascading drop down. You can create cascading drop downs with different column ordering using the same database lists.
- allow other values in the list.

1. *Add and configure your List.*

Go to **Attributes > Attribute Categories** or Task type specification form and click on any text attribute field.

Note:

- Make sure you are in **Grid Layout**.
- Bring a text **attribute** into one of the cells.
- Make sure that it is not a **restricted set**. You cannot view the lists of cascading attributes in the **restricted sets** category.

An item **Restrict Values** will be visible in the **Details** section. You can see the cascading attribute lists here.

Details for selected cell:

Attribute	CountryCode
Attribute Type:	Text
Label:	Label Text: <input type="text" value="CountryCode"/>
	Label Image: <input type="text"/>
	Position: <input type="text" value="Left"/>
Span Columns:	<input type="text" value="1"/>
Style:	WebCenter Attribute <input type="text"/> Add Style
Visibility:	Editable <input type="text"/> Add Rule
Restrict Values:	List <input type="text"/> Country list <input type="text"/> Copy List
	Column: <input type="text" value="CountryCode"/> Configure List
	Rendering: <input type="text" value="Dropdown"/>
Allow Multiple Values:	<input type="checkbox"/>
Info Page:	Info HTML page (name+extension) <WebInstanceRoot>/custom/AttributesHelp/

2. Click on the **Configure List** link.

Configure List ✕

Use the arrows to change the order of the columns.
Column ordering only has effect on the tree view in search results (asset browser)

	Column	Attribute
▼	Region	Region
▲	Country	Country

Correct the previous entries when a selection is not valid

Allow Other Values

Autoselect matching values when other values are filled out outside of attributes page (e.g. workflow)

OK

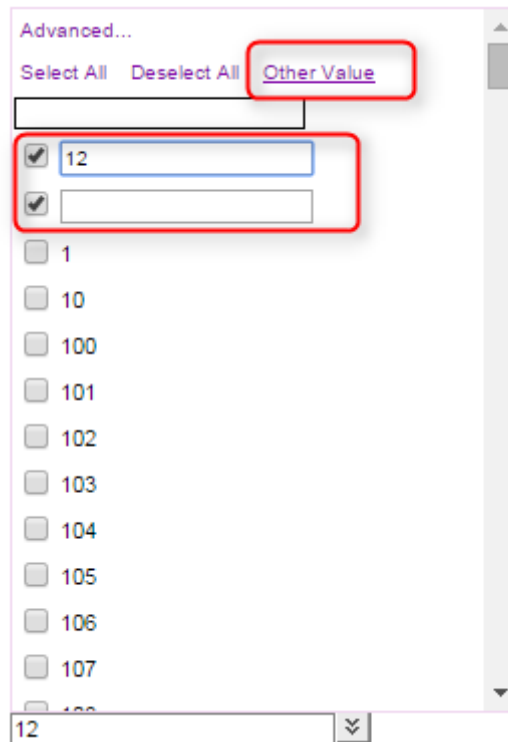

3. In the resulting dialog, you can use the arrows to change the order of the columns in the cascading drop downs.

Tip: You can configure the list column order to create a cascading tree in search results for your asset browser. In the example above, you can change the `Region` to a higher level using the arrow to move up.

4. By default, the cascading attribute values are corrected when one of the corresponding values change. Disable the **Correct the previous entries when a selection is not valid** option if you do not want your cascade to correct entries automatically. This allows you to select combinations that are not present in the referenced list.
5. You can also specify whether the attribute values restricted to a list column should be allowed to have non-list values. Enable **Allow Other Values** to do so.
 - If you have turned the **Allow Other Values** option off, only the list column values can be selected as a value. This means that if you have an empty field, you cannot type anything there.
 - If the **Allow Other Values** option is on, you can type in an attribute value. The other attributes in the same cascade will not be filtered to the new value until you save the attributes.

Note: This configuration is **attribute category** specific. So the column in the database list remain the same.

- If the **Allow Other Values** option is on for a multi-value attribute, you can click on the **Other Value** link on the top to enter a non-list value. As a result, you will get an additional row to enter the new value. You can create multiple rows this way.

6. Optionally, enable **Autoselect matching values when other values are filled out outside of attributes page (e.g. workflow)**. This checkbox is off by default.

When this option is on, if one value was filled out by a workflow or elsewhere, the entire cascading will be executed in the **attribute** page.

If the option is off, cascading will only occur when changes are done by a user in the attributes page.

Cascading Dropdowns from Excel Sheet

Installing Cascading Dropdowns from Excel Sheet

You can create Cascading Dropdowns by following the steps below.

Note: We recommend that you reconfigure the attribute categories and task types to use the database **lists**. The Excel sheet based cascading dropdowns will become obsolete eventually.

1. Go to `WebCenter\WebServer\tomcat\webapps\WebCenter_Inst\custom`. Create a folder named `excel` under the `custom` folder if it is not present.
Only for WebCenter 10.2 users: go to `webapp\javascript\cascading dropdowns` and copy the two javascript files to `webapp\javascript`. We recommend that these two files are backed up.
2. You need to place an XML file named `lists.xml` and the excel file (with your attributes to be imported) in the `excel` folder.
You will find an example XML file called `lists.xml` and excel sheets in the `excel` folder under `webapp\custom_example`.

3. Adapt `lists.xml` according to your requirements, within the structure given in the example file. See an example below:

```
<lists>

  <list>
    <name>Countries and Managers</name>
    <file>CountryList.xls</file>
    <type>Excel</type>
    <sheet>Country</sheet>
    <column><columnName>CountryName</columnName></column>
    <column><columnName>CountryCode</columnName></column>
    <column><columnName>Region</columnName></column>
    <column><columnName>CountryManager</columnName></column>
    <column><columnName>RegionManager</columnName></column>

  </list>
  <list>
    <name>Countries</name>
    <file>CountryList.xls</file>
    <type>Excel</type>
    <sheet>Country</sheet>
    <column><columnName>CountryName</columnName></column>
    <column><columnName>CountryCode</columnName></column>
  </list>

</lists>
```

Note:

- `<lists>`: This tag is obligatory in this code. You can specify the rest of the details regarding the importing attribute list under `<list>` tag. In the above example, two attribute lists are being imported.
- `<name>`: You can specify the name of the list which should appear among the WebCenter attribute lists after this tag. There are two lists in the above example. The lists are named `Countries` and `Managers and Countries`. These names appear in as List names in the **Restrict Values** option.
- `<file>`: You should indicate the file name (including the .xls extension) after this tag. In the above example, it is `CountryList.xls` and this file is placed along with `lists.xml` in the `custom` folder.
- `<type>`: This should be `Excel`.
- `<sheet>`: Here you should specify the name of the work sheet in the excel file. Please avoid special characters and spaces in the sheet name. The sheet name in the above example is `Country`. You can make more than one lists from one sheet.

Remember:

You cannot make one list from the columns placed in different sheets.

As shown in the example, you can make two lists from the same excel sheet or from different sheets in the same excel file.

- `<column>`: Each column in the excel sheet should be specified separately under the `<column>` tag for each of the lists. In the example, five columns are specified under the list named `Countries` and `Managers` and two columns under the list named `Countries`. The data from the specified columns will be imported into WebCenter attribute categories.
- `<columnName>`: You should indicate name of the column here. Excel files get column names from the values placed in the first row. Please avoid special characters in the column names.

4. Save and close the `lists.xml` file.

Make sure that your XML is XML-compliant and in the right folder (`excel`).

5. Login to WebCenter as an admin. In the attribute category definition (**Attributes > Attribute Categories** and in `Grid Layout`), click on a text attribute (not on a restricted set).

A **Restrict Values** item will be visible in the **Details** section. This shows a dropdown with the lists you have configured in `lists.xml`.

These lists will have the values from the columns of the excel sheet.

Note: If you are uninstalling WebCenter, the custom folder should be backed up and placed back in the same location as before to restore the Cascading Dropdown functionality in the new installation. If this folder or one of the files is missing, you will lose the installed Cascading Dropdowns.

Using Excel based Cascading Dropdowns

The cascading attributes that have been imported will be visible in the attribute category definition. You can see a dropdown with the lists you have configured in **lists.xml** here. These dropdowns are filtered to the row combinations from Excel worksheets.

An example use case is when you want to use all your brands and sub-brands and the respective managers to be filled in to the project or for when you choose a product. If you have an excel file with the information that needs to be imported into WebCenter, you can import this by following the steps described in *Installing Cascading Dropdowns from Excel Sheet* on page 344

1. Create an Excel file with Column Names in the first row and fill the columns with your brand related information that needs to be in the WebCenter Cascading Attributes.

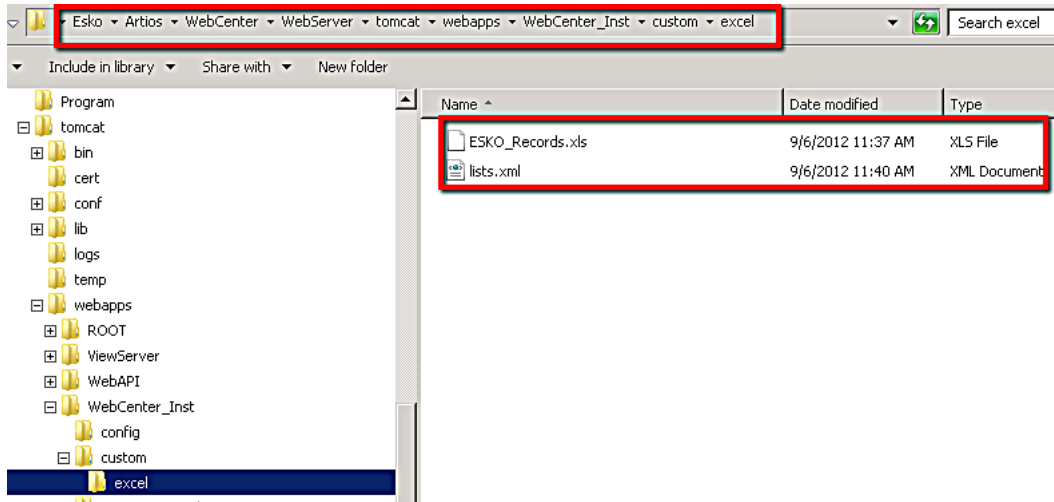

Note:

- Please note that the columns that should be part of one list should be placed in one Excel Sheet. It is not possible to make one list out of the data placed in different sheets.
- The Cascading Dropdowns are filtered to the row combinations from the specified worksheet. The linking of row combinations is currently only possible for the columns placed in one Excel sheet.
- We recommend you delete the first empty lines at the bottom of the Excel sheet to avoid the Excel driver picking up completely empty lines and producing them as valid combinations.
- Make sure you save the Excel file as a .xls and not as a .xlsx file.
- The current driver for Excel sheets does not support Asian characters. Installing another driver can help solving this problem, but Esko does not have an out-of-the-box recommendation at this time.

	Brand	Category	ProductManager	Director	SeniorVP	Group	Ec
2	ESKO	WebCenter	Jijo Dominic	Hans Dewitte	Bernard Zwaenepoel	Web Solutions	Pac
3	ESKO	WebCenter	Jijo Dominic	Hans Dewitte	Bernard Zwaenepoel	Web Solutions	Brar
4	ESKO	WebCenter	Jijo Dominic	Hans Dewitte	Bernard Zwaenepoel	Web Solutions	Con
5	ESKO	WebCenter	Jijo Dominic	Hans Dewitte	Bernard Zwaenepoel	Web Solutions	Sigr
6	ESKO	WebCenter	Jijo Dominic	Hans Dewitte	Bernard Zwaenepoel	Web Solutions	Stru
7	ESKO	Automation Engin	candida.hart	Geert De Proost	Bernard Zwaenepoel	Engines	Cow
8	ESKO	ArtPro	Bjorn Willems	Frank Adegeest	Bernard Zwaenepoel	Editors	Brar
9	ESKO	PackEdge	Bjorn Willems	Frank Adegeest	Bernard Zwaenepoel	Editors	Cow
10	ESKO	Studio	Kris Van Bael	Frank Adegeest	Bernard Zwaenepoel	Editors	Sch
11	ESKO	Dynamic Content	Jijo Dominic	john.chatterton	Bernard Zwaenepoel	Web Solutions	Pac
12	ESKO	Dynamic Content	Jijo Dominic	john.chatterton	Bernard Zwaenepoel	Web Solutions	Brar
13	ESKO	Dynamic Content	Bjorn Willems	Frank Adegeest	Bernard Zwaenepoel	Editors	Cow
14	ESKO	Dynamic Content	Isabelle Nance	Frank Adegeest	Bernard Zwaenepoel	Editors	Prac

- Adapt **lists.xml** according to the information from the Excel file. Save and close the file.

The Excel file and the XML file should be placed in the folder named **excel**. See the location of the folder below.

```
<lists>

  <list>
    <name>Esko Brands and Managers</name>
    <file>ESKO_Records.xls</file>
    <type>Excel</type>
    <sheet>Esko</sheet>
    <column><columnName>Brand</columnName></column>
    <column><columnName>Category</columnName></column>
    <column><columnName>ProductManager</columnName></column>
    <column><columnName>Director</columnName></column>
    <column><columnName>SeniorVP</columnName></column>

  </list>
  <list>
    <name>Esko Group</name>
    <file>ESKO_Records.xls</file>
    <type>Excel</type>
    <sheet>Esko</sheet>
    <column><columnName>Group</columnName></column>
    <column><columnName>Ecosystem</columnName></column>
  </list>

</lists>
```

See more on installation of this feature in [Installing Cascading Dropdowns from Excel Sheet](#) on page 344

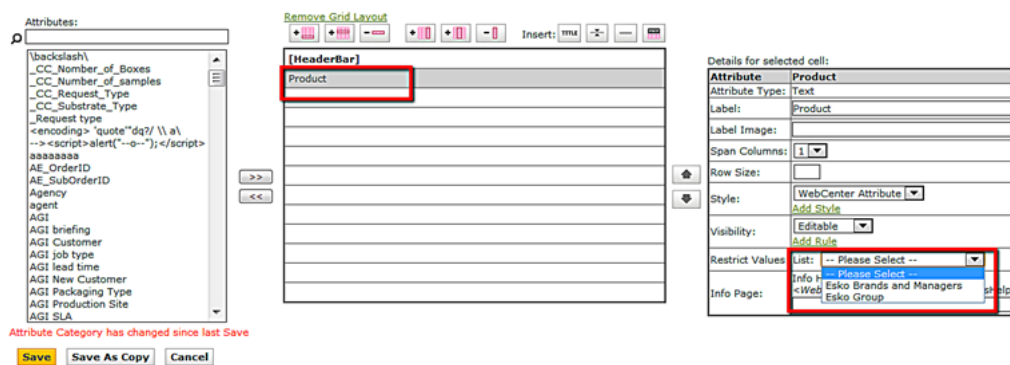

Note: You can define more than one lists using columns from a single Excel sheet.

In the Admin mode, go to **Attributes > Attribute Categories** and click on any text attribute field.

Note:

- Make sure you are in **Grid Layout**.
- Bring a text **attribute** into one of the cells.
- Make sure that it is not a **restricted set**. You cannot view the lists of cascading attributes in the **restricted sets** category.

An item **Restrict Values** will be visible in the **Details** section. You can see the cascading attribute lists **Esko Brands and Managers** and **Esko Group** as **lists**. These are now available for use in your **Projects** and **Forms**

3. Create attribute categories which contains the product and brand specific information and save it.
 - a) Create specific **attributes**. Select the type as text if you want to have Cascading Dropdowns in the Details. Read more about creating attributes in [Create an Attribute](#) on page 294

 Weight(lbs,kg)

b) Create/edit **attribute category**. Bring these attributes to this category in the **Grid layout**. In this example, an attribute category is created with Esko brand related attributes. See the screenshot below.

- c) Select the **List** and **Column** in the **Restrict Values** Section for each of the attributes that needs to contain Cascading Dropdowns. **List** indicates the list names given in the **lists.xml** file and **Column** indicates the column names in the Excel sheets associated with that list.
- d) You can have more than one values in the attribute fields by enabling **Allow Multiple Values**. In the above example when a product has to be associated with more than one Ecosystems, you can enable **Allow Multiple Values** with more than one Ecosystems.

When you have defined attribute category with lists and columns, you will have Dropdowns available in each of the fields and it will respect the row combinations of Excel values. Therefore, when you select one value in a specific attribute field, the related information will be smartly filtered and automatically filled in if there is only one possible value left for those attribute fields.

The dropdowns interact in such a way that only those values are shown which are linked to the already chosen values for other columns. This will be a very handy feature when complicated forms have to be filled in.

In the example here, you can see that when WebCenter is selected, all the associated information is filled in from the same list. The associated data come from the columns of the list Esko Brands and Managers.

Note:

If you would like smart filtering and automatic fill in, the columns have to be specified in the same list in lists.xml.

If you want independent columns with all values irrespective of the selection, define separate lists.

Name	Studio	Type	Name	Value
CategoryEsko	WebCenter	Text	BrandEsko	ESKO
Esko Ecosystem	---Please Select---	Text	Esko Product Managers	Jijo Dominic
Esko Group	---Please Select---	Text	Esko Senior Vice Presidents	Bernard Zwaenepoel
			Esko Directors	Hans Dewitte

Note:
 You can apply rules to these **lists** to induce advanced customization. For example, you can set one attribute (Brand description) to be read-only. As a consequence when you select the attribute Brand(editable), the brand description (read-only) will be automatically filled in.

4. Apply the attribute category with embedded lists containing imported information to any related project or documents. You can also use these attributes to build Asset Browsers. Read more in [Lists](#) on page 337

Note: Cascading dropdowns are used in setting up an Asset Browser. Read more in

Troubleshooting

When a column contains lots of numbers, non-numbers are no longer appears in the dropdown and the numbers are displayed with .0 after them

This is caused by the excel reader (which is a piece of Microsoft code) trying to figure out the data type in the column. It does not work according to the formatting type and therefore changing the formatting would not solve the problem. So if half (approximately) of the values are numbers, it interprets them as numbers and dumps all the rest. We are looking for a solution by enforcing the numbers to be interpreted as text.

To work around this problem, you can do add space to each value to make it pure text. The procedure to do this automatically is detailed below.

1. Make a new column.
2. Copy the header from the original column to this new column.
3. Change the original column name.
4. In the new column, set the value for the first (non-header) row to CONCATENATE(" ",X2). Here, X is the new column with the original data.
5. Copy this to all rows (select the cells from the just entered cell all the way down and do a Ctrl-D).
6. Save your file and close it

The Restrict values choice does not appear in the cell details while selecting a cell in the Attribute Category layout

You need to make sure that you:

- are in the **Grid layout**
- choose the right **Attribute Type** for the selected cell. It should be text (simple, not rich text) type.
- did not choose a **Restricted Set**.

If all the above settings are correct and you do not have the **Restrict Values** option, you have to check the configuration of the lists.xml. If WebCenter fails to find a lists.xml, it assumes that there are no lists and therefore does not show the **Restrict Values** option. The most likely cause is that lists.xml is not at the right location.

It should be placed under `WebCenter\WebServer\tomcat\webapps\WebCenter_Inst\custom\custom`.

Check also the access rights to see if the access to read the xml is given.

The problem could arise if your lists.xml is not well-formed (not a valid xml). To check this, open the file with Internet Explorer. If you get a message "The XML page cannot be displayed", it indicates that your XML is not valid. Internet Explorer also points to other errors.

I get an error message in the Attribute Category layout

You will get an indication about what is going wrong by reading the error message. Most errors look like:

- *Cannot read list Project Code*
- *error:*
- *java.sql.SQLException: [Microsoft][ODBC Excel Driver] Cannot open database '(unknown)'. It may not be a database that your application recognizes, or the file may be corrupt. xxx\custom\excel\Products.xls*

Check whether:

- the Excel file is open. You can check it by opening it yourself . If it is opened by someone else, Excel warns you about it.

Note: You need to close it after you open the Excel file. If you leave it open, it might result in the error described above.

- Check the location of the Excel file.
- Cross check the name of the Excel file with the one from the error message.
- Check for any typing errors in lists.xml.

I get an error message "List xxx is no longer configured".

This means that the **attribute category** points to a list which is no longer configured correctly in XML file(lists.xml). In this situation, all dropdowns will be replaced by simple text fields.

The dropdowns do not appear during project creation, document upload or attribute editing

Open the **Attribute category layout** as admin and see whether you get an error message. This situation points to the removal of lists.xml or one of its items.

After a re-install my Cascading dropdowns no longer appear.

If you are uninstalling WebCenter, the custom folder should be backed up and placed back in the same location as before to restore the Cascading Dropdown functionality in the new installation. If this folder or one of the files is missing, you will lose the installed Cascading Dropdowns.

Why Use Database Lists instead of Web Server Lists?

Database Lists	Web Server Lists
Higher Security : These are maintained in the protected WebCenter database.	You need advanced setup through IIS configuration to prevent security breach.
Reliability : Existing database drivers are reliable.	The Excel reading driver is system dependent. This limits access to one reader at a time.
Scalable	The scalability is poor.
Easy Update	Difficult to update configurations. When you update, you have to save your custom Lists folder separately
Easy administration :You can manage these via the WebCenter interface. Even non-administrators can update the master data if the administrators allow this.	Administration only via the web server.
Faster data loading : The attribute category loads information bit by bit ensuring a better user experience.	Excel based lists are loaded entirely when the form is loaded. This slows down the form data loading.
Unlimited List Size :We have tested the Lists with up to 200,000 rows of data.	There is also a limitation to the size of the data (maximum of 15000 rows in the Excel sheet). The driver used is limited to 64K rows which would make a product list with 100,000 products non-practical.
Support for .xlsx files	Only .xls files are supported.

Important:
 WebCenter 14 is a 64-bit system using only 64-bit drivers. In order to continue using the web server based cascading dropdowns, you have to install this 64-bit driver. Read more info on [Esko Knowledge Base](#).

3.15.5. Document References

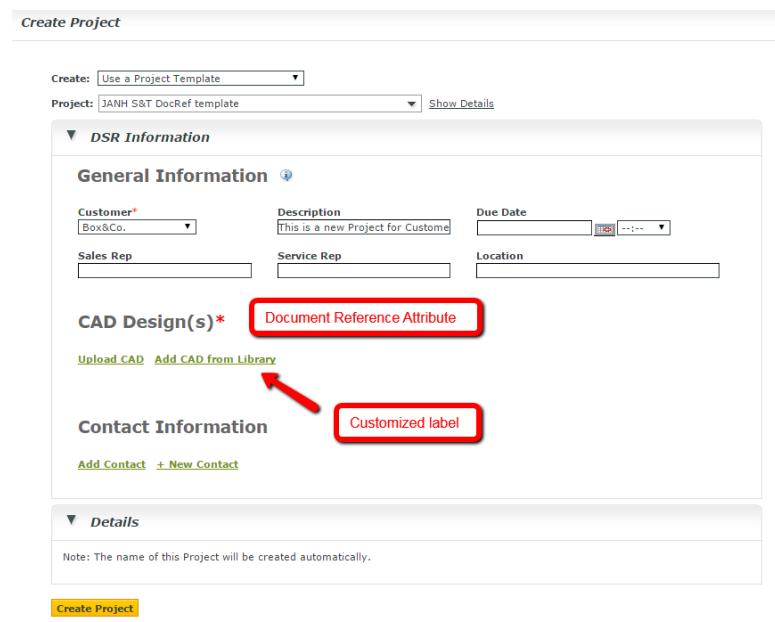

You can make use of **Document References** to specify product and its components or master-child relationships. Using this feature, you can create an attribute link to refer to a document that is located within another project or a document library.

The document reference attribute behaves like a normal attribute which can be added into any attribute categories. However, you can configure them to provide document sources for your projects. For example, when you are re-using your existing marketing statements or claims for individual packaging projects, you can store them in a library and use document references in your future projects to link to them.

Both **Projects** and **Documents** can have document references. You can also create and use [document reference task specifications](#).

You can:

- configure the document reference links to access specific projects designed as document libraries, or to access saved searches or asset browsers.
- store your text statements in a library project. Using document references, you can link to relevant text statements from each of your individual packaging artwork.
- configure the file types of documents for these links. You can link a 3D file to one or more CAD files as document references where the reference links are configured to add only .ARD files.
- configure a document reference attribute to point to multiple documents.
- refer to a CAD overlay from the Graphic file for 3D viewing. Read more in <https://wiki.esko.com/pages/viewpage.action?pageId=170043393>.

It is possible to specify attributes specific to the document reference attribute links. For example, your packaging project for a box can have a document reference link to an artwork PDF. The specific barcode can be linked to this document reference via a **reference category**.

Note: You will see warnings when deleting a document that is referenced elsewhere in WebCenter.

Create a Document Reference Attribute

Creating a **document reference attribute** is similar to [creating an attribute](#).

1. Click **Admin > Attributes > New Attribute**.
2. Enter information in the fields as appropriate:

In the field...	Fill in the...
Name	name of the document reference attribute
Label	text of the label which has to be displayed. To get the translated text of the label in the other languages chosen, select the blue icon to open Find or Create Translated labels on page 296
Description	description of the attribute contents (for example, link to the CAD shape document).
Type	select document reference as the type.

In the field...	Fill in the...
	<p>--- Select Attribute Type ---</p> <hr/> <p>--- Select Attribute Type ---</p> <p>Area(sq in.,sq cm)</p> <p>Area(sq in.,sq mm)</p> <p>Area(sq ft,sq m)</p> <p>Date and Time</p> <p>Distance(in.,mm)</p> <p>Distance(in.,m)</p> <p>Document Reference</p> <p>Float</p> <p>Integer</p> <p>Rich Text</p> <p>Text</p> <p>Text (Right to left)</p> <p>Volume(cu in.,cu cm)</p> <p>Volume(cu in.,cu dm)</p> <p>Volume(cu ft,cu m)</p> <p>Weight(lbs,gr)</p> <p>Weight(lbs,kg)</p>
	<p>References are attribute-links pointing to different</p>

In the field...	Fill in the...
	document sources. When you select this option, you will have additional options.
Values	will be set to Prompted by default.
Versions and Revisions	<p>Use this field to point to the exact version of the document you need as the document reference link. This is especially useful when you want to point to an approved version. By default, it points to the latest version, but you can set this to:</p> <ul style="list-style-type: none"> Latest Version: When you select this, the document reference link will be updated to the latest version of the document. <div data-bbox="730 792 1436 954" style="border: 1px solid #ccc; padding: 5px;"> <p>Note: When you update the referred document, the document link will point to the latest version regardless of the Change Properties permissions in the Project > Security tab.</p> </div> <ul style="list-style-type: none"> Selected Version: Use this setting if your document reference link should point to a certain version always. In this case, the document reference will not be updated to point to the latest version when a new version of the reference document is uploaded. Selected Revision: When you choose this, the document reference will always point to the latest version of the selected revision. <div data-bbox="730 1312 1436 1473" style="border: 1px solid #ccc; padding: 5px;"> <p>Note: When you update the referred document, the link will source the latest version of the selected revision regardless of the Change Properties permissions in the Security tab.</p> </div>
Reference Category	<p>To apply a reference category to the document reference, select from the drop down listing all the attribute categories.</p> <div data-bbox="692 1626 1436 1720" style="border: 1px solid #ccc; padding: 5px;"> <p>Note: Rich text attributes and document reference attributes cannot be used as reference attributes.</p> </div> <p>You can use a reference category (which is an attribute category) to assign certain attributes to the document reference link. This is very useful when the property is not linked to the product or the component specifically. You can use reference categories to specify properties of the reference links.</p>

3. Select **Attribute is also a task specification** if you want to be able to use the attribute as a task specification.

For more information about task specifications, see [Basic Concepts of Task Management](#) on page 820".

4. Click **Create**.

Document Versions and Revisions

Use this field to point to the exact version of the document you need as the document reference link. This is especially useful when you want to point to an approved version. By default, it points to the latest version, but you can set this to:

- **Latest Version:** When you select this, the document reference link will be updated to the latest version of the document.

Note: When you update the referred document, the document link will point to the **latest version** regardless of the **Change Properties** permissions in the **Project > Security** tab.

- **Selected Version:** Use this setting if your document reference link should point to a certain version always. In this case, the document reference will not be updated to point to the latest version when a new version of the reference document is uploaded.
- **Selected Revision:** When you choose this, the document reference will always point to the latest version of the selected revision.

Note: When you update the referred document, the link will source the latest version of the **selected revision** regardless of the **Change Properties** permissions in the **Security** tab.

Note:

When you upload a new **version** or **revision** of the reference document, your **Preferences > Security** settings will over-write the above settings.

- When the **Allow changing attributes of approved documents** option is turned off, the document references (as project attributes or task specifications) will not be updated to point to the latest versions.
- If the setting **Allow changing attributes of inactive projects** is turned off, the document references of such projects will not get updated to the latest **revision / version**.

Reference Category

You can use a **reference category** (which is an **attribute category**) to assign certain attributes to the document reference link. This is very useful when the property is not linked to the product or the component specifically. You can use **reference categories** to specify properties of the reference links.

For example, you can:

- define the position of a text fragment (document reference link) in an artwork.
- size of a barcode on a box. The barcode is the document referenced in the box and the size of the barcode is an attribute of the document reference link.

Note: This feature is only available with the Lifecycle Management License.

To apply a **reference category** to the document reference, select from the drop down listing all the **attribute categories**.

Note: **Rich text attributes** and **document reference attributes** cannot be used as **reference attributes**.

Deleting Documents used as Document References

- When you try to delete documents (or document versions) being used as references elsewhere, you will get a warning message with a list of **projects / documents / tasks** where it is being used as a reference.

When you confirm the deletion, the documents / version will be deleted.

Note: However, you cannot delete documents when the **Preferences > Security** settings are turned off:

- When the **Allow changing attributes of approved documents** option is turned off as a security setting, the documents / versions referenced as project attributes or task specifications cannot be deleted.

You will get an error message and a list of **projects / documents / tasks** where the document or version is being used.

- If the setting **Allow changing attributes of inactive projects** is turned off as a security measure, the documents / versions referenced in those projects cannot be deleted.

You will get an error message listing the occurrences where the document is being referenced.

Edit a Document Reference Attribute

1. Click **Admin > Attributes**
2. Click the attribute to edit.
3. Edit the attribute as desired. You can change the **Name, Description, Versions and Revisions, Reference Category** and **Attribute is also a task specification**.

Edit Attribute properties and click **Change**.

Name *
Tip: Enter a name with a prefix to find it back more easily.

Description

Type * Document Reference

Value * Prompted
 Calculated
 Restricted Set

Versions and Revisions * ⓘ

Reference Category ⓘ

Attribute is also a Task Specification

Attribute Categories ACAD Test, ACAD Test Exported, ACAD Test Exported 2

Task Types test deletion of task specification

4. Click **Change** to make the changes.

Attention: When you edit the **versions and revisions** settings, the changes will not be reflected in the existing document references. The changes are updated for the future uses of the edited attribute.

Copying Document Reference Attributes from source Project or Template

When a project is created from an existing project or a template, the Document Reference Attributes that are copied from the template or the source project are copied into the documents in the newly created project. Documents that are local to the source project or template is local to the newly created project as well.

When a project is copied or created along with the documents,

- The documents are copied to the new project and the document reference attribute values of the documents point to the original documents.
- For all document reference project attributes, the referenced document is copied to the new project and attribute points to the new document, which is local to the new project.
- Remote documents in the template/source project remain remote in the new project with no change to corresponding document reference.

Any document reference attributes which are referenced to documents when copied to the target project while creating a new project from a source project are remapped to the new project as local.

Documents added to the document references through the **Link** in the current project document source, will be also remapped to the document references to the new project created.

Note: When you copy a project without the documents, all the document references point to the source project or its referenced project.

Upload a New Version

You can upload a new version to an existing document only once. This restriction helps to ensure multiple versions of the same documents are not uploaded accidentally.

Delete a Document Reference Attribute

1. Click **Admin > Attributes**
2. Select the attribute to delete and click **Delete Attribute(s)** in the actions menu.
If the attribute is not being used, it is deleted immediately.
3. If the **document reference** is being used elsewhere, you will be asked to confirm the deletion. Choose from:
 - **clear the attribute from the Project(s), Document(s), Document Reference Attribute(s) or Category(s):** When you select this option, your document reference attributes and its values are deleted from the projects / documents / where it is being used. However, the original document or its attributes are not deleted.
 - **Cancel deletion.**

Document References in an Attribute Category

You can set up the document references with advanced options in the **attribute category grid layout** page.

Document reference attributes appear just like the other attributes in this page.

Read [Configure a Document Reference Attribute in a Category](#) on page 362.

Document References in One Column

Note: You need the Life cycle management license to place and edit the document references with its advanced features. If you do not have this, the list layout is the only available option. In the list layout, you will have a simple preview:

- multiple values are always supported
- default style
- drop down rendering when multiple values are added (when editable)
- document references are always rendered as a set of hyperlink read-only.

Configure a Document Reference Attribute in a Category

You need to use the **Grid Layout** for the advanced features associated with the document reference attributes within the cell of an attribute category.

- To add document reference attributes to a category or remove them from it, use the chevron (<< or >>) buttons to move them between the two columns.

You can see a **Preview** of your attributes under the columns.

- When you add a document reference attribute, you can setup advanced options in the **details** table:

Reference Category:	No Reference Category selected
Version Mode:	Latest Version
Document Source(s):	Components_Default ⓘ Edit Configuration
Rendering:	Table ▾ ⓘ Components_Default Edit Render Configuration

- Check **Allow Multiple values** to allow the reference to multiple documents. This feature is detailed in [Create a Multi-Value Attribute](#) on page 329
- Reference Category** is a read only field which refers to properties specific to this document reference link.

This field is set during the creation of the document reference attribute. You can specify an attribute category for each document reference attribute to define the properties of the reference / link. Read more in [Reference Category](#) on page 358.

- Version Mode** refers to the document version you are referencing to. This field is also set during the creation of the document reference attribute. Read [Document Versions and Revisions](#) on page 358.
- Document Source:** You can configure different types of document sources for a customized **document reference link**.

a) Click **Edit Configuration**.

You can configure *your document sources* in the **Edit Document Source Configuration** pop-up.

b) Click **Add document source** to add more document sources for this **Document Reference Attribute**.

c) If you have different *attribute views*, you can setup different *source configurations*.

Read more in:

- [Adding Document Sources for a Document Reference Attribute](#) on page 364.
- [Document Sources for Different Attribute Views](#) on page 366.
- Rendering:** You can setup a **Simple** or advanced **Table** display of the **document reference** links in a Project / Template / Forms.

If you select your rendering as:	The result will be...
Simple	 <ul style="list-style-type: none"> The document references will have:

If you select your rendering as:	The result will be...
	<ul style="list-style-type: none"> • the document name as a hyperlink. Click this link to open the document in a new tab. • a thumbnail. Click on the thumbnail to open the document in the Viewer. • a delete button • up/down arrow to re-order the document list.
Table	<p>An advanced table depending on your configuration. For example, you can configure editable attributes into your table.</p> <p>Read more details in: Create an Advanced Table Rendering on page 367</p>

- **Save the attribute category.**

A user with attribute update permissions can:

- delete a document from the list of document references.
- add a document. The **document sources** as configured will be available as a header to the simple / table rendering.

Note:

1. If **allow multiple values** is turned off, document source links will appear next to the added document in the same row.
2. Without the necessary upload rights to the folders of the project, a user cannot add documents to them.

- change the order of the referenced document.

Adding Document Sources for a Document Reference Attribute

You can configure your **document sources** (such as a Project/template which serves as a library of assets, a Saved search of your assets, or your document templates) in the **Grid layout**. Your configured sources will appear in the places (such as templates or forms you have designed) where you set the document reference categories.

Edit Document Sources Configuration

A Document Reference_Default

Source	Label	Details	Operation	Target Folder
Document Templates	Standard New	Document Template selector Any Document Template configured Copy Operation Basic Copy	Copy	
Document Templates	Standard New	Document Template selector Any Document Template configured Copy Operation Copy with Local References	Copy	
Saved Search	Standard Search	Search Name -- Select Search -- Document Template selector Any Document Template configured Copy Operation Copy with All References Basic Copy Copy with Local References Copy with All References	<input checked="" type="checkbox"/> Copy <input type="checkbox"/> Link <input type="checkbox"/> Move <input type="checkbox"/> Use By Reference	

Add Document Source

OK

You can configure:

- a simple **Browse** link for the user to upload a document.
- **Document Templates** from the template library. This will serve as a place holder with pre-configured settings such as attribute categories. Read more about templates in [Document Templates](#) on page 157.
- **Current Project**
- **Saved Search:** Use this option to allow the user to select a file from a saved search. When the user clicks the document reference as a link (with a custom **label**), saved search results will appear in a pop-up with all the configured options.
- **Asset Management System:** Use this to allow selecting a file from the configured Asset Management Systems. Read more in [Configure Asset Management Connections](#) on page 407

You can specify settings for your users:

- the **Label**
- the **Details** such as:
 - the **document template** library
 - the name of the **saved search**
 - allowed file extensions
 - >copy operation
- the type of **operation** depending on the document source. You can allow the users to:
 - **copy**
 - **link**
 - **move**
 - **use by reference**
- the destination folder

Options are similar to the [Project / Template document creation settings](#).

Tip: You can [setup different configurations for different attribute views](#).

Document Sources for Different Attribute Views

There is always one document source configuration assigned to a document reference attribute in a category depending upon the **view**. In the **default view**, the name of this configuration will be "AttributeName"_Default.

You can create dedicated document sources for custom [attribute views](#). When you are in a custom **view**, click **Create Configuration for the Current View** to create a custom document source.

You will get an **Edit Document Sources Configuration** pop-up with a copy of the default setup.

Create a new setup for the current **view** and click **OK**. To revert to the default, click **Return to Default View Configuration**.

Note: **Return to Default View Configuration** will delete the current configuration and restore the default.

Source	Label	Details	Operation	Target Folder
Document Templates	Simple	Document Template selector Any Document Template configured	Copy	02 - Text Statements
Saved Search	Simple	Search Name PCM Text Library Search Technical	<input type="checkbox"/> Copy <input type="checkbox"/> Link <input type="checkbox"/> Move <input checked="" type="checkbox"/> Use By Reference	02 - Text Statements

In other views, the configuration name can be:

- "AttributeName"_Default if the configuration in the current **view** is inherited from the **default view**.
- "AttributeName"_ViewName if the **view** has its own configuration. If the configuration is shared with another **view**, ViewName can be from the other **view**.

Asset Management Connection as a Document Source for Document Reference

You can select **Asset Management System** as a Document Source. You can further add specific details from what has to be fetched from the asset management system by selecting **Configure** which opens the **Asset Management Configuration** window.

Following information has to be specified for the Configuration

- Choose either a Workspace that should be opened or workflow that should be called in the Asset Management.

- When Workspace is selected: Choose the **Name Space** and **Parameter** from the drop down and value can be keyed in or filled using SmartNames
- When Workflow is selected: Parameters should be added to the request, and values can be keyed in or filled using SmartNames

Note: This setup can be exported for reuse or another setup can be imported from file.

Create an Advanced Table Rendering

Adding an advanced table of document references allows you to customize the way your document will be shown to users when they are applied (For example, in a template).

It also allows you to configure advanced features such as making an attribute of the document **required** or **read only**.

Note: The document reference attributes will inherit the **style** specified in the **attribute category**. This style is further expanded to the individual document's attributes as well.

- Click **Use Grid Layout** in the **Edit Category** page. Add your document reference attributes.

Reference Category:	No Reference Category selected
Version Mode:	Latest Version
Document Source(s):	Components_Default ⓘ Edit Configuration
Rendering:	Table ▾ ⓘ Components_Default Edit Render Configuration

- Select the **Rendering** as **Table** in the *grid layout*.

In the **Edit Render Configuration** dialog, you can set up the advanced rendering.

Note: You can create *custom tables* for your different views.

- Enable **Hide Header** if you do not want a header row in the document references table. The labels will be displayed in line for each document.
- Enable **Allow Bulk Operations** when any action performed on the document reference is also cascaded to all the references which are made to that particular document reference. Actions performed on the document reference could be to
 - Remove a Referenced document which removes all the document references in the tree structure
 - Replace and Undo
 - Getting document to Local and Undo action
 - Upload a new version and/or edit a text statement
 - Update to the latest version
- Enable **Limit Bulk Operations to Document References with matching Operations configured**, when you want to perform bulk operations on document rows which are filtered based on document sources and actions configured for them. Read more about *bulk operations*.

User is informed about the number of rows the bulk operation will be really performed (after filtering) in the specific bulk operation modal dialog.

	Name <u>Report test.pdf</u>	color2 (prop) <input type="text"/>	City <input type="text"/>	Project <u>DocRef project</u> ⊗
	Name <u>mpp.txt</u>	color2 (prop) <input type="text" value="pitch black"/>	City <input type="text" value="London"/>	Project <u>DocRef project</u> ⊗

- Enable **Open Links in new Tab** , to open any link in the document reference in a new tab.
 - Click **Add Column** to add more columns to the table.
- The rows in the **Edit Render Configuration** pop-up correspond to your document reference columns.

Edit Render Configuration

Local/Remote Project	<input type="text" value="Project Folder Name"/> <input type="checkbox"/> Copy Text Content Status		Editable	auto	<input type="checkbox"/>
Replace Button			Read Only	auto	<input type="checkbox"/>
Delete Button			Read Only	auto	<input type="checkbox"/>

- Select **Type** as **Document Name** which is a mandatory field. In the **Details** section, you can disable:
 - **Show Document Source**
 - **Show Document Description**
 - **Show Folder**
 - **Show Document Template**

Your rendering will have a hyperlink to the document depending on the user permissions. These options are additional details added to the document and can be viewed only when a new document is added.

[box_sprint2.ard](#)

The name will not be a hyperlink for users without document view permissions.

- Depending on how your **document properties** should be rendered, configure the table columns. You can create custom **Labels** for your selections. The properties will be displayed as **read-only**.

Choose Document PropertyDetails as...	The result in the rendering table will be...												
<ul style="list-style-type: none"> Description VersionRevision VersionAuthor Project ApprovalStatus ApprovalStage ModifiedDate Thumbnail 	<p>The selected document properties will appear in the table header with the custom label. For example:</p> <ul style="list-style-type: none"> the current Approval Stage of the document. The user can click to access the approval pop-up. Clickable thumbnail of the document with the default (50x50) or specified pixels. <table border="1"> <thead> <tr> <th>Version</th> <th></th> <th>estado de aprobación</th> <th>etapa de aprobación</th> </tr> </thead> <tbody> <tr> <td>1</td> <td></td> <td></td> <td>Stage2</td> </tr> <tr> <td>1</td> <td></td> <td></td> <td>Etapa 3</td> </tr> </tbody> </table>	Version		estado de aprobación	etapa de aprobación	1			Stage2	1			Etapa 3
Version		estado de aprobación	etapa de aprobación										
1			Stage2										
1			Etapa 3										
<p>Tip:</p> <ul style="list-style-type: none"> Create custom labels Specify the pixels for your thumbnail. Check the box Allow uploading a new Version button 	<ul style="list-style-type: none"> Upload New Version if you have the rights to upload will be available in the Version column. 												

- You can configure **document actions** in the table rendering of the document references. The actions will appear next to the documents listed in the table only when it is relevant.

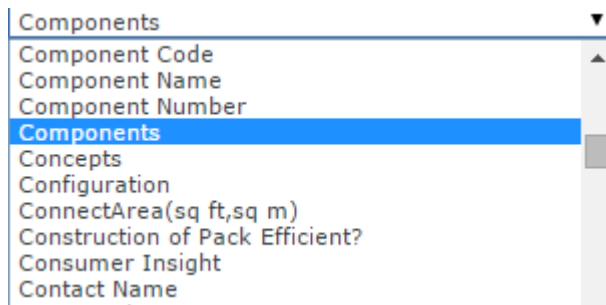

Choose Document Actions as...	The result in the rendering table will be...
<ul style="list-style-type: none"> • View • Open in 3D • Open in ArtiosCAD • Download • Upload New Version • Update to Latest Version 	<ul style="list-style-type: none"> • A 3D  button will be available only when there is an existing 3D perspective. • Open in ArtiosCAD option will be available for CAD files. Clicking on it will open the CAD document as set up in the preferences • Download option will be available when the user has download permission. • Upload New Version: This is available when the user has the rights to upload new version. <div data-bbox="900 1066 1433 1234" style="border: 1px solid gray; padding: 5px; margin-top: 10px;"> <p>Note: The Upload New Version  button can also be placed in the Version column by checking the Allow uploading a new version check box.</p> </div> • Update to Latest Version: Allows user to update to the latest version

Note:

- If you change the **attribute** values during the upload of a new version, these are only applied on the new version of the document. The previous version will have the old attribute values.
- If a document version is linked in multiple projects, all linked projects will get the new document version.
- If the configured columns do not fit in the table, the table will assign each column its minimum width and show a horizontal scroll bar.

- Configure how your **Document attributes** should be displayed. Select the relevant **attribute** from the drop down as a specific column (with a custom **Label**) in your table.

Specify the Visibility of the attribute as...	The result in the rendering table will be...						
<ul style="list-style-type: none"> • Editable if you want the users (with the right permissions) to be able to edit this attribute. • Required if you want to make it mandatory for users (with the right permissions) to fill in this attribute. • Read Only if you don't want any user to be able to edit this attribute. 	<ul style="list-style-type: none"> • The selected document attributes will be displayed in the table header and its values in the respective columns. <div style="text-align: center;"> <table border="1"> <tr> <td>Width *</td> <td>Length</td> </tr> </table> </div> <ul style="list-style-type: none"> • The users can type in the values for the editable attributes. <div style="text-align: center;"> <table border="1"> <tr> <td>Weight</td> <td>Date</td> </tr> <tr> <td><input type="text" value="1g"/></td> <td><input type="text" value="May 26, 2015"/> <input type="text" value="13:30"/></td> </tr> </table> </div> <div style="border: 1px solid gray; padding: 5px; margin-top: 10px;"> <p>Note: You can configure the Visibility also at the attribute level. If your settings differ, the most restrictive setting will be applied.</p> </div>	Width *	Length	Weight	Date	<input type="text" value="1g"/>	<input type="text" value="May 26, 2015"/> <input type="text" value="13:30"/>
Width *	Length						
Weight	Date						
<input type="text" value="1g"/>	<input type="text" value="May 26, 2015"/> <input type="text" value="13:30"/>						

Tip: Click **add column** and select another attribute to have more attributes listed in your table.

Tip:
 You can configure a project's **document reference attributes** to be non-editable and still allow the user to edit the **attributes** of the **documents** referenced.
 Your user can do this from the project's **attribute category** tab.

Tip:

Optionally, you can setup the **Project > Notifications > Project Attribute/Category change** to receive notifications about document references.

Reference category changes will be notified according to the **Project > Notifications > Document Attribute/Category change** settings.

- Configure **Expand Attributes**  / **Collapse Attributes**  button for your document references. This allows you to expand or collapse the **document attributes** of your **references**.

Tip: You can configure different **expand attributes** settings for different views. Specify the **view** name here.

Note:

The check box **Use Creation View for new Documents** is switched on by default. As a result, you will get the *creation view* whenever you use **Upload/ Browse, Copy** or **New** regardless of the view you are creating the rendering for. If this option is disabled, you will see the specific view or the default view.

When you save the view will change to the specified or default view depending on the configuration.

Edit the Visibility as...	The result in the rendering table will be...
<ul style="list-style-type: none"> read-only editable <div style="border: 1px solid gray; padding: 5px; margin-top: 10px;"> <p>Note: The user needs Change properties right to edit attribute values.</p> </div>	<p>Click  to expand the document attributes (which may also be document references):</p> <div style="border: 1px solid gray; padding: 5px; margin-top: 10px;"> <p>Tip: Keep this editable, if your users have to edit the document reference's attributes.</p> </div> <p>When the document attributes are expanded, you can use  to collapse them.</p>

	Thumbnail	Name								
		BOXCO_00001.ard								
<table border="0" style="width: 100%;"> <tr> <td style="width: 50%;"> Customer <input type="text" value="Box&Co."/> </td> <td style="width: 50%;"> Box Brands <input type="text" value="BoxingBox"/> </td> </tr> <tr> <td> Description <input type="text" value="Blue box for Box&Co."/> </td> <td> CAD Number <input type="text" value="1"/> </td> </tr> <tr> <td> Display <input type="checkbox"/> </td> <td> Style <input type="text" value="spark"/> </td> </tr> <tr> <td></td> <td> Length <input type="text" value="300"/> </td> </tr> </table>			Customer <input type="text" value="Box&Co."/>	Box Brands <input type="text" value="BoxingBox"/>	Description <input type="text" value="Blue box for Box&Co."/>	CAD Number <input type="text" value="1"/>	Display <input type="checkbox"/>	Style <input type="text" value="spark"/>		Length <input type="text" value="300"/>
Customer <input type="text" value="Box&Co."/>	Box Brands <input type="text" value="BoxingBox"/>									
Description <input type="text" value="Blue box for Box&Co."/>	CAD Number <input type="text" value="1"/>									
Display <input type="checkbox"/>	Style <input type="text" value="spark"/>									
	Length <input type="text" value="300"/>									

- Select the relevant **reference properties** and specify if you want it to be **Read-only / Editable / Required / Hidden**.

Reference properties are **attributes** (*reference category*) of the document reference link. You can select one of them from the attribute drop down in the **Details** cell.

Reference Property ▼	DEKE_Ingredient Quantity (float) ▼
Reference Property ▼	DEKE_Ingredient Unit ▼

Note: Reference Property field is only available when a *reference category* is specified for the document reference.

Specify the Visibility of the reference category attribute as...	The result in the rendering table will be...
<ul style="list-style-type: none"> • Editable if you want the users (with the right permissions) to be able to edit this attribute. • Required if you want to make it mandatory for users (with the right permissions) to fill in this attribute. • Read Only if you don't want any user to be able to edit this attribute. <p>Hidden if you want to specify a Reference Property, but do not want to show it in the table.</p> <p>Note: This option is specific to Reference Properties.</p>	<ul style="list-style-type: none"> • The reference attributes will be displayed in the table header and its values in the respective columns. • The users can type in the values for the editable attributes. <ul style="list-style-type: none"> • No visible reference attributes in the table • The values (of the reference attributes) are retained when you <i>duplicate</i> or <i>replace</i> a document reference.

Note:

Choose **Collapse** check box when you choose **Document Property, Reference Property, Reference Property Filter, Document Attribute, Project Property, Project Attribute, Master Text, Translation Text, Text Language Flags** fields for **Type**, to expand or collapse the column while rendering in the table.

Photo	Ingredient	Quantity
	Blueberries	<input type="text"/>

- You can allow the users to move a referenced document into the current project. To set this up, create a column with **Local / Remote** setting. Specify the **visibility** as **editable** or **read-only**. You can move all the referenced documents into the local project by hovering on the **Location** in the header and selecting the option **Copy All References into Current Project**.

+ Upload		+ Link		+ Search		+ Search	
Location	Thumbnail	Name	Version				
Copy All References into Current Project							
Reference		Reference ■ Allergen statement 0002_TextDoc_00000814_PCM.wcc	1				
Reference		Reference ■ Best before date 123Best before date.wcc	8(F)				
Reference		Reference ■ Dosage instructions 123Dosage instructions.wcc	1				
Reference		!!Carrot11.pdf	1				
Reference		00000002_Nutritional Facts_C.wcc	1				

You can move any of the referenced document to the local by clicking on the Referenced field of the required document and selecting the option **Copy to Current Project**.

The users need to **Change Properties** and **Add** permissions to move a document to local folder. The document reference will point to the local copies.

The user will be able to specify:

- a new name and description
- document template
- target folder

If the setting is **Read-only**, the user will see  indicating remote project.

- When you are creating a Copy Sheet using Text Document References, you can configure text related data to the table. Read more in: [Create a Table Rendering for Text Documents](#) on page 380
- To configure the rendering with Project related parameters, choose from
 - Project Property
 - Project Attribute

Read more details in: [Project Properties in Advanced Table Rendering](#) on page 378

- Optionally, add:
 - a) a **Numbering** column.
 - b) **Up / Down** arrows to let the users change the sequence.
 - c) **Duplicate** button which allows the user to duplicate a reference along with its properties. Read more in: [Duplicate a Document Reference](#) on page 377.
 - d) **Replace** button which allows the user to replace a document reference. Read more: [Replace a Document Reference](#) on page 377.
 - e) a **Delete Button** to let the users delete the document references from the table.
 - f) **Row Selector** to let the users select single or multiple documents. Using this, user can select multiple documents from the document table and perform document actions on them.
- Save the configuration by clicking **OK**. To revert from this configuration, click **Revert to WebCenter Default Configuration**.
- **Save** the **Attribute Category**.

If the logged in user does not have permissions to view the document, the document table will have (based on the configuration):

1. **Document name** with !. The user will see a warning message.
2. Editable **reference properties** displayed in the specified columns
3. **Up /Down** arrows
4. **Delete** button
5. **Numbering** ("#")

Note: If the settings are not **editable**, the document table will have the document name and its sequence number.

Advanced Table Rendering for Custom Views

Note:

You can create dedicated table (of document references) for custom *attribute views*. When you are in a custom **view**, click **Create Configuration for the Current View** to create a custom table.

You will get an **Edit Render Configuration** pop-up with a copy of the default setup.

Edit Render Configuration

Name: DocRef3_Default

- Hide Header
- Open Links in new Tab
- Allow Bulk Operations
 - Limit Bulk Operations to Document References with matching Operations configured

Type	Details	Label	Visibility	Width	Collapse
Reference Property	INSTANCE_SEQUENCE	INSTANCE_SEQUENCE	Editable	auto	<input type="checkbox"/>
Up/Down			Read Only	auto	<input type="checkbox"/>
Document Property	Thumbnail 50 px	Thumbnail	Read Only	auto	<input type="checkbox"/>
Document Name	<input checked="" type="checkbox"/> Show Document Source <input checked="" type="checkbox"/> Show Document Description <input checked="" type="checkbox"/> Show Folder <input checked="" type="checkbox"/> Show Document Template	Name	Read Only	auto	<input type="checkbox"/>
Document Actions	Open 3D View View Open in ArtiosCAD Download Add Action		Read Only	auto	<input type="checkbox"/>
Document Property	Version <input checked="" type="checkbox"/> Allow uploading a new version <input checked="" type="checkbox"/> Allow updating to latest version	Version	Read Only	auto	<input type="checkbox"/>
Local/Remote Project	Project Folder Name <input type="checkbox"/> Copy Text Content Status		Editable	auto	<input type="checkbox"/>
Replace Button			Read Only	auto	<input type="checkbox"/>
Delete Button			Read Only	auto	<input type="checkbox"/>

Add Column Revert to default configuration

OK

Create a new setup for the current **view** and click **OK**. To revert to the default, click **Return to WebCenter Default Configuration**.

Note: **Return to WebCenter Default Configuration** will delete the current configuration and restore the default.

In other views, the configuration name can be:

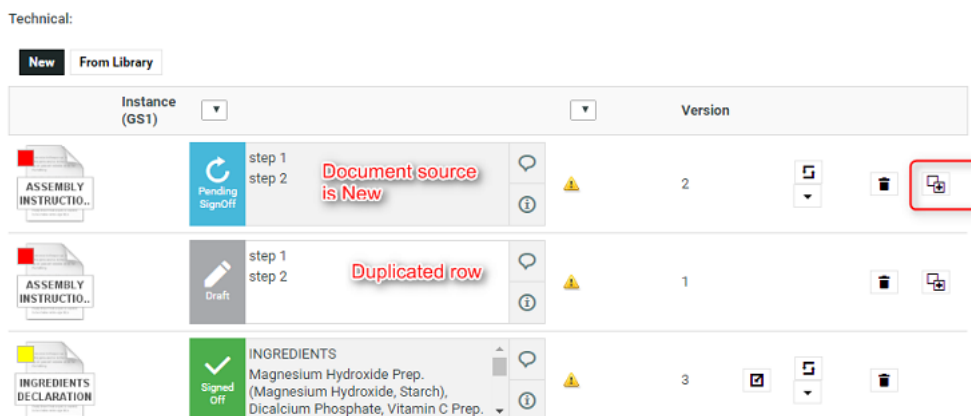

- **"AttributeName"_Default** if the configuration in the current **view** is inherited from the **default view**.
- **"AttributeName"_ViewName** if the **view** has its own configuration. If the configuration is shared with another **view**, *ViewName* can be from the other **view**.

Duplicate a Document Reference

You can configure a **Duplicate** option in your document reference table. When the user **duplicates** a reference, a new row of document reference will be created. The duplicated document will have the same content, document **attributes** and **reference category** as the previous one.

In the case of Text Document, Content file, then each element status in the file will be reset to draft.

Note: Only users who are Project managers, Administrators or with Change Properties rights can replace the document reference.

When you configure a **Duplicate** button, it will allow the users:

- to duplicate a document row with **Copy** and **New** as *document sources*.
The duplicate documents are created in the current Project where the copied or newly created documents are stored.

Tip:

- The document will be named as [FileName] [Duplicate] [1], [FileName] [Duplicate] [2], etc.
- Use the **Rename** document action to change the document name.

You cannot duplicate a document reference if the document source is:

- **Browse / Link / Use by Reference / Remote.**

Behavior while duplicating document and its reference properties:

- If **Allow multiple values** is turned off in the attribute category, the duplicate will replace the original instead of adding a new document reference.
- The duplicated document will have the same Attribute category including the child document references. The Reference categories and its settings are copied at parent and child levels.
- The duplicated row inherits the entire hierarchy (if any) of the parent row including the attribute values.
- It is possible to duplicate a newly created document row.

Replace a Document Reference

You can configure a **Replace** option in your document reference table. When the user **replaces** the old reference, the new document reference will have the same **reference category** as the old one.

Note: Only users who are Project managers, Administrators or with Change Properties rights can replace the document reference.

When you configure a **Replace button**, it will allow the users:

- to replace the document via any of the configured *document sources* (**upload, browse**, etc.). If the user did not select any option, the first source will be taken as the default.
- to **Undo the action** before saving the new document reference.

This document will have its own **Attribute Category** but will keep the same **Reference Category** as the old reference.

Project Properties in Advanced Table Rendering

You can configure the document's Project related details in the document reference rendering.

Project Property

If you select **Project Property** as the **Type**, you can specify the following parameters of the document's host Project in the document rendering.

- **Project Property**
 - Project Name
 - Project Due Date
 - Project Status. You can choose to:
 - Show Label and Icon
 - Show Only Label
 - Show Color Label
 - Show Only Icon
- **Project Attribute:** Specify the attribute that you want to show from the drop-down.

Bulk Operations on Document references

A single document can be referenced multiple-times from various Projects /Document Attribute Details, Project Creation Form or Task Execution Page.

To speed up and improve working in such a situation, you can perform the bulk operations on the documents referenced by a document reference attributes.

When you perform the following actions on a document references,

- Remove a document from a document reference attribute
- Replace a document referenced by a document reference attribute

- Make a document referenced by a document reference attribute local to the current project
- Update the reference of a document to refer to the latest version of the document (available only for “Selected version/revision” document reference types)

you can choose to perform only on the selected document or on all the documents it is referenced to. By all documents it is referenced, means a search is performed in the document reference tree structure for affected documents including the document references with bulk operations turned off.

Note: Bulk operations are not performed in

- BOM Documents
- Read-only and hidden document references

You can also enable the option **Limit Bulk Operations to Document References with matching Operations configured** in the **Edit Render Configuration** in Attributes Category page. When the option is chosen, document rows to be modified by any of supported bulk operations are in addition filtered based on document sources and actions configured for them. Only document rows where the bulk operation can be performed directly are filtered and are modified by the bulk operation.

Creating a Copy Sheet

Copy sheet is a term used to describe all the content together which will be attached to a particular artwork or printed item. A copy sheet containing aggregated content helps you to:

- validate the copy sheet templates for consistency, accuracy and compliance with the established content management process.
- review, proof-read and approve copy sheet in one place.

You can create a copy sheet using Text Content Document References in an **Attribute Category**. This gives the option to attach this copy sheet to your Projects or artwork documents.

The copy sheet categories allow you to:

- track the content on an artwork.
- easily reuse existing approved content
- configure separate permissions and approval system for each text document.

Tip:

By configuring [Document Rendering](#) for Text documents, you can attach copy sheets to Tasks. When you configure Workflows with manual tasks for editing or approving, the users can work on the copy sheet directly from their task.

An Attribute Category based copy sheet offers the following advantages:

- the languages. To view a particular translation corresponding to a master, just select that language in the filter drop down.
- the **Instance Sequence**. See more in: [Dynamic Content documentation](#)
- the option to [replace a text document with another](#)
- the button to [duplicate a document](#) with the same reference attributes
- [advanced document reference options](#)

You can *Edit, Start Approval, Approve and Reject* actions from the copy sheet depending on your content permission.

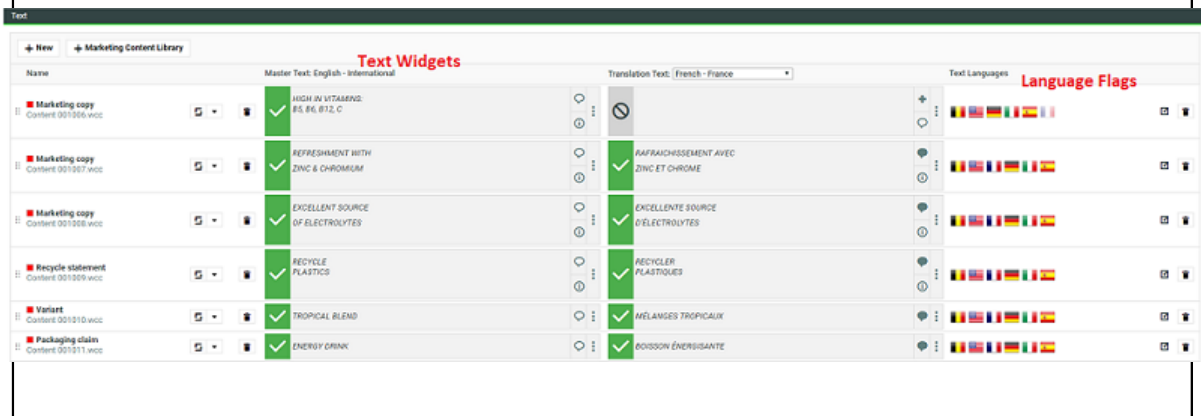

Note:

The text document references are used when you import Dynamic Content into WebCenter. Read about this in: *Import Dynamic Text* on page 903.

See the example screen shot below. The configuration explained here is only an example. You can configure your document references according to your needs.

Tip: You can configure the copy sheet with different **Attribute Views** to provide custom views to your users. For example, a content collator and Translation Language Editors can have different *custom views* of the same text document reference category.

Note: You can also add the languages by clicking on the **+** displayed in the text statement. On deletion of a language, the **+** icon is again displayed to enable adding back the language. You can configure the corresponding attribute category to display the languages one by one in a table.

Create a Table Rendering for Text Documents

You can configure Text or Table Documents as document references and add them to a Project or Document Attribute category. The configuration and rendering are similar for Task Specifications.

To create a Copy Sheet using Text Document References, you can configure text related data to an advanced table rendering.

1. *Create a Table Rendering.*
2. In the **Edit Rendering Configuration** pop-up:

Specify...	The result in the rendering table will be...
Master Text	Master Text Statement in a text widget along with its content in the edit field and all related text content actions.

Specify...	The result in the rendering table will be...
<p>Translation Text</p> <p>Text Language Flags</p>	<p>Note: The Visibility should be specified as Editable if you want your users to edit the text.</p> <hr/> <p>Translation Text Statement(s) in widgets. One or more columns can be configured for the translations of the Master Text. The Master and Translation languages will also appear in a drop down.</p> <p>The language drop downs for Master and Translation Text columns.</p> <hr/> <p>Note: The master and translation languages are populated from the project attributes MASTER_TEXT_LANGUAGE and TRANSLATION_TEXT_LANGUAGE respectively.</p>

Tip:

You can specify a default language code for Text statements. The selected language will be the default in the document reference table. If default language is not specified, the first language from the language drop down will be selected as the default.

WebCenter also supports right to left languages like Arabic and Hebrew for text content.

3. Specify the width for Master Text and Translation Text.

By default, the width of every column is set to **Auto**. However, you can configure the width for the following:

- Document Name
- Master Text
- Translation Text
- Translation Languages

Tip:

To change the width of the columns, specify pixels or a percentage (of the width of the table). If the label of the column is too big for the width specified, the column width will be bigger to accommodate this.

Edit Render Configuration

Name: Scope Other Doc Ref_Default

Hide Header
 Open Links in new Tab

Type	Details	Label	Visibility	Width	Collapse
Expand Attributes (+)	View: Default <input checked="" type="checkbox"/> Use Creation View for new Documents	+	Read Only	auto	<input checked="" type="checkbox"/>
Up/Down			Read Only	auto	<input checked="" type="checkbox"/>
Translation Text	<input type="checkbox"/> Show Side by Side	Translation Text	Editable	450px	<input checked="" type="checkbox"/>
Text Language flags	Show for: Master Language(s) Display: Show only flags Language Flag Indicators	Text Languages	Editable	100px	<input checked="" type="checkbox"/>
Document Actions	Open 3D View Open in ArtiosCAD Download Add Action		Read Only	auto	<input checked="" type="checkbox"/>
Local/Remote Project	<input checked="" type="checkbox"/> Retain text document status		Read Only	auto	<input checked="" type="checkbox"/>
Delete Button			Read Only	auto	<input checked="" type="checkbox"/>
Document Property	Description	Description	Read Only	auto	<input type="checkbox"/>
Text Language flags	Show for: Translation Language(s) Display: Show flags and languages	Text Languages	Editable	100px	<input type="checkbox"/>

Add Column Revert to default configuration

OK

4. Configure the display of Text Language Flags. You can configure the **Display** as **Show only Flags** or **Show Flags and Languages**.

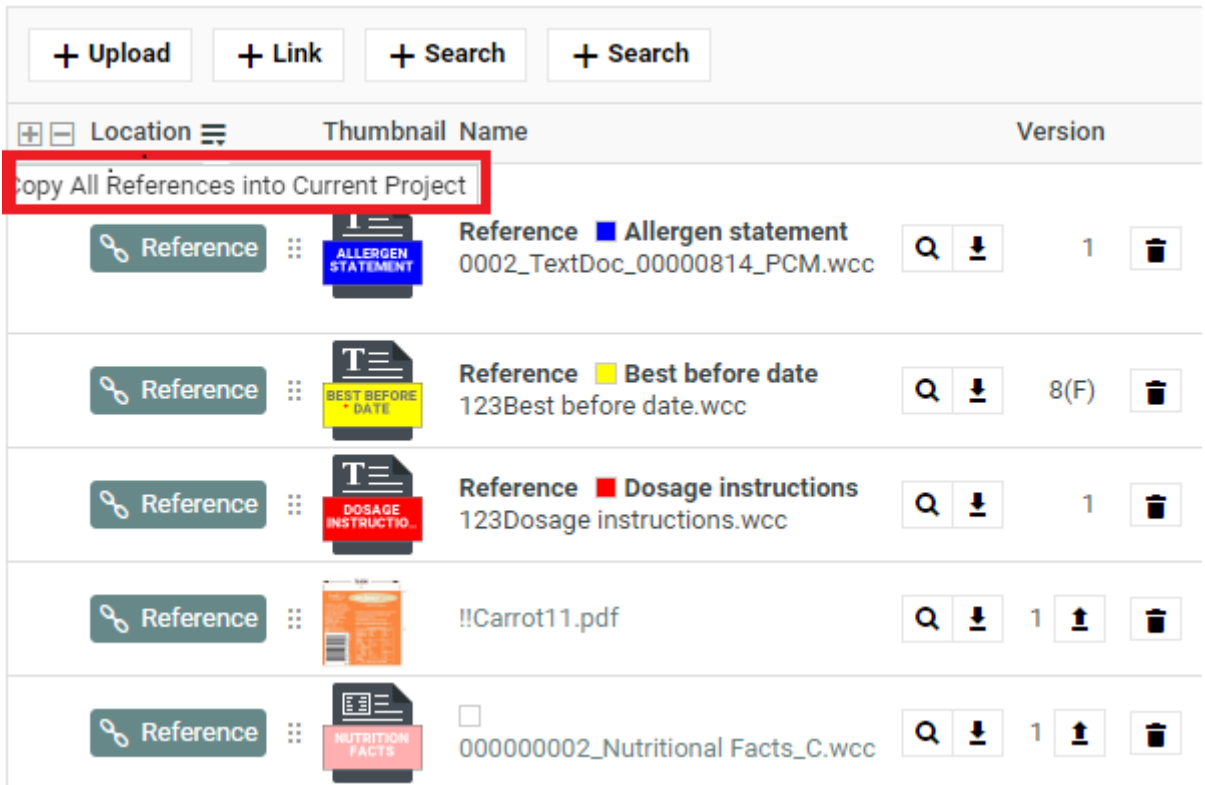

These flags will be based on the Project Language Attributes.

- In the copy sheet view, all the newly created text documents will have the current Project's *Language attributes* as flags.
- All the sourced content (referenced from other Projects) will have the flags based on the source Project's language attributes.

To add the current project's languages, select them from the available flags.

- You can add or delete flags in this view. Read more in:

5. You can allow the users to move a referenced document into the current project. To set this up, create a column with **Local / Remote** setting. Specify the **visibility** as **editable** or **read-only**. You can move all the referenced documents into the local project by hovering on the **Location** in the header and selecting the option **Copy All References into Current Project**.

You can move any of the referenced document to the local by clicking on the Referenced field of the required document and selecting the option **Copy to Current Project**.

The users need to **Change Properties** and **Add** permissions to move a document to local folder. The document reference will point to the local copies.

The user will be able to specify:

- a new name and description
- document template
- target folder

If the setting is **Read-only**, the user will see indicating remote project.

6. If you are configuring **Local / Remote** button to allow copying of documents, ensure that you have enabled or disabled **Retain text document status**.

When this option is turned off, if you copy to **Local**, the approval status of the Text Document will be reset to **Draft**.

If **Retain text document status** option is turned on, when you copy the document, the document's approval status will be retained as it is.

7. Define adequate permissions to view and edit Text Statements:

Whether or not your user can edit or perform approval actions on a Text Element is determined by the following settings and permissions:

- **Visibility** should be specified as **Editable**.
- If your Text Document Reference is a child of another document (for example an artwork), the **Expand Attributes (+)** column of the Parent document should be configured as **Editable**.
- The user should have appropriate Content Permissions. Read more in: [Managing Text Permissions](#) on page 479.

Tip:

Check these Project level permissions (**Project Details > Security**) to troubleshoot editing problems:

- **Change Properties**
- **Lock/Update**
- **Start/Stop Approval**
- **Upload new version**
- **Change Task**
- **Download**
- **Add**

Note: The Text widgets, related languages and statuses are rendered only for Text Document References.

How to Create a Functioning Document Reference System

You can make use of **Document References** to specify product and its components or master-child relationships. Using this feature, you can create an attribute link to refer to a document that is located within another project or a document library.

This advanced feature allows you to create a system of references (like a "hanger" for your related assets) to keep a product and its parts together even when they are not located together. For example, the CAD file, the artwork, the die and its leaflet. For a display, its language variants, parts and artwork together.

To create such document reference system, you need:

- Reusable components stored in the form of libraries
- Document Templates
- Version / Revision aware Document Reference Attributes and other Attributes
- Attribute Categories with your document reference attributes and other types of attributes

Follow the steps below to create an advanced document reference system.

1. Create WebCenter Projects as Libraries and organize your assets in them.

Examples for your libraries

- Structural design files for your packaging shapes

Project: DEKE_DSR_Box_Library

Manager: Keizer, Debbie (DEKE)

Customer:

Due On:

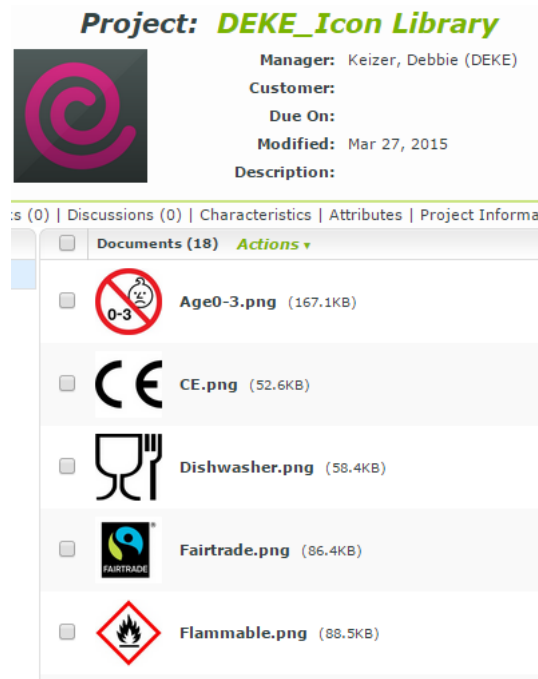

Modified: May 13, 2015

Description:

ks (0) | Discussions (0) | Characteristics | Attributes | Project Information

<input type="checkbox"/> Documents (15) Actions ▾
<input type="checkbox"/>  BOXCO_00001.ard (28KB)
<input type="checkbox"/>  BOXCO_00002.ard (28KB)
<input type="checkbox"/>  BOXCO_00003.ard (28KB)
<input type="checkbox"/>  BOXCO_00004.ard (28KB)
<input type="checkbox"/>  Boxes002.ard (28KB)

- Graphical design files from the creative agency
- Standard design elements such as your brand logo, company logo etc.
- Symbols such as recycle symbols, warning symbols, Quality Symbols etc.

- Text Content Documents
- Barcodes

To organize further, you can create [advanced saved searches](#) or [SmartName searches](#).

2. Create your Attributes and Attribute Categories for the specification / packaging request.

For example, Production quantities, count, budget, material type, ink coverage, color, language variants, Barcode etc. Read:

- [Create a Document Reference Attribute](#) on page 355
- [Reference Category](#) on page 358

3. Create Document Templates with Attributes.

Your Project Managers can use [Document Templates](#) on page 157 as document placeholders for future project documents.

Document Templates

Please select the Template or Project that will serve as a Document Library:

Select: Do not use a Document Library
 Template
 Project

When the Document library contains ARD files, how do you want to use these ARD files when creating a new Document?

Always run the ARD as a standard
 Run the ARD as a standard when the IsStandard Attribute is set to 'yes'
 Never run the ARD as a standard

Save

Note: Link to the document templates in [document creation settings](#) of the Project Template.

4. Create your document reference attributes and enable advanced features in grid layout.

a) Select **document reference** as the attribute type. **reference category** attribute (such as count) of the link. Read: [Create a Document Reference Attribute](#) on page 355.

Examples:

- Specify the **version / revision** of the document it should refer to.
 - Specify a **reference category** if you have properties that are specific to a document reference link. For example, count.
- b) Add the **document reference attribute** to an attribute category.
- You can make the attribute **read-only / editable / required** by setting the **visibility**.
 - You can create a document reference where the user can add multiple documents by enabling **allow multiple values**.
 - You can use all the advanced features available in the **grid layout**.

Edit Category DEKE_Artwork

Icons

[Add Icon\(s\)](#) 3

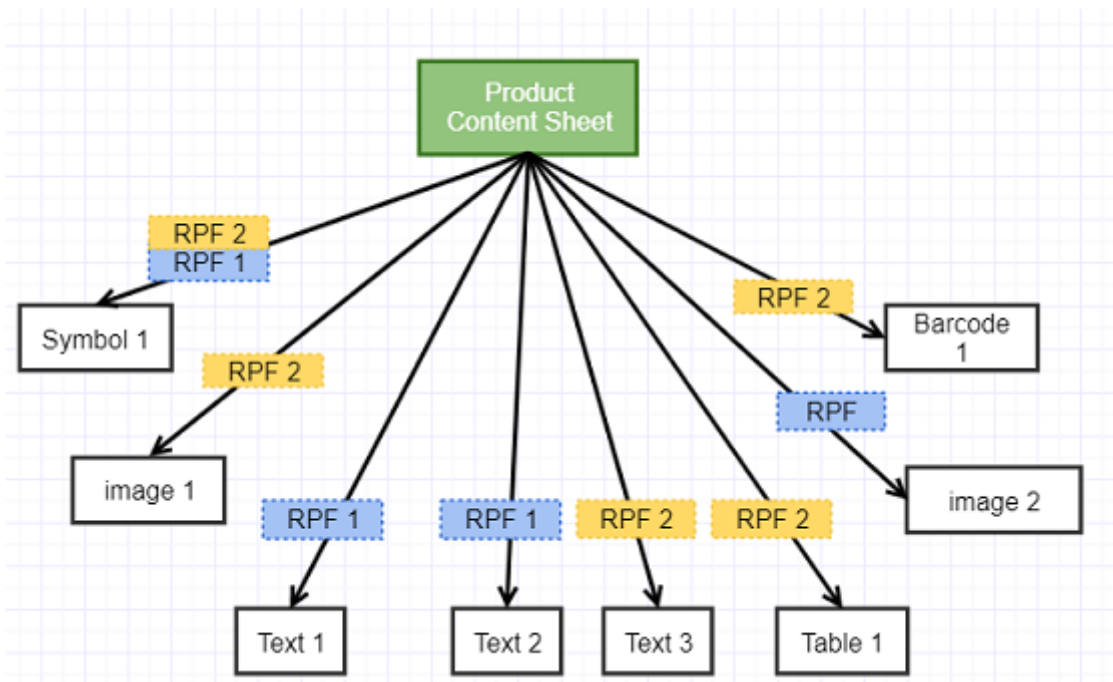

- Add Icon(s) (Reference): CE.png
- Add Icon(s) (Reference): Dishwasher.png
- Recycle2.png

- 1. CAD documents are rendered in a **Table** configuration. The header contains custom labeled **document sources**. You have editable reference properties such as offsets configured in the table.
- 2. The customized `add_ink` link will take you to the inks library to choose your inks for the current project.
- 3. The configured `Add_icons` link will take you to a saved search. This document reference attribute is rendered as **Simple**. Therefore, the references appear as a list.

You can have documents stored in the local folder or referred in document reference links. However, the user gets the view of both the local and referenced documents together.

Referenced Property Filter

Reference Property Filter (RPF) is a restricted view of the reference property attribute category. It filters the attributes that are both part of the Reference property Attribute Category and the Project Attribute Category. For example,

Multiple products or artworks can reuse the same content like text, recipes, images and so on. To specify the context of using the content as reference, you have to filter the context, in which the content sheet can be used in the artwork. To know more about **Product Content Sheet**, read [Product Content Sheet](#) on page 520.

Configuring Reference Property Filter

Reference Property Filter is available only, when a reference property attribute category is defined for the Document Reference Attribute. It will show the attributes in the reference property attribute category which are also present in the Project Attribute Category of the document or in a Document Attribute Category and have values.

This configuration is used to display the column of the reference properties which defines the reference property filter of the document

+ Upload + New + Link + Search			
Thumbnail	Name	Scope Flavour	Scope
	Variant Variant_1.wcc	Chocolate X Apple + Lime Twist X Tropical Blend X	Mu
	Marketing copy Marketing copy_3.wcc	Apple + Lime Twist X	Mu
	Marketing copy Marketing copy_4.wcc	Tropical Blend X Coconut & Berry X	Mu
	Recycle statement Recycle statement_1.wcc	Apple + Lime Twist X	Sir
	Marketing copy Marketing copy_5.wcc	Strawberry X	Mu

reference.

Note:

It is important add the values as attributes in the Project or Document to render the same in the Reference Property Filter.

In the above image **Scope Flavor** and **Scope Outputs** are the **Reference property Filters** and the values Chocolate, Apple+ Lime Twist or multipack are the attributes defined in the attribute category of the project.

Reference property is allowed to have the values only from the project attribute category.

Viewing Reference Property Filter

Reference Property Filter can be viewed in the **Attributes** tab of a Project or Document.

+ Upload + New + Link + Search			
Thumbnail	Name	Scope Flavour	Scope Output
	Variant Variant_1.wcc	Chocolate X Apple + Lime Twist X Tropical Blend X	Multi Pack X
	Marketing copy Marketing copy_3.wcc	Apple + Lime Twist X	Multi Pack X Single Pack X

In the render configuration for the header row, the details and the label are not applicable and the width is always set to auto. You can collapse or expand the columns to view.

Copy Document References

You can create new projects from the template projects with an option to copy all the document references along with them. You have both the option to copy only the local references or copy all the references in multiple levels.

You can use this also in **Task Specifications**, "Documents" section of Project Creation page and Task Execution page.

While copying, along with the documents all the attributes including their values are also copied.

To enable copying of the Document Reference Attributes, the Document sources in the Attribute Category of the document has to be configured.

Edit Document Sources Configuration

ANKR_ATTR_DOCREF2_Default

Source	Label	Details	Operation	Target Folder
<input type="checkbox"/> Saved Search	Simple Basic Copy	Search Name: SOBK_Image Search Document Template selector: Any Document Template configured Copy Operation: Basic Copy	<input checked="" type="checkbox"/> Copy <input type="checkbox"/> Link <input type="checkbox"/> Move <input type="checkbox"/> Use By Reference	Folder2
<input type="checkbox"/> Saved Search	Simple Deep Copy	Search Name: SOBK_Graphics & ArtiosCAD Library Search Document Template selector: Any Document Template configured Copy Operation: Copy with Local References	<input checked="" type="checkbox"/> Copy <input type="checkbox"/> Link <input type="checkbox"/> Move <input type="checkbox"/> Use By Reference	Folder1
<input type="checkbox"/> Document Templates	Simple Deep copy All	Document Template selector: Any Document Template configured Copy Operation: Copy with All References	<input type="checkbox"/> Copy <input type="checkbox"/> Link <input type="checkbox"/> Move <input type="checkbox"/> Use By Reference	Copy
<input type="checkbox"/> Current Project	Standard Link	Document Template selector: Any Document Template configured Copy Operation: Copy with All References	<input type="checkbox"/> Copy <input type="checkbox"/> Link <input type="checkbox"/> Move <input type="checkbox"/> Use By Reference	Link

Only the following document sources can be configured for **Copy Action**:

- Document Template (New)
- Saved Search

- Copy from Project

There are three options to copy that you can configure namely:

- **Basic Copy** – Only the selected document is copied to the destination project. Document references of the newly created (copied) documents are set to reference the same documents as the original/source document(s).
- **Copy with Local References**– Selected document and all documents referenced by it that are from the same source project are copied to the destination project.
- **Copy with All References** Selected document with all document it references are copied to the destination project, irrespective of the project it is located.

Note: Copy Actions are not supported in BOM documents tables/sections and also when copying a document from Documents page in Project Details.

3.16. WebCenter Configuration

The Configuration menu contains entries for configuring e-mail notifications, LDAP authentication, push-through folders, BackStage / Automation Engine Approval clients, the System Info page, etc.

3.16.1. Configure E-Mail

You can set up e-mail configuration using the Admin module. All changes to the setup are effective immediately.

1. Click **Admin > Configuration > E-Mail Environment Setup**.

2. Provide the required e-mail settings:

Configuration Option	Description
E-Mail Service Protocol	Set to the SMTP protocol.
E-Mail functionality enabled	To enable/disable e-mail functionality.

Configuration Option	Description
E-Mail debugging output in log	To enable/disable e-mail debugging output in log files.
E-Mail Service Host	Address for the preferred mail server that will act as the server for dispatching e-mail notifications.
E-Mail Service Port Number	Port number on which the e-mail server is listening for incoming e-mails.
Outgoing E-Mail Notifications "FROM" Address	Supply a valid e-mail address. This will be used as the "From" e-mail header for every e-mail sent by the system. This information is important for returning undelivered mail (the filled-in address should belong to the administrator, since he will most likely be addressed with undelivered mail for troubleshooting).
E-Mail Session Authentication	Select this option if the mail server connection session should be authenticated using a username and password.
E-Mail Service Username	Mail account user name when authentication is required.
E-Mail Service Password	Mail account password when authentication is required. The password is stored in encrypted format.

3. Click **Send Testing E-Mail**.
4. Edit the contents of the test e-mail if required.
5. Click **Send E-Mail**.

A response will appear stating whether or not the e-mail could be sent successfully. There are 3 possible outcomes of the e-mail environment testing page:

- **Test E-Mail Sent:** The environment is set up correctly.
- **JMS System Error:** Communication with the JBoss proprietary messaging framework failed. An administrator should check the JBoss server configuration and/or log files for possible causes.
- **Mail Server Connection Error:** The connection to the specified mail server did not succeed. Either the data the administrator supplied on the e-mail environment setup page was incorrect, or the mail server is currently down. An administrator should either check the e-mail environment settings for possible misspellings or contact the mail provider as to the status of the mail server.

6. If necessary, return to the configuration page and correct the settings.

3.16.2. Configure Search Crawler Setup

You can change the **Search Crawler Setup** from **Admin > Configuration > Search Crawler Setup**. All the below mentioned actions can only be performed by the Admin users.

1. Choose the **Search Enabled** option to enable or disable search.

2. Enable **Rebuild Index on Restart** option to allow or disallow rebuilding the index upon search crawler restart (default is enabled).
3. Enable **Index Document Revisions** to index all the **Document Revisions**. If this is not enabled, only the **Latest Version** for every Document is indexed. If this option is enabled, users can search for the revisions on the Document Search page.
4. To skip the indexing of Workflow Tasks, you can disable **Index Workflow Tasks**. Changing this option will trigger re-indexing. When this option is disabled, you cannot search for workflows in the Task Search.
5. Enable **Index Any level Document Reference** to search the entire Document referenced within WebCenter and return in the search result when the document search is executed.
6. Enable **Index all currently referenced Document Versions** to add the earlier versions of the referenced document to the search index. The index will be rebuilt once this option has been changed in the setup.
7. Enable **Index Live Text in Documents** to search for text inside the documents in a **Document** search. Read more [here](#).

1. Status

Last crawl activity shows the date and time of the last search crawl activity and **Crawl Tasks Waiting** shows the pending crawl tasks.

Index Live Text in Documents

Search Crawler Setup in the configuration menu has an option choose whether to **Index Live Text in Documents** or not. This allows enabling or disabling of **Document Content** indexing which is disabled by default.

Changing the state of the option, results in a full re-indexing of the document content. In such a case, Documents are not re-indexed but only the document content is re-indexed which means Document Search will find all results while the document content indexing is ongoing.

Note: When the option is turned off, the search index with document content is cleared to save space.

3.16.3. Configure External Web Connections

An external web connection is a connection to some data in an external system (usually a MIS system). The MIS system calculates the data (for example the cost/price information for an order) and WebCenter retrieves this data through the external web connection and displays it on a WebCenter page.

After configuring the external web connection, you can choose to add a link to it in a WebCenter top-level menu, project menu or a **My Work** section. See the Customization Guide for more details.

Create an External Web Connection

1. Go to **Admin > Configuration > External Web Connections**.
2. Click the **New External Web Connection** link in the **External Web Connections** page.

3. Enter the **Name** to give your external web connection.
4. Enter the **URL** of the data you want to retrieve in your external system. This needs to be accessible by either the WebCenter Application Server or Web Server.

You can use *SmartNames* in the URL. The supported SmartNames are:

- all basic project properties (see *List of Available SmartNames* on page 429),
- all project attributes,
- Requestor SmartNames ([Requestor UserName], [Requestor Location], etc...). Here, Requestor indicates the user who is logged in.

These SmartNames will be resolved when activating the connection, depending on the context. This means that for example:

- if you are using the [Requestor UserName] SmartName, it will be resolved to the name of the user currently logged in to WebCenter (the one clicking the link to the external web connection).
- if you are using the [Project Name] SmartName, it will be resolved to the name of the current project.

So if you are using an order ID as project name and you want to connect to an external system containing information about that order ID, whose URL is `http://ExternalSystem/OrderInformation.jsp`, then you can use `http://ExternalSystem/OrderInformation.jsp?orderID=[Project Name]` as URL here.

This will be resolved to for example: `http://ExternalSystem/OrderInformation.jsp?orderID=Order_83289`.

Note: When using SmartNames, you should take into account where the connection will be used from (where in WebCenter it will be integrated).

- You can use user-related SmartNames (such as [Requestor UserName]) if the connection is to be added to a top-level menu or a My Work section.
- You can use user-related and project-related SmartNames (such as [Project Name]) if the connection is to be added to a project menu.

See the Customization Guide for information about integrating a link to an external web connection into the WebCenter user interface.

5. In **Type**, select if your external system outputs **HTML** or **XML**.

Note: If your external system outputs **XML**, you will need an XSL (eXtensible Stylesheet Language) file to transform this to HTML and display it in WebCenter. Your WebCenter installation comes with an example XSL file, that you can customize.

See the Customization Guide for more details.

6. Click the **Test** button to test the connection to your external system. You should see a green check mark if the connection is successful.

Note: The test button will only check whether or not the main URL is reachable. It will not take into account any SmartName used to pass on parameters, as SmartNames have to be resolved from a specific context in WebCenter.

In the example above, the test will try to connect to `http://ExternalSystem/OrderInformation.jsp`, and not to `http://ExternalSystem/OrderInformation.jsp?orderID=[Project Name]`.

Edit an External Web Connection

- To edit an external web connection, click its name in the **External Web Connections** page.

Attention: If you change the name of a connection here, you will also need to change it in the customization files used to integrate a link to this connection into the WebCenter user interface!

See the Customization Guide for more details.

Make Direct External Web Calls

You can directly call to a service instead of adding the External web calls to the menu or Homepage Sections. This can be done with the call:

```
GetExternalWebInfo.jsp
```

The call takes the same parameters as the previously mentioned calls. For example, this call can be used in a javascript button in the Attribute Category (using CustomFormExtensions).

Example: A SOAP call made out of JavaScript .This function could be added in CustomFormExtensions.js

```
soap: function(att) {
  var extWebConn = "SOAPService"; // name of connection

  var attr1 = att['attr1'];
  var attr2 = att['attr2'];
  var attr3 = att['attr3'];

  var body = "<?xml version='1.0' encoding='utf-8' standalone='no'?">"
  + "<soap:Envelope schema_params"
  + "  <soap:Body>"
  + "    <Operation xmlns='http://tempuri.org/'>"
  + "      <Request>"
  + "        <data>"
  + "          <attr1>"+ attr1+"</ attr1>"
  + "          <attr2>"+ attr2+"</ attr2>"
  + "          <attr3>"+ attr3+"</ attr3>"
  + "        </data>"
  + "      </Request>"
  + "    </ Operation >"
  + "  </soap:Body>"
  + "</soap:Envelope>";

  var formData = new FormData();
  formData.append("externalwebconfigname", extWebConn);
  formData.append("requestbody", body);
  formData.append("requestmethod", "POST");
  formData.append("requestheader",
  "Content-type:text/xml; charset=utf-8");
  formData.append("requestheader",
```

```

"SOAPAction:http://tempuri.org/CalculateNewQuote");
formData.append("responsetype", "application/xml");
formData.append("callfromwebserver", "1");

$.ajax({
  url: "GetExternalWebInfo.jsp",
  dataType : "xml",
  type: 'POST',
  enctype: 'multipart/form-data',
  cache: false,
  processData: false,
  contentType: false,
  data: formData,
  async: false
})
.done(_.bind(function(data) {
  // Read and handle data
}, this))
.fail(_.bind(function(err, status, errStr) {
  alert("Request failed: " + errStr);
}, this));
}
    
```

Add Parameters to a direct call dynamically

Parameters cannot be always resolved by SmartNames. For example, when we make a calculation with attributes and need to pass this as a parameter.

To resolve this use the parameter **requestparams**. The content of this parameter will be appended to the URL called by the server. The content of the parameter should have the format **param1=value1¶m2=value2&...**

Note that URL encoding should be used when appending to the external web connection URL.

```

If ExternalWebConfig has URL https://www.google.com/, then
GetExternalWebInfo.jsp?
ExternalWebConfigName=ExternalWebConfig
&requestparams=q%3Dtest (URL encoded "q=test")
will resolve to https://www.google.com/?q=test
    
```

Change Request Method

It is possible to call a service both with the GET or with the POST method. The default method will be GET.

To choose the request method, add a parameter **requestmethod** which can have a value GET or POST. For example

```

GetExternalWebInfo.jsp?
ExternalWebConfigName=ExternalWebConfig3
&method=POST
    
```

The parameter is available for `GetExternalWebInfo.jsp`, `myexternalwebinfo.jsp` and `projdetailsexternalwebinfo.jsp`

Change Response Type

It is possible to have another result than HTML. To do that, you will have to pass which response type you want. This can be done by adding a parameter **reponsetype**. The response type has to be a valid MIME type. For example,

```

GetExternalWebInfo.jsp?
    
```

```
ExternalWebConfigName=ExternalWebConfig3
&responsetype=application/json
```

The parameter is available for `GetExternalWebInfo.jsp`, `myexternalwebinfo.jsp` and `projdetailsexternalwebinfo.jsp`.

Add Request Headers

It might be required to add request headers to some calls. It is possible to pass these headers along. This can be done by adding one or multiple instances of the parameter **requestheader**.

These have to be in the following format: `<request_name>:<request_value`

```
GetExternalWebInfo.jsp?
ExternalWebConfigName=ExternalWebConfig3
&requestheader=Cache-Control:No-Cache
&requestheader=Pragma:No-Cache
&requestheader=Expires:0
```

The parameter is available for `GetExternalWebInfo.jsp`, `myexternalwebinfo.jsp` and `projdetailsexternalwebinfo.jsp`.

Add Request Body

For some calls, it might be required to add a request body to the call. It is possible to pass this body along.

This can be done by adding the parameter **requestbody**, with the needed request body as value.

```
GetExternalWebInfo.jsp?
ExternalWebConfigName=ExternalWebConfig3
&requestbody= <soap:Envelope ...>...</soap:Envelope>
```

The parameter is available for `GetExternalWebInfo.jsp`, `myexternalwebinfo.jsp` and `projdetailsexternalwebinfo.jsp`.

Delete an External Web Connection

- To delete one or more external web connections, select it/them on the **External Web Connections** page and select **Delete External Web Connection(s)** in the action menu.

Attention: Deleting a connection that is in use will break the pages that use that connection. The system will show an error message on these pages.

3.16.4. Configure Workflow Connections

With a workflow connection, creating a project in WebCenter can automatically create a linked job in Automation Engine or any JDF-enabled workflow.

This way, the project files can automatically be copied into the workflow job (if desired), and the job parameters can be defined from WebCenter, based on project information and attributes.

This means that:

- WebCenter can act as the single interface for your customers, CSR and sales,
- all the data collected through WebCenter is available for workflow automation.

You can also define when the project will synchronize with the workflow job automatically, and if the WebCenter Project Manager can synchronize them manually.

You can also use a workflow connection to save documents (only approved documents or all documents) and the XML metadata about the documents and project to a network folder. This allows you to archive your documents and metadata externally.

To Configure a Workflow Connection

1. [Create a connection.](#)
2. [Add that connection in a project template.](#)
3. [Define when the workflow jobs created will be automatically synchronized to the linked WebCenter projects.](#)

Workflow Connections

Use **Workflow Connections** to synchronise your WebCenter Projects/Documents information with Automation Engine and other third party workflow systems. You can send a JDF file containing information about WebCenter project/document to Automation Engine or other systems. In Automation Engine, this will result in an updated Job or a new Job.

In addition, you can use **Workflow Connections** to submit external workflows. For example, using this connection, the **Submit Workflow** node can execute external workflows on your workflow systems.

You can also use **Push Through Folders** to integrate with such systems. However, these folders copy the WebCenter documents to the specified destination.

When syncing with Automation Engine Jobs, the **Workflow Connections** map:

- Project / Document **attributes** to Automation Engine **Job Setup** parameters including the customer details.
- Documents to Automation Engine job documents.

JDF Service

Use **JDF Service** connection to export your projects as JDF files and automatically create jobs in your Automation Engine. In this case, projects and documents will be communicated to Automation Engine using JDF tickets. Also, you can execute a workflow in Automation Engine using this setup.

ZIP Folder

Enter the address of the network folder to use for archiving your documents and metadata. This must be in an accessible network share, in UNC format.

Note: The ZIP file generated will contain:

- [documentversion_id].[extension]: the archived document,
- [documentversion_id].[extension].xml: the XML file containing the metadata of the archived document,

where [documentversion_id] is a unique number corresponding to that version of the document and [extension] is the file extension of the original document.

JMF Service

A **JMF Service** is a service to which the JDF tickets can be posted encapsulated in JMF messages.

Setting up a JMF Service:

JDF Hot Folder

When your WebCenter drops a JDF file into the Hot Folder that is shared between WebCenter and Automation Engine, the Automation engine processes it. When processing is finished, it writes the result into the output folder associated with the JDF Hot Folder.

Note: This must be in an accessible network share, in UNC format (for example \\MyWorkflowServer\MyJobContainer\HotFolder).

 **Attention:** The JDF hotfolder does not support the execution of external workflows. The **Submit Workflow** node in WebCenter workflows will fail when a Hot Folder is chosen for the connection.

Create a Workflow Connection

- Click **Admin > Configuration > Workflow Connections**.
- The **Workflow Connections** page appears, listing the workflow connections already created (if any).
- Click **New Workflow Connection**.
- Enter a **Configuration Name**.
- Select your **Connection type**. Here you can choose **JDF Service / Zip Folder** or **both**:

New Workflow Connection

Configuration Name*

Connection Type

JDF Service(Synchronize Project / External Workflows) ⓘ

ZIP Folder(Synchronize Document + Metadata) ⓘ

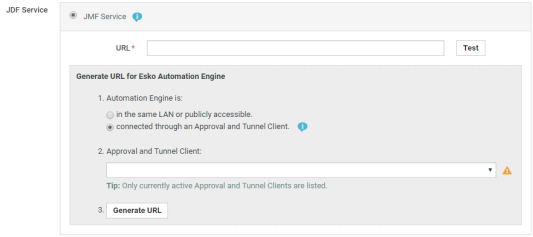

Active Configuration

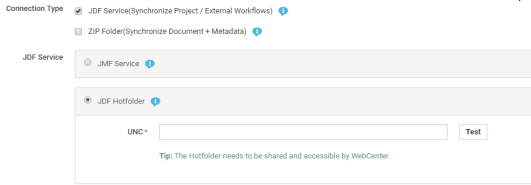

Create

Options	Description
<p>To export your projects as JDF files (and automatically create jobs in your workflow system from your projects)...</p>	<p>Use JDF Service connection to export your projects as JDF files and automatically create jobs in your Automation Engine. In this case, projects and documents will be communicated to Automation Engine using JDF tickets. Also, you can execute a workflow in Automation Engine using this setup. Read more.</p>
<p>To automatically archive your documents and metadata (as a ZIP file) in a network folder...</p>	<p>Enter the address of the network folder to use for archiving your documents and metadata. This must be in an accessible network share, in UNC format.</p> <p>Note: The ZIP file generated will contain:</p> <ul style="list-style-type: none"> • [documentversion_id].[extension]: the archived document, • [documentversion_id].[extension].xml: the XML file containing the metadata of the archived document, <p>where [documentversion_id] is a unique number corresponding to that version of the document and [extension] is the file extension of the original document.</p>

• **JDF Service:**

Use **JDF Service** connection to export your projects as JDF files and automatically create jobs in your Automation Engine. In this case, projects and documents will be communicated to Automation Engine using JDF tickets. Also, you can execute a workflow in Automation Engine using this setup.

If your JDF Service is...	Follow this procedure...
<p>JMF Service</p> <p>Note: You need JMF Service to connect to Automation Engine if it is not in the same LAN or not publicly available.</p>	 <p>You can setup a JMF connection following the steps below:</p>

If your JDF Service is...	Follow this procedure...
	<p>1. Select whether your Automation Engine is:</p> <ul style="list-style-type: none"> in the same LAN or publicly available. connected through the Approval and Tunnel Client. Read in Configure Workflow Approval and Tunnel Clients on page 410 <p>2. If your Automation Engine connection is:</p> <ul style="list-style-type: none"> in the same LAN / public, specify either the host address (e.g.: 192.168.1.1.1) or the host name (aeserver.brand.com). via an Approval and Tunnel Client, select the client from the drop-down. <p>3. Click Generate URL. The URL field above will be filled in automatically.</p> <div style="border: 1px solid gray; padding: 5px; margin-top: 10px;">  Warning: A Workflow Connection connected through an Approval and Tunnel Client will block one concurrent license. </div>
<p>JDF HotFolder</p>	<p>Select this option if your JDF tickets should be placed in a shared <i>Hot folder</i>.</p> <p>1. In the UNC field that appears, enter the address of your workflow's JDF hot folders (in which to place the JDF file). This must be in an accessible network share, in UNC format (for example \MyWorkflowServer\MyJobContainer\HotFolder).</p>  <p>2. Click Test.</p>

- Enable the **Active Connection** option to activate this workflow connection.

Note:

If you disable this option, there will be no synchronization between WebCenter and your workflow system, but the connection data will be saved, so you can reactivate it later.

- Click **Create**.

Edit a Workflow Connection

1. On the **Workflow Connections** page, click the name of a workflow connection.
2. Change the workflow connection's *settings* as desired.
3. Click **Save**.

Delete a Workflow Connection

1. On the **Workflow Connections** page, select the workflow connection(s) to delete.
2. Click **Delete Configuration(s)** in the actions menu.

Add a Workflow Connection to a Project / Template

Once you have created a workflow connection, you need to add it to project templates that Projects Managers will use to create projects. You can also add the connection to individual projects if desired.

1. On the Project Details page of the project or template, go to **Configure > Workflow Connection**.
2. Select **Connect this project to a workflow**.
This shows extra options.
3. In the **Workflow Connection** list, choose the workflow connection you defined.
4. Select **Allow manual synchronization by the Project Manager** if you want Project Managers to be able to synchronize the workflow job to the project on demand.

If you select this, Project Managers will have an extra action on the Project Details page: **synchronize with workflow**.

Note: Whether you enable manual synchronization by Project Managers or not, the workflow job will be automatically synchronized with the project when certain events occur (see [Define When the Project and Workflow Synchronize](#) on page 407).

5. Define when to automatically synchronize the workflow job to the project:
 - select **Synchronize on all statuses** to synchronize whenever the project status changes,
 - select **Only synchronize on a completed status** to only synchronize when the project has a completed status.

Note: There can be more than one completed project status defined in the system.

Note: Make sure you have selected **Project status change** as event that will trigger an automatic synchronization (see [Define When the Project and Workflow Synchronize](#) on page 407).

6. Select **Copy documents when synchronizing** if you want the project's documents to be copied to the workflow job.

Note: When you are using a workflow connection that automatically archives your documents and metadata in a network folder (see [Create a Workflow Connection](#) on page 402), **Copy documents when synchronizing** is always selected.

You can also choose to copy **Only approved documents**, or **Only documents in (a certain) folder** (select the project folder containing the documents to copy). This will work even you rename the folder later. If you try to delete the folder, you will get a warning.

7. Define **Additional Settings** for the workflow job.

In Automation Engine, you can see these settings in the **Job Setup**. See the Automation Engine documentation for more information.

Note:

You can use SmartNames to define those **Additional Settings**.

Click the Insert SmartName  button and select a SmartName in the list that appears next to the button. SmartNames are shown between brackets, like **[Project Name]**.

This list contains general project information (**[Project Name]**, **[Project ID]**, **[Customer Name]**...), and all the attributes defined in WebCenter. The attributes don't need to have been added to the project to be available here.

You can use several SmartNames if desired, or a combination of SmartNames and text, for example **WebCenter_[Project Name]_[Customer Name]**.

- a) Fill in the job's **Order ID**. This is mandatory as it allows WebCenter and Automation Engine to identify the job.

We recommend you use the **[AE_OrderID]** SmartName (corresponding to the WebCenter **AE_OrderID** attribute created automatically when you created the workflow connection) for the job **Order ID**.

- b) Fill in the job's **Suborder ID** if needed (this is optional).

We recommend you use the **[AE_SubOrderID]** SmartName (corresponding to the WebCenter **AE_SubOrderID** attribute created automatically when creating the workflow connection) for this.

- c) If you want to use a Automation Engine job template when creating the job (so that some of the Job Setup information is already defined), define the template to use in **Template Name**.

Attention:

If using SmartNames, make sure that they resolve to an existing Automation Engine job name.

SmartNames are resolved when the job is created via the JDF Hot Folder.

8. Click **Save**.

Define When the Project and Workflow Synchronize

Once you have created a workflow connection and added it to project templates, you need to define what events will trigger an automatic synchronization between the workflow job(s)/ network folders and the WebCenter project(s).

You can set this *for your whole WebCenter system*, but you can also overrule *in specific projects or templates*.

System-Wide

1. Go to **Admin > Preferences > Notifications**.

The **Notifications** page has a column called **Synchronize with Workflow**.

2. Select the events that will trigger an automatic synchronization.

This means that when one of the events you selected occurs in a project, and the project is connected to another system, the synchronization will take place.

For example, if you select **Upload new document**, the workflow job created will be synchronized to reflect the project when a user uploads a new document into the project.

3. Click **Save**.

At the Project/Template Level

1. Go to the project or template's **Notifications** tab.

You can only do this as an Admin user.

2. Select the events that will trigger an automatic synchronization in the **Synchronize with Workflow** column.

When one of the events you selected occurs in a project, and the project is connected to another system, the synchronization will take place.

3. Click **Save**.

3.16.5. Configure Asset Management Connections

Asset Management Connections

You can configure Asset Management Connections to connect to external data asset management (DAM) system (for example, MediaBeacon or another WebCenter system). When you have successfully configured a connection, your users can use it as a source for assets. You can also push a new version of an asset (or a new asset) back to the external DAM. This feature allows you to keep your repositories in an external system.

Once configured, these Asset Management connections can serve as **Document Sources** in WebCenter.

Configuration

To create a new Asset Management connection,

1. Go to the **Admin > Configure > Asset Management Connections** page.

If you already have Asset Management Connections, they will be listed in this page. To edit a connection, simply click the name of the connection.

2. Click **New MediaBeacon Connection** or **New WebCenter Connection**.
3. Specify / edit:
 - **Name**, a unique name for the connection
 - **URL** and the **API** key for a MediaBeacon connection
 - **URL, User name** and **Password** for WebCenter connection.
4. After specifying the parameters, click **Test Connection**.

Upload from external Asset Management connection

When successfully configured, you can use these as custom Document Creation sources. When a DAM is used as a source, the user is able to select documents (with meta data) from a MediaBeacon workspace or a WebCenter Saved Search.

These configurations allow you to push a new version of a document to the asset management system using a workflow node. Specify the Asset Management connection and a mapping between the WebCenter attributes and the meta-data of the external system, the node can be used in a workflow.

You can view the Asset management connection details in the Document information in WebCenter. In the **Document Details** > **Document Information** tab, view:

- **Asset Management Origin** – The name of the Asset Management Connection used to import the document (+ link).
- **Asset Management Document ID** – The ID of the original document that resides on the external asset management system.

3.16.6. Configure Push-Through Configurations for Workflow Folders

About Workflow Folders

What is a workflow folder?

When creating a folder the Project Manager can define it as a **workflow folder**, using a push-through configuration defined by the Admin.

Any file that is uploaded into this folder will be automatically copied to a location defined in the configuration. For this reason, workflow folders are sometimes also referred to as “push-through folders”.

Workflow folders are particularly useful when that other location is a hot folder of a workflow system such as Nexus, Automation Engine or Odystar, so that the file will automatically be processed by the workflow system.

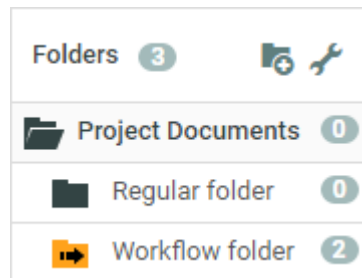

Note:

The Configuration for workflow folders needs to be defined by an Administrator.

Project Managers can then select one of the defined configurations when they create a new folder.

Recognizing workflow folders

Workflow folders have a yellow icon with an arrow on it.

The files in a workflow folder have two extra icons:

- The first shows whether the copy of the file was successful or not.
- The second is a button to copy the file again to the location defined in the configuration.

Create a Push-Through Configuration

1. Click **Admin > Configuration > Push-Through Configurations**.

The **Push Through Configurations** page appears, listing the push through configurations already created (if any).

2. Click **New Push Through Configuration** to add a new configuration.
3. Enter a **Configuration Name**.
4. In the **Destination UNC** field, type the path to the target folder in UNC format (for example \\MyWorkflowServer\Container_Data\WebCenter).
5. Choose a **File Naming** option:
 - **Document name:** documents copied to the destination folder will keep their original WebCenter name.
 - **[Project_name]_[Document_name]:** the copied documents will get a file name consisting of the project name, an underscore and the original document name.
 - **[Customer_name]_[Project_name]_[Document_name]:** the copied documents will get a file name consisting of the Customer name, an underscore, the project name, another underscore and finally the original document name.
6. Choose the **Workflow Type** to enable additional integration functionality:
 - Automation Engine,
 - Nexus,
 - Odystar.
7. Enable the **Active Configuration** option to activate the push-through mechanism for this configuration.

If you disable this option, files will no longer be copied, but the configuration data will be saved, so you can reactivate it later.
8. Click **Create**.

Delete Push-Through Configurations

1. Click **Admin > Configuration > Push Through Configurations**.
2. Select the configuration you want to delete.
3. Click **Delete Configuration** in the actions menu.
4. Click **OK** to confirm.

3.16.7. Configure Workflow Approval and Tunnel Clients

When WebCenter and Automation Engine are not on the same LAN, this **workflow approval and tunnel client** will establish a bi-directional communication.

Note: The Automation Engine Pilot needs to have the **workflow approval client** credentials to send messages to WebCenter.

This is configured through **Admin > Configuration > Workflow Approval Clients** in WebCenter, and, in the case of Automation Engine, in **Tools > Configuration > Web Sites** in the Automation Engine Pilot.

Attention:

Configure the WebCenter account first so that it can be tested from within the workflow approval server.

WebCenter and the workflow approval server must use the same user name and password!

This is completely separate from a normal WebCenter user. Workflow approval clients may not log in to WebCenter.

Two manual configuration steps must also be performed outside of WebCenter to ensure proper communication between the workflow approval client and WebCenter systems that are not on the same LAN.

Create a Workflow Approval and Tunnel Client

1. Click **Admin > Configuration > Workflow Approval and Tunnel Clients**.
2. Click **New Workflow Approval and Tunnel Client**.
3. Enter the **User Name** and **Password** for the workflow approval client user.
4. Click **Create**.

Note: If you have several Automation Engine, Nexus, or Odystar sites communicating with WebCenter, you need to create a separate Workflow Approval Client for each site.

Change the Password for a Workflow Approval and Tunnel Client

1. Click **Admin > Configuration > Workflow Approval Clients**.
2. Click **Change Password** link next to the name of the client user.
3. Change the password and click **Change**.

Delete a Workflow Approval and Tunnel Client

1. Click **Admin > Configuration > Workflow Approval Clients**.
2. Select the client.
3. Click **Delete Client(s)** in the actions menu.
4. Click **OK** to confirm.

Configure the Workflow Approval and Tunnel Client Software

Configure the access to WebCenter in the client application for your workflow server.

For instructions, please consult the documentation of your workflow server (Automation Engine, Nexus or Odystar).

3.16.8. Upload Saved Search Results Template

You can upload an Excel file (.xls) to be used as template when users [download search results to Excel files](#).

Note: This will only be used when downloading the results of **global saved searches** (you can upload one template per global saved search).

1. Go to **Admin > Configuration > Upload Saved Search Results Template**.
2. **Browse** to the Excel file to use as a template for a saved search.

Note: Name it exactly as the saved search you want to use it for (ignoring the extension)!

3. If you want to update an existing template file (uploaded with the same name), select **Overwrite if template file already exists**.
4. Click **Upload**.

When downloading search results using that template, you will find the results data in a sheet called "Search Results".

Note:

You can upload a template containing charts and additional sheets referencing the main "Search Results" data sheet (for example through Pivot tables).

In this case, remember to put referencing elements to "auto-update on open" to update the sheet automatically when the Excel document is opened.

3.16.9. View System Information

The System Info page lists various system statistics. Click **Admin > Configuration > System Info** to view the system statistics and properties.

System Info

WebCenter usage info

Number of Projects 113342

Number of Documents per type

Graphics 21354

Digital Film 53

Cape 256

CHILI Package 599

Other 34012

Text Content 126

ArtiosCAD 9110

Page List 208

Collada 1681

User management info

Number of licences 45

Number of Users 11812

Number of guaranteed access Users 13

3.16.10. Troubleshooting Tool

If you experience some problems with WebCenter, or if you want some real-time information on your WebCenter system, you can run the **Troubleshooting Tool**. To do this, you can either:

- Go to **Admin > Configuration > Troubleshooting Tool** in the WebCenter user interface.
- Go to `http(s)://<server>/<instance>/tstools/index.html` in your web browser.

Note:

- You can run the tool from this web page even if your WebCenter server is not running (some tests will fail if WebCenter is not running).
- When running this tool as a non-Admin user, you can only execute simple tests (advanced tests require Admin access).
- You can execute all troubleshooting tests from localhost without the need to log in as an administrator. This can be done by accessing the Web Server machine and navigating to: <http://localhost:8081/<instance>/tstools/index.html>.

The tool starts automatically. For each test, the tool gives a status and some extra information. You can use this information to troubleshoot your WebCenter installation and, if you cannot solve the problem, to call Esko customer support.

Test status	Meaning
OK	The test was executed and everything works as expected.
BAD	The test was executed, it could be working, but something requires attention.
FAILED	The test failed. It is very likely that there is something wrong with the system.
SKIPPED	The test wasn't executed due to a lack of rights (you didn't log in as an Admin user) or because a previous (related) test failed.

Workflow Troubleshooting

If you run the test on the *Workflow Engine* at the *Troubleshooting Tools* page, it will result in :

- **OK** if the Workflow Engine is running
- **Bad** if the Workflow Engine is still starting up
- **Failed** if the Workflow Engine is not running.

You can also see the Workflow Database states such as :

- The total number of running workflows in the Workflow Engine
- The total number of tokens in these workflows
- The total number of triggers in these workflows
- The total number of wait triggers in these workflows

When you have a problem workflow, click on the **Details** section to know more about the specific **tasks** and **projects** creating issues. You will also see a tip describing how to resolve the problem.

Read <https://wiki.esko.com/pages/viewpage.action?pageId=170037353>.

3.16.11. Workflow Engine

Use the WebCenter Workflow Engine page when the workflows get stuck, fail to complete or when a workflow loops cause the system to crash. This is a convenient way to troubleshoot workflows.

Note: Since version 14, this component runs as a background process of JBoss running the workflows in WebCenter. For versions before WebCenter 14, the Workflow Engine runs along with the JBoss. Because of this, you have to restart the JBoss to restart the Workflow Engine.

To see the status of the Workflow Engine, go to **Admin > Configuration > Workflow Engine**.

- **Started** when the Workflow Engine is running (green)
- **Starting** when the Workflow Engine is still starting up (orange)
- **Stopped** when the Workflow Engine is not running (red)

To change the status, use the following controls:

- **Restart**
- **Start**
- **Stop**

This page also displays the data on:

- **The total number of running workflows in the Workflow Engine**
- **The total number of tokens in these workflows**
- **The total number of triggers in these workflows**
- **The total number of wait triggers in these workflows**
- **The number of workflow events per second:** This is the average number of Workflow Events per second generated by the Workflow Engine within the past 20 seconds.
- The workflow engine queues (**Queue Name**) and their **sizes**:
 - **Internal Event Processing Queue**
 - **Workflow Step Processing Queue**
 - **Trigger Processing Queue**

3.16.12. Cleanup Tool

When objects are deleted, they remain in the database marked as “Deleted”. To permanently clear this data, an off-line tool is used which can be scheduled for a time when the server load is low.

The Clean Up tool has to be run by System Administrator with operating system access to the WebCenter Application server. To run the tool at regular intervals, the Windows Task Scheduler can be used.

Running the Cleanup tool

- On the WebCenter Application Server operating system, navigate to `<WebCenter_install_directory> \ApplicationServer\Cleanup`.
- Execute the batch script ‘cleanup.bat’ (either by double clicking or executing in a command prompt). This will connect to WebCenter and instruct it to scan through the database and purge obsolete records.

The clean-up tool produces progress feedback in the displayed command prompt and also stores it in the log file. To view the log, go to:

- `<WebCenter_install_directory> \ApplicationServer\Cleanup\logs
\cleanup.log`

Inspecting Cleanup Tool Status from browser

You (Admin) can view the status in the **Admin > Configuration > Cleanup Tool** page. The following states are possible:

- **Running.** You can stop the tool by clicking the **Stop** button. You will be asked to confirm your stop action.
- **Stopping** – a stop request was submitted to the server, but the cleanup tool is not yet stopped. In this state, you cannot execute any action.
- **Stopped**
If the status is **Stopped**, you will be able to:
 1. Specify the **Minimal age of items to clean** (in hours). The default is 0 hours.
 2. Start the cleanup tool by clicking the **Start** button. If you **Start** the process, you will be asked to confirm your start action. As soon as the cleanup tool starts up, the status will change to **Running**.

Altering ProfileDefaults

You can prevent Stopping or Starting the Cleanup tool from browser.

- To prevent Stopping the Cleanup tool from browser, change the `ProfileDefaults` record `WC_CLEANUP_ENABLE_STOPPING` to "0" by either of the following methods:
 - Use the URL:
<WebCenterInstance>/siteconfig.jsp?key= WC_CLEANUP_ENABLE_STOPPING &value=0
 - or directly by a SQL script.
- To prevent Starting the cleanup tool from the browser, set the `ProfileDefaults` record `WC_CLEANUP_ENABLE_STARTING` to 0. You can use either of the following:
 - Use the URL:
<WebCenterInstance>/siteconfig.jsp?key= WC_CLEANUP_ENABLE_STARTING &value=0
 - or directly by a SQL script.

Note:

Once set, the value can no longer be changed from the `siteconfig.jsp`, but only altered in the database directly. This allows efficiently blocking these features from being executed from the browser.

3.16.13. Site Service

View Log Files

Go to **Admin > Configuration > Site Service** to:

- see system settings (click **Show Site Defaults**),
- set the maximum number of days to retain log files:

You can specify the **Max Age of JBoss Log Files** field as the number of **days** you want to retain the logs.

Important: If you set a very high number of days, it will affect your hard drive disk space over time. You have to watch the disk space and delete the log files manually.

- download **JBoss** and **Tomcat** log files.

3.16.14. Authentication

Single Sign-on allows you to use a centralized system for authentication. For instance, you can use a single credential on many systems including WebCenter.

You can configure:

- a single set of credentials for all systems (like LDAP)
- free access to WebCenter without a separate login page.

The two previously existing authentication mechanisms ([LDAP](#) and simple password authentication) have been modified adding extra flexibility. You can either make all users authenticate with LDAP by default or configure multiple LDAP servers.

Note:

You need a WebCenter Advanced License to configure more than a simple password authentication and one LDAP server.

Table: Single Sign On Definitions

Single Sign-On System	The system providing authentication, (e.g. yammer, SAML, LDAP)
System Administrator	The administrator who deals with WebCenter from both an application point view and from an IT (operating system and database) point of view.
Administrator	WebCenter Administrator
SSO plug-in (SSOP)	The full deployment of an integration with a Single Sign-On system. Will also be used as synonym for the implementation of the Java 'ServiceProvider' concept. The Service Provider is in fact part of the deployment of the plug-in.
Single Sign-On Instance configuration	Defines an Instance and its place (priority and availability) in the system.
Plug-in specific Instance configuration	Part of the instance configuration that may differ depending on the plug-in.
Single Sign-On Instance	A plug-in can have multiple instances. Its behavior is determined by the plug-in and the instance configuration.
User Configuration	Configuration information for a specific user
Instance Specific User Configuration	The user configuration dependent on the SSO instance.

	Note: This configuration is dependent on the instance and not the plug-in.
Standard Login Page Instance	The standard login page.
Custom Login Behavior Instance	The alternate page (or dialog) when a user is not authenticated.
Default Single Sign - On Instance	The instance that will be selected by default.
User	Has access to WebCenter after login.
Database	Relational database. The primary location for persisting data in WebCenter.

Add a plug-in to the system

You can add plug-ins that are not WebCenter standard by placing a set of `.jar` files in `<installation_root>/ApplicationServer/JBoss/sso-plugins` folder.

These files contain the plug-in implementation and the associated libraries. To remove a plug-in, you have to stop the application server. Restart the application server after replacing the `.jar` files.

Note:

1. You do not have to restart any of the WebCenter servers after installing a new plug-in.
2. When an Application Server is being updated, any existing SAML plugin version that might have been there already when updating is replaced with the latest version provided by the WebCenter installer.

Add a Single Sign-On Instance

1. From the **Configuration > Authentication (SSO)** page, click on the **New SSO Instance** link.

Note: You cannot have more than one **basic** authentication.

2. Give the new Instance a **Name**.
3. Select the **Plug-in** from the drop down.
The **Plug-in** drop down will display all the SSO Plug-ins available in that particular WebCenter.
4. Click **Create**.

When the instance is created successfully, you will return to the **Single Sign-On Instances** list. The new instance is also displayed as the last instance.

Manage Instances

Go to **Configuration > Authentication (SSO)** to get an overview of the configured **Single Sign-On Instances**.

Enabling the **Allow Project Managers to change their users' access to SSO instances** option will allow the Project Managers to modify their users **authentication** settings at the user **profile** page.

When this is disabled, Project Managers will be prevented from changing their user's access to SSO instances. The PMs will not be able to see the **Authentication** drop downs to the user's profile. In addition, the disabled instances will be hidden.

Single Sign-On Instances New SSO Instance

Allow Project Managers to change their Users' access to SSO instances.

Name	Plug-in	Password Recheck	ID	Priority	Enabled	Listed	Try Next	Configure	Default	Delete
Basic password authentication	Basic password authentication	Yes	00002_0000000244	1	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>		Allow	delete
SAML Esko	SAML 2.0 (v1.0.11)	No	00002_0000000247	2	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	edit	Allow	delete
LDAP	LDAP password authentication	Yes	00002_0000000245	3	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	edit	Deny	delete
Test SAML	SAML 2.0 (v1.0.11)	N/A	00002_0000000248	4	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	edit	Deny	delete

Name: Name of the Single Sign-On Instance. Will be used for display in multiple places.

Plug-in: Name of the plug-in to which the Single Sign On Instance belong.

Password Recheck: Whether a particular instance supports password re-entry (upon submitting approval) or not.

- **Yes:** if the system setting to re-enter password is enabled.
- **No:** if the re-entering of password is disabled.
- **N/A:** indicates that the information is currently not available. For example, if the instance is not enabled or fails to load.

ID: the internal ID. As an administrator, you can use this while addressing an SSO provider directly. For example, when redirecting from an external system.

Priority: determines the order in which the Instances are attempted for authentication. Also determines the display order in several places (user settings and log-in page).

Enabled: indicates whether the instance is operational. You have to enable an instance to use it for authentication. The options to change Instance specific user settings is only available for the enabled Instances.

Listed: indicates that an explicit log-in button will be available when the Instance is enabled.

Try Next: when this is enabled, the next Instance will be tried after the default log-in fails. The log-in attempts will stop at the first enabled Single Sign-On Instance when the **Try Next** option is disabled.

Configure: displays the **Edit** links to configure the plug-in specific instance configuration.

Default: you can configure whether a user is allowed to or denied from using an Instance. You can allow some users to authenticate at a specific Instance. The default can be changed in the user specific configuration.

Delete: use the **Delete** link to delete an Instance.

Configure a Single Sign On Instance

To access the Single Sign On Instance configuration page, click the **configure** link from the instances row.

1. Go to the **Configuration > Authentication (SSO)** page. You will see the *overview table* of the configured **Single Sign-On Instances**.
2. Click **Edit** link in the row corresponding to the Instance to be configured. This opens a plug-in specific configuration of an existing Single Sign On Instance.

Note: You cannot edit the **Basic Password** configuration.

3. Modify the configuration details.
4. **Save.**

To make it active, you need to check the **enabled** option. To make it listed on the login page, enable **listed**. When you create a new User, the login options are determined by the status in the **default** column.

If an instance is in the **denied** status for a user, he/she will not get that option listed on the login page. The status specified in this page becomes the default in the user profile page.

Single Sign-On Settings

You can view the Single Sign On settings specific to your User account in the **My WebCenter > My Password** page. This page will display the Single Sign On Instances that are enabled for your User account.

You may modify configuration details of the Single Sign On Instance depending on your permissions to do so. If you have permission to modify, all your values will be saved.

Note: User specific settings are possible when the Single Sign On Instance supports user specific configuration.

Configure LDAP(S)

LDAP

LDAP (Lightweight Directory Access Protocol) is an application protocol for querying and modifying directory services running over TCP/IP.

In the context of WebCenter, it allows you to let users sign on to WebCenter with the same user name and password they use to log on to the corporate network.

LDAPS

LDAPS is the more secure variant of the protocol, and it uses SSL connections instead of plain (i.e. Unprotected) connections. It requires you to install certificates on the server, as described in *Install Certificates for LDAPS on the Application Server* on page 63.

While logged in to the WebCenter web interface as an administrator:

1. From the **Configuration > Authentication (SSO)** page, click on the **New SSO Instance** link.
2. Give the new Instance a **Name** and select the **Plug-in** as **LDAP password authentication**.
3. Click **Create**.

A new LDAP instance will be created.

4. In the [overview table](#) of the configured **Single Sign-On Instances**, click **Edit** link corresponding to the LDAP instance.
5. Modify the configuration details.
6. Enter the name or IP address of the **LDAP Server**.
Example: `esko.com`.
7. Type the **User Distinguished Name (DN)**.
Example: `CN=BG System,OU=Users,OU=Gent,OU=Belgium,OU=Locations,DC=esko,DC=com`.
8. Provide the **Password** for the user you specified in the **User Distinguished Name** field in the previous step, and confirm it.
9. Enable the option **Use secure connection (LDAPS)** to encrypt all communication between WebCenter and the LDAP server.
10. You can specify additional elements in the **Advanced settings** field. For example, you can change the default port that is used in the case of LDAP over SSL. Use the various lookup keys to match the LDAP field against the WebCenter properties and then change the default LDAP keys. See below:

Options	Description
ssl.port	Default LDAP secure connection port The default value is 636.
lookup.userinitials	AD path used for LDAP login name lookup. The default value is <code>sAMAccountName</code> .
lookup.firstname	First name key <code>givenName</code> (default)
lookup.lastname	Last name key <code>sn</code> (default)
lookup.mailid	Mail id key <code>mail</code> (default)
lookup.phonenumber	Phone Number key <code>telephoneNumber</code> (default)
lookup.mobilenumber	Mobile Number key <code>mobile</code> (default)
lookup.title	Maps to the Function in WebCenter <code>title</code> (default)
autoupdate	Enable this to look up user info and to update during log in (values: 0 or 1). Specify the value as 1

Options	Description
	The default is 0.
enforce	Enable this to make the user info read only for the user (values: 0 or 1). The default is 0.

11. Click **Save** to save the setup.

Note: Every time you change a setting on the **LDAP Setup** page, you must re-enter the full LDAP credentials.

Single Sign On Log-in types

You will have different SSO login behavior depending upon the configuration and priority of the Single Sign On Instances.

- **Standard Login Page Instance (SLPI):**

This will show the login page when not logged in. LDAP and plain password authentication are examples.

- **Custom Login Behavior Instance (CLBI):**

CLBI might redirect you to a portal or show a dialog. SAML is an example of the CLBI type.

WebCenter 14.0.1 supports the SAML plug-in. Using this plug-in, WebCenter can communicate over the SAML 2.0 protocol with Shibboleth, PingFederate and Active Directory Federation Services (ADFS). WebCenter users can authenticate using their company-wide account. This will provide seamless access to WebCenter.

Note:

You need WebCenter advanced license to enable this feature.

The plug-in supports the following SAML 2.0 profiles:

- SP POST – IdP POST
- Unsolicited SSO (SP POST – IdP HTTP Redirect)

Note: SAML Artifact binding is not yet supported

Important: We recommend that you contact Esko solution architects for configuring the SAML plug-in.

You can also access the login page by directly navigating to login.jsp. The different login behaviors can again be triggered if the buttons for the wanted instances are listed on the login page.

A plug-in may override the logout behavior. For example, logging out may lead you to a portal.

Single Sign on Passwords on Approval

When the *Require password for approvals/rejections* setting is enabled, your user is required to provide his password during approval. This depends on the Single Sign On Instance used by the user.

When the Instance supports this setting, the password is the same as the one required for the Single Sign On authentication.

Note:

LDAP and basic password authentication support this setting. It is not expected to be supported by SAML.

Token Authentication

You can use **Token** based authentication to grant access to WebCenter without user credentials. For instance, you can grant access to the document approval page for approval actions using a document link.

- **Token:** A token is a piece of string that encodes various user data (username, expiration date, signature, etc.) which acts as a substitute for credentials.
- **TokenAuth:** The WebCenter SSO plugin that is able to generate such tokens for WebCenter users and authenticate users based on these tokens. This is installed during WebCenter installation.:

To allow Token based authentication, follow the steps below

1. [Add a Single Sign-On Instance](#) on page 417 specifying a **Token Authentication** plugin.
2. [Configure a Single Sign On Instance](#) on page 419. Make sure that the instance is in the **Allow** status.

3. Specify the **Enable link expiration** and **Validity** parameters and Save.

The **Enable Link Expiration** is on by default and the **Validity** is set to 60 days. This means that all the links sent to authenticate using this instance will be expired after the **validity** period.

4. To send a login link to a User, click **Mail Login Link** from the User **Profile** page. The user can click on this link to login.

The default landing page is the **My Work** page. If the token is expired, the user will see the Login page with an error.

Whenever the token-authenticated user receives a notification with a link, the link contains a token to authenticate without user credentials. This permits the users added to the approval cycle to log in using the approval links from the notification mails.

SAML Authentication

The SAML plugin will make it possible for WebCenter to communicate over the SAML 2.0 protocol with Federated Identity Provider Services such as Shibboleth, PingFederate and Active Directory Federation Services. This allows the users to authenticate through a Single Sign On (SSO) mechanism with WebCenter using their federated identity.

The configuration page of an instance of the SAML 2.0 (v1) plugin consists initially out of four sections:

- **SAML Profile** – Used to specify which SAML profile to use.
- **Identity Provider Details** – Used to specify and submit metadata of the Identity Provider, as well as configuring general customer specific settings.
 - **Identity Provider Metadata:** Update the URL to the meta data of the IdP or alternatively upload a file containing the information.
 - **Identity Provider Entity ID:** Specify the ID to be selected from the metadata
 - **Links WebCenter Username to :** specify the field where WebCenter will look for the User name in the response. It can either be Subject Name ID or the Attribute where you specify the Attribute Name.
 - **On error URL :** specify the URL where the user will be redirected when error occurs in the authentication process
 - **On Logout URL:** specify the URL where the user will be redirected during the Logout process
- **WebCenter Service Provider Details**
 - **Entity Id:** This id will be auto generated when you save this page. By Default it points to the current WebCenter Instance.
 - **Assertion Consumer URL :** This URL will be auto generated when you save this page.
 - **Name Id Format:** Specify the format of Name Id of the subject.
 - **Formatting:** Select **Use URL Parameters** if URL parameters has to be used in Assertion Consumer Service URL.

Example:

https://domain.com/WebCenter_Inst/sso.wcr?ssoiid=00002_0000000004

Or:

https://domain.com/WebCenter_Inst/sso.wcr/00002_0000000004/end.wcr

- **Signing:** If the request has to signed, upload the signing certificate.
To be able to sign these outgoing authentication requests, WebCenter needs a private key and its corresponding certificate. These can be uploaded in a Java keystore in the

“SP Keystore” field. This field appears along with the “Keystore Password”, the “Key Alias” and the “Key Password” fields when the “Sign Authentication Requests” option is enabled.

- **User Provisioning:** Enable the option **Allow User Creation on First Login** to create new user in WebCenter.

Following SAML attributes are required for the new user creation.

Attribute name	Type	Containing	Required
WCR_USER_FIRST_NAME	String	The first name of the user.	No
WCR_USER_LAST_NAME	String	The last name of the user.	Yes
WCR_USER_EMAIL	String	The email the user.	Yes
WCR_USER_PHONE	String	The phone number of the user.	No
WCR_USER_MOBILE	String	The mobile number of the user.	No
WCR_USER_FUNCTION	String	The job title of the user	No
WCR_USER_GROUPS	(Multi) String	The names of the WebCenter groups to which the user should be added.	No

- **Authorization:** Select **Synchronize User Groups on login** to synchronize the user membership with the groups when the user log-ins to WebCenter.
- Save the changes and enable the SSO Instance in **Single Sign-On Instances** page.

Now the IdP details from the URL or the uploaded file is displayed.

Check the information updated by clicking on **WebCenter Service Provider Metadata** which is used to display the Service Provider metadata of WebCenter. This information can now e shared with Identity provider.

How to Login to WebCenter when the Single Sign On is broken

You can access WebCenter overriding the Single Sign On configuration in emergency situations. This can happen when the configured external system is down or when a mistake occurs leading to a broken configuration.

Use basic password authentication locally from the web server to gain access to WebCenter.

Note:

- You need direct access to the web server operating system to execute this.
- You have to remember a basic authentication password of a WebCenter Admin user. Or you should have enabled **Forgot Password** feature.

3.17. Configure Microsoft Office Files for Viewing

You can view Microsoft Office documents (and other file types) in WebCenter (16.1 onwards). This feature requires configuration where you should specify the file extensions and corresponding OBGE Workflow tickets.

Read in [Configure Viewable Other File Types](#).

3.17.1. Steps to Configure Viewable Other Files

1. Modify: `WebCenter_Instance/custom/customizationConfig.xml`.

Inside this configuration file, add a 'SupportedViewableOther' section. Within that tag, you can place multiple instances of the extension tag, where you can define the file extension and the value for ViewGenerationTicket (which refers to a Ticket on the OBGE).

```
<SupportedViewableOther>
  <extension value=".doc" ViewGenerationTicket="MSOffice_to_SVG"/>
  <extension value=".docx" ViewGenerationTicket="MSOffice_to_SVG"/>
  <extension value=".ppt" ViewGenerationTicket="MSOffice_to_Pixel"/>
  <extension value=".pptx" ViewGenerationTicket="MSOffice_to_Pixel"/>
  <extension value=".xls" ViewGenerationTicket="MSOffice_to_SVG"/>
  <extension value=".xlsx" ViewGenerationTicket="MSOffice_to_SVG"/>
</SupportedViewableOther>
```

Note: WebCenter allows deployment of multiple web instances on one server and the configuration of customizationconfig.xml is done per instance. However, the Workflow Engine is shared across all instances. To push a configuration to all instances, add the following to the customizationconfig.xml file:

```
<MainInstance value="true"/>
```

2. You need to create Custom Workflow Tickets (with a ScriptRunner Node) for OBGE according to the mapping made in the customizationconfig.xml. See the examples for such Workflow Tickets in [Recommendations and Examples](#) on page 426.
 - The ScriptRunner node should refer to the right server (can be the OBGE itself) where the right conversion Script is located.

Read more in: [Pixel Based Viewing Vs SVG Viewing](#) on page 425

3.17.2. Pixel Based Viewing Vs SVG Viewing

You can view documents in pixel based or vector based formats depending on the view files that are generated (as specified in the [configuration](#)).

Pixel based viewing

Use the pixel based setup if you need the graphical compare and channel information for the documents. This setup will not render sharp text or text extraction.

To enable pixel based viewing, we propose the following structure in the OBGE Workflow Ticket:

- A **Scriptrunner** node to convert *Other* document to a viewable type, e.g. PDF.
- A **Select Document** node to select the generated document.
- A **Prepare for Viewing** node to generate the pixel-based view files.
- A **Scriptrunner** node to remove the temporary files created in the first step.

See [Recommendations and Examples](#) on page 426.

Vector based viewing

A vector based setup will enable you to extract text and view sharp text in deep zoom viewing. However, the graphical compare and channel information are deactivated in this setup.

To enable vector based viewing, we propose the following structure in the OBGE Ticket:

- Configure **Scriptrunner** node to convert *Other* documents to SVG files.
- For single page documents, an SVG should go straight into the **Job** folder, which is passed as a parameter to the script.
- For multi-page documents, an SVG for each page should go into a sub-directory of the Job Folder with the page number as folder.
- We recommend generating a thumbnail for each page in the Script file. These need to go in the same folder as the SVG file. The following files are needed:
 1. <Document_name>.JPG, which is 200x200 pixels
 2. <Document_name>_50.JPG, which is 50x50 pixels
 3. <Document_name>_100.JPG, which is 100x100 pixels

See [Recommendations and Examples](#) on page 426.

3.17.3. Recommendations and Examples

The setups detailed below will create 'viewable files' in two steps. The Microsoft Office documents will be converted to PDF. In the next step, the PDF documents will be converted into SVG view files or pixel based view files.

We recommend LibreOffice to convert the document to a PDF. This will just execute a "Save as PDF" on the document. You can use MS Office which requires licensed MS Office to be present on the server.

The recommended solutions given below refers to the Tickets and Scripts given in the example folder.

Note: Remember to fill out the file paths mentioned in each of these Scripts.

See this [KB Article for example scripts and tickets](#).

3.18. Connecting to Automation Engine

You can connect to your or a client's Automation Engine from WebCenter. Using this connection, you can:

- send files
- push metadata
- launch a workflow

To establish a successful connection, you need to configure both the Automation Engine and the WebCenter settings.

Read about configuring the Automation Engine [here](#).

You can connect to Automation Engine:

- in the same LAN or publicly available through an **Automation Engine Host Address**

Tip: The Host Address may look like '192.168.1.1' or 'aeserver.brand.com'.

- via a tunnel when not publicly available or not in the same LAN. Read in: [Create a Tunnel between WebCenter and Automation Engine](#) on page 427

3.18.1. Create a Tunnel between WebCenter and Automation Engine

When the Automation Engine is not situated in the same LAN and not available publicly, you need a tunnel to send exchange workflow commands and data between WebCenter and Automation Engine. To create such a tunnel, follow the steps below:

Web

1. [Create a Workflow approval and tunnel client](#).

When WebCenter and Automation Engine are not on the same LAN, this **workflow approval and tunnel client** will establish a bi-directional communication.

Note: The Automation Engine Pilot needs to have the **workflow approval client** credentials to send messages to WebCenter.

2. Enter the **Workflow approval and tunnel client** credentials in the Automation Engine configure tool.

Fill out the client **Name** and **Password** and click the **Check Connection** button. This will check if the user can log on successfully.

3. **Save** this configuration.

Tip: After configuring a new WebCenter site, it is recommended to close your Pilot and start it again in order to see the updated list of WebCenter sites in your tickets.

4. Optionally, you can check the connection between Automation Engine and WebCenter from the **admin > configurations > workflow and tunnel clients** page. Click the **Start Monitoring** link to see if the connection is active.
5. Click **Admin > Configuration > Workflow Connections**.

The **Workflow Connections** page appears, listing the workflow connections already created (if any).

6. Click **New Workflow Connection**.
7. Enter a **Configuration Name**.
8. Select the **Connection type** as **JDF Service**.
9. Now, specify the **JDF Service** as **JMF** service.

Note: You need **JMF Service** to connect to Automation Engine if it is not in the same LAN or not publicly available.

10. Specify that your Automation Engine is connected via the **Approval and Tunnel Client** created in step 2. Select the **Approval and Tunnel Client** from the drop-down and click **Generate URL**.

Warning: A **Workflow Connection** connected through an **Approval and Tunnel Client** will block one concurrent license.

11. Enable the **Active Connection** option to activate this workflow connection.

Note:

If you disable this option, there will be no synchronization between WebCenter and your workflow system, but the connection data will be saved, so you can reactivate it later.

12. Click **Create**.

3.19. SmartNames

A SmartName is a variable that refers to a value that is resolved according to the context, for example `[Project Creation Date]` refers to the creation date of the current project. It is a placeholder value for a property which will be replaced with an actual value when placed in the right context.

You can use SmartNames in different pages in WebCenter. They are displayed between square brackets.

Folder:

You can also combine them with plain text.

Folder:

Using SmartNames to specify a setting ensures that you can use the existing information without having to remember it and thereby reducing errors.

For example, if you use [Parent Project Name], the smartname will resolve to the name of the existing Parent project(s) taking the current Project as the search context.

3.19.1. Using a SmartName

You can use SmartNames anytime you see the SmartName symbol  in a text field.

1. Click .
2. In the **Select to append a SmartName** field or **Insert a SmartName** dialog, select the desired SmartName using one of the following methods:
 - a) During the **autoname** generation, browse to the desired SmartName in the **Select to append a SmartName** field and select.
Alternatively, you can also double-click the SmartName.
 - b) In the **Search** using SmartNames, you can scroll in the main **sections** list and double-click on the desired SmartName.
You can also search for a SmartName.
 - The search field has support for AND and OR operators.
 - Spaces can be used and will act as AND operators.
 - Semicolons can be used and will act as OR operators.
 - You can place your search term inside double quotes ("") when an exact match is required.

Tip:

- You can type the first letters of the SmartName you are looking for to show it in the list.

3.19.2. List of Available SmartNames

The following is the list of available SmartNames

Section	SmartName Available	Workflow	Search	AutoName
Attributes (Document)	All WebCenter attributes are available in both Workflow and search	#	#	
Attributes (Project)	All WebCenter attributes are available in both Workflow and search	#	#	
Document	[Document Description]	#		
	[Document Extension]	#		
	[Document ID]	#		
	[Document Name]	#	#	
	[Document Version ID]	#	#	

Section	SmartName Available	Workflow	Search	AutoName
	[Document Version Number]		#	
	[All Document Version IDs of Document]		#	
	[All except Latest Document Version ID]		#	
	[Document Version Revision]		#	
	[Document Version Project]		#	
Other	List	#	#	
Project	[Customer Legal Name]	#		
	[Customer Location]	#		#
	[Customer Name]	#		#
	[Customer ShortName]	#		#
	[Due Date]	#		
	[Project Description]	#		
	[Project ID]	#	#	
	[Project Name]	#	#	
	[Project Manager]	#		
	[Project Manager Name]		#	#
	[Project Manager Location]		#	#
	[Project Manager Location Code]		#	#
	[Project Manager Last Name]		#	#
	[Project Name]	#	#	
	[Project Template Name]		#	#
	[Parent Project ID]		#	
	[Customer Location Code]			#
	[Salesperson]	#		
[Project Creation Date]			#	
Specifications	All WebCenter Specification available only in Workflow	#		
Task	[Workflow ID]	#		
Text/Table Content	[Content Status]	#		
	[Element Type]	#		
	[Language Status]	#		

Section	SmartName Available	Workflow	Search	AutoName
	[Master Languages]	#		
	[Text Content Value]	#		
	[Table Content Value]	#		
	[Translation Languages]	#		
Dates	[Current Date]	#		
	[Project Due Date]	#		
	[workflow Due Date]	#		
	[workflow Start Date]	#		
User	[Requestor User Name]		#	#
	[Requestor First Name]		#	
	[Requestor Last Name]		#	#
	[Requestor Location]		#	#
	[Requestor Company]		#	#
	[Requestor Company Location Code]		#	#
Email	[Project Manger (E-mail)]	#		
	[Sales Person (E-Mail)]	#		
	Workflow Task Owner (E-Mail)]	#		
Groups	All Groups available in WebCenter	#		
Roles	All Roles available in WebCenter	#		
Users	All Users available in WebCenter	#		
Iteration	Iterator Value	#		

Note: The **EditField** SmartName can be used only in the Suffix.

3.20. Bill of Materials

3.20.1. What is a Bill of Materials?

A Bill of Materials (or "BOM") is a list of all parts and assemblies required to build a complete shippable product. It shows what will be created and delivered during a project.

In WebCenter, this is a list of documents representing the deliverables. The documents can be actual production files or placeholder documents.

3.20.2. Enabling the Bill of Materials Feature

By default, the Bill of Materials functionality is disabled for the entire WebCenter system. This means that Bill of Materials features will not be visible.

To enable it, do the following:

1. Go to **Admin > Preferences > General**.
2. Under **Bill of Materials**, select the **Use Bill of Materials** option.
3. Click **Save**.

3.20.3. Viewing a Project's Bill of Materials

Every project has a Bill of Materials, which is by default empty.

If *the Bill of Materials feature is enabled*, you will see a **Bill of Materials** tab on your Project Details page. The tab header indicates how many documents are linked to the Bill of Materials.

Note:

You will only see the document(s) in the Bill of Materials (and their attributes) if you are either:

- an Administrator,
- the Project Manager,
- invited to the Project, with view permissions on **all** documents in the Bill of Materials.

Otherwise, you will see a message stating that you don't have permissions to view the document(s) in the Bill of Materials.

Upload Copy Add to Bill of Materials

Save

When clicking this tab, you see the documents in the Bill of Materials, with information about the documents (folder, version, approval cycle, tasks...) and their **Count**. This indicates how many copies of that document are required for that project's Bill of Materials.

Note: The count is specific for a document within a project. This means that the same document can be linked in multiple projects with a different count.

If a document has an attribute category assigned, you will see a + button. Click it to show its attributes (in list view), and click - to hide them again. To show/hide the attributes of all documents in the BOM, click + or - in the header of the table.

Tip: By default, the "Default" view for the attribute category is displayed, but if the attribute category has a view called "BOM", this view is shown.

3.20.4. Editing the Bill of Materials

Who Can Edit the Bill of Materials?

Administrators and the Project Manager can always change the Bill of Materials. Other members can be allowed to change it, if they have the **Change BOM** permission. This permission can be set on the project's **Security** page (see *Project and Document Security* on page 809 in the User Guide).

Note: You can only set the **Change BOM** permission at the Project level, not at the folder level.

If a user can change the attributes on the attributes page, he/she can also change them on the Bill of Materials page.

Table: Permissions on Bill of Materials Documents

	Administrators	Project Managers	Users with Change BOM Permission	Users without Change BOM Permission
Can add/remove documents to/from the BOM in active projects	YES	YES	YES	NO
Can add/remove documents to/from the BOM in inactive projects	YES	YES	NO	NO
Can change the count of BOM documents	YES	YES	YES	NO

Adding Documents to the Bill of Materials

You can only add documents to the Bill of Materials if:

- you are an Administrator,
- you are the Project Manager,
- you have **Add** and **Change BOM** permissions on the Project.

Adding Documents to the Bill of Materials at Project Creation

If you want Project Managers to be able to already add documents to the Bill of Materials when creating a Project, do the following:

1. As an Administrator, go to the Project or Template that Project Managers will use to create Projects, and click the **Configure** tab then **Project Creation**.

Tip: Use a Project or Template that contains a Bill of Materials with documents if you want Project Managers to have the option to copy these documents into their new Project's Bill of Materials.

2. Select the **Show** check box for the **Change Bill of Materials** option.

If you want Project Managers to have to add **at least one** document to the BOM when creating the Project, also select the **Required** check box.

Click **Change**.

3. When a Project Manager creates a Project from that Project or Template, he/she will see a **Bill Of Materials** section on the Project creation page.
 - when creating the Project from a Template, that section will contain the documents in the Template's Bill of Materials.
 - when creating the Project from a Project, he/she will have to choose whether to copy the documents from that Project's Bill of Materials into the new Project's Bill of Materials.

To copy them, the Project Manager should select **including BOM** in the **Copy setup from an existing project** pop-up.

Note: A Project Manager will not see a **Bill Of Materials** section on the Project creation page when creating a blank Project.

4. The Project Manager can still edit the Bill of Materials while creating the Project. He/she can:
 - add documents using the *Upload*, *Copy* and *New* links,
 - remove documents by clicking the - buttons in their rows,
 - change the **Count** of Bill of Materials documents,
 - edit the documents' attributes (by clicking + and filling them in).

Add Documents from the Bill of Materials Tab

From the Project's **Bill of Materials** tab, you can:

- *Upload a new document from your computer or network.*
- *Copy a document from another Project.*
- *Create a placeholder document from a document template.*
- *Add a document already in the Project to the Bill of Materials.*

Upload a Document from your Computer or Network

To upload a document into your Project's Bill of Materials:

1. Click **Upload** at the bottom of the **Bill of Materials** tab.
2. Click the **Browse** button and browse to your document.
3. If desired, select a *document template* to use for your document.

Note: This is only available if the Project has been created from a Project/template containing document templates, or if the Project itself has document templates configured.

The template you choose will determine what attributes are associated with the document.

If you don't select a document template, the document will have the attribute category associated with its document type in the **Configure > Document Creation** tab of the Project (see *Document Types* on page 162).

4. Fill in the attributes associated with the document (at least the required ones).
5. If desired, enter a new **Name** and a **Description** for your document.

Note: If *Automatic Document Naming* is set up for *document creation* in the Project, the **Name** will be created automatically (you cannot enter it).

6. Enter the **Count** of this document (how many copies are needed for the Bill of Materials).

This can be a fraction or a decimal number.

7. Choose where to upload the document (in the Project's **Root Folder** or one of its sub folders).

Choose **Default (Template)** if you want to use the folder defined in the document template you selected.

8. Click **Save**.

Copy a Document from Another Project

To copy a document from another project into your Project's Bill of Materials:

1. Click **Copy** at the bottom of the **Bill of Materials** tab.
2. Select a Project (or start typing a Project name) in the second drop-down list.
3. Select a document in that Project (or start typing a document name) in the third drop-down list.
4. If desired, select a *document template* to use for your document.

Note: This is only available if the Project has been created from a Project/template containing document templates, or if the Project itself has document templates configured.

The template you choose will determine what attributes are associated with the document.

If you don't select a document template, the document will have the attribute category associated with its document type in the **Configure > Document Creation** tab of the Project (see *Document Types* on page 162).

5. Fill in the attributes associated with the document (at least the required ones).
6. If desired, enter a new **Name** and a **Description** for your document.

Note: If *Automatic Document Naming* is set up for *document creation* in the Project, the **Name** will be created automatically (you cannot enter it).

7. Enter the **Count** of this document (how many copies are needed for the Bill of Materials).
This can be a fraction or a decimal number.
8. Choose where to upload the document (in the Project's **Root Folder** or one of its sub folders).
Choose **Default (Template)** if you want to use the folder defined in the document template you selected.
9. Click **Save**.

Create a Placeholder Document from a Document Template

To create a placeholder document from a *document template*:

Note: This is only available if the project has been created from a project/template containing document templates.

1. Click **New** at the bottom of the **Bill of Materials** tab.
2. In the pop-up that opens, select the document template to use and click **OK**.
The template you choose will determine what attributes are associated with the document.
3. Fill in the attributes associated with the document (at least the required ones).
4. If desired, enter a new **Name** and a **Description** for your document.

Note: If *Automatic Document Naming* is set up for *document creation* in the Project, the **Name** will be created automatically (you cannot enter it).

5. Enter the **Count** of this document (how many copies are needed for the Bill of Materials).

This can be a fraction or a decimal number.

6. Choose where to upload the document (in the Project's **Root Folder** or one of its sub folders).

Choose **Default (Template)** if you want to use the folder defined in the document template you selected.

7. Click **Save**.

Add a Document Already in the Project to the Bill of Materials

To add a document already in the Project to the Bill of Materials:

1. Click **Add to Bill of Materials** at the bottom of the **Bill of Materials** tab.
2. Select the Project document to add to the Bill of Materials.
3. Enter the **Count** of this document (how many copies are needed for the Bill of Materials).

This can be a fraction or a decimal number.

4. Click **Save**.

Tip: In the Project's **Documents** tab, documents that are in the Bill of Materials have a BOM icon . You can click this icon to see the Bill of Materials.

Add Documents from the Documents Tab

You can add documents that are already in the Project to the Project's Bill of Materials.

To do this, select the document(s) to add and click **Actions > Add to Bill of Materials**. This adds the document to the Bill of Materials with a count of 1.

Add Documents from the Upload Page

You can also add a document to a Project's Bill of Materials while uploading a document using the **Upload** button. You just need to select **Add to Bill of Materials** and specify a **Count** (see [Uploading a Document via Upload](#) on page 587).

Note:

You can only do this if:

- you are an Administrator,
- you are the Project Manager,
- you have the **Change BOM** permission.

Add Documents from a Workflow

You can add documents to the Bill of Materials automatically using the workflow's **Add to Bill of Materials** task.

In the task's **Parameters**, you can set the documents' **Count**.

Tip: You can use a SmartName (for example a document or project attribute) to set the count.

Here is an example workflow using the **Add to Bill of Materials** task:

Tip: You can use the **Select Document** task to select all the documents in the BOM (select the **Documents in the Bill of Materials** option in the **Parameters**).

Add Documents from Automation Engine

You can add documents to a WebCenter Project's Bill of Materials using the Automation Engine **Publish on WebCenter** task (from Automation Engine 12.1).

When you publish an Automation Engine **Product** to WebCenter, the **Product Properties** and **Product/Product Part Parameters** will be taken as WebCenter attributes.

If there are existing WebCenter attributes with corresponding names, their values will be updated during publishing.

The following Product (Part) properties and Product (Part) Parameters are synchronized with WebCenter attributes:

Automation Engine Properties/Parameter	WebCenter Attribute (Internal name)
Product Customer Reference	ae.p.cusref
Product Custom Field 1	ae.p.category1
Product Custom Field 2	ae.p.category2
Product Custom Field 3	ae.p.category3
Product Internal ID	ae.p.id
Product ID	ae.p.prodid
Product Name	ae.p.name
Product Description	ae.p.desc
Product Part Internal ID	ae.ppid
Part Default Angle	ae.pp.defaultangle

Automation Engine Properties/Parameter	WebCenter Attribute (Internal name)
Part Default Dotshape	ae.pp.defaultdotshape
Part URL	ae.pp.url
Part Default Ruling	ae.pp.defaultruling
Part Preferred InkBook	ae.pp.preferredinkbook
Part Preferred InkBook UI	ae.pp.preferredinkbookui
Part Internal ID	ae.pp.id
Part Custom Field 3	ae.pp.category3
Part Custom Field 2	ae.pp.category2
Part File	ae.pp.file
Part Status	ae.pp.status
Part Status Nickname	ae.pp.status_nickname
Part Status User	ae.pp.status_user
Part Status Notes	ae.pp.status_notes
Part Status Date	ae.pp.status_date

When a **Product** or **Product Part** is published, corresponding WebCenter documents are automatically added to the **Bill Of Materials** of the Project.

The **Product Amount** for the Job (if given) becomes the **Count** property of the **Bill of Materials**.

Removing Documents from the Bill of Materials

To remove a document from the Bill of Materials, select it in the **Bill of Materials** tab and click **Actions > Delete from Bill of Materials**.

Note: Removing a document from a Project (or moving it outside that Project) removes it from the Project's Bill of Materials as well.

3.20.5. How to Search for a Bill of Materials

Search for Projects that have a Bill of Materials

When searching for Projects using the *normal search*, you can specify that you only want to see Projects that have a Bill of Materials. To do this, select **Only Projects with Bill of Materials** in the **Bill of Materials** option.

Viewing the Bill of Materials in a Project Search

When searching for Projects, you can view a summary of the Bill of Materials documents per approval status for each Project found.

To do this, just select the **View (List)** option for **Bill of Materials** on the **Search For Projects** page. See *Search Result Options* on page 554 in the User Guide for more information about displaying search results.

Search Results Save This Search Save Search Results

Name ↑	Status	Bill of Materials
 Demo_00001	Platemaking	      1 1 2 1 5
 Demo_00002	Platemaking	   1 5 6
 Demo_00003	Platemaking	 1
 Demo_0004	Active	 1
 Demo_0005	Active	 1

In the **Bill of Materials** column on the **Search Results** page, you can view the number of:

-  approved documents,
-  force approved documents,
-  rejected documents,
-  force rejected documents,
-  documents waiting for approval,
-  documents with a paused approval setup,
-  documents without an approval setup,

-  (all) documents,
... in each Project's Bill of Materials.

Tip: Click one of the approval statuses' icons (for example pending ) to show the BOM documents with this status.

3.20.6. How to See if a Document is Part of a Bill of Materials

In the Project's **Documents** tab, documents that are part of the Bill of Materials have a BOM icon . You can click that icon to go to the Project's Bill of Materials page.

On the **Document Details** page, the BOM icon  indicates whether the document is a part of a Bill of Materials. You can also click that icon to go to the Project's Bill of Materials page.

Note: A document can be part of more than one Project's Bill of Materials (if it is linked into multiple Projects).

3.20.7. Bill of Materials History

You can see all changes made to your Project's Bill of Materials in the **Project History**.

You can see for example:

- new documents added to the Bill of Materials,
- documents removed from the Bill of Materials,
- changes to a document's count.

3.20.8. Email Notifications for Bill of Materials Changes

To send email notifications when something has changed in your Bill of Materials:

1. In your Project, go to the **Notifications** tab and select who to **Notify by E-Mail** in the **Bill of Materials Changed** row.
2. Click **Save**.

The recipients will get emails when:

- a document is added to the Bill of Materials,
- a document is removed from the Bill of Materials,
- a document's count is changed.

3.20.9. Working on the Bill of Materials from ArtiosCAD Enterprise

With ArtiosCAD Enterprise, you can see all your Projects and (ArtiosCAD) documents from WebCenter.

If you open a document in ArtiosCAD Enterprise, you can go to the Project's Bill of Materials and see a list of all the Bill of Materials documents.

Note: You need ArtiosCAD Enterprise 12.1 to work with WebCenter Bills of Materials.

In ArtiosCAD Enterprise, you can:

- change the count of ArtiosCAD files in the Bill of Materials,
- add a document revision (A, B, C...) to an ArtiosCAD file (this is shown in the **Version** column of the **Bill Of Materials** tab, and in the document's **Action History**),

Note: When you work with revisions on a Bill of Materials document, the latest version within a revision is the version in the Bill of Materials.

- add a print item to an ArtiosCAD file (this is shown in a separate column in the **Bill Of Materials** tab),
- change the order of the Bill of Materials documents.

Once you click **OK**, this is updated in WebCenter.

Note: You cannot add a document revision or a print item to an ArtiosCAD file, or change the order of the Bill of Materials documents from WebCenter.

3.21. Autonaming

3.21.1. Autonaming Projects / Documents

An administrator can configure a setup for automatically naming the projects and documents. You can specify the rules for both **Project** and **Document Autonaming**.

Note: By default, this feature is not enabled.

Autonaming Structure

An **Autoname** consists of a **Prefix**, **Suffix** and **Counter Length**.

A **Counter** keeps track of the count when a new project is created or when a new document is uploaded. The **Counter Length** is the fixed length of the Counter.

For example; If the **Prefix** is **begin_**, **Suffix** is **_end** and the **Counter Length** is set to **4**, then the Autaname will be **begin_0001_end**. The next one will be **begin_0002_end**.

Note:

The Project / Document **Autonames** are generated during the Project creation or Document submission.

Note:

- The Prefix field cannot be empty. The Prefix and Suffix fields are limited to 150 characters for Counter Length field is 20.
- If the counter length is 0 or left empty, no numeric part will be added to the Autaname. The maximum characters for Counter Length is set to 20.

Autonaming Projects

You can configure Autonaming for Projects in the following ways:

- [Systemwide Project Autonaming](#) on page 443
- [Autonaming in Projects / Templates](#) on page 443

Systemwide Project Autonaming

You as an administrator can enable/disable systemwide **Project Autonaming**.

1. Log in to WebCenter as an Admin user.
2. Click **Admin > Preferences > General**. The General page appears.
3. In the **Project Autaname Generation** section, specify appropriate **Prefix**, **Suffix** and **Counter Length**.

Click to select required SmartNames. The **EditField** SmartName can used only in the Suffix.

Enable **Use Automatic Naming for Creation of Blank Projects** to apply the autoname generation settings for projects created from a blank template.

4. Click **Save** to make the changes.

Autonaming in Projects / Templates

Use template based **Autonaming** setup to apply automatic naming to the Projects created from a Template or another Project.

Note: If you setup **Autonaming** in an existing template, only the future Projects will be named automatically.

Note: When you setup Autonaming in a template, only the future projects will be named automatically. It does not alter the existing Projects created from the same template.

1. Log in to WebCenter as an Admin user.
2. Click **Admin > Project Management > Projects** or **Templates**.
3. Choose the Project or Template and go to **Configure > Project Creation** tab. Enable the **Use Automatic Naming** option. Then select:
 - **Use Custom Automatic Naming** to specify an automatic naming setup just for this **Project** or **Template**.
 - **Use Default Automatic Naming**, if you have configured [Systemwide Project Autonaming](#).
You can apply the same settings by selecting the **Use Default Automatic Naming** option.
4. If you select the **Use Custom Automatic Naming** option, you have to enter the text boxes with appropriate **Prefix**, **Suffix** and the **Counter Length**.

Note: Click to select required SmartNames. The **EditField** SmartName can be used only in the Suffix.

5. Click **Change** to make the changes.

Systemwide Autonaming for Different Document Types

The administrator can set up the document **Automatic Document Naming** settings per Document Type in the following ways:

- [System-Wide Document Autonaming](#) on page 444
- [Template/Project-based Document Autonaming](#) on page 445

System-Wide Document Autonaming

The administrator can set up the document **Automatic Document Naming** settings per Document Type.

The options available are None or Custom Automatic Naming options. The Custom option allows you to customize the required autoname setup.

The option **Apply Automatic Naming to Documents in Blank Projects** allows you to setup autoname generation for blank documents also. The **Apply Default Attribute Categories to Documents in Blank Project** option allows you to add the default attribute category to documents which exists in blank projects. For example: If you upload abc.ard file and the Prefix is **[FolderName]** the Counter Length is set to **4** and the Suffix is empty, then the autoname will be generated as **DESIGN_0001.ard**.

Using the **Scope of the Counter** option the administrator can specify whether the counter will continue counting system wide, or whether it will reset for every project. If the option **Reset per Project** is selected then, autoname will be generated as begin_0001_end and next document will be begin_0002_end and so on.

If **System wide Counter** is selected and files already exists, autoname will be generated as begin_0098_end and next can be begin_0112_end. The counter here depends on the number of files which are uploaded to the system and not on each of the project.

1. Log in to WebCenter as an Admin user.
2. Click **Admin > Preferences > Document Types**. The Document Types page appears.
 - Select the **Apply Automatic Naming for Creation of Blank Projects** check box to apply the autonaming setup to the Projects created from blank template.
3. Set the corresponding **Automatic Document Naming** field to **Custom..** Read more in: [Document Type Preferences](#) on page 104
 - a) Specify a **Prefix, Suffix** and the **Counter Length**. Read also: [Autonaming Structure](#) on page 442
 - b) Specify the **Scope of the Counter**.
 - c) Optionally, you can enable **File Extension Specific Counter** for autonaming. This will make sure that you have different counters for different types of documents.

If the option **Reset per Project** is selected, the Autonaming will be reset in every project and the counter depends on the documents uploaded to any single Project.

If **System wide Counter** is selected, the Autoname will be generated counting the existing files (for example: begin_0098_end). The counter here depends on the number of files which are uploaded to the system and not on each of the project.

Note: Click to select required SmartNames. The **EditField** SmartName can used only in the Suffix.

If you upload abc.ard file to the folder Design where the Prefix is **[FolderName]**, the Counter Length is set to **4** and the Suffix is empty, the name of the document would be **DESIGN_0001.ard**.

4. Click **Save** to make the changes.

Template/Project-based Document Autonaming

- **Template/Project-based document autonaming:** The administrator can set up the document auto name settings per document type on the Document Types page. The Document Types page allows to enable/disable specific document types and is extended to also have a section for setting auto naming details per document type. The administrator can specify Prefix, Suffix and Length for each of the Document Types available.

Note:

Only newly uploaded documents will have the correct auto naming settings applied to them.

When the option **Apply automatic naming to Documents in Blank Projects** is selected, the default settings will be used when uploading documents in projects which are created without a template.

Using the **Scope of the Counter** option the administrator can specify whether the counter will continue counting system wide, or whether it will reset for every project.

If the option **Reset per Project** is selected then, autaname will be generated as begin_0001_end and next document will be begin_0002_end and so on.

If **System wide Counter** is selected and files already exists, autaname will be generated as begin_0098_end and next can be begin_0111_end. The counter here depends on the number of files which are uploaded to the system and not on each of the project .

The SmartName [Project Attribute] and [Document Attribute] contains an extra option. When selecting these options, an extra drop-down appears to select the attribute. It is advised to set such attributes required in the creation view of the attribute category, else this part of the name will remain blank.

Note: Changing or modifying the attribute value after creation of the project or document will not change the existing name.

1. Log in to WebCenter as an Admin user.
2. Click **Admin > Project Management > Templates**. The list of available templates appears in the Template Management page.
3. Click one of the required templates and then click **Configure > Document Creation**. The Document Types page appears.
4. Select the required Document type and then in the **Automatic Document Naming** section choose between None, Default or Custom options.
 - a) If you select the **None** option, the autonaming option is not selected.
 - b) If you select the **Default** option, the setting as per **System wide Document Auto Naming Settings** are taken into consideration.
 - c) If you select the **Custom** option, you can enter the text boxes with appropriate **Prefix**, **Suffix** and the **Counter Length**. The **Scope of the Counter** specifies whether you want the counter to work on all the documents in the system, or only to work on the documents of the project when a new document is created.

Note: Click to select required SmartNames. The **EditField** SmartName can used only in the Suffix.

The SmartName [Project Attribute] and [Document Attribute] contains an extra option. When selecting these options, an extra drop-down appears in which an administrator can select a required attribute.

5. Click **Save** to make the changes.

Note: When the Document Autonaming settings for a Template are changed, these are not applied to all projects already created from this template.

Using SmartNames in Autonoming

You can use **SmartNames** to set the prefix and suffix in AutoNaming.

The SmartNames list contains general Project information and all the Attributes defined in the system. You can use several SmartNames or a combination of SmartNames and free text.

Note: To know more on configuring project information see [Project and Document Attributes](#) on page 292.

- Click the **Insert SmartName** button  and select a SmartName from the list that appears next to the button.

If you select:

- [Project Attribute],
- [Document Attribute],
- or [Project Creation Date],

you will get another **Select to append a SmartName** field in which you can select a required attribute.

See below some examples of SmartNames in Autaname Generation:

The result will be, for example: `Chicago_23.12.12_0001_printpromotion.`

The result will be, for example: CAD_0001_printpromotion_Chicago.

Note:

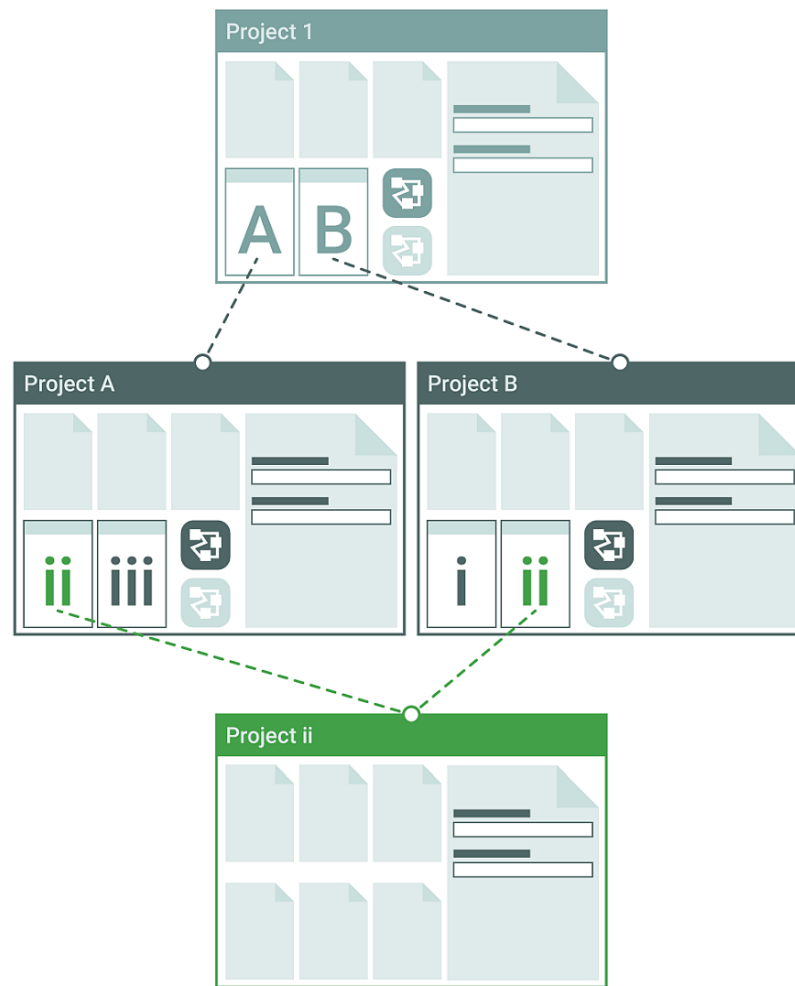

- The [EditField] SmartName can be used only in the Suffix and if required, the administrator can edit this field. If the [Edit Field] is empty, then it is not replaced by any text, but left blank.
- Ensure that you do not use square brackets [] for other fields. The system will take it as a SmartName.
- You can use several SmartNames if desired, or a combination of SmartNames and text.
- If a SmartName is selected and if it is empty or not found, the field will be blank in the Autaname.

3.22. Program Management

3.22.1. Introduction

Many Brand Owners are tackling large, complex packaging programs (campaigns) which span across packaging ideation to delivery of individual packaging to specific markets. Typically these efforts involve several parallel and sequential projects. While a packaging project involves dealing with a relatively short-term objective, a Packaging Program (Campaign) is much more complex and deals with several short-term and long term objectives and requires a large pool of resources.

Accomplishing a program's objectives involve planning and conducting a number of related projects, multiple work streams with their own requirements and planning, the results of which are components of the overall outcome.

3.22.2. Program Management Related Components

WebCenter has features to specify components, create a group of projects in a Program hierarchy and modify them as needed.

WebCenter Program management offers:

- *Component definition and approval*
- *Creation of Child Projects under the hood of a Program*
- *Ability to attach (and remove) existing projects into a Program*
- *Communication between the Program and its Projects.*
- Features to support multiple levels: for example, a Project/ Grouping /SKU/Component.
- Shared Projects and Components among different Programs
- A Program Overview with *drill-down* and *Dashboard*. The program overview will provide the status and risk indicators.

Definition and Approval of Components

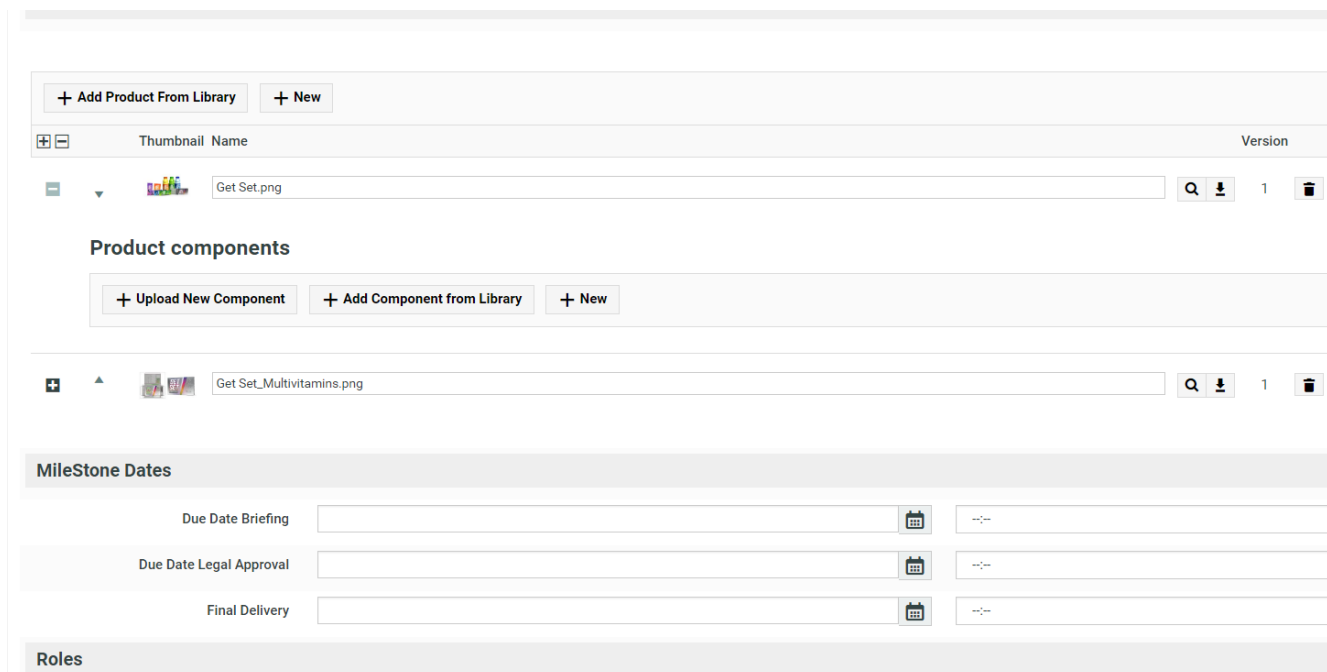

Program planning may require multiple iterations and produce multiple work products and components. As a first step, you need a Program (Parent Project) setup which describes the outline, rationale, launch criteria, important dates and involved regions and suppliers. The second part deals with the individual or child projects within the Program which are entirely dependent on the products and component planning.

Defining Products and Components in the Briefing Phase

To start a Program with new Products and Components, the Program Manager can use a placeholder document ([Document Templates](#) on page 157). To define existing components, just refer to them as [Document References](#) on page 353 or copy them to the current scenario. You can source the components from existing libraries, contextual saved searches, or from a previous program.

If you have configured a [duplicate](#) action, the user can easily create a copy of the component (for example, variants) including its meta-data and document references values.

See the example below. The following structure can be built into your Program Template using its **Attribute Category's** document sources.

For example, when you initiate a Program for multiple SKUs, you can use Document Templates for new SKUs. The Products can keep common approved Components as document references. Using the document reference table, you can:

- Define products and components along with their master-child relationships,
- Easily duplicate a Component with its meta-data
- Process them through an approval process if needed

See details about how to create Projects based on these documents in [Adding/Creating Projects in a Program](#) on page 451.

Create Components

To streamline your Program's product and component definition, follow the steps below:

- Create an Attribute category for the Parent Project Template with document references and other Attributes.

Note: Read more about shared Attributes in: [Create a Child Project](#) on page 455.

- [Add Document References to the Program Template's Attribute Category.](#)
- [Define Document Sources for your Documents](#)
- [Define how these documents should appear in the Template](#)
- [Configure duplicate option in the rendering of the document references](#)

Adding/Creating Projects in a Program

Once you have defined a Program or Parent Project with components, you can add multiple Child Projects as members in a few ways. You (as an admin user) need to configure **actions** in the menu for any of these options to become available.

You can:

- **Create Projects individually based on a Child Project Template.**

This provides an interactive way of creating a child Project from the Program context. If you have common Attributes configured in both the Program and Child Template, they can be shared between the Parent and Child. For example, Program's Attributes such as milestones set in the Program and Role setup.

The administrator has to configure a Create Child action for a Program Manager.

The Child Project Template can have Attributes and documents that are not shared with the Program.

Note: The Child Projects are independent WebCenter Projects that can have their own planning, workflows, folder structure etc.

Read more in: [Create a Child Project](#) on page 455.

- **Create Projects using a workflow.**

You can use workflow to create multiple Child Projects in one go. You can either add this step into a workflow or create a dedicated workflow action in Project details page.

Tip: Create a *custom workflow* action for Project detail and apply it to the Program Manager's menu. You can then select multiple documents and launch a workflow. You can use this more than once if you want to launch your Program in waves.

- **Add an existing Project.**

You can add existing Projects to a Program. For example, you may want to use an approved SKU-project in a Program. The **Attach** action lets you select and add an existing Project as a child.

Read more details in: [Attach Project Action in a Program](#) on page 455

- **Create a Sibling Project.** Create sibling action allows you to copy the setup from your existing Child Project to create exact replicas or variants with slight modifications. For instance, after creating component Projects, you may see that you need an extra component with the same requirements.

It is possible to modify some Attributes after creation of a variant. Or you can disable copying of some elements by unchecking them. The options are the same as in [Create a Project Based on Another Project](#) on page 767

This action will be used when creating variants of the child project.

Note: All these actions are configurable and you can configure the actions that are most relevant in your Program-Project hierarchy.

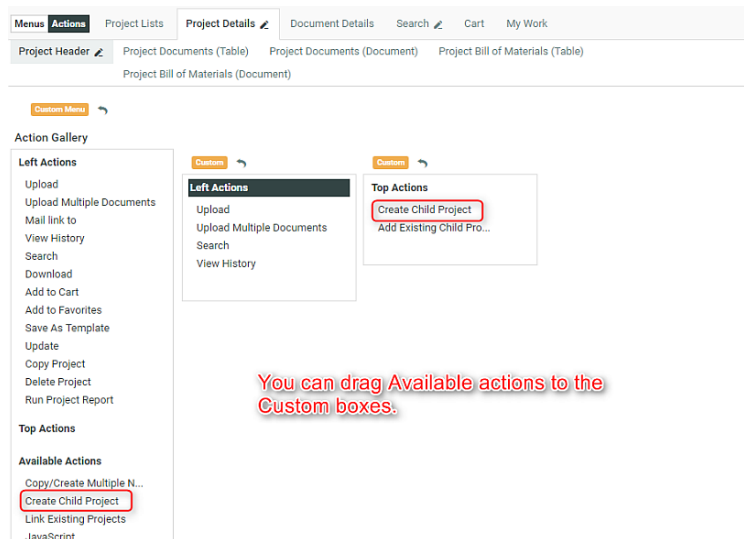

Notes

- You need **Change Property** rights (in both levels) to establish a relationship between parent and child.
- A project can have multiple children and can have multiple parents.
- All relationship changes are logged in the Project history.

Configure Create Child Action in Program's Details

As an Administrator user, you can customize the **Project Details** actions to include a **Create Child Project** action.

- Go to **Admin > Preferences > Menu > Actions > Project Details > Project Header**.
- Select the **Menu** you want to edit.
- From the **Action Gallery**, drag the **Create Child Project** to one of the **Custom** boxes.

Read more in: [How to Create a Custom Action Button](#) on page 120

- Edit the settings of this **Action**. You can customize this to suit your needs. See more in: [Action Settings](#) on page 118.

We recommend that you do the following optional steps:

- a) Select the users for whom you want to make this **Action Visible To**. In the example, this Action is set only for Project Managers.
- b) Select a Child Project Template. This will be the Template that will be loaded when a Project Manager (user) click on this action.

Note: If a Template is not specified in this action, your user can:

- either select a Template that is available in the system
- or create a Project without a Template

- c) Specify a Project Visibility characteristic.
 1. *Create a specific Characteristic* for configuring a menu item. You can create characteristics for your custom menu items as well as the default ones.
 2. Select the specific Characteristic in the **Project Visibility** field of the action. You can select this from the drop down list.

This menu item will appear in the **Project Details** page only if the specified **Characteristic** was assigned to the **project** or the **template**.

As an administrator, you can switch this on and off in the **Project Details > Characteristics** page.

- Save.

Create a Child Project

To create a new Project as a child project of a Program, you (admin) can configure a **Create Child Action** in the Program. Once configured, the Program Manager and the Project Members will be to create Child Projects in your Program.

The Child Projects inherit the **attribute** values, **role** assignments and **company** information from the Program, and they can have their own set of **attributes** and **workflows**.

The Project creation uses the Template configured in the *menu*.

For example, if the custom **action** links the template "Child Project Template", then this is used in creating the child Project.

The child inherits most of the setup from the Template except the values of:

- **Company / Location**
- **Attribute Values**
- **Role Assignment**

Note:

- The Attribute categories are inherited from the Template (used to create the child Project) and the **values** of the common Attributes (present in both Parent and Child Templates) will be inherited from the parent.

Note:

- If a common attribute has an empty value in the Parent, the value will be taken from the Child's template.
- Similarly, the Roles are taken from the Template but the assignment of the Roles will be taken from the Parent. If the Roles are not assigned in the parent, the assignment will be inherited from the Template.

Caution:

If the Parent and the child Project's template have different role assignments, the assignment of the parent project is taken.

- If a Template is not specified in this action, your user can:
 - select a Template that is available in the system.
 - or create a Project without a Template

You can have a document source with a SmartName search to point to the parent Project

Attach Project Action in a Program

To add Projects to a Program, you need a Saved Search configured in your Program to list 'related' Projects.

The administrator can specify the Saved Search that should be used to search and find these possible child projects.

To create a custom **Link Existing Projects** Action in the Project Details (of the Program), follow the steps below:

1. Go to **Admin > Preferences > Menu > Actions > Project Details > Project Header**.
2. Select the **Menu** you want to edit.
3. From the **Action Gallery**, drag the **Link Existing Project** to one of the **Custom** boxes.
This Action is available in Project Search Results by default.
4. Edit the settings of this **Action**. You can customize this to suit your needs. See more in: [Action Settings](#) on page 118.
 - a) Select the users for whom you want to make this **Action Visible To**. In the example, this Action is set only for Project Managers.
 - b) Select a **Saved Search**. This will be the displayed in the pop-up to select a Project.
Specifying a Saved Search (for example, based on common attribute values) in the **Attach** action allows you to configure a pop-up dialog with the most relevant projects.
 - c) Optionally, specify a Project Visibility characteristic. Select the specific Characteristic in the **Project Visibility** field of the **action**.

This menu item will appear in the **Project Details** page only if the specified **Characteristic** was assigned to the **project** or the **template**.

As an administrator, you can switch this on and off in the **Project Details > Characteristics** page.

In the Program's details, you can use this Action to select Projects (from a Saved Search) and add to the Program.

Add Sibling Projects

If you want to clone a Child Project within the context of a Program, configure the **Create Sibling Project** action in the Project details page.

You have to configure the action in the Child Project Details and make sure that it is applied to the Project Managers' menu.

The cloned sibling will be a copy of the child Project from which the action was started and it will also have the same Parent Project.

Notes

- If the child Project has multiple parents, the cloned Project inherits all the parents where the Project Manager has "change property" permissions.
- In the original parent project, an entry in the action history is added to indicate that the new project was added as a child.

Create a Sibling Project

1. Click the **Create Sibling** action button from a child Project of your Program.
2. In the **Copy setup from an Existing Project** pop-up, select what you want to copy (and deselect what you don't want to copy).

Copy setup from an Existing Project

- Copy Project Manager
- Copy Members
- Copy Approval Settings
- Copy Folders
 - Including Documents
 - Including Bill of Materials
- Copy Attributes
- Copy Characteristics
- Copy Tasks From Source Project ▼
- Copy Security Settings
- Copy Notifications
- Copy Discussions

Cancel
OK

For Tasks, you can choose to copy the **Tasks** from the original Project or from another project by typing in the template name. The default setting is to copy Tasks from the Project that is being copied.

Click **OK**.

3. Fill in the new project's *Details*.
4. If desired, add *Documents* to the project.
5. Add *Members* to the project.
6. If the template has attributes defined, fill them in the *Attributes* section.
7. Click **Create**.

This brings you to the new project's details page.

Creating a project adds an event and this is stored in the Project History.

This event will add following information to the Project History:

- The Project/Template from which the new Project is created.
- The name.
- The Project Manager.
- The Salesperson (if there is any).
- The Customer (if there is any).
- The Location (if there is any).
- The description (if there is any).

Note: When a project is created from a template or an existing project, then only the changes (like deletion of attribute values or adding a new document) from the template or existing project is logged in the events.

Remove Projects from a Program

You can configure and use [Detach](#) and **Delete** actions in a Program.

- If you want to remove child Projects **permanently** from the system, select them in the child Projects tab of a Parent Project and click **Delete** action.
- To remove some child Projects from a Parent, use the **Detach** action. This action removes them from the parent, but does not delete them from the system.

This is a configurable action that has to be set up in the Saved Search displaying child Projects. Read more in: [Detach Child Projects](#) on page 252.

Detach Child Projects

You can configure **Detach Child Project(s)** operation in a Saved Search. Program Managers can use this in a contextual Saved Search configured in the Parent Project's details. The use case is that the Project or Program Manager can select existing Child Projects displayed in the search tab and detach them from the Parent Project.

Note: The action is only available to the users with **Change Permissions** of the parent and child project.

- Create a global [Saved Search](#) to search on child Projects. Enable the **Search Result Layout** option **Allow Detaching Child Projects**.
- Apply the Saved Search into the Project Details menu of the Parent Project Manager.
- To detach child Projects, go to the Child Projects tab with the saved search, select child Projects and click **Detach Child Project(s)**.

Program Dashboard with a Drill-down View

You can also build different types of overview on on-going programs as a way to easily monitor your Program and Projects. The solution allows you to build overviews at all levels of your Program hierarchy.

The admin can create searches with any relevant criterion and use them in different levels of the Project drilldown.

To build a high level overview, use the following advanced the Saved Search features:

- [Drilldown](#)
- [Dashboard](#)

The drill-down feature allows you to quickly access the specific Projects or Components that require special attention.

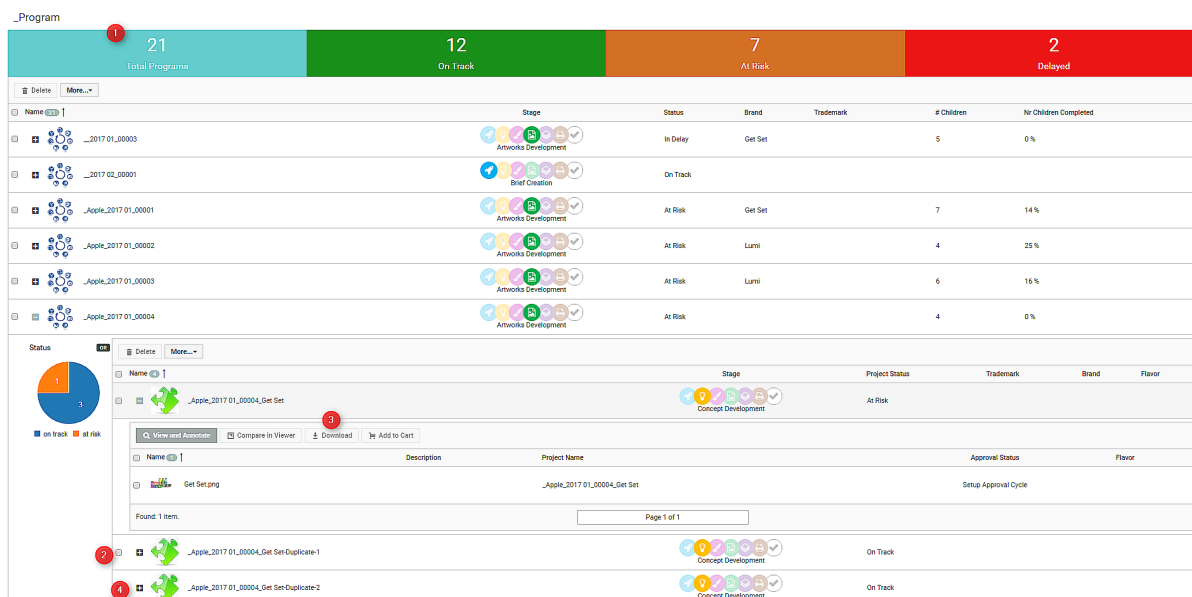

Drilldowns

You can use Project search based **drilldowns** to set up a:

- Drill-down into all levels of Projects. This feature allows the Program Manager to explore project data beyond the overview. If you have a nested structure (Project / Grouping / SKU / Components) in your Program, an expand button lets you access the next level.
- Drill-down into Components (documents) or Tasks

Read more in: [Configuring a Drill down Search](#) on page 237

The example screenshot gives an overview where the Program Manager can quickly zoom into Programs based on their status (which in turn is based on the status of their child Projects).

1. The parent Search with Programs. This example shows a [Search Results Dashboard](#) on page 237 with **counters**.
2. The second level of Drilldown which executes the **Saved Search** specified in the parent search. This search contains a **Dashboard** with a **Facet Graph**. [Configuring a Drill down Search](#) on page 237
3. The third level of **Saved Search** with a **Document Search**.
4. The expand button to execute the drilldown.

Dashboards

The interactive **dashboards** can be configured with:

- **Counters.**
 You can, for example, build a diagnostic overview of the status of your Program using counters. You can, for example, show the Project Statuses in these traffic light counters (at risk, in delay, or on track). With a simple click on one of these counters, you can zoom into the relevant Projects.
 In the example above, a click on the “On Track” counter will display the search results for specified in the counter configuration. The status is only an example, you can build your counters based on any relevant Attribute that you may want to monitor. Each counter has it's own saved search and displays the count of the results.
 Read more in: [Building a Search Based Counter](#) on page 241.
- **Charts** to visualize your Program data.
 You can configure facet based Charts in dashboards and use them in your Program hierarchy to visually display the Program data. The Charts(based on facets) shows the distribution of values.

A simple click on a chart section(value) will refine the results. In the screenshot, the counters provide the most high level overview where as the first level drill-down displays a pie chart which shows the distribution based on Project Status.

Overview from Programs and Projects

In addition to the overview of all Programs and their drilldowns, you can also configure contextual saved searches for your Parent Project Details menu. If you are a Program Manager working in a Program's details page, you may need direct access to the child Projects. Likewise, from each of the Child Project, there should be access to the parent or Program.

To configure this:

1. Create a [Saved Search for Parent Projects](#). Similarly, create another Saved Search for Child Projects and plug this into the Parent's Project Details menu.

Tip: Use SmartNames to use Saved Searches in the context of a Program or Project. If you set the **Parent Project** as the [Project id], your results will list all the Child projects of the current project. See more in: [SmartNames in Search](#) on page 232

2. Plug these searches into Project Details menu and apply it to the relevant users (Program Managers and Project Managers).

Communication Channels-Rules

Since the projects are children or sub-projects of the overall program (campaign), there is a need for communication among all levels, program to projects, projects to program and among projects. The updates happening in a program have mutual consequences and therefore should be communicated in both ways. You may want to setup the following channels:

- Alert the parent or a related project about a new deliverable
- Alter the status of a related Project depending on another
- Notify Program when a child Project encounters change: a status update or metadata change.

Rules in Programs and Projects

The Administrator of the system can configure "actions" "triggered" by an "event". These are **Rules** that can be specified in the Program/ Project's templates. Rules enable you to start tasks automatically based on events in your project.

The triggered actions will be implemented in the Program or Project specified in the attached "action"**(Task based Action)**. You can use the JavaScript node in the Task to execute these actions.

The configuration of the Rules is based on Program/Project Template and therefore, once setup, can be reused (or exported) in future Programs.

See some examples of Task based Actions below:

- If a child Project's status changes to Overdue, change the status of the Program to At Risk
- Change attribute values in a Program based on the values in the child Project
- Calculate task overdue status every hour and send reminders

The JavaScript node allows you to enables you to update crucial parameters of related Projects. See details in the Workflow section.

Configure Rules in a Project

What is a Rule?

You can configure a **Rule** to execute specific **Actions** based on one or more Trigger events. The Rule sets reside in Project Templates and will be applicable in all Projects created from them, including the previously created ones. This administrator feature lets you establish communication between Child and Parent Projects or between any two Projects. See an example use case at the end of this chapter.

Note:

You need the **WebCenter Task Management Advanced** or **WebCenter Life Cycle Management** license to be able to define Rules.

To set up **Rules**, go to **Project Template > Configure > Rules** tab.

Triggers

A **Trigger** is an event that happens in the system (for example, the Child Project Status changes to **Completed**). A successful Trigger condition will execute a Task based **Action**.

You can specify multiple triggers and actions in a Rule. When one Trigger event(as specified in the Rule) happens, the system evaluates the Rule and executes the corresponding Action(s).

See the supported Triggers below:

- **Project Status Change:** The **Action** is executed when the Project Status changes.
- **Project Attribute Change:** The **Action** is executed when the specified Project Attribute changes. You can specify the attribute from a drop-down.
- **Project Due Date Change:** Any change in the Project Due Date will trigger the specified **Action**.
- **Date/Time Reached** trigger lets you define an exact time stamp to execute the Rule. When the server time passes the Trigger time, the Rule will be executed. There are 2 options:
 - Specific Date: the actions will be executed on the specific date and time
 - Date in Project + Offset: the actions will be executed on the selected Project Due Date or Date/Time attribute plus or minus an offset of days and/or hours.

Note: The calculation is done in working days/hours.

Actions

- **Start Task:** This action launches a Task in the same Project where the Rule is configured. Specify the **Task** by selecting it from the drop-down.
- **Execute Javascript:** This action launches a specified **JavaScript Rule Action**. You can specify one from the **Javascript Rule Actions** configured in the system.

It is possible to configure multiple actions by clicking on the '+' sign. Use 'x' to remove existing actions.

Example

See the example of a Project Template's Rule below. This Rule gets executed when the specified `Date/Time Reached`.

Edit Rule

Rule Name*

Enabled

Description

Order

When any of these Triggers occur

Perform Action(s)

Warning: Calculating date/time triggers can potentially take a while. This rule will be applied in 4 projects.

The Javascript Rule Actions are configured in **Admin > Project Management > JavaScript Rule Actions**. See the example script below.

```

var children = API.getProject().getChildProjects();
if(children.length > 0){
    var atRisk = false;
    var inDelay = false;
    for(var i = 0; i<children.length; i++){
        var child = children[i];
        if(child.getStatusName() != 'Completed'){
            atRisk = true;
        } else if(child.getStatusName() == 'Non-active'){
            inDelay = true;
        }
    }
    if(atRisk){
        API.getProject().getAttribute("mvbe Campaign State").setValue('At risk');
    } else if(inDelay){
        API.getProject().getAttribute("mvbe Campaign State").setValue('In delay');
    } else {
        API.getProject().getAttribute("mvbe Campaign State").setValue('On schedule');
    }
}

```

Two days before the milestone, this Rule will get executed. Depending on the child Projects' statuses, the Program Project's status will be updated.

3.23. Packaging Content Management in WebCenter

3.23.1. Introduction to Packaging Content Management in WebCenter

WebCenter Packaging Content Management offers a simplified platform for creating, translating, approving and managing text / copy assets.

The Packaging Content Management module offers:

- a repository / library for your text content with GS1 tagging
- re-use of your content across multiple projects
- support for a translation based or single language workflow.
- export to and import from industry standard formats
- ability to view and edit your text in the context of your artwork in the WebCenter Viewer.
- a complete approval workflow
- established content rights facilitating the ownership at different stages

3.23.2. Basic Concepts

Text Document and Text Elements

Text Content Document

The WebCenter Text Content Document (`WebCenter Copy Content`) is an XML file that contains:

- Text that goes on Artwork. This includes the master text and the translated versions.
- Approval states
- Clearly defined ownership rights
- Element Types

A Text Document is a WebCenter **Document Type** and can have:

- Revisioning
- The documents are housed in projects or libraries (for re-use)
- Attributes
- Can be streamed through a workflow
- Download rules
- Document references from other documents. For example an artwork can refer to various text content documents.
- Text Content Template. Read about it here [Text Document Template](#) on page 466

Text Content Statement

A Text Content document has two elements: the Master text and its translated statements. When a Text statement is specified as the Master, it needs to be approved before approving the translation.

The Master and Translation Statements can be viewed together.

Text Content / Table Ownership via Permissions

Text Content Ownership

WebCenter offers established ownership for different phases of the text and table creation and the approval process. You have four default content permissions:

- **Content Manager**
- **Editor**
- **Approver**
- **Add Language**

These permissions, when mapped to the WebCenter roles, allows their assignees to perform specific functions on the document.

Note:

- To configure these permissions, the project manager needs to assign at least the **Content Manager** rights to a relevant Role.
For example, you can configure a **Role, Marketing** to have the **Content Manager** function.
- The Content Manager can then activate the **Editor, Approver** and **Add Language** permissions by assigning them to relevant WebCenter roles.
If you do not assign a role to a specific permission, the specific permission will remain inactive for the document.
- The permissions are set at each text/table document (.wcc or .wtc) level and will be passed on along with the document and its versions when copied or moved.
- It is not possible to add custom permissions.

Four Types of Permissions

1. CONTENT MANAGER:

The WebCenter Role with this permission facilitates the entire content management process to ensure accuracy and compliance. For example, the role Marketing could have this permission where the Marketing has the responsibility of the packaging content. The Content Manager will manage the Master and Translated statements.

Note: The Content Manager Role is not associated with any specific language.

This role will manage all the permissions and the settings for the current document.

Note: Content Manager Role cannot act as an Editor or Approver unless this permission is granted to the same role.

2. EDITOR

The Content Manager typically assigns this right to the dedicated roles who will create, edit, revise or translate the text. This can be assigned per language.

An Editor Role (for example, a Translator) can edit when a document is in the **Draft** state, not in **Signed-Off** or **Pending Sign-off** state. After editing, the role can mark it as **Pending Sign-off**.

Note:

- The **Content Manager Role** has to configure the list of translation languages to make use of multiple language based **Editor** permissions.
- You can configure **Roles** for all languages to which the content should be translated and grant them the **Editor** permission.

3. APPROVER: A **Role** with this permission can approve the text content. This permission can also be configured per language. The approver puts the Text Statement to **Signed-Off** or **Rejected** state.

4. ADD LANGUAGE:

Any user with **Add Language** permission can add language to a text or table content document. The users can be assigned with permission to add only specific languages.

Manage Permissions

Content Permission 	Language	Role	Assignee(s)
CONTENT MANAGER		 PCM_CONTENT MANAGER	 MRJN
EDITOR	 English - International	 PCM_CONTENT MANAGER	 MRJN
EDITOR	 English - United States	 PCM_CONTENT MANAGER	 MRJN
EDITOR	 Dutch - Belgium	 PCM_CONTENT MANAGER	 MRJN
EDITOR	 French - France	 PCM_CONTENT MANAGER	 MRJN
APPROVER	 English - International	 PCM_CONTENT MANAGER	 MRJN
APPROVER	 English - United States	 PCM_CONTENT MANAGER	 MRJN
APPROVER	 Dutch - Belgium	 PCM_CONTENT MANAGER	 MRJN
APPROVER	 French - France	 PCM_CONTENT MANAGER	 MRJN
ADD LANGUAGE	 English - International	 PCM_LEGAL	 MRJN  MRJN_USR2
ADD LANGUAGE	 Dutch - Belgium	 PCM_TECHNICAL	 MRJN  MRJN_USR3
ADD LANGUAGE	 French - France	 PCM_CONTENT MANAGER	 MRJN

_REQUESTOR Role

To create new Text/Table Documents, edit, approve or to reuse content during the Project Creation phase, you need to grant the relevant permissions to the **_REQUESTOR** role. You can

give these permissions in the libraries of Text/Table Document Templates, or Projects with approved Documents.

Delegation of Approvals in Text Content and Tables

An user can delegate his WebCenter tasks to another user. The delegated user can perform all actions on behalf of the delegator. When the delegate approves text or table content, the password validation is done on the delegate's password.

When a user has logged in on behalf of another user, and approves any text or table content, the same can be viewed by clicking **Approval Info** in the ellipsis. Alternatively, it can also be viewed in the **Document > Action History**.

Text Document Template

Text Document Template

An Administrator or Project Manager can [create Text Document Templates](#) using which the users can generate new text documents.

You can create a Text Document Template with pre-configured:

- Element Type
- Master and Translation Languages
- Approval Setup

These templates can be later reused as Document Sources.

Note:

It is not possible to create Text Documents without configuring the **Document Templates** and **Document Sources**.

When configuring a text document reference for a **Task / Project Template**, you have the option to specify [document sources](#). These are buttons that will allow you to create, or link, or copy or reference documents in their respective documents tables.

Text Content Element Types

Text Content Element Type

WebCenter uses the **Element Types** concept and terminology from the GS1 standard to categorize the Text Documents. The Text Content Element Type categorizes the documents and maps to the WebCenter **Content Types**.

See the Element Type categorization below.

Header Information	Product Identity	Marketing Copy, Claims & Endorsements	Nominal Content	Global Warning & Caution Statements	Usage Instructions & Consumer Relations Info	Ingredients and Technical Facts	Distribution & Manufacturing	Patent, Trademark, Copyright, Legal	Various
Countries of Sales	Additional Product Variant Information	Content Claim	Gross Content Statement	Warning Statements	Recycle Statements	Ingredients Header	Distribution Statement	Patent Statement	Sweepstakes Offer
	Brand Name	Disclaimer	Net Content Statement	Allergy Warnings	Contact Information	Ingredients Declaration	Manufacturer Statement	Patent Numbers	Product Display Disclaimer
	Product Form	Marketing Claim	Package Count		Website	Active Ingredients Header	Importer Statement	Copyright Trademark Statement	Cross Sell
	Product or Statement of Identity	Marketing Copy			Disposal Information	Active Ingredients Declaration	Location of Origin	Under License Statement	Diet Exchanges
	Product Variant	Not for Sale Statement			Opening Instructions	Inactive Ingredients Header	Lot Number		Consumer Guarantee
	Sub Brand Name	Packaging Claim			Usage Instructions	Inactive Ingredients Declaration	Manufacturing Site		Recipe
		Pricing Statement			Storage Instructions	Drug Facts	Internal Package Identifier		
		Product Features			Assembly Instructions	Nutrition Facts	Packaging Statement		
		Promotional Copy			Preparation Instructions	Nutrition Claims	Regional Contact Information		
		Third Party Endorsements			Other Instructions	Registration Information	Local Contact Information		
		Violator				Quality Statements	Online Printer Header		
		Warrenty				Environmental Statements			
						Preservatives			
						Technical Facts			
						Shelf Life Statement			
						Product Use			

It is possible to add custom Element Types other than GS1 types. Read more in [Configure Element Types as a List](#) on page 473.

These are used when extracting Dynamic Content into WebCenter as well as exporting the artwork's GS1 XML.

Text Content Translation

You can configure workflows to draft, translate and approve text in this module. To translate Text Elements (statements), in a translation software that uses XLIFF content (e.g. Trados or SDL), you can export them in XLIFF format. To do the review and final approval, you can import the translated content back in the same format.

You can either:

- automate the export-import process using the Workflow nodes
- or use [actions](#) to manually export an XLIFF file and later import it back.

Note:

XLIFF is an industry standard format used in the industry to exchange data in a translation project.

Invariant Text Document

If translations are not required, the Content Manager can specify the Document as an invariant to avoid translating a Master statement. For example, a Text Document containing the Brand name.

You can set the **Invariant** status on a Text Document or Template.

Documents marked as invariant can have only one master language and are no longer considered as invariant if there are more than one master language

Note: Invariant content which existed prior to 18.1 and which has more than one master language will become non-invariant.

See: [Text Content Tab](#) on page 965

Inherit Content

Whenever a new language is added to a Text content document, it is easy to follow the contents of either the master or translation language that already has the content. This could also prove very useful in cases where the two languages have mostly similar content like English-International and English US.

To inherit content option for the text statements in your document, **Allow Inherit Content** option has to be chosen in the **Configure Content** in **Text Information**. When this option is enabled, you can choose to either follow the **Master Language** or **Default** to the element type choice or choose **None**.

You can choose

- **None** to follow language, but no language will be selected by default at the text content element level for the newly added language.
- **Default** to follow the language in the language list. If no language is defined in the language list, then **None** is selected at the element level. Language lists for Master and Translation languages are configured initially when setting up the content management. To know more, read [Configure Master and Translation Language Lists and Attributes](#) on page 475
- **Master Language** to follow the master language in the element widget.

Note: Irrespective of the option chosen at the content configuration, the user can still change the option at the element level.

Text Approval

The Packaging Content Management module offers separate approval processes for the Master and its translations. All the Approval information with regard to the Master and Translations stay within the Text or Table Content Document.

Note: This approval process is different from the regular WebCenter approval process.

The Approval process starts when a content Editor [starts approval](#) on a text statement or table element.

When you have configured the right [permissions](#), the users who has the **Approver** permission can perform approval actions. To automate the approval, you can configure manual tasks in a workflow and assign them to the relevant Roles.

Once approved, the master and translated text remain locked for regular users.

Note: Only the Content Manager has the rights to change the text element to draft.

The text element can be in one of the following states:

- **Draft:** The initial state of the Text Document where the content is still being worked on.
- **Pending Sign-off:** When drafting is complete, and the status is ready for its approval cycle. An approver can review and approve or reject the document.
- **Signed-off:** When the approval cycle is completed and the content drafted in the document is 'Signed Off'.
- **Sign-off Rejected:** When the approval cycle is completed and the content drafted in the document is 'Rejected'.

Note: Approver will be requested to re- enter the password before approving or rejecting any text content document, provided the option is enabled by the Admin user.

Approval Types

Content Managers can set up the **Approval Type** for Text Content Documents. There are three Approval Types:

- **Default:** Only one member has to approve. For example, if the Approver permission is assigned to two Roles, only one member (from any Role) has to approve.
- **One of role:** One member of each Approver Roles (assignees) has to approve to complete the signing off. In case a Role is assigned to several members (groups or users), any Group member or user from that Role can approve.
- **All of Role – One per Group :** At least one member from each Role-Group has to approve. If there is an individual User, then he or she has to approve as well.

Dynamic Content in WebCenter

Dynamic Content- Linking with Adobe® Illustrator®

Esko's Dynamic Content for Adobe® Illustrator® brings the power of XML-based automation to Adobe® Illustrator® CS5, CS5.1, CS6 and CS7 on Mac and Windows.

Dynamic Content helps designers to be more efficient and win client confidence by minimizing the errors. By eliminating the process of copying and pasting the 'revised text', this minimises the errors.

In a typical case, the designer creates a design in **Adobe Illustrator** with "placeholders" for text content. These are tagged with appropriate GS1 Element Types (Content Types). You (brand owner) can process and approve the corresponding text content (with Element Type tagging) in WebCenter.

Dynamic Content can keep this link active and import the dynamically tagged content into Copy sheets. The edited and approved content can be exported back in GS1 format.

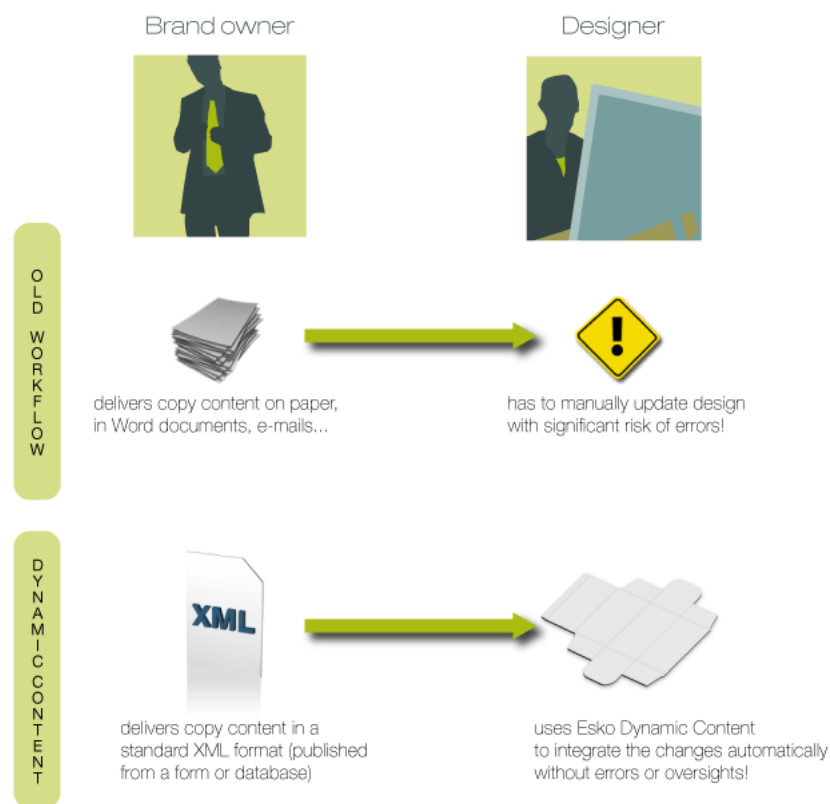

Why Dynamic Content?

Esko Dynamic Content allows packaging designers to add externally maintained content elements such as legal copy or nutritional information to a packaging design. This solves an increasingly common problem in the designer's day to day work: human error in copied content.

The ever growing number of stock keeping units that are brought onto the market by brand owners has resulted in an explosive growth in the **volume of artwork** that needs to be created for all the packaging of each unit. At the same time, the designs themselves become more and more complex in their competition for the consumer's attention.

Many designs share pieces of content. Some content is **mandatory**, required by regulatory instances such as the FDA, EMEA, or national bodies. Other content simply **recurs** on different variants of a shared design.

The end result is the same: an **increasing number of human interactions**, often of the "copy-paste" type, that at the same time increases the risk of errors slipping into the design. Errors in artwork are wasteful, generating rework, delays in product launches and sometimes even requiring product recalls.

Benefits of Using Dynamic Content

The Dynamic Content plug-in helps automate the insertion and updating of externally maintained content into a design. This prevents a number of common problems, and it saves valuable production time by eliminating repetitive manual tasks.

Some **typical problems prevented by a Dynamic Content workflow:**

- Typing errors;
- Wrong versions of copy text or barcodes are used in the final design;
- Cut-and-paste errors (e.g. when copy text is provided in a Microsoft Word document or PDF, and the designer has to manually copy this into the Illustrator document);

- Text overflows;
- Shared elements on design variants are not synchronised.

Because Dynamic Content allows you to keep this mandatory or shared content separated from the Illustrator document, it also **eliminates repetitive and time consuming updates**: simply modify the external XML file to update the text, barcodes, and nutrition tables on the design. Review cycles have never been this easy.

A Typical Workflow in Dynamic Content

A typical Dynamic Content-based design workflow includes an exchange of information between brand owners and designers. Often, the content to be used in a design will change multiple times during the design and production process, and it is in these cases that Dynamic Content will prove its worth.

A sample workflow for the use of Dynamic Content could be the following:

Stage	Description
1	The brand owner’s marketing department draws up the text that needs to appear on the packaging design. The text is entered into a PDF form or a content management system, which can export an XML file.
2	The brand owner sends the PDF form or XML file containing the text to the designer.
3	The designer produces a packaging design in Adobe Illustrator and links the text elements from the XML file to text objects in the Illustrator template. In the GS1 workflow, the designer can generate the "Response" XML and send it back to the brand owner. This Response message tells the brand owner what items were used in the artwork and how many times.
4	Later, the brand owner makes changes to the text, produces a new XML file and sends this to the designer.
5	The designer replaces the original XML file on his disk with the new version. Dynamic Content automatically detects the changes, and immediately alerts the designer. It clearly shows exactly what has changed, and where.
6	Based on the alerts displayed in Dynamic Content, the designer can very quickly accept automatically updated text, or make any required formatting changes. There is no need for copying, pasting, or any other manual and error-prone operations, and Dynamic Content alerts the designer to problems such as text overflow.
7	Thanks to Dynamic Content, stages 4 - 6 can occur repeatedly without losing time or introducing errors.

XML Basics

XML stands for Extensible Markup Language, and it is a markup language similar to HTML. However, where HTML describes the layout of a web page, XML markup describes the contents and the structure of a document.

Below is an example of a basic XML document:

```
<?xml version="1.0" encoding="UTF-8"?>
```

```
<body>
<p> This is a very cool product! </p>
</body>
```

XML documents are often used to exchange data or textual content.

In the context of the Dynamic Content plug-in, XML is a useful format because:

- it separates content- the text itself- from layout and presentation, which will be defined by Illustrator text objects.
- it describes and contains the structure of the text that must be used on a design.

For more information on the XML format, please refer to the Appendix "An Introduction to XML".

3.23.3. Essential Configuration Steps to enable Packaging Content Management

To setup the foundation of a working Content Management System follow the steps below:

1. Enable *the Text Content Document Type*. Optionally also specify the *Language Editor and Approver Prefixes*.
2. Configure Packaging Content Management related attributes. You can migrate the essential configuration into your WebCenter or do it as follows:
 - a) *Configure Element Types*
 - b) *Configure Master and Translation Language Lists and Attributes* on page 475
 - c) *Configure Text Reference Attributes* on page 477
 - d) *Create Text Document References with Rendering*
 - e) *Configure Language Index Attributes*. These will be used when you Import Dynamic Content.
 - f) *How to Configure a Setup to Extract Images, Symbols and Graphics* on page 499

Packaging Content Management

Note: You need the Packaging Content Management license to be able to use this module.

Smart Role Names for Editors and Approvers

To work with language specific *Smart Role Naming* on page 483 specify your:

- **Language Editor Role Prefix**
- **Language Approver Role Prefix**
- **Add Language Role Prefix**

The specified prefixes will be used to automatically create **Role names** specific for each language in the **Role Mapping > Manage Permissions** page. If the **Roles** column in **Manage Permissions** is left blank, values in **Language Editor Role Prefix**, **Language Approver Role Prefix** and **Add Language Role Prefix** are taken to calculate the role names for Editor, Approver Text Content and Add Language permissions.

A change in a Text document creates a new document version. To allow or prevent the users from creating new Revisions use the **Revision Raise** option:

Select **Raise revision when Master Text Contents are updated** to allow raising a Revision when master text is updated.

Select **Never raise revision** if master text changes should not be saved as a new Revision.

Note: This setting is independent of the **Allow raising Document Revision when uploading a new Document Version** setting.

Copy comments from a text document

Choose either to **Keep Comments** or **Remove comments if state reverted to Draft** or **Remove Comments always** when copying a document.

You can choose the option **Keep Comments** to copy all the comments when copying a document.

Comments are cleared if the state of the element is changed to draft, when the option **Remove Comments if state reverted to Draft** is chosen.

Similarly, all the comments in the elements are cleared while copying, when the option **Remove Comment always** is chosen.

Note: Same behavior is replicated in workflow when documents are copied using Copy/ Move Document. Move document option does not respect this setting.

Configure Element Types as a List

You can categorize the packaging content using the **Element Types** list in WebCenter. You can use the categorization from the GS1 / IPC standard or any other.

Note:

GS1 is an international non-profit association dedicated to the design and implementation of global standards and solutions. The GS1 system of standards is the most widely used one in the packaging supply chain standards system.

You can create a [WebCenter List](#) for configuring the **Element types**.

Note: Only Administrators can configure Lists.

- Create and upload your Excel (either .xls or .xlsx) document containing the element types to a project named [List Manager](#).

	A	B	C	D	E
1	ELEMENT_TYPES	HUMAN READABLE FORM	ELEMENT CATEGORY	PCM_ELEMENT_TY	COLOR
2	ACTIVE_INGREDIENTS_DECLARATION	Active ingredients declaration	Ingredients and Technical Facts	TECHNICAL	yellow
3	ACTIVE_INGREDIENTS_HEADER	Active ingredients header	Ingredients and Technical Facts	TECHNICAL	yellow
4	ADDITIONAL_PRODUCT_VARIANT_INFORMATION	Additional product variant information	Product Identity	MARKETING	red
5	ALLERGEN_STATEMENT	Allergen statement	Global Warning & Caution Statements	LEGAL	blue
6	ASSEMBLY_INSTRUCTIONS	Assembly instructions	Usage Instructions & Consumer Relations	MARKETING	red
7	BRAND_NAME	Brand name	Product Identity	MARKETING	red
8	CONSUMER_GUARANTEE	Consumer guarantee	Various	LEGAL	blue
9	CONSUMPTION_CONTEXT	Consumption context		MARKETING	red
10	CONTACT_INFORMATION	Contact information	Usage Instructions & Consumer Relations	MARKETING	red
11	CONTENT_CLAIM	Content claim	Marketing Copy, Claims & Endorsements	MARKETING	red
12	COPYRIGHT_TRADEMARK_STATEMENT	Copyright trademark statement	Patent, Trademark, Copyright, Legal	LEGAL	blue
13	CROSS_SELL	Cross sell	Various	LEGAL	blue
14	DECLARATION_CONTEXT_FOOTNOTE	Element Type Drop-down in the interface		Optional	Color used id
15	DIET_EXCHANGES	Disclaimers	Various	TECHNICAL	low Thumbnails
16	DISCLAIMER	Disclaimer	Marketing Copy, Claims & Endorsements	LEGAL	blue
17	DISPOSAL_INFORMATION	Disposal information	Usage Instructions & Consumer Relations	MARKETING	red
18	DISTRIBUTION_STATEMENT	Distribution statement	Distribution and Manufacturing	TECHNICAL	yellow
19	DRUG_FACTS	Drug facts	Ingredients and Technical Facts	TECHNICAL	yellow
20	ENVIRONMENT_STATEMENTS	Environment statements	Ingredients and Technical Facts	TECHNICAL	yellow
21	FUNCTIONAL_NAME	Functional name	Product Identity	MARKETING	red
22	GROSS_CONTENT_STATEMENT	Gross content statement	Nominal Content	TECHNICAL	yellow
23	ICON_VARIABLE_TEXT	Icon variable text	Various	MARKETING	red
24	IMPORTER_STATEMENT	Importer statement	Distribution and Manufacturing	TECHNICAL	yellow
25	INACTIVE_INGREDIENTS_DECLARATION	Inactive ingredients declaration	Ingredients and Technical Facts	TECHNICAL	yellow

a) Add the following mandatory columns to your worksheet:

- ELEMENT_TYPES should contain the Element Type tags.
- HUMAN_READABLE_FORM with the Element Type names.

Note: This will appear as the Element Type drop-down in the interface. For example, in the [Text Document Details](#) on page 484 page.

- b) Optionally, you can add an ELEMENT_CATEGORY column. This column can contain the categories used to group Element Types.
- c) Optionally, add the PCM_ELEMENT_TYPE_RESPONSIBLE (this name can be different) column.

This is column can have the Role names who would be responsible a particular Element Type. For example, a role Legal would have the responsibility for the Element Type Consumer Guarantee.

Tip: In your Workflow configuration, you can look up in this list to find the Role matching a particular Element Type. Read more in the Workflow section.

d) Add the COLOR column. Use this to specify the color coding for the Element Types.

If you have specified Red corresponding to Brand Name, your Text Document Thumbnail will be color coded as Red.

- [Create](#) a List named ELEMENT_TYPES.
- When configured, the **Element Types** will appear as a drop down in Text Document Details page.
- If the Element Types are color coded using the COLOR column, you will see Text Document Thumbnails in the system.

Configure Thumbnails for Text Documents

When you upload a **Text Content Document**, a thumbnail with it's name gets generated according to the color code specified in the [Element Types](#) list.

If you update the color code of an Element Type in the List, the existing thumbnails will not be updated immediately. Update the document's Element Type to generate a new thumbnail.

If color code column is not defined, thumbnail will not have color code in it, but still Element Type will be displayed.

Note:

If the Element Type name is longer than the thumbnail, it is truncated to fit in the thumbnail size.

Note:

Supported colors: green, blue, red, yellow, white, black, orange, cyan, magenta, pink, light gray and dark gray. RGB colors (rgb(x,x,x)) are also accepted in the **Element Types** list.

Configure Master and Translation Language Lists and Attributes

You have to configure Master and Translation Lists for setting up the Packaging Content Management module.

The master and translation languages can be added as [WebCenter Lists](#) and your users can easily access and select the appropriate languages in the Attributes tab.

Note: Only Administrators can configure Lists.

1. Create and upload your Excel (either .xls or .xlsx) documents to the [ListManager](#) project.
 - a) Create the Master Language document in Excel. Add the following mandatory columns to your worksheet:
 - For example, English- United States.
 - LANGUAGE_CODE: Specify the code of the languages that you want to include
 - DESCRIPTOR: Describe the language code you specified
 - FLAG_FILENAME: Specify the name of the image file which has the flag of the country the language is used. For example fr-ca will have Canadian flag whereas fr-fr will have French flag.
 - LANGUAGE_INDEX: 1, 2, etc...
 - DIRECTION: Specify if the language is written right to left or left to right. This ensures that the cursor is placed appropriately.
 - FONT_FAMILY: Specify the font family that you want to use for the language

Note: Specify the name of the font family that you want to add as a customized font for the PCM. To add a customized font in Packaging Content Management, follow the steps given in the KB article <https://wiki.esko.com/pages/viewpage.action?spaceKey=KBAS&title=KB196429311%3A+WebCenter+-+How+to+support+custom+fonts+and+languages>.

And also add the fonts in the application server pcm/TablePreviews/custom/fonts folder location.

- **LANGUAGE_INDEX:** This is the corresponding field to locale Sequence tag in GS1 XML standard. This is used in **Import Dynamic Content** node to map the GS1 XML coming from Dynamic Content.

- **Note:**
When you add a language code in these Lists, a corresponding flag image will be available for you in the interface. The flags are installed in the `WebCenter\WebServer\tomcat\webapps\WebCenter_Inst\images\country_flags` folder. When you add a custom language to the Lists, place a corresponding flag image in this folder.

The flags are 16x16 in size. The subfolder `WebCenter\WebServer\tomcat\webapps\WebCenter_Inst\images\country_flags\big` contains same flags in bigger (32x32) sizes.

- b) Create the Translation Language document in Excel. Add the following mandatory columns specified in the Master text Language excel sheet.
2. **Create** Lists named `MASTER_TEXT_LANGUAGE` and `TRANSLATION_TEXT_LANGUAGE`.

General list information

List Name* MASTER_TEXT_LANGUAGE

Description

Input Source Properties ⓘ

Document MasterLanguageList.xlsx

Sheet Name Sheet1

Log File MASTER_TEXT_LANGUAGE_11.log

- Flush existing list data before updating the List. The existing data will be replaced by the new data!
- Database Username and password are required when deleting data from List

List Properties

Input Columns	List Columns	Unique Identifier ⓘ
LANGUAGE_CODE	LANGUAGE_CODE	<input type="checkbox"/>
DESCRIPTOR	DESCRIPTOR	<input type="checkbox"/>
FLAG_FILENAME	FLAG_FILENAME	<input type="checkbox"/>
LANGUAGE_INDEX	LANGUAGE_INDEX	<input type="checkbox"/>
DIRECTION	DIRECTION	<input type="checkbox"/>
FONT_FAMILY	FONT_FAMILY	<input type="checkbox"/>

-

3. Create the following attributes in **Admin > Attributes > Attributes**

- MASTER_TEXT_LANGUAGE
- TRANSLATION_TEXT_LANGUAGE

These attributes define the languages that are used by the Text Content as part of the Project's Attribute Category.

4. Create an **Attribute Category** and add the language attributes to it.

5. **Restrict Values** to the language lists. And specify the **Column** as **Descriptor**.

To select more than one language, you need to enable **Allow Multiple Values**.

These attributes has to be added to the Project's or Templates **Attribute Category**. The User can then select the Master Language and Translation Languages according to that Project's needs.

Configure Text Reference Attributes

You need to create two attributes which are used in mapping the Dynamic Content data. When Dynamic Content is imported, these are used to map the location and the instance sequence of the text. These are later used in exporting the Content into GS1 format as well.

Note: These are not visible to your users.

1. Create the following **Attributes**.

- INSTANCE_SEQUENCE This will be a reference attribute (of a text document reference) keeps the instance sequence (a number) of the Text Statements.
- LOCATION_LIST This reference attribute stores the specific location of the Text Element on the artwork for each dynamic Text Element.
- EXPECTED_NUMBER_OF_OCCURRENCES This reference attribute store the number of expected occurrences of a particular content(image, text, table, Barcode in an artwork.

2. Create an **Attribute Category** which will be used as a **Reference Category** when configuring [Text Document References \(Copy Sheet\)](#).

Note: Specify the **Visibility** as **Hidden (Keep Values)**.

[Creating a Copy Sheet](#) on page 379

When you are viewing an artwork document in the Viewer, the Text Documents are highlighted when you click on them. The reference property Location_List is used in rendering this feature. Add this reference category to Text Document attributes used in Copy Sheets.

Configure Language Index Attributes

To map the **Language Index (Locale Index)** from Dynamic Content, you can create attributes. These attributes are needed when you configure [Import Dynamic Content](#) node in the workflow.

Note: Without setting these attributes, the import node will use default indices from the [language lists](#). We recommend that you create these attributes to be able to specify the language indices for each project.

- Create the language attributes and add them to the Attribute Category.
See the example screen shot:

The screenshot shows a web editor interface. On the left, there is a table with the following content:

[Title]Select the artwork languages.	
[Spacer]	
PCM Artwork Language 1	PCM Artwork Language 6
PCM Artwork Language 2	PCM Artwork Language 7
PCM Artwork Language 3	PCM Artwork Language 8
PCM Artwork Language 4	PCM Artwork Language 9
PCM Artwork Language 5	PCM Artwork Language 1
[Spacer]	
[Title]Metadata	
[Spacer]	
PCM Market	PCM Brand

On the right, the 'Details for selected cell:' panel is open, showing configuration options for the attribute 'PCM Artwork Language 1':

- Attribute:** PCM Artwork Language 1
- Attribute Type:** Text
- Label:** Label Text: Artwork Language 1
- Span Columns:** 1
- Style:** Field
- Visibility:** Editable
- Restrict Values:** List (set to ALL_LANGUAGES_1), Column: DESCRIPTOR, Rendering: Dropdown
- Allow Multiple Values:**
- Info Page:** <WebInstanceRoot>/custom/AttributesHelp/

- Configure **Restrict Values** as a Language List to get the attribute selector drop down listing all languages. Use this in the Template that is used to import Dynamic Content and the workflow step [Import Dynamic Text](#) on page 903.

3.23.4. Managing Text Permissions

Ensure that:

- you have invited the right **Roles** in your **Project** or **Template** with the Text document.
- you have added the Master and Translation Languages to the Project's Attribute Category to configure Language specific Editor and Approver permissions. It is important to do role mapping in a *smart way*.
- you have enabled the right [Preferences](#).

If you are a **Project Manager / Admin**, you can manage and assign content permissions.

Note:

A user without any of these permissions can only view (depending on the view permissions) the text content documents.

1. To manage Permissions, go to the **Document details > Text Information > Role Mapping**.

When you click on a Text Content Document Type icon, the **Document Details** will have the **Text Information** tab with the following sub-tabs:

- [Text Content](#)
 - [Role Mapping](#)
 - [Compare](#)
2. Click on **Manage Permissions**. This will open up the **Role Mapping** page.
 3. Click **Add Permission**. Repeat this for as many permissions as you want.

Content
Role Mapping
Compare

Content has changed since last Save.

For each Content Permission, select the Language. If the '[ALL OTHER LANGUAGES]' option is selected under Language, SmartName is applied automatically to derive the Roles (if Role is not selected).
[Click here to Manage Roles](#)

Content Permission	Language	Role	
CONTENT MANAGER ▾		PCM_CONTENT MANAGER ▾	✕
EDITOR ▾	[ALL OTHER LANGUAGES] ▾	PCM_CONTENT MANAGER ▾	✕
APPROVER ▾	[ALL OTHER LANGUAGES] ▾	PCM_CONTENT MANAGER ▾	✕
ADD LANGUAGE ▾	English - International ▾	PCM_LEGAL ▾	✕
ADD LANGUAGE ▾	Dutch - Belgium ▾	PCM_TECHNICAL ▾	✕
ADD LANGUAGE ▾	French - France ▾	PCM_CONTENT MANAGER ▾	✕

4. Choose the **Content Permission** from the drop-down listing:
 - **Content Manager**
 - **Editor**
 - **Approver**
 - **Add Language**
5. For the Content Managers permission, define the appropriate **Role**.
 Read about the permissions below:
 1. **CONTENT MANAGER:**

The WebCenter Role with this permission facilitates the entire content management process to ensure accuracy and compliance. For example, the role Marketing could have this permission where the Marketing has the responsibility of the packaging content. The Content Manager will manage the Master and Translated statements.

Note: The Content Manager Role is not associated with any specific language.

This role will manage all the permissions and the settings for the current document.

Note: Content Manager Role cannot act as an Editor or Approver unless this permission is granted to the same role.

2. EDITOR

The Content Manager typically assigns this right to the dedicated roles who will create, edit, revise or translate the text. This can be assigned per language.

An Editor Role (for example, a Translator) can edit when a document is in the **Draft** state, not in **Signed-Off** or **Pending Sign-off** state. After editing, the role can mark it as **Pending Sign-off**.

Note:

- The **Content Manager Role** has to configure the list of translation languages to make use of multiple language based **Editor** permissions.
- You can configure **Roles** for all languages to which the content should be translated and grant them the **Editor** permission.

3. APPROVER: A **Role** with this permission can approve the text content. This permission can also be configured per language. The approver puts the Text Statement to **Signed-Off** or **Rejected** state.

4. ADD LANGUAGE:

Any user with **Add Language** permission can add language to a text or table content document. The users can be assigned with permission to add only specific languages.

Manage Permissions

Content Permission 	Language	Role	Assignee(s)
CONTENT MANAGER		 PCM_CONTENT MANAGER	 MRJN
EDITOR	 English - International	 PCM_CONTENT MANAGER	 MRJN
EDITOR	 English - United States	 PCM_CONTENT MANAGER	 MRJN
EDITOR	 Dutch - Belgium	 PCM_CONTENT MANAGER	 MRJN
EDITOR	 French - France	 PCM_CONTENT MANAGER	 MRJN
APPROVER	 English - International	 PCM_CONTENT MANAGER	 MRJN
APPROVER	 English - United States	 PCM_CONTENT MANAGER	 MRJN
APPROVER	 Dutch - Belgium	 PCM_CONTENT MANAGER	 MRJN
APPROVER	 French - France	 PCM_CONTENT MANAGER	 MRJN
ADD LANGUAGE	 English - International	 PCM_LEGAL	 MRJN  MRJN_USR2
ADD LANGUAGE	 Dutch - Belgium	 PCM_TECHNICAL	 MRJN  MRJN_USR3
ADD LANGUAGE	 French - France	 PCM_CONTENT MANAGER	 MRJN

Note: You may choose to give more than one permission to a Role. For example, the Content Manager can have Editor and Add Language permissions as well.

6. Define the **Editor** permission and assign it to a role. Select the corresponding **Language** from the drop-down.

You can automatically create **Editor** and **Approver** Roles for all languages in one go. Read about [Smart Role Naming](#) on page 483. To do this for the editor permission:

- a) Make sure that the **Admin** preference section has the right Prefixes. Read [here](#).
- b) Next to the **Editor** permission, select **All Other Languages**.

Manage Permissions

Content Permission	Language	Role	Assignee(s)
CONTENT MANAGER		MARKETING	Varghese, Shalet (SKVA)
EDITOR	English - United States	LANGUAGE EDITOR EN-US	
EDITOR	Dutch - Belgium	LANGUAGE EDITOR NL-BE	
EDITOR	English - Ireland	LANGUAGE EDITOR EN-IE	
EDITOR	French - Canada	LANGUAGE EDITOR FR-CA	
EDITOR	French - France	LANGUAGE EDITOR FR-FR	
EDITOR	Greek	LANGUAGE EDITOR EL	
EDITOR	Italian - Italy	LANGUAGE EDITOR IT-IT	
EDITOR	Portuguese - Portugal	LANGUAGE EDITOR PT-PT	

7. Define the **Approver** permission and assign it to a role.

Select **All Other languages** to create Approver roles with default names in one go.

Note: You can configure Editors and Approvers individually for some languages and choose the Smart Role Naming for the rest of the languages by selecting **All Other languages**.

8. To edit Content Permissions, click **Manage Permissions** and edit or change the assignment of a permission.

- The **Role Mapping** page will list all the Content Permissions, respective languages, Roles and their assignees (individual or Group).

The Roles will be clickable if they exist in the system and are invited to the Project.

- The Master Language of the Project will be highlighted in bold.

If you would like to give content editing and approving permission during Project Creation, assign Editor and Approver permission to the `_REQUESTOR` role.

For example, if you assign Editor permission to the `_REQUESTOR` role, the Editor can draft the text during project creation.

EDITOR **English - United States** `_REQUESTOR` BO, Manager (BO_MANAGER) Keizer, Debbie (DEKE)

Warning: During a Project's creation, you can assign another user as the Requester. If this happens, the permissions defined for the `_REQUESTOR` role does not get transferred. In this scenario, some updates done during the Project creation may be lost.

Smart Role Naming

When your content workflow contains translations into different languages, you can have **Editor** and **Approver** permissions assigned to **Roles** (text authors/editors and approvers such

as legal or marketing) associated with these languages. To automate the naming of such Roles, you can specify prefixes for these placeholder **Roles**.

Manage Permissions

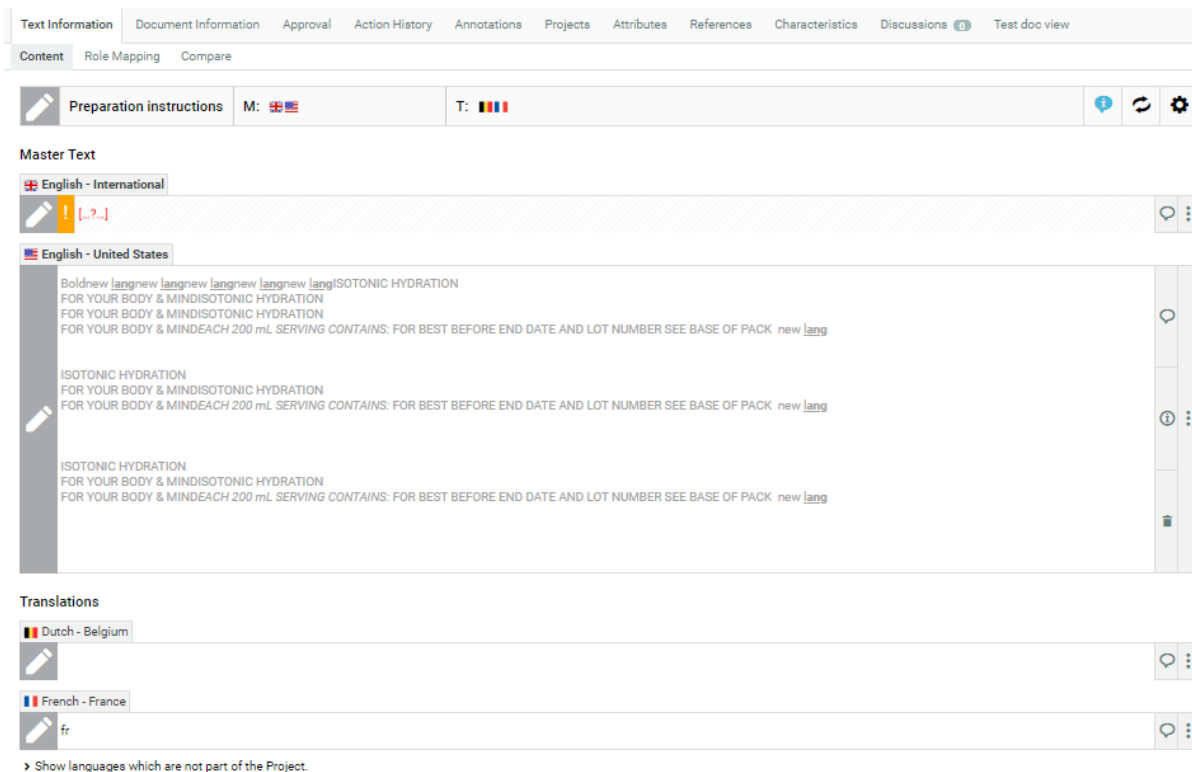

Content Permission	Language	Role	Assignee(s)
CONTENT MANAGER		MARKETING	Varghese, Shalet (SKVA)
EDITOR	English - United States	LANGUAGE EDITOR EN-US	
EDITOR	Dutch - Belgium	LANGUAGE EDITOR NL-BE	
EDITOR	English - Ireland	LANGUAGE EDITOR EN-IE	
EDITOR	French - Canada	Prefix + Language Code LANGUAGE EDITOR FR-CA	
EDITOR	French - France	LANGUAGE EDITOR FR-FR	
EDITOR	Greek	LANGUAGE EDITOR EL	
EDITOR	Italian - Italy	LANGUAGE EDITOR IT-IT	
EDITOR	Portuguese - Portugal	LANGUAGE EDITOR PT-PT	

The names of the Roles will have the specified **prefix** (In the example screenshot, Language Editor) and the respective language code.

Text Document Details

When you click on a Text Content Document Type icon, the **Document Details** will have the **Text Information** tab with the following sub-tabs:

- [Text Content](#)
- [Role Mapping](#)
- [Compare](#)

3.23.5. Creating a New Text Document

An Administrator or Project Manager can [create Text Document Templates](#) using which the users can generate new text documents.

Note:

It is not possible to create Text Documents without configuring the **Document Templates** and **Document Sources**.

When configuring a text document reference for a **Task / Project Template**, you have the option to specify [document sources](#). These are buttons that will allow you to create, or link, or copy or reference documents in their respective documents tables.

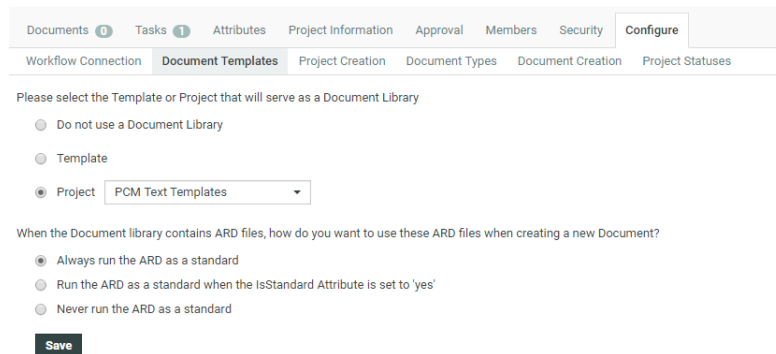

1. Create a **Project** or **Template** to host all your **Text Templates** (a Text Document Template library).
2. To create text document templates:
 - a) Upload Text Documents (.wcc) into this Project or Template. We recommend that you create Templates per Element Type. This allows the users to create a new Text Document for each of the Element Type.
 Make sure that you have enabled the text document type in the [Preferences section](#).
 - b) Go to **Document Details > Text Information > Text Content** tab of the Template and add the corresponding Element Type to the template.
 - c) Also, specify Master and Translation languages for each template.
 - d) Specify the **Approval Type** as:

- **Default:** Even if one user approves, the document is approved.
 - **One of Role:** At least one user per role assigned should approve the text content document
 - **All of Role - One per Group:** From every group, at least one user should approve
- e) In the **Role Mapping** tab, assign the [Content Permissions](#).
- f) Repeat for all the text document templates you want to create.

Note:

- New documents created from this document template will inherit the settings.
- The approval cycle is different from other document Types. Read more about Text Document Approval in our KB.

3. Create a Project Template for each kind of project that may be required by Project Managers.
4. In each of these Templates **configure** the **Document Library** as follows:
 - a) In the **Project Details** page, **Configure > Document Templates**.
 - b) Select **Project** or Template and select your document template library from the drop-down.

- c) Click **Save**.
- When creating a Project from this Template, the user can click **New** and select a **Text Document Template** from the Templates library to create new documents.
5. Create an Attribute Category for your Template.
 - a) Add [Language Attributes](#) and restrict them to Language Lists.
 - b) You need Document Reference Attributes. Create and add them to this Category.
 6. To allow the user to create new documents from the Copy sheet (document references) attached to this template, configure [document sources](#) for the individual reference attributes.

Tip: Use a Saved Search configured to search for Table Templates as a document source for better user experience. You can, for example, add a Search Panel.

The user will be able to add **New** Text Documents from **Template > Attributes** section when creating a Project.

3.23.6. Creating a Copy Sheet

Copy sheet is a term used to describe all the content together which will be attached to a particular artwork or printed item. A copy sheet containing aggregated content helps you to:

- validate the copy sheet templates for consistency, accuracy and compliance with the established content management process.
- review, proof-read and approve copy sheet in one place.

You can create a copy sheet using Text Content Document References in an **Attribute Category**. This gives the option to attach this copy sheet to your Projects or artwork documents.

The copy sheet categories allow you to:

- track the content on an artwork.
- easily reuse existing approved content
- configure separate permissions and approval system for each text document.

Tip:

By configuring *Document Rendering* for Text documents, you can attach copy sheets to Tasks. When you configure Workflows with manual tasks for editing or approving, the users can work on the copy sheet directly from their task.

An Attribute Category based copy sheet offers the following advantages:

- the languages. To view a particular translation corresponding to a master, just select that language in the filter drop down.
- the **Instance Sequence**. See more in: [Dynamic Content documentation](#)
- the option to [replace a text document with another](#)
- the button to [duplicate a document](#) with the same reference attributes
- [advanced document reference options](#)

You can [Edit](#), [Start Approval](#), [Approve and Reject](#) actions from the copy sheet depending on your content permission.

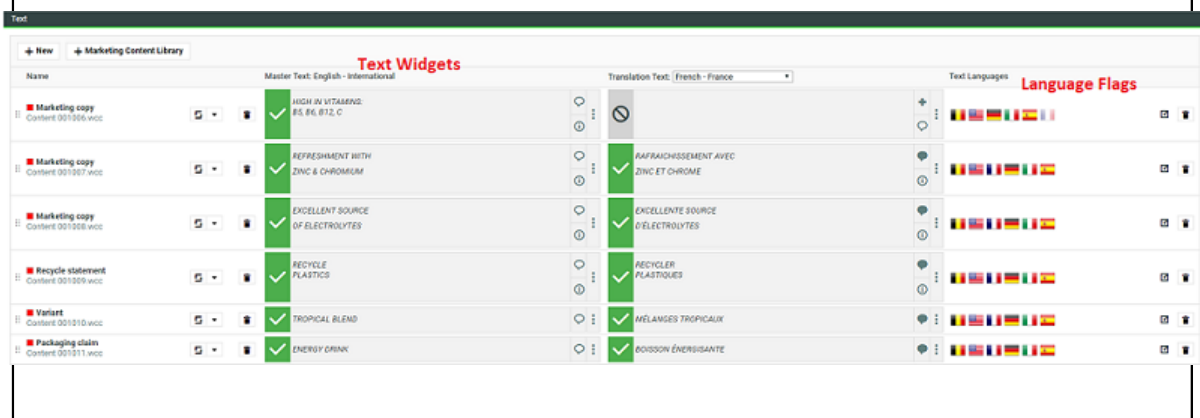

Note:

The text document references are used when you import Dynamic Content into WebCenter. Read about this in: [Import Dynamic Text](#) on page 903.

See the example screen shot below. The configuration explained here is only an example. You can configure your document references according to your needs.

Tip: You can configure the copy sheet with different **Attribute Views** to provide custom views to your users. For example, a content collator and Translation Language Editors can have different [custom views](#) of the same text document reference category.

Note: You can also add the languages by clicking on the **+** displayed in the text statement. On deletion of a language, the **+** icon is again displayed to enable adding back the language. You can configure the corresponding attribute category to display the languages one by one in a table.

Create a Table Rendering for Text Documents

You can configure Text or Table Documents as document references and add them to a Project or Document Attribute category. The configuration and rendering are similar for Task Specifications.

To create a Copy Sheet using Text Document References, you can configure text related data to an advanced table rendering.

1. [Create a Table Rendering](#).
2. In the **Edit Rendering Configuration** pop-up:

Specify...	The result in the rendering table will be...
Master Text	<p>Master Text Statement in a text widget along with its content in the edit field and all related text content actions.</p> <p>Note: The Visibility should be specified as Editable if you want your users to edit the text.</p>
Translation Text	<p>Translation Text Statement(s) in widgets. One or more columns can be configured for the translations of the Master Text. The Master and Translation languages will also appear in a drop down.</p>
Text Language Flags	<p>The language drop downs for Master and Translation Text columns.</p> <p>Note: The master and translation languages are populated from the project attributes MASTER_TEXT_LANGUAGE and TRANSLATION_TEXT_LANGUAGE respectively.</p>

Tip:

You can specify a default language code for Text statements. The selected language will be the default in the document reference table. If default language is not specified, the first language from the language drop down will be selected as the default.

WebCenter also supports right to left languages like Arabic and Hebrew for text content.

3. Specify the width for Master Text and Translation Text.

By default, the width of every column is set to **Auto**. However, you can configure the width for the following:

- Document Name
- Master Text
- Translation Text
- Translation Languages

Tip:

To change the width of the columns, specify pixels or a percentage (of the width of the table). If the label of the column is too big for the width specified, the column width will be bigger to accommodate this.

Edit Render Configuration

Name: Scope Other Doc Ref_Default

Hide Header
 Open Links in new Tab

Type	Details	Label	Visibility	Width	Collapse
Expand Attributes (+)	View: Default <input checked="" type="checkbox"/> Use Creation View for new Documents	+	Read Only	auto	<input checked="" type="checkbox"/>
Up/Down			Read Only	auto	<input checked="" type="checkbox"/>
Translation Text	<input type="checkbox"/> Show Side by Side	Translation Text	Editable	450px	<input checked="" type="checkbox"/>
Text Language flags	Show for: Master Language(s) Display: Show only flags Language Flag Indicators	Text Languages	Editable	100px	<input checked="" type="checkbox"/>
Document Actions	Open 3D View Open in ArtiosCAD Download Add Action		Read Only	auto	<input checked="" type="checkbox"/>
Local/Remote Project	<input checked="" type="checkbox"/> Retain text document status		Read Only	auto	<input checked="" type="checkbox"/>
Delete Button			Read Only	auto	<input checked="" type="checkbox"/>
Document Property	Description	Description	Read Only	auto	<input type="checkbox"/>
Text Language flags	Show for: Translation Language(s) Display: Show flags and languages	Text Languages	Editable	100px	<input type="checkbox"/>

Add Column Revert to default configuration

OK

4. Configure the display of Text Language Flags. You can configure the **Display** as **Show only Flags** or **Show Flags and Languages**.

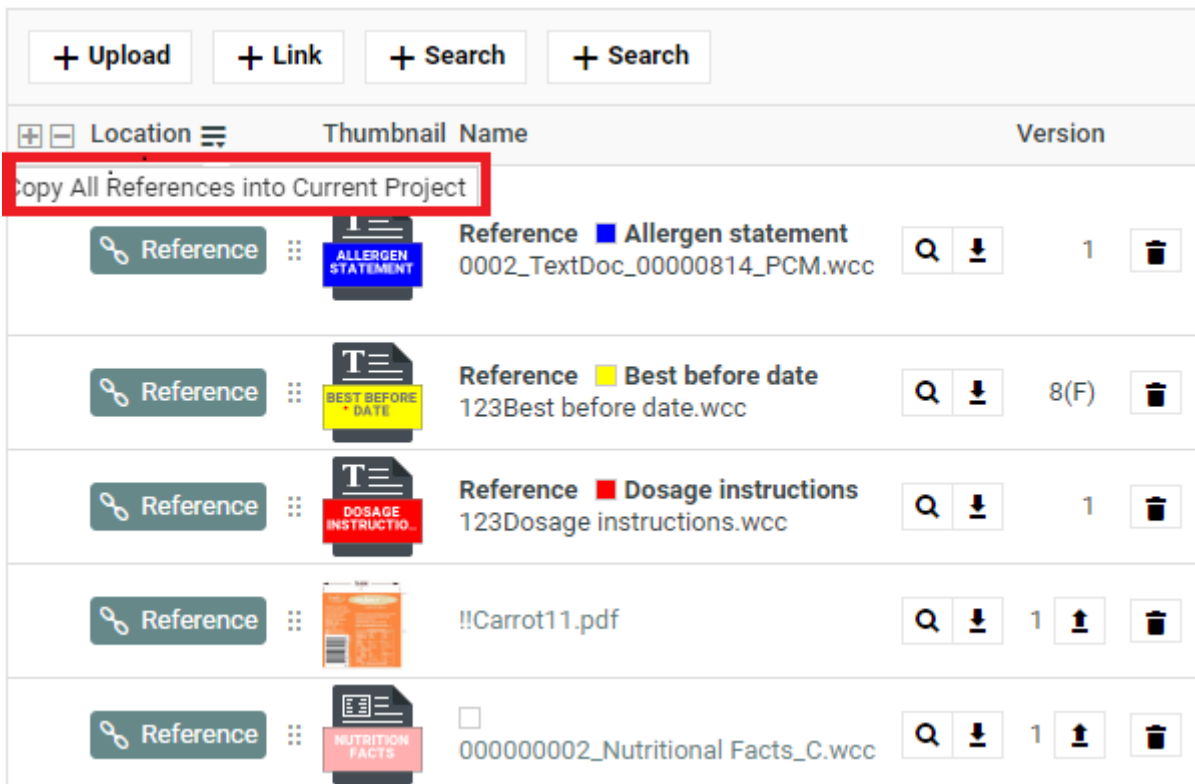

These flags will be based on the Project Language Attributes.

- In the copy sheet view, all the newly created text documents will have the current Project's *Language attributes* as flags.
- All the sourced content (referenced from other Projects) will have the flags based on the source Project's language attributes.

To add the current project's languages, select them from the available flags.

- You can add or delete flags in this view. Read more in:

5. You can allow the users to move a referenced document into the current project. To set this up, create a column with **Local / Remote** setting. Specify the **visibility** as **editable** or **read-only**. You can move all the referenced documents into the local project by hovering on the **Location** in the header and selecting the option **Copy All References into Current Project**.

You can move any of the referenced document to the local by clicking on the Referenced field of the required document and selecting the option **Copy to Current Project**.

The users need to **Change Properties** and **Add** permissions to move a document to local folder. The document reference will point to the local copies.

The user will be able to specify:

- a new name and description
- document template
- target folder

If the setting is **Read-only**, the user will see indicating remote project.

6. If you are configuring **Local / Remote** button to allow copying of documents, ensure that you have enabled or disabled **Retain text document status**.

When this option is turned off, if you copy to **Local**, the approval status of the Text Document will be reset to **Draft**.

If **Retain text document status** option is turned on, when you copy the document, the document's approval status will be retained as it is.

7. Define adequate permissions to view and edit Text Statements:

Whether or not your user can edit or perform approval actions on a Text Element is determined by the following settings and permissions:

- **Visibility** should be specified as **Editable**.
- If your Text Document Reference is a child of another document (for example an artwork), the **Expand Attributes (+)** column of the Parent document should be configured as **Editable**.
- The user should have appropriate Content Permissions. Read more in: [Managing Text Permissions](#) on page 479.

Tip:

Check these Project level permissions (**Project Details > Security**) to troubleshoot editing problems:

- **Change Properties**
- **Lock/Update**
- **Start/Stop Approval**
- **Upload new version**
- **Change Task**
- **Download**
- **Add**

Note: The Text widgets, related languages and statuses are rendered only for Text Document References.

Configuring Document Sources for Text Documents

You can configure your **Document Sources** (such as a Project/template which serves as a library of Text Documents / Artworks), a Saved search of your Text Documents, or your Document Templates) in the **Grid layout** of an Attribute Category or Project Template.

Edit Document Sources Configuration

PCM Technical DocRef_Default

Source	Label	Details	Operation	Target Folder
Document Templates	Simple New Statement(s)	Document Template selector Any Document Template configured	Copy	02 - Text Statements
Saved Search	Simple Approved Statement(s)	Search Name PCM Text Library Search Technical	<input type="checkbox"/> Copy <input type="checkbox"/> Link <input type="checkbox"/> Move <input checked="" type="checkbox"/> Use By Reference	02 - Text Statements

Add Document Source

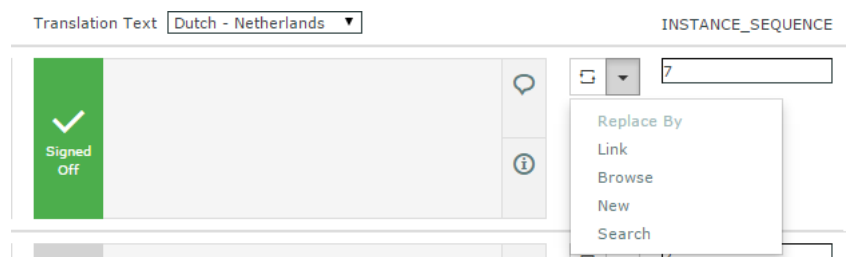

OK

Your configured sources will appear in the places (such as templates or forms you have designed) where you set the document reference categories. Read more in: [Adding Document Sources for a Document Reference Attribute](#) on page 364.

Replace a Document Reference

You can configure a **Replace** option in your document reference table. When the user **replaces** the old reference, the new document reference will have the same **reference category** as the old one.

Note: Only users who are Project managers, Administrators or with Change Properties rights can replace the document reference.

When you configure a **Replace button**, it will allow the users:

- to replace the document via any of the configured [document sources](#) (**upload, browse**, etc.). If the user did not select any option, the first source will be taken as the default.
- to **Undo the action** before saving the new document reference.

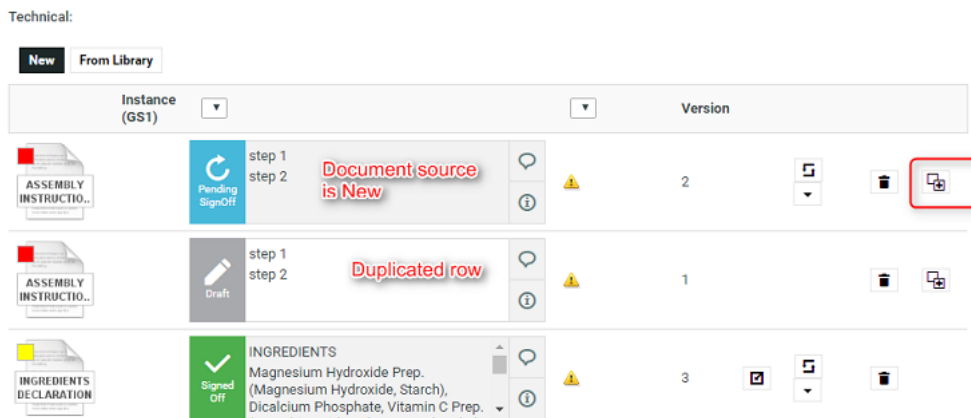

This document will have its own **Attribute Category** but will keep the same **Reference Category** as the old reference.

Duplicate a Document Reference

You can configure a **Duplicate** option in your document reference table. When the user **duplicates** a reference, a new row of document reference will be created. The duplicated document will have the same content, document **attributes** and **reference category** as the previous one.

In the case of Text Document, Content file, then each element status in the file will be reset to draft.

Note: Only users who are Project managers, Administrators or with Change Properties rights can replace the document reference.

When you configure a **Duplicate** button, it will allow the users:

- to duplicate a document row with **Copy** and **New** as *document sources*.

The duplicate documents are created in the current Project where the copied or newly created documents are stored.

Tip:

- The document will be named as [FileName] [Duplicate] [1], [FileName] [Duplicate] [2], etc.
- Use the **Rename** document action to change the document name.

You cannot duplicate a document reference if the document source is:

- Browse / Link / Use by Reference / Remote.**

Behavior while duplicating document and its reference properties:

- If **Allow multiple values** is turned off in the attribute category, the duplicate will replace the original instead of adding a new document reference.
- The duplicated document will have the same Attribute category including the child document references. The Reference categories and its settings are copied at parent and child levels.
- The duplicated row inherits the entire hierarchy (if any) of the parent row including the attribute values.
- It is possible to duplicate a newly created document row.

3.23.7. How to Configure a Setup to Extract Dynamic Content

This chapter provides an overview of what needs to be configured to have a functioning Content Management setup in WebCenter.

To efficiently manage the content, you need a setup that addresses the packaging content in the context of packaging artwork. To create such a system you need:

- Reusable text documents stored in the form of libraries
- Text Document Templates

- Artwork libraries and Templates
- Attribute Categories with Languages to be attached to the Projects
- Copy Sheet or Text Document References attached to Artworks

The steps below describe how to create a setup to import Artwork templates from Adobe Illustrator (With Dynamic Content) along with the Text Content mapped to a Copy Sheet.

Note: This is an example configuration. Other than the essential steps, all other steps meant as recommended, not mandatory.

Note: To get you started, we have created a migration setup that you can import into your system and start on it. See in: [Knowledge Base article](#).

1. **Follow the Essential steps to configure the module.**
2. **Create Text Document Templates. You need these templates to create new Text Documents.**

Important: You can create Text Templates with all the necessary configuration automatically. This is recommended if you require a large number of templates. Contact Esko Professional to configure your Text Templates automatically.

You can now start using these templates to create new Text Content Documents.

The screenshot shows the WebCenter interface for a project named "PCM Text Templates". The project is active and managed by Daemen, Karsten (KADA). The interface includes a navigation menu with options like "Documents", "Bill Of Materials", "Tasks", "Attributes", "Project Information", "Approval", "Members", "Security", and "Configure". A sidebar shows "Folders" with "Project Documents" and "Text Document Templates". The main content area displays a table of document templates:

Documents	Version	Approval	Uploaded	Tasks
Active ingredients declaration.wcc (2.1KB) WCC Template Document	1	Setup Approval Cycle	May 4, 2016 at 3:05 PM Daemen, Karsten (KADA)	
Active ingredients header.wcc (2.1KB) WCC Template Document	1	Setup Approval Cycle	May 4, 2016 at 3:05 PM Daemen, Karsten (KADA)	
Administration route.wcc (2.1KB) WCC Template Document	1	Setup Approval Cycle	May 4, 2016 at 3:05 PM Daemen, Karsten (KADA)	
Allergen statement.wcc (2.1KB) WCC Template Document	1	Setup Approval Cycle	May 4, 2016 at 3:05 PM Daemen, Karsten (KADA)	
Assembly instructions.wcc (2.1KB) WCC Template Document	1	Setup Approval Cycle	May 4, 2016 at 3:05 PM Daemen, Karsten (KADA)	

3. Create WebCenter Projects as Text Libraries and Artwork Libraries and organize your assets in them.

Do this for:

- Text Content Documents,
- Artworks,
- and more...

See more examples [here](#).

To organize further, you can create [advanced Text Searches](#).

4. [Create copy sheets](#). They are Attribute Categories with Text Document References.

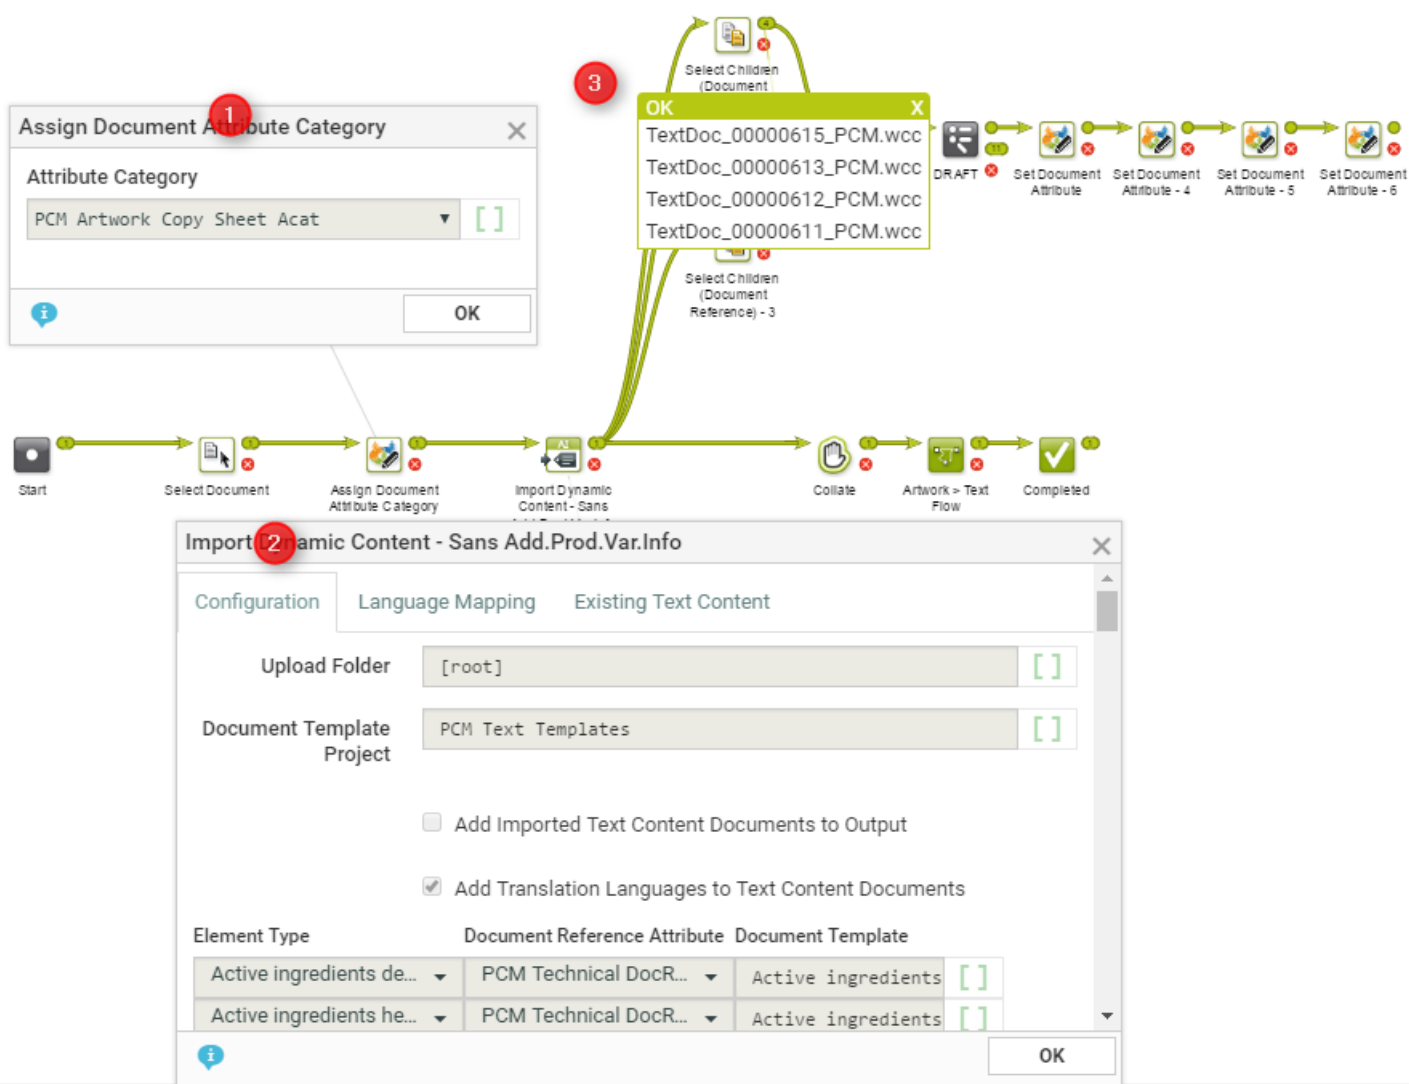

- a) Create your **text document reference attributes** and add them to an **Attribute Category**. You can use the advanced features available in the **grid layout**.
- b) Add the mandatory [Reference Category](#) to these document references. This is used in matching the Artwork's Dynamic Content elements to text references.
- c) [Create a table rendering](#) with text related options. You can configure Master and Translated Text widgets for your copy sheet. You can use all the advanced features available in the **grid layout**.

Depending on the User's permission (Editor, Approver or Content Manager), they can do content actions in this page.

- Make the attributes **editable** (the **visibility** setting) to allow for text editing.
- Allow adding multiple documents by enabling **allow multiple values**.
- d) Configure the **document sources**. Choose the operation (copy, link, move, or use by reference). Read more in: [Adding Document Sources for a Document Reference Attribute](#) on page 364

document sources settings you configure here will be rendered in the text document table.

- Create a custom **label**.
 - Specify the source of the document. For example, a **Saved search** of text documents for adding approved text. To create new text documents, the source will be **Document templates**.
 - Specify the type of operation: **copy**, **move** (move content to the local folder) or **use by reference** (to use approved content from a library or saved search).
5. Create other attributes necessary for the document as per the requirement.
6. **Create Import setup for Adobe Illustrator design files with Dynamic Content**. This workflow will map the content to the copy sheet attributes (text document references) created in the previous step.
- a) Create a Task Type for the import workflow.
 - b) Configure your workflow [step](#) to assign the Copy Sheet attribute category to
 - c) Create a step to extract the [text content as Copy Sheet references](#) of the artwork.
 - d) Configure the [Import Dynamic Text](#) on page 903 step with document reference and document template mapping. Specify the reuse policy for partial matches in this step.
 - e) [Route the workflow depending on the text document status](#).

In the example, when an artwork with Dynamic Content arrives at a Packaging Content Management workflow, the following steps happen:

1. The workflow assigns a **Document Attribute Category** to the artwork (parent). This 'copy sheet' category contains the **document reference attributes** to which the text content will be imported.

Note: If this step is not in the workflow, the **Import Dynamic Content** will use the Project's attribute as the default.

The category contains the **Document Reference Attributes** for:

- technical text statements,
- legal statements and
- marketing statements

to serve as the copy sheet template.

2. The **Import Dynamic Content** step maps the various Element Types to appropriate **document reference attributes** as configured.
3. The *Select Children* nodes select the text documents (technical, legal and marketing) separately. These documents can be processed as separate text documents while keeping the link between them and the artwork alive.

Later in the production process, you can supply the approved textual content in the form of an XML file. Read in: *Export to GS1 Format* on page 899. Using the Esko Dynamic Content plug-in, the designer can add the approved content to the Illustrator document.

7. Create Approval Workflows to assign Tasks for different approval stages.

When you have assigned Content Permissions and assigned them to Roles, the assignees can manually go into each text document and approve it. However with a workflow, you can assign *Tasks with Text Documents* to those Roles automatically.

Note: You need to configure these Workflows according to your business needs.

Read more in the KB article:

8. Create other Workflows depending on your business needs.
9. Configure Project Templates to create projects to update or create new Artwork templates with content.

- a) Configure the Project Creation Form.
- b) Invite **Members** (Roles and Groups) who will perform various tasks in the Project context.

These are important for activating the Content Permissions (from Document Templates). Read more in: *Managing Text Permissions* on page 479

- c) In **Configure > Document Templates**, link *the text document templates* to allow creating new text documents.
- d) Optionally create a custom setup for document sources in **Configure > Document Creation**.
- e) Assign an **Attribute Category**. It should contain the following attributes and any other attribute relevant to your Projects.

- MASTER_TEXT_LANGUAGE
- TRANSLATION_TEXT_LANGUAGE

Note: The MASTER_TEXT_LANGUAGE and TRANSLATION_TEXT_LANGUAGE attributes determine the languages of the Text Content documents located in that Project.

- *Language Index* attributes.

Note: If the Language Index values are not specified, the default values (from the Language Lists) will be used as indices.

To determine the Master and Translation languages of a Project, you need to define these in the **Template > Attributes** page.

- f) Add the Workflow Tasks to the Template. The workflow tasks configured for import and approval are configured to launch right after the project creation.

3.23.8. How to Configure a Setup to Extract Images, Symbols and Graphics

You need to create attributes which are used in mapping the Images, Symbols and Barcode to the document templates. When images, symbols and Barcode are imported, these are used to map the location. These are later used in exporting the content into GS1 format as well.

Note: These are not visible to your users.

1. Create the following Attributes.

For Symbols

- **SYMBOL_NAME** This is an attribute commonly used for storing the name of the symbol present in the artwork.

For Images

- **EXTERNAL_IMAGE_PATH** This is an attribute commonly used for storing the path of the image present in the artwork.

Note: If the incoming document is a chili document, ensure that the attribute **ARTWORK_VARIABLE** is available.

For Barcodes

1. **BARCODE_TYPE** This is an attribute for storing the type of Barcode present in the artwork.
 2. **BARCODE_BASECODE** This is an attribute for storing the base code of the Barcode present in the artwork.
 3. **BARCODE_COMPOSITE_COMPONENT** This is an attribute to store the composite component for GS1 Barcodes.
2. Include the above attributes as required in the **Attribute Category** of the Document Template / Document.
 3. Ensure the following attributes are part of **Reference Property** of the document references.
 - **INSTANCE_SEQUENCE** This will be a reference attribute for the document.
 - **LOCATION_LIST** This reference attribute stores the specific location of the document.

You can view the imported images, symbols, and graphics in the Attribute category for the document.

3.24. Nutrition Facts Tables

The **Nutrition Facts Table** (also known as the **nutrition information panel**, and other slight variations) is a highly regulated and required component in food and beverage packaging.

WebCenter Packaging Content Management offers a platform for data management of your nutrition facts, review in the context of artwork and reuse.

The solution will address the following:

- Complying with regulatory requirements. For example, FDA and USDA requirements in the USA and complex, multilingual Nutrition Facts Tables with predefined templates.
- The complexity of data management. SmartName can pull data from your data system for use in your nutrition fact tables.
- Established table rights facilitating the ownership at different stages. For example, who can fill in the data and who can approve, etc.
- Integration with Adobe Illustrator®
- Automation of Nutrition Facts Table creation. A content manager can pick a template which already has the SmartName mapping to point to the right data.
- Smart content reuse. You can use our template system to create different tables from the same pool of data. This is supported with a repository / library for your Table content.
- Support for a translation based or single language workflow.
- Export to and import from industry standard formats
- Approval workflow

Table

A Table in WebCenter is a collection of statements. The table is treated like a single document with multiple statements. A Table has Content Permissions mapped to certain Roles, and specified Languages.

Tables are created based on a Templates (Document Templates). An administrator user can import Table Templates into your system. For example, an FDA approved template with pre-selected nutrition fact statements. The best practice would be that the content manager adapts a series of table templates with specified table statements and permissions and other users create tables based on these templates (and localize them).

Table Statements

A **Table** contains statements with a text label and an editable field. You can define different approval processes for these statements. While the Table Templates contain a pre-determined set of such statements (based on FDA regulations, for example), it is possible to add and delete statements.

- **Element Type:** This indicates what the value of the element represents (e.g.: "Calories", "Vitamin A", "Saturated Fats", ...).

Note: Although it is possible to use your custom Types, the Templates come with GS1 nutrient element types.

- **Instance:** This will be a number indicating the numbered occurrence of a particular **Element Type** in the table. By default, it takes the value "1" except when there are multiple occurrences. If you have three daily values for every nutrient, their individual instances will be "1", "2" and "3".
- **State:** The statements can be in one of the following states: **Draft**, **Pending Signoff** and **Signed Off**. Users with corresponding permissions can change the state of each element.
- **Value:** The actual value of this element that will be displayed in the table (e.g. "230", "10 g", "2%", ...)

- **Static and Variable part:** The text part of the table is treated as static and the numeric fields as variables. This means that users won't be able to edit or adapt the design components of the layout. There are exceptions to this rule: for example, the "Serving Size" in "cups".

3.24.1. Table Content Document in WebCenter

Table Content Document

A Table in WebCenter is a collection of statements (either nutrition fact statements or text statements). The table is treated like a single document with multiple statements in it.

The WebCenter Table Content Document (.wtc) is an XML file that has the following features:

- Table Content that goes on in the Artwork. You can manage the values of the table. This includes the master and the translated tables.
- Approval states for individual Table statements as well as for the whole Table
- Clearly defined ownership rights for Table statements and for the whole Table
- Element Type tagging
- Revisioning
- Download rules
- Attributes
- Document references from other documents. For example an artwork can refer to various text content documents
- Table Content Template
- Can be streamed through a workflow

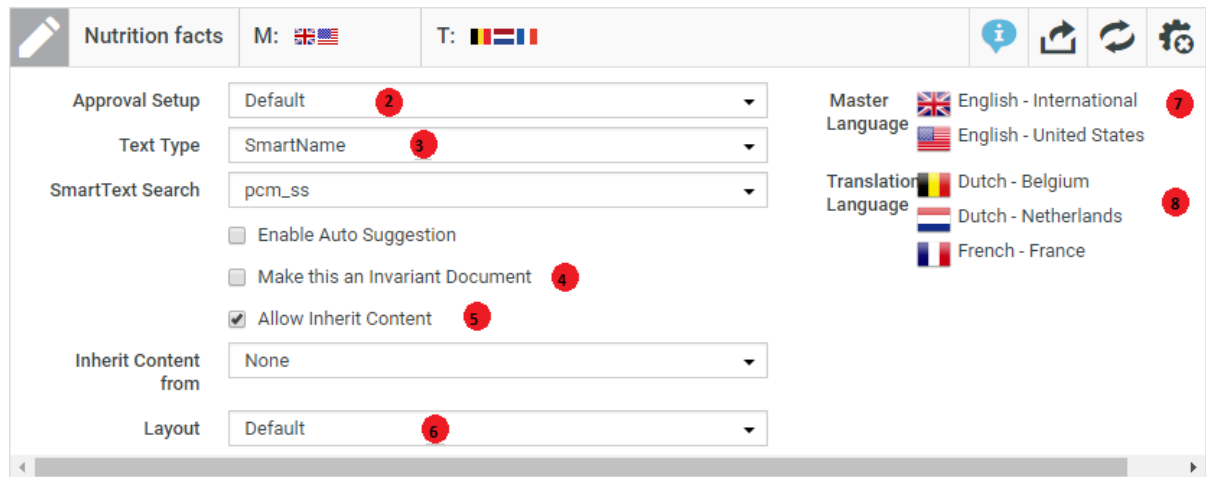

1. [Table Properties Widget](#)
2. [Table Widget](#) on page 504
3. [Preview](#)

4. Translation Widgets

Table Properties

The content manager of the table can modify the table properties such as:

- add or delete translation languages
- make the table invariant
- choose the text type
- choose the layout of the table

Click the **Configure** icon to define the properties such as:

1. The tool bar with Configure icon and tools to:
 - **Resolve SmartName** (only if the table is of SmartName Type)
 - **Export to GS1** tool to export the table in GS1-XML format.
2. [Approval Setup](#)
3. **Type:** Select from **Simple**, **Rich Text** or **SmartName**. If you choose **Smart Name**, you can choose the **Reference Source** from the drop down.
4. Translations: Enable **Make this an Invariant Document** if translations are not required for the table.
5. Choose the **Allow Inherit Content** option to follow a particular language for all the elements in the table. You can either choose **None** where no language is selected by default or **Default** to follow the language chosen at the element level or one of the **Master language** in the project.
6. Choose **Layout** as Grid to customize the Language Layout view. If you have chosen the Grid Layout, you can perform the following actions in the language widget:
 - Define the number of columns and rows for a table
 - Drag and Drop support for rows and column
 - Add or delete rows

Note: If no option is chosen, default layout remains.

7. **Master Language** is specified in the Project's attribute category.
8. **Translation Language** :This list will show the document's translation languages. You may have more languages to add from if they are present in the Project's Attribute Category. Add more languages by hovering and selecting the language.

Text Approval

The Packaging Content Management module offers separate approval processes for the Master and its translations. All the Approval information with regard to the Master and Translations stay within the Text or Table Content Document.

Note: This approval process is different from the regular WebCenter approval process.

The Approval process starts when a content Editor *starts approval* on a text statement or table element.

When you have configured the right *permissions*, the users who has the **Approver** permission can perform approval actions. To automate the approval, you can configure manual tasks in a workflow and assign them to the relevant Roles.

Once approved, the master and translated text remain locked for regular users.

Note: Only the Content Manager has the rights to change the text element to draft.

The text element can be in one of the following states:

- **Draft:** The initial state of the Text Document where the content is still being worked on.
- **Pending Sign-off:** When drafting is complete, and the status is ready for its approval cycle. An approver can review and approve or reject the document.
- **Signed-off:** When the approval cycle is completed and the content drafted in the document is 'Signed Off'.
- **Sign-off Rejected:** When the approval cycle is completed and the content drafted in the document is 'Rejected'.

Note: Approver will be requested to re- enter the password before approving or rejecting any text content document, provided the option is enabled by the Admin user.

Approval Types

Content Managers can set up the **Approval Type** for Text Content Documents. There are three Approval Types:

- **Default:** Only one member has to approve. For example, if the Approver permission is assigned to two Roles, only one member (from any Role) has to approve.
- **One of role:** One member of each Approver Roles (assignees) has to approve to complete the signing off. In case a Role is assigned to several members (groups or users), any Group member or user from that Role can approve.
- **All of Role - One per Group :** At least one member from each Role-Group has to approve. If there is an individual User, then he or she has to approve as well.

Table Approval Status

The approval process can be done at two levels: approval of each nutritional fact statement and as a composite table.

The status of the Table widgets (Master and Translation) depends on the approval state of the table statements. If all the elements are signed off but one is still in the **Draft** state, the widget status will also be **Draft**.

See the approval states below:

1. Signed Off
2. Ready for Approval
3. Draft
4. Rejected

The **Approver** user can approve the entire table (per language) in one go. To do that, hover over the status icon and click **Approve**.

In the case of individual statements, the Approver can change the status to the next possible Approval State. For example, if a statement is in **Draft** state, the user can put it to **Ready for Approval**. Translation languages can be edited even if the master language is not yet signed off.

Note: If **Require Password for Approvals/rejections** option is enabled, then the Approver is asked to enter the password for approval or rejection. The same information is also updated in the **Action History**.

Table Widget

The Master Language Widget contains the Statements or actual table content. The editor users can enter data in the specific fields.

If the table has translations, they will appear as widgets below the master table.

Table Tools

In the **configure** tool bar:

- you can add [Table Elements](#).
- change the [approval state](#) of a document. After the data entry, you can approve or start the approval process.

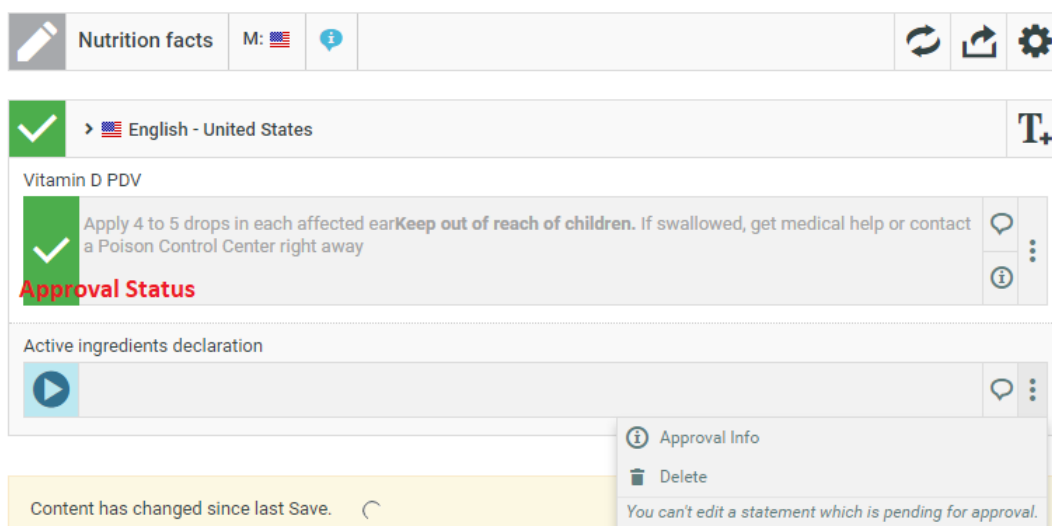

Table Statements

The individual statements or elements can have it's own approval state. The statements have a name label(for example, serving size) and an editable field. Read about adding more elements in the table in: [Table Element Types](#) on page 507.

Language Widgets

If you have added Translation languages to the document, you will have translation widgets below the master table.

Click on the configure  icon and T+ to add table elements to your translation widgets. You can add all or some of the Table Elements present in the Master table. However, you cannot add elements that are not in the Master table.

Each Language has it's own approval process and approval can be done at the whole table level or as individual statements.

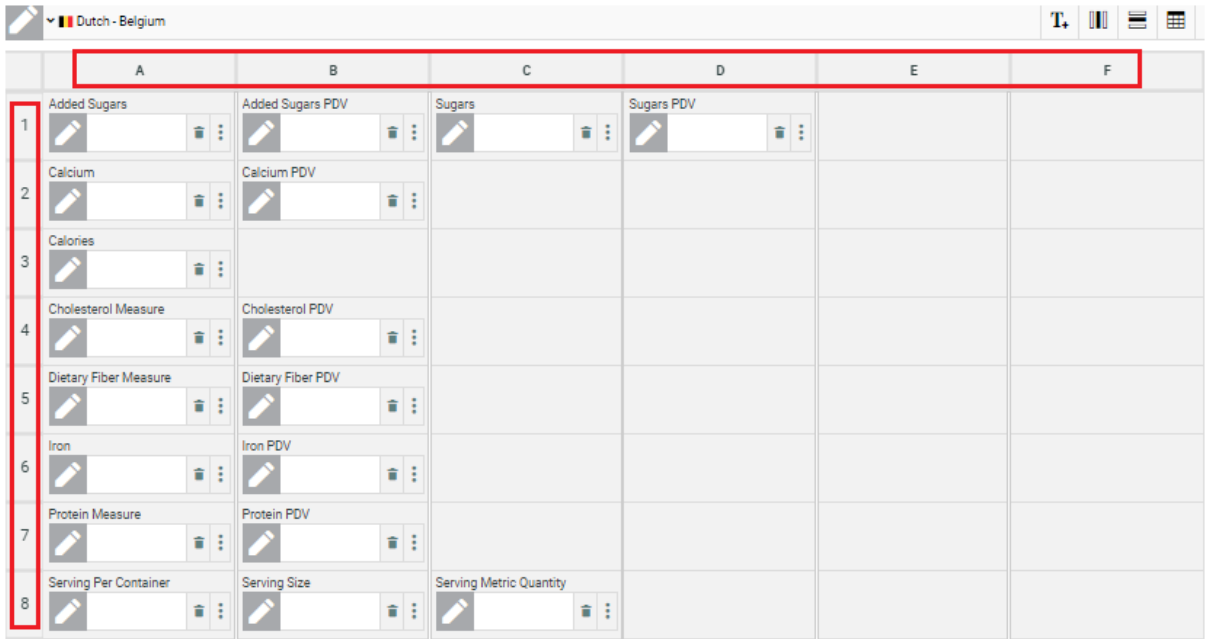

The screenshot displays a table interface with the following components:

- Table Header:** "Nutrition facts" with flags for Master (M: US) and Translation (T: FR), and icons for refresh, share, and settings.
- Master Language Widget:** "English - United States" with a "Master Language" label and a "T+" icon.
- Translation Widgets:** "French - France" with a "Translation Widgets" label and a "T+" icon.
- Table Elements:**
 - Serving Size
 - CALORIES_LABEL
 - CALORIES_LABEL (2)
 - ENERGY_LABEL
 - FATS_LABEL
 - FATS_VALUE

Rows and Columns

Add or Remove columns / Rows in Grid Layout

You can easily add Rows or delete by clicking on any cell in the Grid layout for the table documents. This can be done only by the users who have **Content Manager** or **Editor** permissions on the particular table document.

	A	B	C	D	E	F
1	Added Sugars	Added Sugars PDV	Sugars	Sugars PDV		
2	Calcium	Calcium PDV				
3	Calories					
4	Cholesterol Measure	Cholesterol PDV				
5	Dietary Fiber Measure	Dietary Fiber PDV				
6	Iron	Iron PDV				
7	Protein Measure	Protein PDV				
8	Serving Per Container	Serving Size	Serving Metric Quantity			

Rows can be added above or below the selected row using the options available in language header.

Similarly, the columns can also be added to the left or the right of the selected column using the options available in language header.

Row Header Icons

Column Header Icons

Reorder Table Rows and Columns

Rows and columns in the Table document can be reordered by drag and drop. You can also re-size the width of a column by using the column re-size handler.

Hide and Show Rows and Columns

Rows in the Table document can be hidden by selecting any cell in the Row and selecting the **Hide Row** option in the language header. To show the hidden row, select the row and choose the **Show Row** option in the language header.

Show and Hide columns also function similarly by using the Show Columns or Hide columns in the language header.

Table Element Types

The individual Table statements can have a particular Element Type. The default Table Types have Element Types corresponding to the GS1 standard. However, you can add custom fields to suit your particular needs.

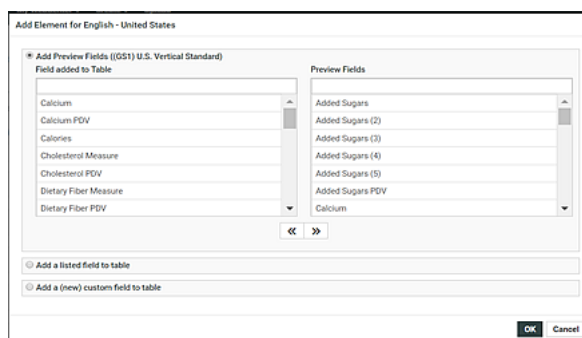

You can add multiple instances of one Type and it will be indicated with a suffix number.

Note: You can add elements to the Master Table and the Translations have the same fields as the master. You cannot add custom types to the translations.

As a Content Manager, you can add or delete fields.

- Click on the configure  icon.
- To add an Element Type, click T+
- When you have selected a particular Standard, the corresponding table element types are available.

If your template is a Standard, you can add more from the **Add Preview Fields ...**section.

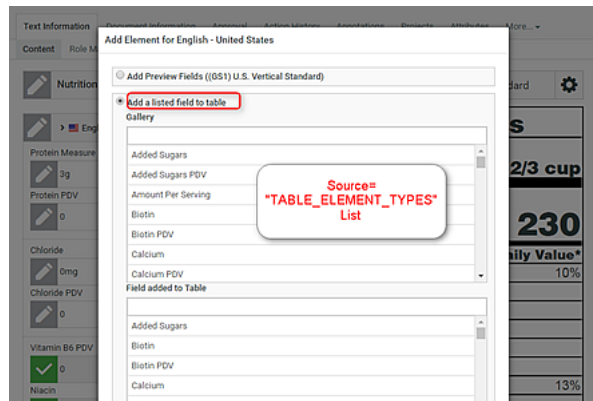

- You can choose from:

Options	Description
Add Preview Fields	To add Element Types of the particular Standard you selected, just click on the field. Use << to take all elements out of the table and use >> to add all fields to the table.
Add a Listed Field	To add one, click on that specific Field. Read below .
Add a custom field	To add a custom Field. Read below .

- You can store your GS1 (or custom) Table Element Types in a [List](#) and use them in a Table.
 - a) Create a List with the Nutrition Fact Element Types with the name `TABLE_ELEMENT_TYPES`. These Types will be available to you in your Table Documents
 - b) To add one field from the List, select **Add a listed field**.

The gallery lists all the types from the List.

- You can also add custom fields that are only relevant in one Table. To create such a field select **Add a custom field** option. You can use this option when you have to create Custom fields in some tables or when you are using the [Custom Templates](#) on page 514.
 - a) Enter the **Element Type Code**, the code that will be used for a the added element type. This is used to highlight the field in the custom previews.
 - b) Also specify the **Instance Sequence** to identify each instance of the same element in a table.
 - c) Click **Add**.
- After modifying the table Elements, remember to click **OK** and to **Save** the table.

Note: The Element Types are used when Dynamic Content Tables get imported into WebCenter.

Text Content / Table Ownership via Permissions

Text Content Ownership

WebCenter offers established ownership for different phases of the text and table creation and the approval process. You have four default content permissions:

- **Content Manager**
- **Editor**
- **Approver**
- **Add Language**

These permissions, when mapped to the WebCenter roles, allows their assignees to perform specific functions on the document.

Note:

- To configure these permissions, the project manager needs to assign at least the **Content Manager** rights to a relevant Role.
For example, you can configure a **Role, Marketing** to have the **Content Manager** function.
- The Content Manager can then activate the **Editor, Approver** and **Add Language** permissions by assigning them to relevant WebCenter roles.
If you do not assign a role to a specific permission, the specific permission will remain inactive for the document.
- The permissions are set at each text/table document (.wcc or .wtc) level and will be passed on along with the document and its versions when copied or moved.
- It is not possible to add custom permissions.

Four Types of Permissions

1. CONTENT MANAGER:

The WebCenter Role with this permission facilitates the entire content management process to ensure accuracy and compliance. For example, the role Marketing could have this permission where the Marketing has the responsibility of the packaging content. The Content Manager will manage the Master and Translated statements.

Note: The Content Manager Role is not associated with any specific language.

This role will manage all the permissions and the settings for the current document.

Note: Content Manager Role cannot act as an Editor or Approver unless this permission is granted to the same role.

2. EDITOR

The Content Manager typically assigns this right to the dedicated roles who will create, edit, revise or translate the text. This can be assigned per language.

An Editor Role (for example, a Translator) can edit when a document is in the **Draft** state, not in **Signed-Off** or **Pending Sign-off** state. After editing, the role can mark it as **Pending Sign-off**.

Note:

- The **Content Manager Role** has to configure the list of translation languages to make use of multiple language based **Editor** permissions.
- You can configure **Roles** for all languages to which the content should be translated and grant them the **Editor** permission.

3. APPROVER: A **Role** with this permission can approve the text content. This permission can also be configured per language. The approver puts the Text Statement to **Signed-Off** or **Rejected** state.

4. ADD LANGUAGE:

Any user with **Add Language** permission can add language to a text or table content document. The users can be assigned with permission to add only specific languages.

Manage Permissions

Content Permission ⓘ	Language	Role	Assignee(s)
CONTENT MANAGER		PCM_CONTENT MANAGER	MRJN
EDITOR	English - International	PCM_CONTENT MANAGER	MRJN
EDITOR	English - United States	PCM_CONTENT MANAGER	MRJN
EDITOR	Dutch - Belgium	PCM_CONTENT MANAGER	MRJN
EDITOR	French - France	PCM_CONTENT MANAGER	MRJN
APPROVER	English - International	PCM_CONTENT MANAGER	MRJN
APPROVER	English - United States	PCM_CONTENT MANAGER	MRJN
APPROVER	Dutch - Belgium	PCM_CONTENT MANAGER	MRJN
APPROVER	French - France	PCM_CONTENT MANAGER	MRJN
ADD LANGUAGE	English - International	PCM_LEGAL	MRJN MRJN_USR2
ADD LANGUAGE	Dutch - Belgium	PCM_TECHNICAL	MRJN MRJN_USR3
ADD LANGUAGE	French - France	PCM_CONTENT MANAGER	MRJN

_REQUESTOR Role

To create new Text/Table Documents, edit, approve or to reuse content during the Project Creation phase, you need to grant the relevant permissions to the **_REQUESTOR** role. You can give these permissions in the libraries of Text/Table Document Templates, or Projects with approved Documents.

Delegation of Approvals in Text Content and Tables

An user can delegate his WebCenter tasks to another user. The delegated user can perform all actions on behalf of the delegator. When the delegate approves text or table content, the password validation is done on the delegate's password.

When a user has logged in on behalf of another user, and approves any text or table content, the same can be viewed by clicking **Approval Info** in the ellipsis. Alternatively, it can also be viewed in the **Document > Action History**.

Nutrition Facts Preview

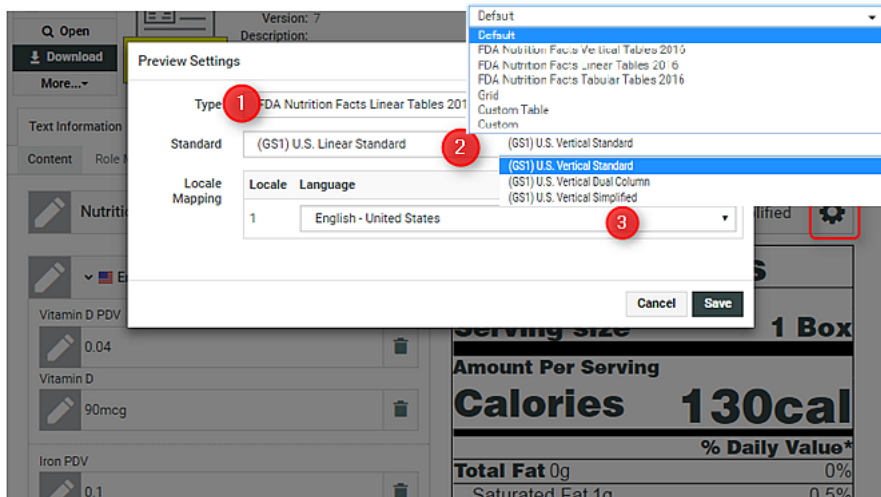

The **Preview** lets you view the data being edited and it adapts according to the changes you make in the nutrition fact statements. You can see the preview of the table document.

Note: The preview is an approximate representation of how it would appear in the artwork. It does not support editing the design elements.

Configuring a Preview

The **Preview** is configurable and you can select from different Nutritional Facts table formats. To specify a Preview:

- click **Configure Preview**
- select a **Type**
- specify the **Standard**

1. Available preview templates (default and *custom*). The following templates are available by default:
 - FDA Nutrition Facts Tabular Tables 2016
 - FDA Nutrition Facts Linear Tables 2016
 - FDA Nutrition Facts Vertical Tables 2016
 - Grid
 - Custom Table
 - Default
2. Standards available for the selected template.
3. The language of the Preview (If you select French, your preview will be updated to show the French content)

You can also add or delete table elements to the master language table to update the document. Read in: [Table Element Types](#) on page 507. Position Preview  icon allows you to configure, where the preview is displayed.

Note: To know more about Grid layout of the table, read here [Table Properties](#) on page 502

Download Preview

From 18.1.1 WebCenter Release, it is possible to download the preview of a Nutritional Facts table in pdf format.

PDF downloaded contains all the mandatory elements and other elements which has values in the same format, font and styling as shown in the Preview.

If any custom fonts are used, then add the fonts also in the application server `pcm/TablePreviews/custom/fonts` folder location to view and download the preview.

Note: Download PDF option is not available if Default type is selected.

3.24.2. Creating Tables

Creating a Simple Table

You can create Tables for your artwork from scratch and store them in WebCenter. These tables can be exported in GS1-XML and use it to communicate between different systems during the artwork management workflow. You can involve various stakeholders through an approval process.

An intuitive preview section adjacent to the edit fields displays the data in the context of the table design. The changes you make are highlighted on the go to give you a very visual data entry process.

Note: You need Table Templates in the system to be able to create a new Table. An Administrator or Project Manager can [import Text or Table Document Templates](#) into the system.

- Import a Project or Template with Table Templates and adapt the settings. When users will create documents from this document template, they will inherit these settings.
 - a) Go to **Document Details > Text Information > Content** tab of the Template to modify the [Table Properties](#) on page 502. You can specify the [Approval Type](#), Table Type, Languages etc.
 - b) In the **Role Mapping** tab, assign the [Content Permissions](#) to have Roles mapped as Editors, Approveres and Content Manager.

Note: Specify `_REQUESTOR` as a Content Manager of the template if you want to create Tables during Project creation.

- c) Optionally, adapt the settings of a template to make it a SmartName based table. Read more in: [Creating Smart Tables](#) on page 513
- To create new tables from these Templates, plug these as a Document Source in your Project Template. Follow the steps below:
 - a) In the Template's **Project Details** page, **Configure > Document Templates**.
 - b) Select **Project** or Template and select the Project your created in the first step and **Save**.
- Create an Attribute Category for your Template.
 - a) Add [Language Attributes](#) and restrict them to Language Lists.
 - b) You need Document Reference Attributes. Create and add them to this Category.
 - c) Configure the **Document Sources** and Rendering of this attribute.

Tip: Use a Saved Search configured to search for Table Templates as a document source for better user experience. You can, for example, add a Search Panel.

- Optionally, create and add workflows for approval and translation. You can also create a Library for your approved tables.

When creating a Project from this Template, the user can click **New** and select a **table template** from the Templates library to create new documents.

Nutritional Facts

After creating a new simple table, you can enter the data either as a workflow step using the [Update Table Content](#) on page 517 node. The users (Editors) can also enter the values manually and send it through the approval process. You can export this table in [GSI XML](#) format (either using an action or a workflow [step](#)) for merging it to the artwork in Illustrator with Dynamic Content.

Creating Smart Tables

You can automate the data collection process required in creating or updating the nutrition facts tables. The process starts with a [Table Template](#) with dynamic data fields(SmartNames). These fields can be constructed to point to an Excel based List or any WebCenter SmartName such as Attributes.

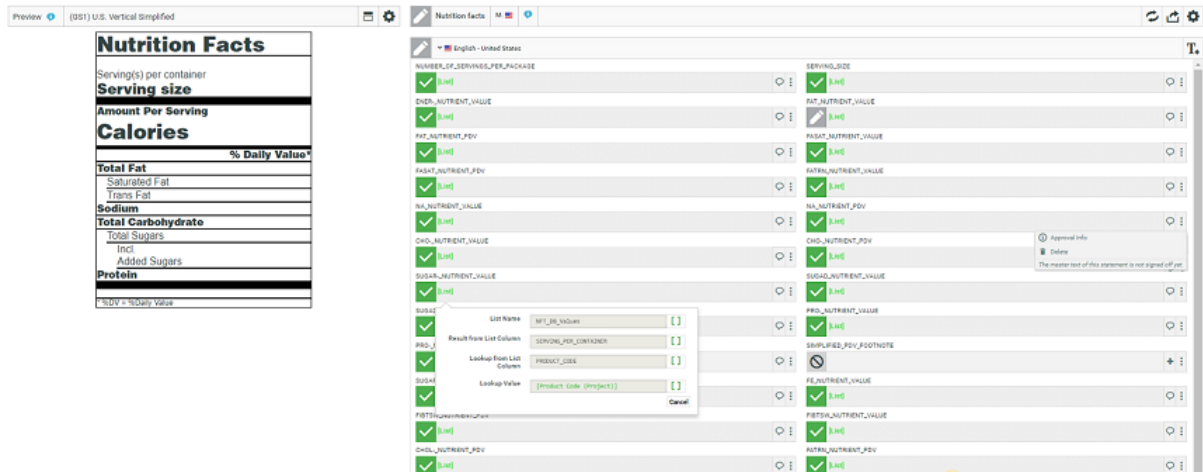

SmartNames are resolved as actual entries in the context of a Project. This way, you can source the data instead of typing in the data manually. This approach helps you to avoid data entry errors in nutrition facts. Also, when you require corrections to any of the data fields, you can just edit a single data source instead of updating all related tables.

To set up a SmartName based Template, follow the steps below:

1. In the **Table Document Template > Text Content > Content** tab, open the [Table Properties](#) on page 502 widget.
2. Specify the **Type** as **SmartName**.

- Specify WebCenter SmartNames for each field. For example, you could point the SmartName to an Excel based WebCenter List. You can also select Attributes as the SmartName.

The Content Manager can approve the SmartNames to lock these fields. It is also possible to delegate the approval to specific Roles based on permissions.

- Plug the smart table as a document source in a Project template to create a new smart table. Read more from: [Creating a Simple Table](#) on page 512. SmartText Search drop down lists the Text Saved search.

After creating a new Table in the context of a Project, the Content Manager can click **Resolve SmartNames** to update the table with numerical values.

In the example screenshot, the SmartNames are from a List based on the specified Product Code of the Project. You will also be able to see the original SmartNames when you hover over the values.

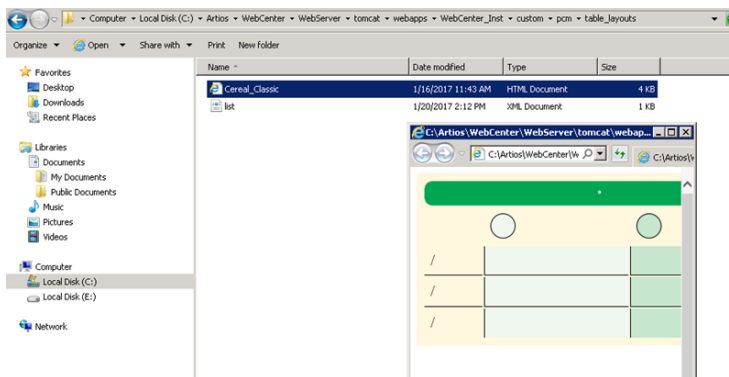

Note: If one or more element of the table content has unresolved Smart Content, you will not be able to approve the table nor the elements.

After the approval of the resolved table, the content remains locked. You can export this table as GS1 XML and finalize the table in Illustrator.

Custom Templates

To install custom preview templates, follow the steps below.

- Place the HTML templates in `WebCenter\WebServer\tomcat\webapps\WebCenter_Inst\custom\pcm\table_layouts` folder and also in `pcm/TablePreviews/custom/folder` of the application server. If any custom fonts are used, then add the fonts also in the application server `pcm/TablePreviews/custom/fonts` folder location.
Register the custom preview template in a "list.xml" in both the above mentioned folders.

- For each HTML Preview, create a `layout` entry in the `list.xml` file. This XML file has to be placed in the same folder as above. See the format of the entry below:

```
<layouts>
...
<layout>
  <type>Name of the Table</type>
  <name>Type of the Table</name>
  <path>Path to the Preview Template</path>
</layout>
...
</layouts>
```

Note:
 The **Type** and **Name** fields will be used in the user interface drop-downs. If a Type is not specified, it will be called "Custom".
 Read more in: [Table Preview](#)

The custom templates will be available in the Preview selector and you can use the **Type** and **Name** fields in the interface to select a Preview.

3.24.3. Workflow Tasks for Tables

Import Dynamic Table

The **Import Dynamic Table** node extracts the **Tables** from your artwork(s) as **Table Content Documents**. You can configure this node to import these Documents with a link to specific **document reference attributes** and **table document templates**.

Note: You need an Attribute Category with Table document references as a pre-requisite to configure this node.

If there are multiple artworks coming into the documents, the node will iterate and extract tables from all of them.

Parameters- Configuration tab

- Specify the **Upload Folder** to store the extracted documents.

- Select the **Document Reference Attribute** for the table. Select the appropriate **document reference** from the drop-down listing all document references.
- **Add Imported Table Documents to Output** . Check this if you want the document sent to the output pin.
- **Reuse existing Table Documents**. The document version specified in the document reference will be reused to store the data instead of creating a new Table Document. If there are no matching tables in the system,new document will be created.

Document Template Tab

- Specify the corresponding **Document Template**. Select the Table Template (either simple or Smart) that corresponds to the incoming Table.

Select the **Document Template Project** at the top of this tab. Enter the name of the Project(s) where you have configured your table templates. You can either specify multiple project names with a "|" between them or provide SmartName which resolve to multiple project names. Read more in: [Creating a Simple Table](#) on page 512

- **Add all Document Template elements** Check this to import all statements present in the document template.
- **Set values from Document Template**. Check this to take values from the Document Template for all matching statements. If there are no matching statements, the incoming values will be used in the table document.

Parameters- Language Mapping tab

You can map the **Locale ID** of the **Dynamic Table** to the corresponding language in WebCenter.

Language Index: When you create the first row, this field will have the value 1 by default. When you create more rows, they will be numbered serially.

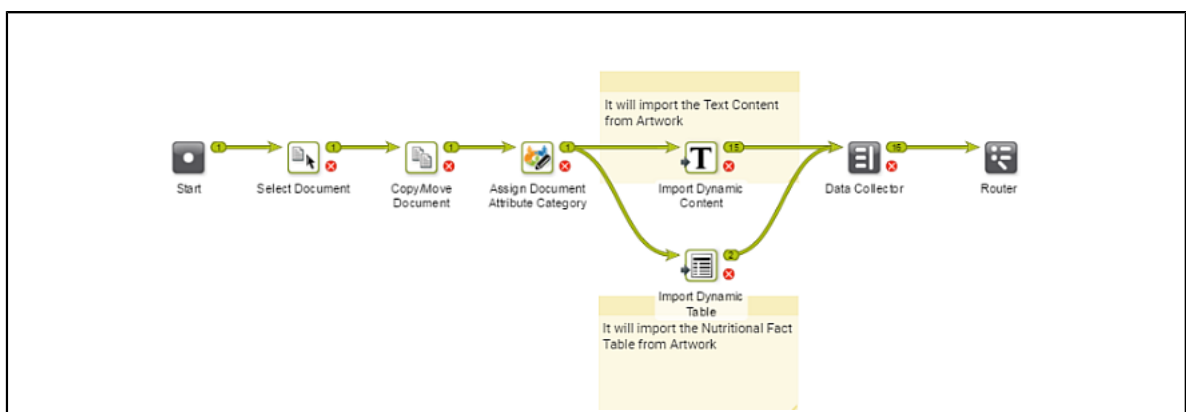

- **Language:** Select the language from a list of languages. Or use a SmartName to dynamically assign the languages.

Note: By default, an imported table is imported as Translated language if it does not exist as a Master Language in the Project's language attribute.

For new Table documents created from this node, the master language table will be added in the **Draft** state, even if that language is not available on the artwork.

Note: If you do not specify language mapping for the imported Dynamic Content, the node will try to find the language in the [Lists](#) (Master and Translation languages).

-Read also: [Import Dynamic Text](#) on page 903.

In the example, when an artwork with Dynamic Content arrives at a Packaging Content Management workflow, the following steps happen:

1. The workflow assigns a **Document attribute category** to the artwork (parent). This 'copy sheet' category contains the **Document reference attributes** to which the text and table content will be imported.

Note: If this step is not in the workflow, the **Import** node will use the Project's attribute as the default.

The category contains the **Document reference attributes** for:

- text statements,
- and nutrition facts table

to serve as the copy sheet template.

2. The *Import Dynamic Text* on page 903 step maps the various Element Types to appropriate **document reference attributes** as configured.
3. The **Import Dynamic Table** extracts the table matching it to the document reference and the table document template.

After the extraction of the content, the workflow processes the content based on the requirements. You can, as in the example, update the incoming table and text using the workflow.

Update Table Content

This workflow node allows you to specify or update Table properties and Table values. You can add:

- Role Mapping
- Languages
- Approval
- Add / Remove / update/ inherit elements and set values for nutritional facts elements

Settings

In this tab, specify the properties in the **Field** and the corresponding values in the SmartName supported **Value** field.

You can specify or update the following properties and their values in this tab:

- **Invariant** : Specify this as `True` if translations are not required for a particular Document.
- **Approval Setup**:
 - **Default**: Only one member has to approve. For example, if the Approver permission is assigned to two Roles, only one member (from any Role) has to approve.
 - **One of role**: One member of each Approver Roles (assignees) has to approve to complete the signing off. In case a Role is assigned to several members (groups or users), any Group member or user from that Role can approve.
 - **All of Role – One per Group** : At least one member from each Role-Group has to approve. If there is an individual User, then he or she has to approve as well.

- **Inherit Content From :**

You can choose to inherit content one of the options below

- **Default:** Will inherit the content from the language that is configured to follow in the Language List.
- **None:** Will not inherit content from any language in the workflow node. However the user can manually change the language at the element level in the document.
- **Master Languages:** Can choose any of the languages from the master language list.

By default **Disable** is chosen which will not allow Inherit content.

- **Type:** Simple or Rich Text. If the Type changes from the existing type, the document status will become **Draft**.

Role Mapping

This tab allows you to map Content Permissions to Roles. To specify the new set of permissions or to specify permissions in a workflow:

1. Enable **Set Permission**. This will show the Permission Settings.
2. Select the **Content Permission** (Add Language, Editor, Approver or Content Manager).
3. Set the corresponding **Language** from a list of all the text content languages supported in the system.

Select [All Other Languages] to specify permissions and role mapping to all languages without permission assignment in one go.

Note: The Content Manager has permissions to all languages by default and cannot be specified per language.

4. Specify the **Roles** corresponding to the selected Content Permissions. The drop-down lists all Roles configured in the system.

Values

This tab lets you add / remove /update table statements and their values. Use a single row per **element** or statement.

Update Table Document

Settings Role Mapping Values Approval

Element	Instance Sequence	Language	Action	Condition	Value
Serving Pe	1	English -	Add	Always	[List]
Serving Si	1	French - F	Inherit	Current va	
Calories	1	English -	Update	Always	[List]
Total Fat	1	English -	Update	Always	[List]
Total Fat	1	French - F	Inherit	Always	
Cholesterc	1	English -	Update	Always	[List]
Cholesterc	1	French - F	Inherit	Always	
Sodium Mea	1	English -	Update	Current va	[List]
Sodium PDV	1	English -	Update	Always	[List]
Total Cart	1	English -	Update	Always	[List]
Total Cart	1	French - F	Inherit	Always	
Dietary Fi	1	English -	Update	Always	[List]
Dietary Fi	1	French - F	Inherit	Current va	
Sugars	1	English -	Update	Always	[List]
Sugars PDV	1	English -	Update	Always	[List]
Added Suga	1	English -	Add	Always	[List]
Added Suga	1	French - F	Inherit	Always	
Protein Me	1	English -	Update	Always	[List]
Protein PL	1	French - F	Inherit	Always	

Cancel OK

- **Element** – The table *Element Type* to be added or removed. This field is a smartname dropdown populated with the list of table element types supported in the WebCenter.
- **Instance Sequence** – Specify the instance sequence number. This number indicates how many occurrences of an Element is present in a Table. The default value is 1.
- **Language** – You can either select from the drop-down (listing all the languages present in the system) or use a SmartName in this field.
If the specified SmartName resolves to multiple languages, then the specified configuration(from that row) will be applied to all of them.
- **Action:** Choose from **Add / Remove /Update/ Inherit** .
- **Condition** You can add a condition where the workflow node can inherit/add/update/ remove elements. There may be a combinations of different conditions that may be given.

Condition	Action Possible
Always	Add, Remove, Update, Inherit
New Value is not empty	Add, Update, Inherit
Current value is empty/not available	Add, Update, Inherit
Current value is empty	Remove, Inherit
Current value is not available	Inherit

Condition	Action Possible
Current value is empty and new value is not empty	Add, Update

- **Value** – Field where you can specify the actual content. You can enter the data or use SmartNames.

Tip: Use List SmartNames(pointing to an Excel sheet based List) to provide content in a smart way.

Note: If you specified the action as **Add** for an existing value, the value is updated. If the element does not exist in the document, the element and the value will get added. However, if the action is **Update** and the element does not exist, the row is ignored.

Note: If you are updating a SmartName table using this node, the value from this node will replace the SmartName in the table.

Approval Tab

This tab allows you to set **Approval Status** (per element, per instance and per language) via workflow. This allows you an automated way of approving the nutrition fact statements.

Note: You can use SmartNames in this step and if your SmartName points to a multi-value attribute, it will resolve to multiple values.

1. Select the **Element** or the statement.
2. Specify the **Instance Sequence** of the element.
3. Select **Language** – You can either select from the drop-down (listing all the languages present in the system) or use a SmartName in this field.
4. Specify the **Status**. You can choose from **Draft**, **Pending SignOff**, **SignOff Rejected** and **Signed Off**.

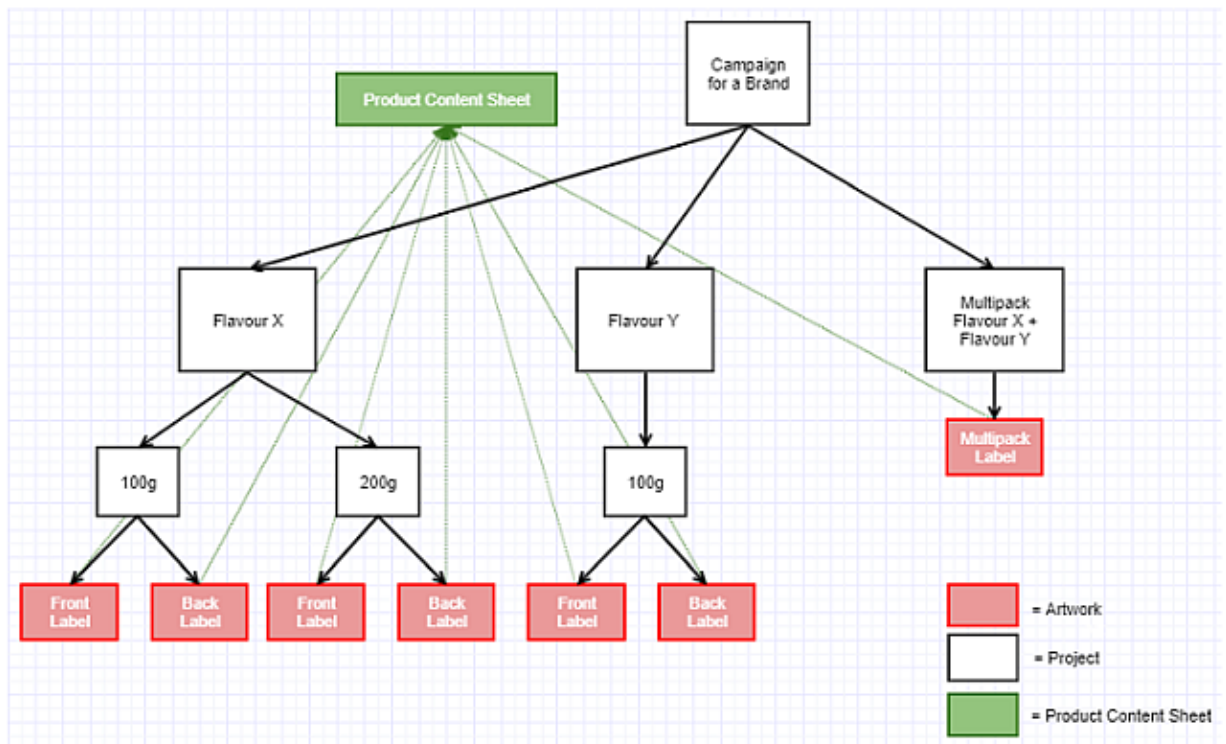

3.25. Product Content Sheet

Artwork design involves coordinating information from many different sources and stakeholders. There could be many possibilities for errors and hence it is important to keep all the assets related to a product saved at one place.

Product Content Sheet (PCS) is a high level document that describes the contents of multiple related products. The PCS will be a repository of all the constituents that are going to be used on the products, like recipes, text, bar codes, symbols, images, nutritional tables and so on. PCS are stored in a file type called Components. Components are unique file which has no physical presence but acts a placeholder for all the documents related to the product. Read more about component file type here [Component File Type](#) on page 585.

With Product Content Sheet, you can:

- Specify the constituents, and also list the usage of these elements.

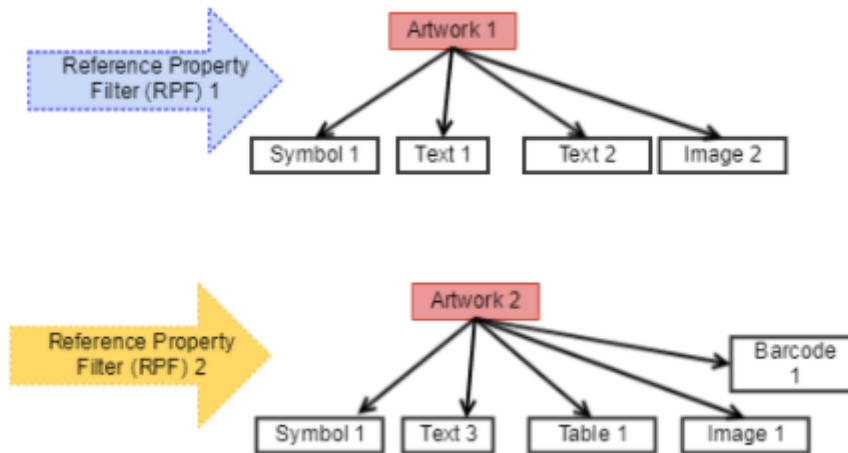

For example, to ensure that a certain recipe is only applicable to the Flavor X of the product or that a certain text statement should only be applicable for a certain serving size.

- Extract all the applicable content elements for a certain artwork, provided you specified the correct usage for the artwork.

For example, when creating the artwork for a multipack, you could specify the requirements as the contents of the PCS that are tagged with "Flavor X" and "Flavor Y". When creating the artwork for the enclosed single flavor product, you would specify that the artwork is only applicable for either the "Flavor X" or "Flavor Y".

Using Reference Property Filter in a Product Content Sheet

For example, Artwork 1 has the Reference Property Filter 1 (RFP 1) which has some of the content extracted from Product Content Sheet. Similarly, Artwork 2 has the Reference Property Filter 2(RFP2) with some of the content extracted. You can notice that Symbol 1 has both RFP 1 and RFP 2 defined and hence are part of both the Artwork 1 and Artwork 2.

3.26. Migrating your Data

As an Administrator, you can migrate your WebCenter data to a different WebCenter server, for example, to:

- test a new version on a test server where you create new configurations. You can copy this to the production server later.
- perform some tests on a test system with production data. You can export your production data (for example a large number of groups with their visibility and download permissions) to the test system.
- rapidly deploy a solution developed by Solution Architects.
- copy data between different WebCenter installations.
- migrate the data to a third party system to archive them.

Note:

Before migrating a configuration, you need to migrate Users:

- Create Users in the target system
- Optionally remove Users

3.26.1. Migrating Self-contained Data

From WebCenter 16 onwards, you can do self-contained migration of Projects / Templates and this saves the effort of migrating items individually. When you migrate a Template or Project with the setup, the items are exported and imported in the correct order.

It is also possible to migrate individual items to a target system. Read in: [Migrating other Data](#) on page 528.

Exporting Templates or Projects

You can export Projects / Templates along with its Attribute Category, Task Types, Documents, Members (*Groups*, Roles, Users), Folders, Lists, Characteristics, Permissions and other settings. It is a self-contained export of all the items that are in a Project or Template.

You can choose whether you want to export the Projects with or without its Documents.

1. Go to **Admin > Project Management > Templates / Projects**.
2. Search for the required **Templates** or **Projects**. You can also select from the list.

-  **Export** to export an XML file without the Documents. For e.g.
ExportedWebCenterProjects.xml
-  **Export with Documents** to export a ZIP file with its Documents. For e.g.
WebCenterDownload.zip

Note: When lists are exported, it is exported in the zip file.

3. Save the XML or ZIP file generated to your computer or a network location.

The below items are included in the Project / Template Export XML / ZIP:

- Project Name, Due Date, Description, Project Status including icons, Project Manager (along with Group)
- Customer, Document template project

Note: The names are exported but the links are established only if they exist in the target system.

- Project Members: Groups and Roles
- Groups, Roles, along with their invitations and permissions: A merged list of all the Project Group and Role members is exported. Read more in [Migrating Groups / Roles](#) on page 529
- Attribute Categories along with Attributes and their values: Reference Categories, their attributes and their values. Restricted sets and lists are also included.

Note: Document Reference values are not included in the export.

- A merged list of Project Attribute Category and default *Document Types* Categories is exported. Read more in: [Migrating Attribute Categories](#) on page 531
- Tasks (Sequence, Icons, Assignees, Allowed Assignees) and Task Types: See also: [Migrating Task Types](#) on page 533

A merged list of Task Types along with icons of all Project Tasks and Tasks attached to *Document Types* is exported.

- Folders and Permissions settings on Folders (for Groups and Roles) and Role Assignments
- *Document Types* settings:
 - Autaname settings
 - Task settings
 - Attribute Category
- *Project Creation*: Creation form settings and Project Autaname settings
- *Document Creation* settings
- Document Sources ([Global Saved Searches](#))

- Notifications
- Document templates

Note: The library of templates should exist the target system.

- Approval Setup:
 - Project
 - Folder
 - Document
- Thumbnails of Project, Folders and Documents

Note: The Thumbnails are exported only when you include documents in the export.

- List of Documents and Folders
- Documents if the option **Export with Documents** is selected.
- Document Approval Status

Note: You can export Approval Statuses this for archiving purposes. But you cannot import it to another WebCenter.

Warning: If you have turned on **Add Approval Information to downloaded PDF** turned on, the approval details will be included in export and import.

- Documents added to Bill of Materials

Items not included in the export:

- Documents attached to Tasks
- Workflow Connection
- Users and Permissions
- Document reference attribute values
- If the company/location does not exist in the target location, then the company is not created.
- Submitted Document approval statuses
- Project, Task and Document Discussions

Importing Templates / Projects

When you import **Templates** or **Projects**:

- They will get created according to the contents of the import XML/ ZIP file.
- Documents will be added only if they do not exist in the target project. Upload will fail if a document with the same name exists in the target project.

1. Go to **Admin > Project Management > Templates** or **Projects**.
2. Click **Import from File** on the Template Management page.
3. Click **Choose File** and then select the XML or ZIP file.
4. Click **Import**.

When you import self-contained XMLs and ZIP files, you will get an overview of the items in the file. You can choose to import them all or select the items individually:

Following items already exist on the system and will be overwritten!
To prevent this, uncheck the items before the import.

- Groups and Roles
 - PCM_LEGAL
 - PCM_MARKETING
 - _REQUESTOR
 - PCM_LEGAL_SUPER
 - PCM_DESIGNER
 - PCM_TECHNICAL
 - PCM_TRANSLATION AGENCY
 - ADMINS
 - PCM_CONTENT MANAGER
- Restricted Sets
 - PCM Responsible Set
 - Languages
- Categories
 - PCM Artwork Library Update ACat
 - PCM Text ACat
 - SAH_EMPTY
 - PCM Artwork Copy Sheet ACat
 - PCM Reference Properties ACat
- Task Types
 - Simple Task
 - PCM Generate and Apply GS1 Flow
 - PCM Draft and Approve Master form
 - PCM Text Library update Flow
 - PCM Create Artwork Flow

Tip:
The documents in the ZIP files will be imported by default.
If you don't want to import the documents, disable **Import the Document(s) in the Project/Template when importing Projects/Templates.**

5. Uncheck the items you do not wish to import and click **Import.**

The referenced objects will be imported first:

- *Attribute Categories including the attributes and restricted sets will be imported. .*
- *Groups / Roles with their settings..*
- *Task Types.*

Caution: When you are importing a Workflow Task Type (during the export of a Project / Template), objects referenced by the Task Types may not be linked properly. If you notice an error, reimport the same Project and the links will be established correctly.

6. Select **Enter Database Credentials** to specify if the WebCenter Database has to create a table or not. If yes, then the **Database Username** and **Password** has to be specified.

After importing these, the Project / Template with its setup will be imported. Check this [list](#) to see what is included in the import.

The items that are not imported are listed below:

- User members and permissions
- Document Reference values
- Company / Location

- Document approval statuses
- Project and Document discussions

Exporting Saved Searches

You can export **Saved Searches** (Project, Task or Document) to in XML format.

Note:

Before migrating a configuration, you need to migrate Users:

- Create Users in the target system
- Optionally remove Users

Note: When you intend to migrate **Saved Searches**, migrate the Projects / Templates first. This will make sure that the search criteria (such as attributes or roles) exist in the target system.

1. Go to **Admin > Search > Saved Searches**. A list of Personal and Global **Saved Searches** is displayed.
2. Select any of the items from Global list and click  **Export**
3. Save the XML file generated (`ExportedSavedSearches.xml`) to your computer or a network location

Note:

- Only **Global Saved Searches** can be exported.

Export of a Saved Search contains:

- Basic properties of each selected Saved Search
- Search Criteria
- Search Visibility Settings
- **Referred Objects**
- Groups, Roles, along with their invitations and permissions:
- Attribute Category used in Search along with their Attributes and values

Note: Document Reference values and the Document sources (Saved Searches) are not included in the export.

- Restricted Set
- Task Specifications specified in Search

Note: The Specification Categories are not imported.

- Task Types along with its settings: See also: [Migrating Task Types](#) on page 533

Note: The Task Status will not get imported

Export of a Saved Search does not contain:

- Company and Location Visibility settings
- Project Status
- Characteristics
- Lists

Note: Text Document Search export will not include the Element Type and Language Lists.

Importing Saved Searches

For Importing **Saved Searches**, use the steps below.

Note: You cannot import a Saved Search exported from a later version.

1. Admin > Search > Saved Searches > Import from File

2. Click **Choose File** and select the XML file.

3. Click **OK**.

You will see a warning about items that already exist and will be overwritten.

4. Uncheck the appropriate items and click **Import**.

If you encounter issues during the import process (for example, a missing Restricted Set on the target server), you see a warning.

See more details about the import of externally referred search criteria below:

In a **Project Search** the following Search criteria are imported:

- Roles: When a match is not found, an error message is displayed and the import fails.
- Attribute (general) and Attribute Category: When a match is not found, an error message is displayed and the import fails.
- Restricted Set value type: When a match is not found, an error message is displayed and the import fails.
- Document Reference: When a match is not found, you get a warning and a feedback message is displayed.

The **Project Search** criterion entities that do not get imported are:

- Project Status: When a match is not found, you get a warning and a feedback message is displayed.
- Characteristic: When a match is not found, you get a warning and a feedback message is displayed.

In a **Document Search** the Search criteria entities that get imported are:

- Search Layout- Show Project Creation Link: When a match is not found, you get a warning and a feedback message is displayed.

In a **Document Search**, the Search criteria entities that do not get imported are:

- Element Type (Configurable Search field): When a match is not found, you get a warning.
- Language (Text Document): When a match is not found, you get a warning.
- Document Type specific metadata: When a match is not found, the import fails with an error message.
- Lists: When a match is not found, you get a warning.

In a **Task Search**, the Search criteria entities that get imported are:

- Task Type: When a match is not found, you get a warning. Import fails if the criteria is used on Task Specification selection page.
- Task Specification: When a match is not found, an error message is displayed and the import fails.
- Search Layout- Show Project Creation Link: When a match is not found, you get a warning and a feedback message is displayed.

In a **Task Search**, the Search criteria entities that do not get imported are:

- Task Status: When a match is not found, you get a warning and a feedback message is displayed.
- Lists: When a match is not found, you get a warning and a feedback message is displayed.

Note: Limitations:

- When you have Document Searches with **Show Project Creation Link** with **Template from Characteristics Path Layout**, the search is imported but the option is not validated.
- **Modified date** related criteria does not consider the Time Zone difference into account.
- Referred Saved Searches (as a document source in a document reference) are not exported.

Importing and Exporting of Lists

In WebCenter 18.0.1, when a Project or a Template is exported, lists in the projects that are part of the Attribute Categories or Task Types are also exported. A zip file containing List configuration and List Documents are created along with the other project components.

WebCenter will now detect whether, if any of the exported objects is dependent on a List or not, and export it in the zip file when the project is exported.

The exported zip file has:

- **ListManager** folder: Contains all the documents needed to reconstruct the List. This folder can have multiple sub-folders exactly as in the source project.
- **XML** file: Contains all the information of the Task Types / Attribute Categories / Project (without documents)

Note: if more than one project is exported with documents, then a folder is created for each project.

On importing of the project, one of the below options may occur.

- **Check whether the list exists:**

WebCenter will check whether the list already exists or not. This is done by using the name of the imported list. If the List doesn't yet exist, we will create a new List otherwise we will update an existing List.

Updating (overwriting) a List:

If the list preexists, WebCenter will check whether the table name used by the list matches the default WebCenter List table name pattern ("WC_LIST...").

If it does, the list is deleted and a new List is created with the specified configuration.

Note: Import of the list may fail, if the lists are preexisting but unable to update to the current list since the table names are not matching in the database.

- **Creating new List:** If the list is not available in the target project, then a new List is created with the configuration found in the zip file.

3.26.2. Migrating other Data

From WebCenter 16 onwards, you do can do self-contained migration of Projects / Templates and individually migrate items.

Tip: When you migrate a Template or Project with the setup, the items are exported and imported in the correct order. We recommend that you do a *Project or Template* migration so that all items are exported in the right order.

Migrating Groups / Roles

You can migrate your groups along with their visibility and download permissions to a target WebCenter.

When importing **Groups**, the system will create Group(s) if it does not exist or update the Group when the Group exists.

Export of Groups contains:

- Basic Information like:
 - Group Name
 - Visibility Type (All Project Managers/Specific Project Managers/Admin)
 - Members
 - Group Task Manager
- Group email including the address and language settings
- Notification settings
- Roles
 - Group is a Role setting
 - Roles, role invitations and assignments

Export of Groups does not contain:

- Role can add another Role

Note: All these will get exported when you do a *self-contained* migration.

- To **Export:**
 - a) Go to **Admin > Groups > Groups**. The Groups page appears.
 - b) Search for the required group name(s) or select from the list available and then click **Export Groups** in the **Action Header**.
 - c) Save the XML file generated (ExportedWebCenterGroups.xml) to your computer or a network location.

See a sample below:

```
<group_list>
  <group id="00002_0000000001">
    <deleted>0</deleted>
    <name>EA SPORTS</name>
    <empty_group>0</empty_group>
    <notify_group>1</notify_group>
    <group_email_address>email@test.com</group_email_address>
    <group_email_language>fr</group_email_language>
    <group_vis_type>2</group_vis_type>
    <is_role >0</is_role>
    <user_members>
      <user>
        <name>USER</name>
        <group_manager>0</group_manager>
      </user>
    </user_members>
    <PM_with_visibility>
      <user>
        <name>JT</name>
```

```

</user>
</PM_with_visibility>
<download_group_permission_list>
  <download_group_permission_view>
    <group id="00002_0000000011">
      <deleted>0</deleted>
      <name>EA SPORTS</name>
      <group_vis_type>2</group_vis_type>
      <is_role>0</is_role>
    </group>
    <download_format id="00002_0000000011">
      <deleted>0</deleted>
      <name>Native</name>
      <short_name>Native</short_name>
      <doc_type_id>00001_0000000001</doc_type_id>
      <enabled>1</enabled>
    </download_format>
  <download_group_permission id="">
    <deleted>0</deleted>
    <group_id>00002_0000000011</group_id>
    <download_id>00002_0000000001</download_id>
    <granted>0</granted>
  </download_group_permission>
  ...

```

- To **Import**:
 - a) Go to **Admin > Groups > Groups**. The Groups page appears.
 - b) Click **Import from XML** on the Groups page.
 - c) Click **Choose File** and then select the XML file.
 - d) Click **Import**. After the import completes, you can see a basic **Import Group Feedback**.

Groups

Import Group feedback	
Number of Groups Created	1
Number of Groups Modified	0
Number of Groups Not Changed	0
Number of Groups Not Imported	0

[Return](#)
[Download Detailed Report in XML](#)

- e) Click the **Download Detailed Report in XML** link to download a detailed report of the import.

Note:

- If there are no visibility settings in the XML, the imported Group(s) will be visible to **All Project Managers**.
- The import will not create Users or Project Managers.
- The download permissions as specified in the Export XML will be granted to the Group(s).

Migrating Restricted Sets

The import of Restricted Sets will overwrite the existing ones with the same name. This is similar to all other import functions.

Note: When you *export* Attribute Categories it will contain the Restricted Sets belonging to that Category.

- To **Export**:
 - a) Go to **Admin > Restricted Sets**.
 - b) Select the Restricted Sets to export and go to **Action Header > Export**.
 - c) Save the XML file generated (`exportRestrictedSets.xml`) to your computer or a network location.

The export will contain the following details of the exported Restricted Sets:

- Name
- Units

Note:

If the existing Restricted Sets (on the target system) have a different **attribute unit**, the import will not succeed in updating them.

- Values
- To **Import** to the target system:
 - a) Go to **Admin > Attributes > Restricted Sets**.
 - b) Click **Import** on top right.
 - c) Click **Choose File** and then select the XML file from your *export*.
 - d) Click **Import**. After the import completes, you will see a basic **Import Restricted Sets Feedback**.
 - e) Click the **Download Detailed Report in XML** link to download a detailed report of the import.

Migrating Attribute Categories

The migration of Attribute Categories will create new Attributes and Attribute Categories if they are not existing in the target system.

The **Export / Import of Attribute Category** contains:

- Basic info:

- Name
- Description
- Layout
- Views
- Attributes:
 - List of Attributes
 - Name of the Attribute
 - Attribute Type
 - Visibility settings
 - Attribute Input Option: **Prompted / Calculated / Restricted**
 - Attribute Values
- All Document Reference Attributes with settings:
 - Bill Of Materials options
 - Versions / Revisions settings
 - Reference Category name and the Reference Category attributes

Tip: Export your Document Sources before the export of the Categories.

The **Export / Import of Attribute Category** does not contain:

- Document Reference Attribute Values (Documents)
- Lists

Tip: Export your Lists before the export of the Categories.

• **To export Attribute Categories:**

- a) Go to **Admin > Attributes > Attribute Categories**.
- b) Select the attribute categories to export and go to **Action Header > Export**.

Warning: If your Attribute Categories were created in another version, it will ask you to re-save the Category. The message will appear as:

The following Attribute Categories cannot be exported because they are outdated. Open each Category and resave.

You also have to re-save the Categories when some Attributes are updated since the last Save.

- c) Save the XML file generated (`exportAttributeCategory.xml`) to your computer or a network location.

See a sample XML below:

```
<category_list>
<category id="00002_0000011548">
<deleted>0</deleted>
<name>Griet Category</name>
<description></description>
<category_XML>XML blob describing the layout of the attribute category for the
different views</category_XML>
<!--Mapping between the attribute category and the attribute -->
<attribute_category_list>
<attribute_category id="00002_0000011549">
<deleted>0</deleted>
<attr_id>00002_0000000302</attr_id>
<category_id>00002_0000011548</category_id>
```

```

<display_order>1</display_order>
</attribute_category>
...
</attribute_category_list>

<!-- List of attributes in the selected category -->
<attribute_list>
<attribute_id="00002_0000000302">
<deleted>0</deleted>

</category_list>

```

• **To Import an Attribute Category:**

- a) Go to **Admin > Attributes > Attribute Categories > Import**.
- b) Browse to the XML file that you saved during *export* and click **Import**.

Caution:

- When importing Attribute Categories, existing Categories with the same name are overwritten. A warning message is displayed on the Import page.
- A warning message is displayed about the items that already exist.

- c) Uncheck the items that you don't want to import and click **Import**.

Migrating Task Types

You can migrate your Task Types with its settings.

When Importing Task Types:

- the Task Types will be created with the settings mentioned in the XML file when they do not exist in the target system. Dependencies to the task type including lists and categories are also imported.

If the document reference attributes of the imported categories/specifications have a reference category, the reference category is also imported.

- If the imported Task Types do exist, they will be updated with the settings from import XML.
- To export **Task Types**:
 - a) Go to the **Task Types > Types** page. Select the Task Type(s) to export and click **Export** .
 - b) Save the XML file generated to your computer or a network location.

Export / Import of Task Types contain:

- Basic Settings
- Task Document's settings
- Discussions with Settings
- Checklist items with Settings
- Views
- Specifications:
 - List and Order
 - Names
 - Type
 - Grid Layout
 - Visibility settings
 - Input Option: **Prompted / Calculated / Restricted**
- Values
- Document Reference Specifications:
 - Bill Of Materials options
 - Versions / Revisions settings
 - Reference Category name and the Reference Category attributes

Tip: Export your Document Sources before the export of the Categories.

- Workflow
- Task Status List with the icons (18.0.1 release onwards)
- Document Upload Settings

Export / Import of Task Types does not contain:

- Document Reference Values (Documents)
- To Import:
 - a) On the **Task Types > Types > Import from XML**
 - b) Click **Choose File** and then select the XML file that you saved during the export.
 - c) Click **Import**.
 - d) You are redirected to **Import Dependencies** screen, where all the imported contents are shown. You have the option to overwrite the existing contents or uncheck the contents which you do not wish to import.

Import Dependencies

Import
Enter Database Credentials
Return

Following items already exist on the system and will be overwritten!
To prevent this, uncheck the items before the Import.

Lists

- PCM_Size
- PCM_Seasonal
- PCM_Output

Categories

- PCM Reference Properties ACat

Following items will be created in the system
Uncheck the items that you do not want to import.

Lists

- PCM_Flavour
- PCM_Container

Task Types

- PASH Copy ATTR Values --

- e) Select **Enter Database Credentials** to specify if the WebCenter Database has to create a table or not. If yes, then the **Database User** name and **Password** has to be specified. Click **OK** for one of the option.
- f) On completion of import, WebCenter shows the list of all contents updated and newly created with warnings.

Migrating Workflows

You can export a Workflow from a Task Type to an XML file and migrate it to another Task Type either on the same system or a target system.

- To export:
 - a) On your Task Type's **Workflow** tab, click **Export Workflow**.
 - b) Save the XML file generated to your computer or a network location.
- To import:
 - a) On your Task Type's **Workflow** tab, click **Import Workflow**.
 - b) Browse to the XML file that you saved and click **OK**.

- c) A note of caution asks you if you are sure that you want to overwrite the current Workflow. Click **OK**.

Note: You will get the following message:

Not all the items in the Workflow are available on this WebCenter when the Task Types linked in the workflow are missing.

3.27. Getting a list of existing projects

standard duckling

To get a list of existing projects based on given filter make a call to the following JSP page:

GetProjects.jsp

With parameters:

1. username
2. password
3. type

Parameter description:

- *type*: specifies category of projects to be listed. This field is mandatory. Supported values are:
 1. my favorite projects
 2. projects I am in
- *name*: limits returned projects to those having the specified string (name parameter) in its name. It's possible to use special characters like in WCR GUI filters and search fields. For example specifying "*name=Toy*project*" returns both "Toyota project" and "Toy Story project" if they exists in WCR database. This is not applicable when type parameter is set to '6' (type=6). In that case the full name of required project (not case sensitive) has to be specified. This field is optional.
- *projectid*: ID of project to be returned. Ignored unless type parameter is set to '6'.

This SDK call can be utilized by project managers (PMs) or administrators.

If *type* parameter is set to '6' (project by ID or name), one of *projectid* and/or *name* parameters has to be specified. *projectid* parameter has precedence. In this mode *name* parameter has to contain a full name of the wanted project without any special "searching" characters.

Example:

To get list of all favorite projects of currently logged in user (PM or admin) that have "Active" status set use the following call.

http://mywebcenter.mycompany.com/WebCenter_Inst/GetProjects.jsp?username=myusername&password=YWjjZGVm&type=1&statusname=Active

To find projects managed by logged in user that contain particular string ("001") in their names use the following URL. The example returns the first set (page) of 200 projects. If there are more you get the rest by incrementing the *curpage* parameter value and calling the SDK again until it returns less than 200 records (projects) back. Note you can utilize *sorting* parameter to control what projects will be in the first returned set (page).

http://mywebcenter.mycompany.com/WebCenter_Inst/GetProjects.jsp?username=myusername&password=YWjjZGVm&type=3&name=*001*&curpage=1&pagesize=200

Returns:

Successful execution returns a list of projects conforming to given criteria(s). If a problem occurs, appropriate error message is returned.

4.2. Getting Started with WebCenter

Use WebCenter to search for information and manage projects. Anyone can search for information, but only Project Managers can manage projects. This document includes documentation for the most common and often-used features, but you will find other features and abilities as you explore the site.

4.2.1. Opening WebCenter

1. Open your web browser and navigate to http://yourservername/WebCenter_Inst or the URL that your system administrator has provided.

Note:

- On a PC using Microsoft Windows, only version 6.0 and later of Internet Explorer and version 1.5 or later of Mozilla Firefox are supported for use with WebCenter. For optimal use on Internet Explorer a more recent version is recommended however. Google Chrome is also supported.
- On Mac OS X, Safari, Mozilla Firefox and Google Chrome are supported for use with WebCenter.

2. Once the page loads, enter your user name and password in the appropriate fields and click **Log In**.

Note:

If your administrator has enabled this, you can click the **Forgot Password?** link in the **Log In** page if you can't remember your password.

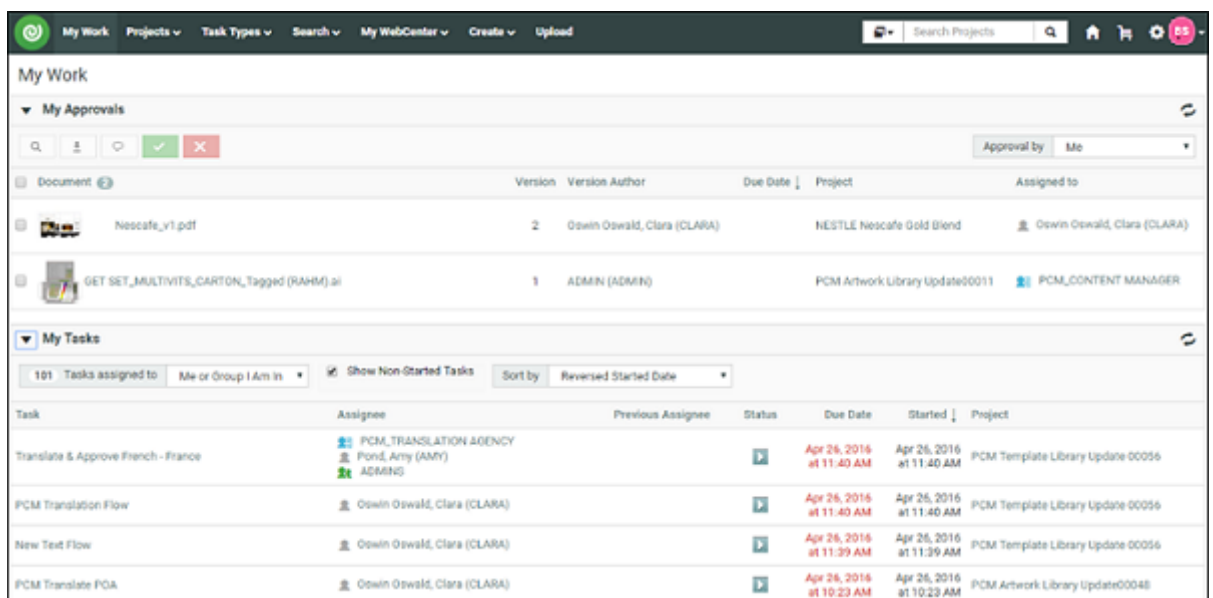

Enter your **Username** or **E-Mail** address in the pop-up that opens, and click **Request New Password**.

You will then receive an e-mail with a temporary password and a link to the **Log In** page.

After logging in, you will be asked to change your password.

The start page defined by your administrator appears (this is generally your **My Work** page).

Note: You can later change the contents of your start page.

4.2.2. Understanding the WebCenter Page Layout

Header

The top right of the WebCenter page always shows:

- the name of the current user,
- a  icon to go back to the user's start page,
- a  Discussions icon which indicates the unread messages and redirect to My Discussions. You can view all discussions related to Project or Document or Tasks that you are involved in. For more details, refer to [Discussions in WebCenter](#) on page 814
- the Cart ,
- Avatar  icon displays the user initials (first letter of first name and last name),
- a link to the WebCenter **Welcome** page,
- **Admin** (if the user is a member of the Admins group),
- **Contact**,
- **Logout**.

Top Menu Bar

By default, the top menu bar contains the following menus: **My Work**, **Projects**, **Task Types**, **Search**, **My WebCenter**, **Create** (if you are a Project Manager) and **Upload** (see [The Default WebCenter Menus](#) on page 544 for more details). An administrator can customize the menus.

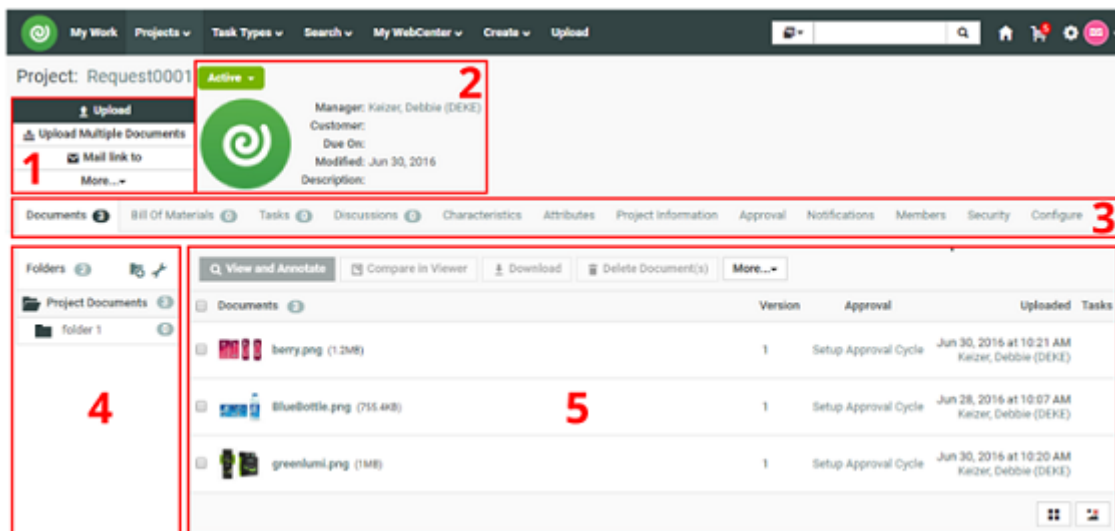

If you have the optional Task Management module and the **User Can Create Task Type** permission, **Task Types** also appears in the top menu bar.

Documents Pages

Below is a sample of project's **Documents** page, in grid layout, for a user who is a Project Manager.

Area 1 is the project actions area, allowing you to perform actions on the whole project (for example, mail a link to the project to a reviewer, add the project to your favorite projects...)

- **Area 2** is the Project Details area, containing the project icon, the name and description of the project, the project status...
- **Area 3** shows links to the project pages. For example, click **Members** to view the project members. The page you are on is shown in bold.
- **Areas 4** and **5** are part of the content pane, that changes depending on the project page you are on. Here, on the **Documents** page, they show the project folders and documents.
- **Area 4** is the Folders pane, showing the projects folders. Click a folder to see the documents it contains.
- **Area 5** is the document pane, that can show the documents in a list or grid view, with or without thumbnails.

Notes

- To act on many documents at once, select their check boxes and then choose an action in the **Actions** menu.
- To select all documents in the current folder, select the check box before the **Documents** header.
- To switch to a list layout, click **Show as List**.
- Hovering over a thumbnail shows a larger version of it in a pop-up window.

For Graphic documents viewable by the WebCenter Viewer, you can click the zoom icon to show an even larger thumbnail (500 x 500 pixels). This is applied to all Graphic documents on which you hover until the page is reloaded.

The pop-up window closes when you move the cursor off the thumbnail.

There is usually more than one way to accomplish a task by using a combination of menu entries, action menus, and clicking status messages. Many methods will lead to the same result.

Note: This layout is the default layout. However, your layout might be different depending on your customization.

4.2.3. The Default WebCenter Menus

My Work

What is displayed?

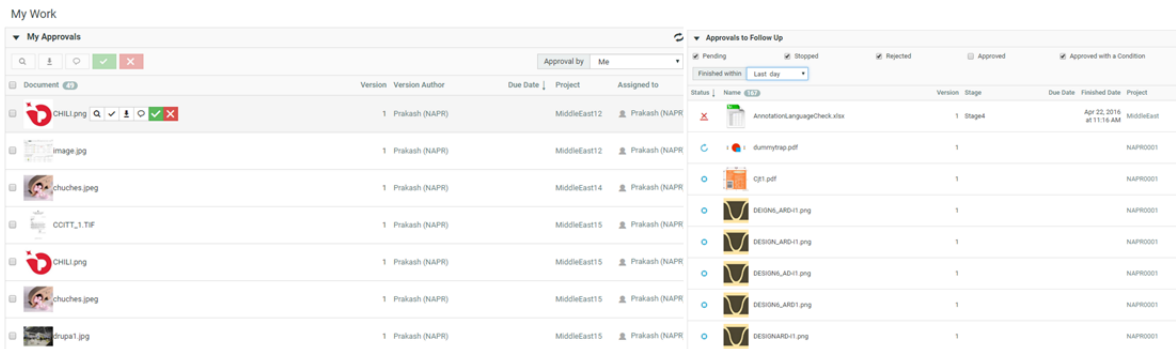

Your **My Work** page lists the documents waiting for your approval, as well as the Tasks assigned to you, or to a group you are in.

Documents that are overdue have red due dates. Documents whose due dates are within the next day have orange due dates, and documents that have far-off due dates have gray due dates. You can also view the **Discussions** and messages in the discussions that you are part of, if you have chosen to view discussion in **My Work** page.

Tip:

If you have a long list of items to attend to, use the filter options in each panel: for example you can limit the display to items assigned directly to you (**Me**), to one of the groups you are in (**A Group I Am In**), or both (**Me or Group I Am In**).

If you are an **Approval Master**, you can filter the approvals you need to follow up by status (for example, to only show the approvals still **Pending**), by due date, etc.

Working from My Work page

- Click a document name to go to the document, or click the project name to go to the project. Note that the behavior may be different in case you are using a **simplified My Work** page.
- To load multiple documents into the Viewer, select their checkboxes and click **View and Annotate** in the actions menu.

You may then navigate between the documents by using the controls in the Viewer header.

- To approve, reject or comment multiple documents, select their checkboxes, and click ,  or  (choose a status that applies to all the documents you selected).

In the pop-up that opens, enter your comment (if applicable) and your password (if required by your server) and click **Commit**.

Note: For Page List documents, the My Work page also displays the number of pages that have already been approved, as well as the total number of pages.

Indirectly Assigned Group Tasks

If you are a Group Representative, you will be the preferred assignee when a Role is assigned to this Group. So the related approvals and tasks appear in your **My Approvals** or **My Tasks** sections on My Work page.

When the Group Representative is absent, any of the Group Members can do the tasks on his or her behalf. To do this,

1. Go to **My Work > My Approvals > / > My Tasks**.
2. Click on the drop down **Documents waiting for Approval** and select the **Me Indirectly** option.

When you select this an additional drop down **On Behalf Of** will be displayed.

3. Select the Representative on whose behalf you are approving the document or doing the task. All Documents / Tasks to which he / she is assigned through a Role or on behalf of a Group are loaded in this page.

You can now do the Approvals from the **My Approvals** section.

Note:

Project History will indicate that those **Approvals / Tasks** were executed on behalf of the Role that is represented by the Group.

To know more about how to setup your **My Work** page, read [My Work Setup](#) on page 545

My Work Setup

This is where you can customize your **My Work** page. To do this, click **My Work > Edit My Work Setup**. Select the blocks you want to be displayed and drop it to **My Work** panel.

You can also select **Show simplified My Work page** (with no links to projects or documents) or you can choose **Reset to Default** option. To know more about My Work page set up, read [Edit the Default My Work Page](#) on page 128

Click **Save** when you are done.

Projects

The **Projects** menu contains the following menu items:

- [Favorite Projects](#) on page 547,
- **Projects** (shows all projects visible to your user),
- [Projects I Am Invited to](#) on page 548,

If you are a Project Manager, you can also see:

- [Projects I Manage](#) on page 547,
- [Create Project](#).

Favorite Projects

Favorite Projects shows those projects for which you have clicked **Add to Favorites** in the project's **Actions** menu.

The Favorite Projects' **Actions** menus contains **Remove from Favorites**, **Add to Cart**, and **Update Project(s)**.

- Filter the list of projects by entering a filter in the **Show Projects** field, or by changing the value in the **Modified** list, and clicking Go.
- To sort the list of projects, click the column header of the field on which you want to sort. For example, click the Created column header to sort on project creation date. This preference is saved in your profile, so it will become your new default sort option.
- To **view** a project, click its name.
- **Add to Favorites** adds the selected projects to your list of Favorite Projects.
- The **Cart** lets you download multiple projects or documents at once, and also lets you e-mail links to projects and documents. The recipients must have user names and passwords for your WebCenter site in order to view the information when they click a link. The Cart retains its contents only until you close the browser window or until you log off.
- **Update Project(s)** checks the version of each visible document in the selected projects and updates each document to its latest version if needed.

To remove a project from the Favorite Projects list, select it and click **Remove from Favorites** in the **Actions** menu.

Projects I Manage

Projects I Manage shows those projects for which you are the Project Manager, or which are managed by a group of which you are a member. It only appears in the menu if you are a Project Manager (either individually or through your group memberships).

In the **Actions** menu are **Delete**, **Update Project(s)**, **Add to Favorites**, **Add to Cart** and **Change Manager**.

- Filter the list of projects by entering a filter in the **Show Projects** field, or by changing the value in the **Modified** list, and clicking Go.
- To sort the list of projects, click the column header of the field on which you want to sort. For example, click the Created column header to sort on project creation date. This preference is saved in your profile, so it will become your new default sort option.
- To **view** a project, click its name.
- **Add to Favorites** adds the selected projects to your list of Favorite Projects.
- The **Cart** lets you download multiple projects or documents at once, and also lets you e-mail links to projects and documents. The recipients must have user names and passwords for your WebCenter site in order to view the information when they click a link. The Cart retains its contents only until you close the browser window or until you log off.
- **Update Project(s)** checks the version of each visible document in the selected projects and updates each document to its latest version if needed.

Delete deletes the selected projects.

To have somebody else manage one of your projects, select the project, click **Change Manager** in the **Actions** menu, then select the new Project Manager and click **Finish**.

Projects I Am Invited to

Projects I am invited to shows all the projects of which you are an invited member.

In the **Actions** menu are **Add to Favorites**, **Add to Cart**, and **Update Project(s)**.

- Filter the list of projects by entering a filter in the **Show Projects** field, or by changing the value in the **Modified** list, and clicking Go.
- To sort the list of projects, click the column header of the field on which you want to sort. For example, click the Created column header to sort on project creation date. This preference is saved in your profile, so it will become your new default sort option.
- To **view** a project, click its name.
- **Add to Favorites** adds the selected projects to your list of Favorite Projects.
- The **Cart** lets you download multiple projects or documents at once, and also lets you e-mail links to projects and documents. The recipients must have user names and passwords for your WebCenter site in order to view the information when they click a link. The Cart retains its contents only until you close the browser window or until you log off.
- **Update Project(s)** checks the version of each visible document in the selected projects and updates each document to its latest version if needed.

Task Types

You will only see this menu if you have the Task Management license. See [Task Management in WebCenter](#) on page 819 for more information.

Search

Searching Content in WebCenter

When searching for projects or documents, you can use normal searching or keyword searching.

The normal method searches more fields than keyword searching, but keyword searching may be more useful when you know less about the desired results.

Both are accessed by clicking **Search** in the main menu.

Tip:

Keyword searching is also available in the header of every WebCenter page, at the top right under **Welcome, Contact, Logout...** You can search for **Projects, Documents** or **Saved Searches** in this search bar.

By combining with the **OR** keyword, you can also search for properties which are empty have a specific value, **EMPTY OR** some value.

Normal Searching

1. In the **Search** menu, click **Projects, Documents** or **Tasks and Approvals**, depending on what you want to search.
2. When using **normal searching**, you see multiple fields to fill in. Click **Keyword Search** to search on keywords alone.

To switch from keyword to normal searching, click the **More options** link.

3. Enter search terms in the fields as desired.

Note:

- To search for **Documents** or **Projects** based on attributes:
 - click the **Attributes** link,
 - select the **Attribute Category**,
 - specify the values of the **Attributes** you are searching for,
 - and click **Add** to return to the **Search** page.

- To search for **Documents** or **Projects** based on **characteristics**:

- click **Characteristics**,
- select the desired items in the characteristics tree or **Find more characteristics**.

You can choose to search on **any of** or **all of** the items selected. Click **Add** to return to the **Search** page.

Searching on attributes and characteristics is available only using normal searching.

Tip:

You can search for documents based on their **Approval Status**: select either a single approval status or:

- **All Approved** to select documents with any approved status (**Approved, Approved with comments, Force Approved** or **Force Approved with comments**).
- **All Rejected** to select documents with any rejected status (**Rejected** or **Force Rejected**).
- **All Completed** to select documents with any approved or rejected status.

Tip:

You can search for document **revisions**. The **revision** field can be shown in the search results and can be used to sort the results.

You can search for revisions only if your administrator has set this up for you. Read about this in [Configure Search Crawler Setup](#) on page 395.

You can specify the **revision** you want to search for from the drop down. Select:

- **Latest Revision** to search the latest revision of the document you are searching for. Only the latest revision will appear in the results. A document can appear multiple times in the search results if multiple versions are linked to different projects.

Note:

The search results will show only the document revisions linked to at least one project. If a version is linked to a project, all the revisions prior to that can be found in the search.

For example, a document has three revisions (Base- versions 1, 2 and 3; Revision A- versions 4,5 and 6 and Revision B-version7).

If the revision indexing is not enabled, the search will find only version 7 if this is the only version linked to a project currently. When revisions are indexed, all the latest versions of the previous revisions will appear in the search results. The search will find version 3 (Base), 6(A) and 7(B).

- **All Revisions** to display all revisions of the document.
- **Base Revision** to search for the first revision of the document.
- **Specific Revision** and specify the revision letter in the field.

Tip:

Searching based on Project Status:

You can specify **Project Status** as a criteria in Project Search. To do so, select the **Project Status** from the drop down. Read more in: [Searching based on a Project Status](#) on page 169

To type in a custom value (or to use wild cards /AND/ OR etc.) click the edit  button.

Tip: When you are searching for **Tasks** based on task specifications:

- click on the link **Task Specifications** and start typing the name of the specification
- or select from the drop down listing all specifications.

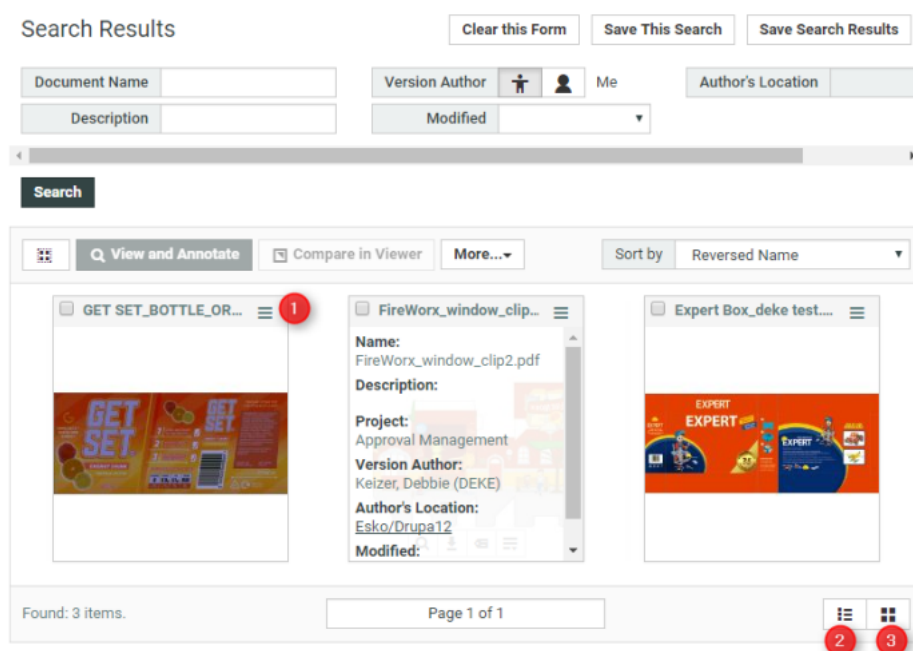

4. Use the [Search Results Options](#) to determine what you want to see in your search results and in what order.
5. You can also:
 - clear all fields: click **Clear this form**.

- save the search query for future use (see [To Save a Search](#) on page 558).
6. Click **Search** to search using the criteria you entered.

Note: For normal searches, WebCenter searches all the fields available on the **Search** page. Each document type in the **Search for** list has different searchable fields.

The **Search Results** page shows your results.

- You can view your Project search results in a **List** or a **Grid** or a **Card**, and choose to view the thumbnails or not.
- Task and Approval Searches can be viewed only as a List
- Document searches can be viewed as **Card** or **List** or **Grid**.

When using **Card** search, you have a catalog like view of your Documents. To view the related information, click **≡**.

The number of items displayed in Card, List or Grid is set in [Preferences](#).

Note:

It is possible to configure a specific Saved Search to always show up as card view in the Search Results Layout options.

The Card style Search provides a new way of displaying Document Search results. The new Card style is more image-centric and allows to hide additional metadata initially.

Note: Search results display only projects or documents for which you have **View** permission.

Use Basic and Advanced Search Characters

Basic Search

You can type in multiple words separated by spaces to look for projects or documents having both words. The words do not have to be in any particular order.

Remember:

If there are no search characters (* ? "), basic or advanced, the search adds stars (*) around every word. The results will show anything that starts, ends or contains the word you are looking for.

For example, if you search for box company, it will return results which include both words but it could also find boxed instead of box.

The following basic search characters *, ?, NOT, OR, AND, EMPTY, "" are always available when searching.

See other examples below:

box company

The search results will contain both box and company in no specific order. The results may also contain boxed.

If you would like to search for a string with multiple words, type them with a space in between them. The order is not important. The search will return results containing both words.

"box company"

If you need the words to be exact (so not sub-strings) and to be in a particular order, use "" around the words.

box comp*

If you want to only find results for prefix or suffixes, you can use stars. The search will only look for the substrings for the words where you added a *.

A search with box comp* will find "company" and "box" but will not find "boxed".

com?any

Use ? as a placeholder for an unknown character.

The search will not find substrings when you use ? .

A search with com?any will find "company".

<p>box OR company</p>	<p>If you don't need the results to contain all words but want to find results that contain any of them, use OR (uppercase!).</p> <p>The example will find results that contain "box" or "company" (or both).</p>
<p>box AND company</p>	<p>Use AND to combine words in the search.</p> <p>The example will find all results containing both "box" and "company".</p> <p>Note: This is the default behaviour when you type in two words together.</p>
<p>box NOT company</p>	<p>Use *NOT to exclude results that contain the term after the NOT from the results.</p> <p>For example you want to find all documents containing box but not company.</p>
<p>EMPTY</p>	<p>You can search on the keyword EMPTY which allows you to search for any documents, projects or tasks where some text attribute or other text property is not filled in.</p> <p>For example, to search for projects that are not created from a template, search with keyword EMPTY on the Project Template field.</p> <div data-bbox="874 1272 1241 1323" style="border: 1px solid #ccc; padding: 2px; display: inline-block;"> Project Template <input style="border: 1px solid #ccc; padding: 2px;" type="text" value="EMPTY"/> </div> <p>By combining with the OR keyword, you can also search for properties which are empty or have a specific value.</p>

Advanced Search

If you want to perform a more precise search, enable **Use Advanced Search Characters**. This allows you to use the **&&, | , (), " , ~ , ** characters as search operators, to refine the search.

Note: When using the advanced search characters, the search won't include the sub-strings. If you would like sub-strings to be included, add *****.

<p>box-company</p>	<p>Use - when you do not want to find results with certain words.</p>
--------------------	---

<p>(box company) OR (apple raspberry)</p>	<p>The example string will find all documents containing box but not company.</p>
<p>company~0.9</p>	<p>Use () to group queries. This example search will find all documents containing box and company along with all documents with apple and raspberry.</p> <p>Use ~ after a word to find words which might contain typing errors.</p> <p>In the example, the search will find all words that have a 90% match with "company". This will also find "company" or "copany".</p>
<p>"company boxes"~3</p>	<p>Combine "" and ~ to search for words in a particular order with some flexibility.</p> <p>The example search will find "company" and "boxes" in that order with up to 3 other words between them. It will find "company that produced boxes".</p>
<p>"Jean-Luc"</p>	<p>If you need to search for a special character like a - sign in word combination, you can use "" around it. You could also escape the special character with the "\ " character like: Jean\Luc.</p>
<p>box && company</p>	<p>&& does the same as AND, does the same as OR.</p>

Search Result Options

Use the **Search Results Options** to determine what you want to see in your search results and in what order.

Search for Projects

Fill in one or more fields. Prefer less fields? Try [Keyword Search](#).

Found: 7 items. Page 1 of 1

Note:

If the Administrator has enabled **Editable** items, you get an Edit  button next to the selected items in the List View.

You can also show the time in the search results for the **Project Due /Modified /Created** dates by enabling **Show time in search results**.

Column Order

Use the **Column Order** column to define how to display the information for each Project found: enter numbers to order the columns (in **List View**) or the text under the project icon (in **Grid View**).

Note: The first column is always the **Project Name**.

Sort

Use the **Sort** column to define how you want your results sorted: first click the check box of the first sorting criterion, then the check box of the second, etc. WebCenter shows numbers indicating the sorting order.

For example, if you want your results to be sorted first by Project Manager then by date created, first click the **Sort** check box for **Project Manager** (this shows a **1** beside it), then the **Sort** check box for **Created** (this shows a **2**).

Read more about sorting in [Sorting Search Results](#) on page 193.

Order

The order column shows the sorting order (**1, 2...**) but also allows you to sort by **ascending** or **descending** order.

- Ascending order \uparrow sorts **from A to Z** (for alphabetical fields like **Project Name**) and **from old to new** (for chronological fields like **Created**).
- Descending order \downarrow sorts **from Z to A** (for alphabetical fields) and **from new to old** (for chronological fields).

Sorting Search Results

You can sort the **search results** in the **List / Grid** view based on sort-enabled search columns.

In the List Layout:

You can click on the primary sort field header \uparrow / \downarrow to switch between ascending and descending. All sortable fields will have the sort icon next to their header text.

To change the primary sort field, click on the sort icon next to it.

- Up arrow \uparrow in the column header indicates that the results are sorted on this field in ascending order. To sort the results in the reverse order, click \downarrow .
- Down arrow \downarrow indicates that results are sorted on this field in descending order. To reverse the order, click \uparrow .

In the Grid Layout:

If the search results are in the **grid layout**, you will see a drop down with sortable fields instead of the sort icons.

For example, sorting by **Name / Reversed Name** will make the name field in the ascending or descending order.

Note:

The configured *sort fields* will be applicable in both the **grid** and **list** layouts.

You can navigate to the page number you want by typing the page number in the footer. If there is only one page to show the results, then there is no footer shown.

Keyword Searching

You can use the Search setup page to search based on a vast array of parameters. However, it is also possible to search using a single **Keyword**.

It is also possible to setup a Keyword search in the Search Panel. This is useful when you want to create Saved Searches with a Keyword field.

- The easiest way to access the search is using the top right menu bar. Enter the terms to search in this **Keyword Search** field.

Tip:

Keyword searching is also available in the header of every WebCenter page, at the top right under **Welcome, Contact, Logout...** You can search for **Projects, Documents** or **Saved Searches** in this search bar.

- Alternatively, in the **Search** menu, click **Projects, Documents** or **Tasks**, depending on what you want to search. From the normal Search page, you can use either:
 - the **Keyword Search** link.

- or the **Keyword** field.
- Click the link **Try Keyword Search** to get a simplified page.
 - a) When using keyword searching, you see the **Keyword Search** field.
 - b) Type in your **Keyword** and click **Search**.
 - For keyword search of projects, WebCenter searches the project name, project description, project characteristics, the modification date, and text attributes.
 - For keyword search of documents, WebCenter searches the document name, document description, document characteristics, project names, approval status, and text attributes.
 - c) Click **Search** to search using the keyword(s) you entered.
- If you'd like to use SmartNames in the **Keyword** field or if you want to create a Search Panel with the Keyword field, use the Normal Searching page.

The **Search Results** page shows your results. If you want to save the search, click **Save Search As...**

Alternatively, you can choose **Save Results to Excel** to download your search results in excel format.

You can choose your desired view of results by clicking **Show as List**, **Show as Grid**, **Show Thumbnails** or **Hide Thumbnails**.

Note: Search results display only projects or documents for which you have **View** permission.

Advanced Searches

Use the **Search** menu to search content in WebCenter. You can search for:

- **Projects**
- **Documents** including their **revisions**.
- **Tasks**
- **Reports**

You can create **Saved Searches** based on your chosen search criteria. If you are an administrator, you can create advanced asset browsers this way. Read in [Searching and Browsing Assets](#) on page 561

To Save a Search

1. In the **Search** menu, click **Projects**, **Documents** or **Tasks**, depending on what you want to search.
2. Define your search criteria.
For more information, see [Search](#) on page 548.
3. Click **Save Search As** and the search results are downloaded in the excel format.
The **Save Search** page appears.
Alternatively, you can also **Save Results to Excel**.
4. Do one of the following:
 - To create a new saved search, type a **Name** for the saved search.

- To update/change an existing saved search, select it from the **Your previously saved searches** list.
- 5. Administrators have to select one of the following **Search scope** options (other users can only save personal searches):
 - **Personal**, if only you should be able to see this saved search.
 - **Global**, if all users of the system should be able to see this saved search.
- 6. Click **Save**.
 You can read more about working with Saved Searches in [Creating Advanced Saved Searches](#) on page 177.

After editing an existing Saved Search, click **Save** to update the search and **Save As** to create a new Saved Search.

Downloading Search Results

You can download the results of your search as an Excel file (.xls).

1. In the **Search Results** page, click **Save Search Results**.
2. In the pop-up that opens, choose to **Open** the resulting Excel file in your spreadsheet application, or **Save** it to your hard disk.
 When the **Save Search Results** are generated to save in an Excel, a progress indicator is shown on the button. This feature is currently not available in Safari Browser.

Creating Advanced Saved Searches

Normal and keyword searches may be saved for future use as a **Saved Search** and can be plugged into menu items (of the main menu or Project details menu), **My Work** and as a document source during project creation and in document referencing.

To access saved searches, click **Search > Saved Searches**. Shown below is a sample Saved Searches page.

Searches can be saved as:

- a **Personal** search visible only to the individual user.
- a **Global** search visible to all WebCenter users.

Note:

1. For each Global Saved Search, an Administrator can determine a set of Groups/ Companies/Locations whose members can view this Saved Search.
2. It is not possible to set Visibility for Personal Saved Searches.

Saved Searches can be configured with advanced [Drilldowns](#) and extensive and visually enhanced [Dashboards](#). You can plug these

- To execute a Saved Search, simply click its name from the **Saved Searches** page. Or select it from the Search window in the menu bar.

- To edit a saved search, click **Edit Search**.
 - To **Make Search Personal**, click
 - To **Make Search Global**, click
- Smart Names** enabled Searches do not have the **Make Search Personal** option.
- To create Global Saved Searches dedicated to a company or group, click **Edit Visibility** link. In the next window, select the **Available Groups, Available Companies/Locations** to whom you want to give the exclusive visibility. In this case, if you assign the visibility to a group, a company or location, the search will be visible to either the group or the company or both.

Visible to all
 Visible to selected Groups and Companies

Please select or start typing... ▼

Available Companies/Locations

Please select or start typing... ▼

All Locations ▼

Add

Note:

If you select a company without specifying any of its locations, all the company locations will be able to access the saved search.

If you remove the **Available Groups/Companies /Locations**, the visibility settings will be modified.

- To delete saved searches, select them and click **Delete**. Use **Select All** and click **Delete** to delete all of them.

Running Reports

You can run pre-configured reports from the **Search** menu if your Admin has given you access to these reports (see the Administration Guide for more information).

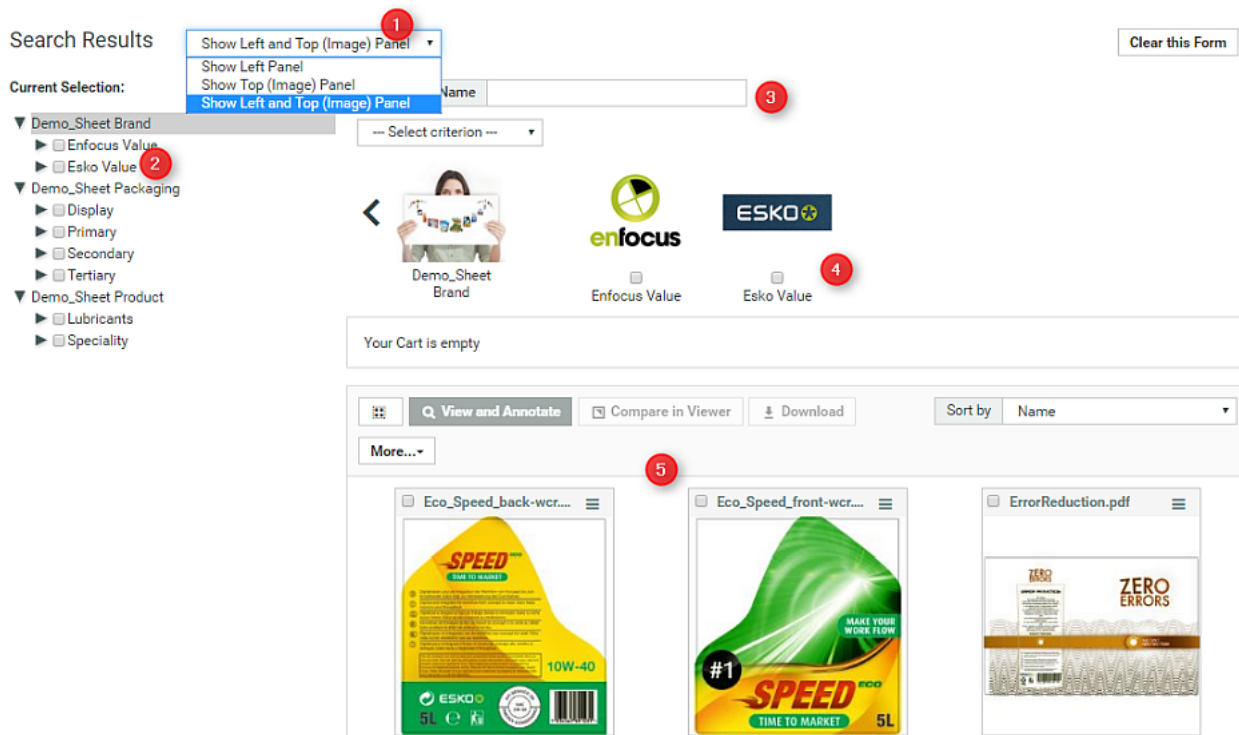

Note: This only includes system-wide reports. *Project reports* are available from within the project.

1. Go to **Search > Reports**.

2. Click on the desired report name on the **Reports** page.
3. If the report requires parameters, the **Run Report** page appears. Specify the report parameters (the mandatory parameters are marked by an *) and click **Run Now**.

Searching and Browsing Assets

The asset browser is a user-friendly feature to search and find assets in a large collection of WebCenter assets. The administrator can customize the Asset Browser into a Menu for easy access. You can use the configured Asset Browser to browse for assets stored in the WebCenter.

In the Asset Browser you can:

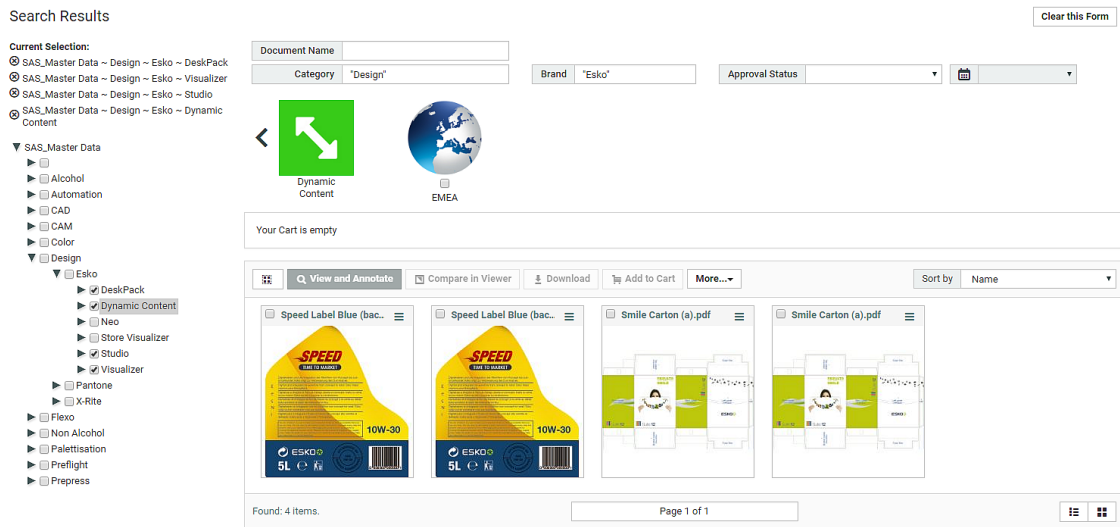

1. Select the browsing options in the Asset Browser. You can choose to see the left Panel (the browsing tree) or the top panel (with images). You can also choose to have both options.
2. Browse the tree(s) on the left panel to select the items based on the visible attributes.
3. You can use the options in the Search Panel at the top to refine the Asset Browsing (Searching) results in addition to the tree selection.
4. If you opted for the image panel, you can browse through the image representations.
5. Select the assets from the results to download or view them (by clicking the **Actions** menu).

You can select the assets and start actions directly from the action list menu if you have all the assets that you need in one single page. You can download the assets, view them or start a new projects with the selected assets from action list.

If the Cart is configured in the Asset Browser, you can use it to collect items from several rounds of searching. You can then download or start with a new project from the Cart.

Tree Browsing in the Asset Browser

You can see an example for tree browsing in Asset Browser below.

- There are different trees with multiple branches for each of these as well.
- If you want to select the sub-brands of **Esiko**, select them one by one. In this example, **DeskPack**, **Dynamic Content**, **Studio** and **Visualizer** are selected. Note that if you select the main branch, all the sub-branches will be automatically included.
- Refine other criteria from other trees according to your needs.
- Click on **Search** to get the assets filtered to your criteria.

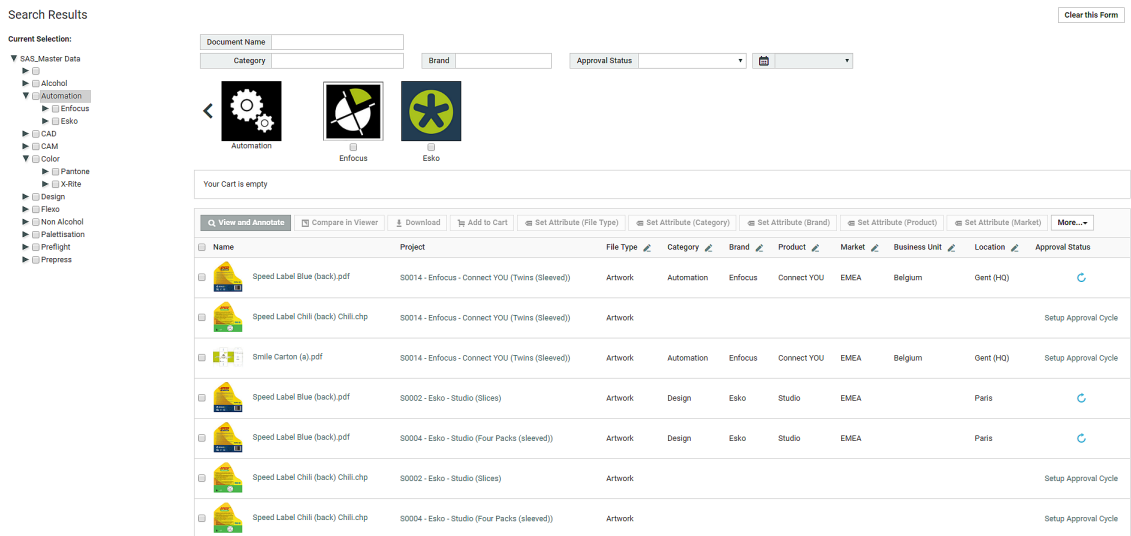

Note: If the **Search** button is not available in your Asset Browser, your results will be automatically set according to your modified criteria.

You can see your selection on the top left hand side.

Note: You can change the result layout from card layout to grid or list layout by clicking on one of the buttons at the bottom right.

Graphical Browsing in the Asset Browser

Graphical Browsing is possible when the administrator has configured the **Attributes** with associated images. Image browsing is straightforward like tree browsing and an example is given below.

- There are three **lists** (Brand, Packaging and Product) in this example. You have multiple **Attributes** under each of these **lists**. For graphical Asset Browsing, you need images configured for the **lists** and **Attributes**. Administrator rights are necessary for adding images to **Attributes** and **lists**.
- To select sub-brands, click on the image representation. This will bring out the images representing sub-brands on the top image pane. Note that if you select the main branch, all the sub-branches will be automatically included as search criteria.
- Refine other criteria from other **lists** according to your needs. In this example all **Attributes** under **Packaging** and **Product** are selected by selecting the **list** images.

You can use the triangular back  button to go back one step at a time.

- Click on **Search** to get the assets filtered to your selections.

Note: If the **Search** button is not available in your Asset Browser, your results will be automatically set according to your criteria.

Using the Cart from the Asset Browser

You can use the Cart in the Asset Browser to assemble the assets selected from the Asset Browser. From the Cart, you can:

- start the viewer
- download the assets
- start a new project with these assets
- modify the assets.

You can do several rounds of searching and browsing to add documents one by one to the Cart and then proceed with the actions listed above.

Note: The Cart has to be configured by the administrator while determining the settings of the Asset Browser (the **Saved Search**). Read more in [Configuring the Cart in the Asset browser](#) on page 215

You can read more about Cart in [Using the Cart](#) on page 582

Creating a Project from the Asset Browser

Your Packaging Projects often involve modification of existing packaging or creation of new packaging with recurring elements. You can use a template for the recurring elements. Asset Browser will help you to browse for these templates and existing packaging projects. You can start creating a project directly from the Asset Browser. You can do this by:

- using the **Cart** to collect items and starting a project using **Create Project from Cart** link.
- or by selecting the **Create Project from Selected** option from **action list** menu.

This will lead to the WebCenter project creation user interface.

Note: The administrator has to enable project creation this in the **Saved Search** settings. Read more in [Configure Project Creation from the Asset Browser](#) on page 217.

Using Searches to do Bulk Project Operations

Updating Project Due Date, Project Manager or Project Status in Bulk

If your administrator has setup a Saved Search Results for bulk operations, you can change

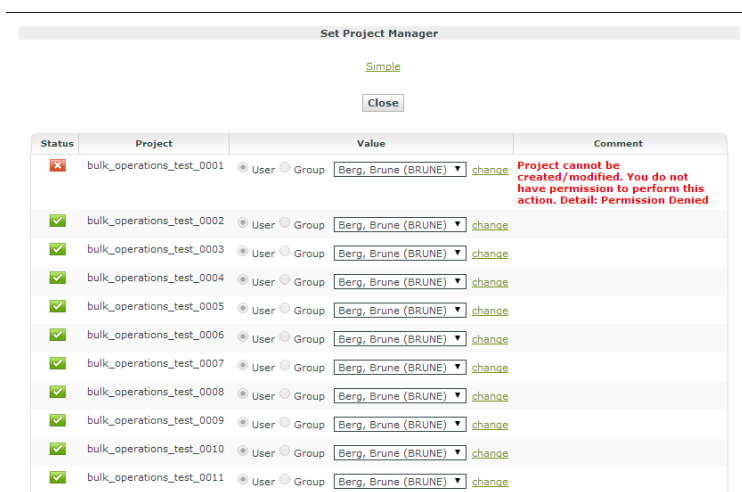

- the **Due date**
- **Project Manager**
- **Project Status**

in bulk.

1. Go to **Search > Saved Searches**. Select one or more projects from the Saved Search Results.
2. Select the **Projects** for which you want to change the Project Parameters.
3. Click the pencil icon for the parameter you want. Or select the desired bulk action from the **Actions** menu.

- A **Simple** bulk operations dialog will open.
4. Do any or all of the following operations:
 - To change the **Project Manager**, first choose whether you want to select a **User** or **Group**. After that, select a user or group from the list, or start typing to find the one you want.
 - To change the **Project Status**, pick a new status from the list.
 5. Choose **Advanced** if you wish to assign different values to your selected projects. You can return to the default mode by clicking **Simple** again.
 6. Click **Start** and wait for the action to complete. You will be notified of any issues regarding the operation.

7. Click **Close** to close the dialog. Your search results will automatically update.

Updating Attribute Category, Project Member or Project Permissions in Bulk

You can change the Project Attribute Category of multiple projects from Project Search results in one go. Also, you can add Project Members to multiple projects and set their permissions.

1. Go to **Search > Saved Searches**. Select one or more projects from the Saved Search Results.
2. Select the **Projects** for which you want to change the Project Parameters.
3. Use the buttons **Change Attribute Category** or **Manage Members/Permissions** in the table header.

- To change the **Attribute Category**, pick an attribute category from the list.

- To add a **Project Member**, first choose whether you want to add a **User, Group** or **Role**. After that, select a user, group or role from the list, or start typing to find the one you want. Once you have selected your desired new project member you can immediately modify the new member's project permissions.

You can specify Custom folder permissions for inviting Project Members in the bulk operation. Use **Add folder** link to add a new line. Specify a set of permissions for the folder by typing in the folder name inside the provided edit field. Only the specified folders' permissions will be changed. Permissions on folders that do not exist in a given Project will be skipped

You can take out the Root permissions from the list. If no Root is in this list but the member is new to the project, he will only get view rights on the Root.

Note: The selected User, Group or Role will be invited if it is not yet present in the Project.

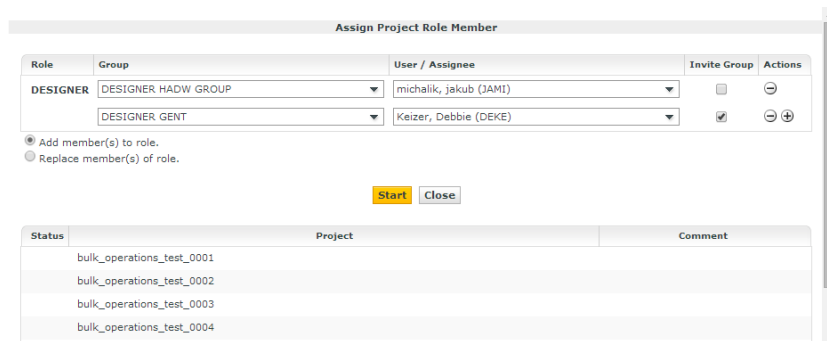

- Click **Start** and wait for the action to complete. You will be notified of any issues regarding the operation.
- Click **Close** to close the dialog. Your search results will automatically update.

Updating Role Members in Bulk

- Go to **Search > Saved Searches**. Select one or more projects from the Saved Search Results.
- Select the **Projects** for which you want to change the Project Parameters.
- Click the pencil icon for the **Role** you want. Or select the desired bulk action from the table header.

Assign Project Role Member dialog will open.

- In this window, you can **Add members to role** or **Replace members of role**.
- Change the value of the desired parameter:
 - Select a User and/or Group to assign to the role.
 - You may add multiple assignments using the **actions** buttons.

- c) Select whether to add the members to the group and replace the members.
If the members are replaced, all blocking tasks and approvals will be moved to the first of the new members.
6. Click **Start** and wait for the action to complete.
The dialog will indicate which projects were successfully modified. It will also list all of the problems.
7. Click **Close** to update your search results.

Searching on Documents

Search by Document Size

Users can search for documents which are of a certain size range using **Version Size**.

Version size will only show the size of the version of the document shown in the results. The size of the previous version of the document is not shown.

The **Version Size** criterion is available for all document types. You can search, sort and facet on the size of the document version (in bytes).

Search by Document Created Date

You can search the documents based on the creation date in a range or in the specified previous number of days and make it hidden or visible or available in the results.

Folder Search

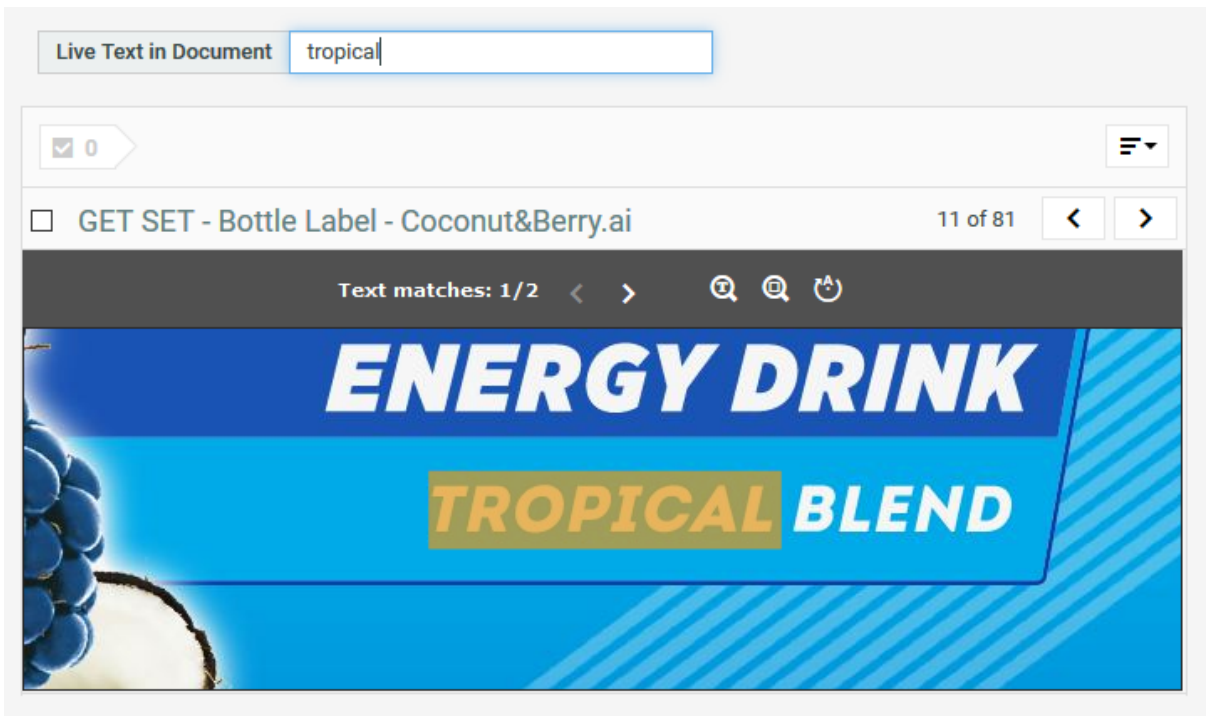

Read more on folder search [here](#).

Live Text in Document

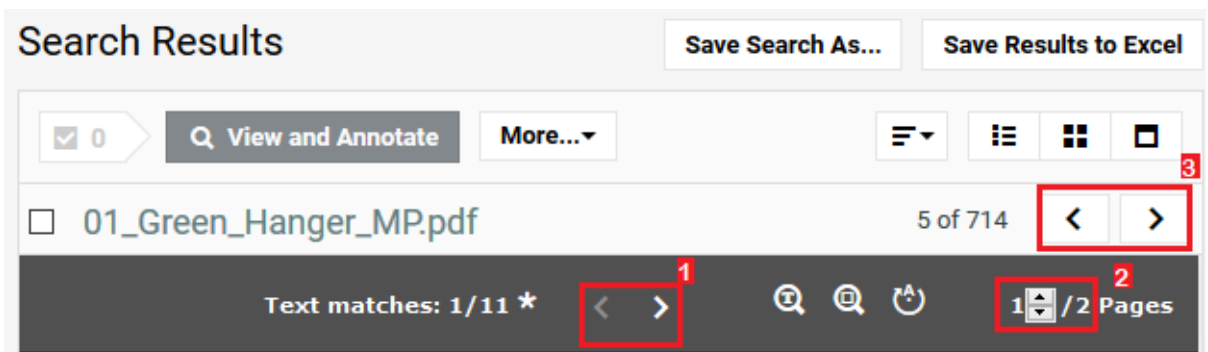

From 18.1.1 onwards, you can search for a text within a pdf document or a AI file using this **Live Text in Document**. This field is available for search, based on the setting in the [Search Crawler configuration](#) set by the Admin user. This search does not find results for the text present within an Image or outlined text.

When the search results are shown as a [Focus layout](#) with a viewer block, the matches for the searched text are highlighted in the document. You can navigate through the matches to see where the searched text occurs. The number of instances of the text occurring in the document are shown in the header.

Note: This field does not support right to left text used in languages like Hebrew, Arabic.

You can navigate through the matches to see where the searched text occurs.

1. Navigate through the text matches within the document
2. Navigate through the pages within the same document
3. Navigate to the next document in the search results

The number of instances of the text occurring in the document are shown in the header. When multiple pages contain a match for the searched text, it is indicated with an asterisk and navigating through the matches will also navigate through the different pages. By hovering over an arrow, you can also see the number of pages containing a match.

Search for Live Text in Document only works on left to right text. For example, text in Arabic or Hebrew are not supported yet.

Searching for Text Content Document

Search and Select Text Content in Search Menu

To search for Text Content, go to **Search > Documents > Search for > Text Content**.

Search for:

Use Advanced Search Characters ? Search Panel Design Enable SmartNames ?

Search Results Options
View Column Order Editable Sort Order

TEXT CONTENT INFORMATION

Element Type:

Document Status:

Statement

Language: Translation:

Text: +

Document Name: 1 1 ▲

Version Author:

Author's Location:

Description: 2

...

+ Any

✎ Draft

🔄 Pending Signoff

✓ Signed Off

✗ Signoff Reject

You can search based on the Text Content Criteria such as:

- **Element Type:** To search for a document based on its Element Type, select it in this field. Read more in: [Element Types](#).
- **Document Status:** To search documents based on its status, select the status (**Draft / Signed Off**) from the drop-down.
- **Statements'** criteria: These fields allow you to select and search based on:
 - **Language** of the Text Element. For example, select English - United States to search for Master statements in English (US).
 - Whether the Element is a **Translation** or **Master**. It can be specified in the **Translation** drop-down.
 - The directionality of the text will be based on the language selected. You can search both **Master** and **Translation** languages for right to left languages like Arabic or Hebrew.

Note: You can also leave these fields blank. If the language field is blank, the search will process all languages (Master and Translated) from WebCenter 18.0.1.

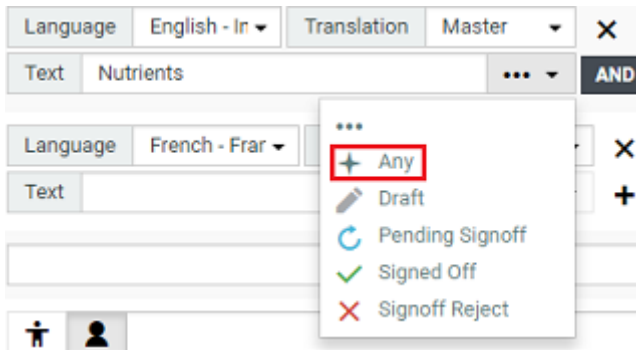

- Actual **Text** from statements. Type the word in the **Text** field.

- **Text Element Status:** Click ... and select the status from the drop- down. For example, you can search for Signed-off statements with a particular text piece.
- A combination of Text Statements' criteria

You can add new rows for additional search criteria by clicking +. When you have multiple rows, you can use either **AND** or **OR** operation to refine the Search.

You can also ignore the search criteria mentioned and only display the results by

choosing *** icon or you can choose the **Any** option to show results of text documents in any of the status.

In the example screen shot, the **Search** will find all Master Statements with `Nutrients` in its content **AND** with French- France as Translation.

Configuring Text Content Documents Search Results

The Search Results page shows all Text Content Documents that match the specified criteria. Each **statement** row selected to **View** is represented as a single column in the Results.

Name	Description	Project	Element Type	Document Status	Master: English - United States	Version Author
Content claim.wcc	Briefing_deketest (01)		Content claim		WITH 26 NUTRIENTS	Kelzer, Debbie (DEKE)
Content claim.wcc	Briefing_KADA Test (01)		Content claim		WITH 24 NUTRIENTS	Conway, Antony (ACON)
Content claim.wcc	Drupa16_BO Library		Content claim		WITH 24 NUTRIENTS	Conway, Antony (ACON)
Content claim.wcc	PCM Text Library		Content claim		WITH 24 NUTRIENTS	Conway, Antony (ACON)

Found: 4 items. Page 1 of 1

Note: You can save Text Document Searches in Excel. The document statuses are not included in the Excel export.

Search Results Options

To customize the Search Results, select your criteria in the **Search Result Options** fields. The **Document Name** is selected by default. Read in: [Search Result Options](#) on page 554.

Search Panel Design

As an Admin, you can setup a Text Content Search with a *Design Panel* just like other document saved searches. The users can select individual text statement criteria in the Panel to filter the search results.

Note:

- If no **Statement** language is selected from the language drop down, you will not be able to view it as a separate column. The results will then match Text statements of any language.
- If the language chosen for the text has the directionality right to left or a custom font, then the text is also rendered right to left or in the custom font in the search results.

Saved Search for Text Content Search

To view My Saved Searches, go to **Search > Saved Searches**, you can view the saved search in the table under **Text Document Searches**. Saved Search for Text Content Document behaves exactly like any other document saved in the WebCenter.

Note: Only an Admin can modify the visibility of a Global Search.

Search Strings Examples

Shown below are different search phrases and their results. For more extensive help on searching, click **Help** in the Search page.

Sample search string	Results	What it does not find
box	box products box company box co. inc.	bottle holders
bo*	box products box company box co. inc. bottle holders	
box NOT "box company"	box products	box company

Sample search string	Results	What it does not find
	box co. inc.	bottle holders
box AND company	box company	box co. inc. box products bottle holders
"box company" OR "box co."	box company box co. inc.	box products bottle holders
box AND (products OR company)	box company box products	box co. inc. bottle holders
* NOT *company*	box products box co. inc.	box company

My WebCenter

The **My WebCenter** menu contains items specifically related to your user.

My Profile

My Profile is where you set your name, your e-mail address, your phone numbers, your function, and your company/location.

My Password

The **Password** field is where you change your password. Enter the new password in the **Password** and **Confirm Password** fields and click **Change**. To set a blank password, enter nothing in the fields and click **Change**.

Note: This presents a security risk and is therefore not recommended.

If the **Passwords must meet complexity requirements** option is enabled by the Admin user, then your WebCenter password:

- May not contain the user's username, first name, or last name
- Must be at least "X" characters, where the minimum password length "X" is defined by your Admin user.
- Must contain characters from three of the following four categories:
 - English uppercase characters (A through Z)
 - English lowercase characters (a through z)
 - Base 10 digits (0 through 9)
 - Non-alphanumeric characters (for example: ! \$ # %)
- Must be different from the previous " **Number**" password(s), where the number of previous passwords is defined by your Admin user.

If the option is not enabled, then the only requirement is that the new password is not blank and not the same as the previous password.

Single Sign-On Settings

You can view the Single Sign On settings specific to your User account in the **My WebCenter** > **My Password** page. This page will display the Single Sign On Instances that are enabled for your User account.

You may modify configuration details of the Single Sign On Instance depending on your permissions to do so. If you have permission to modify, all your values will be saved.

Note: User specific settings are possible when the Single Sign On Instance supports user specific configuration.

My Preferences

In **My Preferences** you set the unit system used to display data, the language used, the display of thumbnails, your start page, and the grid size for search results (for Esko ArtiosCAD and Graphics documents) and discussions.

General

- **Language** sets the language used by the user interface.
- **Start Page** sets the page that appears when you log on. You can, for example, select a Saved Search with a visual Dashboard as the starting page.
- **Units** sets units for all measurements to either Metric (mm, cm, dm, m) or Imperial (in, ft, yd).
- **Thumbnails:** selecting **Show thumbnails** shows thumbnails in document lists by default.
- **Cart: Clear Cart on Logout** is always enabled by default. Disable this option if you want to access **Cart** contents in future sessions.
- **Your Browser Timezone** shows the timezone used by your browser and WebCenter.

Project Lists

- **Show ... Rows** sets the number of projects displayed in the List layout.

Document Lists

- **Default Layout** sets the default view for document lists: **Grid** or **List** or **Card** layout.
- **Show in Grid** sets the number of documents displayed on a single page in the Grid layout (defined as a number of **Columns** and **Rows** in the grid).
- **Show in List** sets the number of documents displayed on a single page in the List layout (defined as a number of **Rows** in the list).

Search Results- All

Show in List sets the number of documents displayed on a single page in the **Search** results List layout (defined as a number of **Rows** in the list).

Search Results- Documents

- **Default Layout** sets the default view for document **Search** results pages to **Grid**, **List** or **Cards** layout.
- **Show in Grid** sets the number of documents displayed on a single page in the Search Results Grid layout (defined as a number of **Columns** and **Rows** in the grid).

- **Show Cards** sets the number of the documents displayed in Card View on a single page in the Search Results.

Search Results- Projects

- **Default Layout** sets the default view for project **Search** results pages to **Grid** or **List** layout.
- **Show in Grid** sets the number of projects displayed on a single page in the Search results Grid layout (defined as a number of **Columns** and **Rows** in the grid).

Discussions

- **Discussions per Page** sets the number of discussion threads displayed per page on the **Discussions** pages.
- **Postings per Page** sets the number of discussion posts displayed per page on a **Discussions** page.

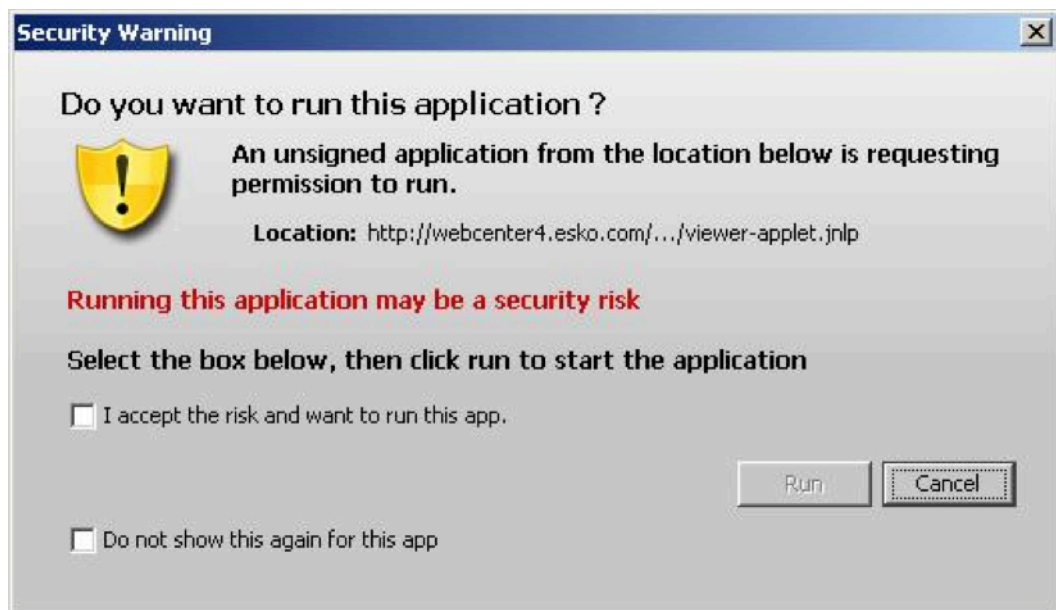

Viewer

- Select your **Viewer Type**. You can set your preference to the [HTML5 Viewer](#) or keep at the default ([Java Viewer](#)).

Note: You can always switch to [Java Viewer](#) from [HTML5 Viewer](#) using the  button.

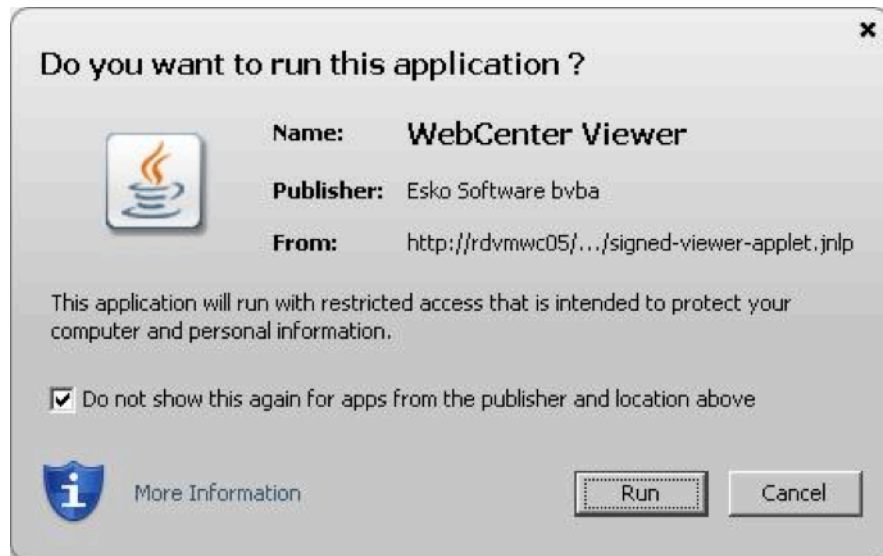

- **Viewer and Workflow Applet:** When [opening a document in the Viewer](#) or when [creating a workflow](#), WebCenter will download a Java applet to your computer.

From Java 1.7.0_21 (for Windows and Mac OS X 10.7 or later), you will get a security warning as the one below when the applet is downloaded. This makes the WebCenter applet look like a security risk for your computer.

You can adapt how this security warning will look like when downloading the applet. In **Viewer and Workflow Applet**, choose either:

- **Signed (sandboxed)** if you want to run the applet in a strict sandboxed environment (with no access to your computer's resources). As the applet is signed by Esko, the security warning looks less threatening.

Note:

As the applet is sandboxed, it will also show a warning when trying to print from the Viewer. You will just need to click **OK** to be able to print.

- **Signed (not sandboxed)** if you want to run the applet without restricting it to a sandbox (the applet can request additional access to your computer's resources). This means that you will not get an additional warning when printing from the Viewer.

As the applet is signed by Esko, the security warning looks less threatening.

- **Unsigned** if you want to run the applet as a default unsigned applet. You will get the default security warning that does not mention Esko, but the applet will be sandboxed. This means that you will have an additional security warning when printing from the Viewer, as for the **Signed (sandboxed)** applet.

Tip:

By default, the applet is set to run as **Signed (sandboxed)**. This will work fine for most users.

More frequent users may want to switch to the **Signed (not sandboxed)** option to avoid always having to click an extra warning away when printing from the Viewer.

Mac OSX 10.6 users running Java 1.6.0 may also want to switch to the **Signed (not sandboxed)** option to avoid getting a warning when closing the Viewer by clicking .

With the latest versions of Java 1.7 installed, most browsers block unsigned applets by default. In this situation, it is recommended to use one of the signed settings instead.

- **Viewer Style** sets the Viewer mode as:
 - **Normal** (Default): All HTML5 Viewer features are available in this mode.
 - **Restricted**: In this mode, the user cannot access features such as [Channels widget](#), [CAD widget](#) and [View widget](#).
The side panels displaying the widgets will be in a collapsed format by default.
 - **Advanced** (Java Viewer only): All HTML5 Viewer features are available in this mode. In Java Viewer all features are activated.
 - **Restricted (New Look)** comes with all the enhanced features available in the HTML5 Viewer. This new viewer presents a cleaner, clutter-free look.
- Specify the **Viewer Quality** as:
 - **Best Performance** (Default):
In this mode, the Viewer uses less compression to transfer images. These images are transferred faster but may contain small compression artifacts.

- **Best Quality:**

In this mode, the Viewer uses less compression to transfer images. It takes longer to transfer these images. However, you can view them without compression artifacts.

Note: This setting is applicable to both the HTML5 and Java Viewers.

- **Annotation Color** sets the color in which annotations will be displayed in the Viewer (you can set **Viewer Default** or choose a color from the list).
- **Annotate Approved Documents** sets if and how the users are allowed to annotate documents that are already approved.
 - Select **Enabled** if you want the users to be allowed to annotate approved documents.
 - Select **Warn if Approved** if you want to display a warning before allowing the users to annotate approved documents.
 - Select **Read-Only if Approved** if you don't want the users to be allowed to annotate approved documents.
 - Select **Warn if Approved or Rejected** if you want to display a warning before allowing the users to annotate approved or rejected documents.
 - Select **Read-Only if Approved or Rejected** if you do not want the users to be allowed to annotate approved or rejected documents.
- **Annotate Documents under Approval** sets who can add annotations in the documents under approval.

Note: A document version is considered under approval as soon as an approval cycle is started

Choose from the following settings:

- **All Users:** This is the default setting. All users with view access to a document can annotate that document once the approval cycle has started.
- **All Approvers and Approval Master:** The Approvers and Approval master defined in the document approval setup (all stages) for the current version can annotate during the approval cycle.
- **All Approvers:** All approvers defined in the document approval setup (all stages) can annotate the document while it is being approved.
- **Pending Approvers and Approval Master:** Only an approval master or approvers who can submit an approval state (Approve or Reject) for the current version can annotate the document during the approval cycle.
- **Pending Approvers Only:** Only approvers who can submit an approval state (Approve or Reject) for the current version can annotate the document during the approval cycle.
- **Log out user when inactive** option can be checked, to log out the users whose sessions are not active for a period of time. Option is given to log in again and continue when the user returns to the viewer.
- **Show Discussions in Viewer** Enable this option to view discussions widget in the viewer and view all the discussion posts about the document viewed.

Note: Project Managers who can Force Approve or Force Reject is not considered an approver. They can add annotations only if the setting is **All Users**.

ArtiosCAD

To open your document in the ArtiosCAD desktop application directly from the WebCenter server, you need to set the **ArtiosCAD Preferences** accordingly.

Open ArtiosCAD Documents

- **No Application:** This is the default **Preference**. When this is selected, you cannot open the documents in the ArtiosCAD desktop applications.
- **ArtiosCAD Standard Edition:** Select this setting to be able to download ArtiosCAD documents and open them in your ArtiosCAD desktop application.
- **ArtiosCAD Enterprise Edition:** Select this to open your ArtiosCAD documents in the installed ArtiosCAD Enterprise Edition directly from WebCenter.

The documents will open in the **managed mode** allowing you to make modifications to the file and update it without having to browse to the corresponding project and folder.

Note: This option is only supported from ArtiosCAD Enterprise 14 onwards.

Document Upload Preferences

- To set the mode for **Multiple Document Upload type**, select HTML5 Upload or Java Applet from the **Document Upload Preferences**. HTML 5 upload is selected by default.
- **Allow raising Document Revision when uploading a new Document Version:** Enable this to allow the users to raise the **revision** while uploading a new **document version**.

Workflow Editor

By default, HTML5 is used as Workflow editor.

User Creation

To create a new approval User from an approval page quickly, you can select and apply a particular user's settings as the **Approval User Template**.

Tip: If you do not want to take up a license for a Template User, deactivate the user by unchecking the **Active User** option in the Profile page.

It is possible to configure this at two levels.

- To specify a global template, go to **Admin > Preferences > General > User Creation Preferences**. Select a particular user existing in the system as your **Approval User Template**.

This template will be set as the system wide approval user template. However, it is possible to override this in **My WebCenter > My Preferences > User Creation Preferences**.

- To specify a template for a User who can create other users, go to **My Preferences > User Creation Preferences** and specify an **Approval User Template**. You have the following options and your choice will override the admin settings:
 - **Do No Use a Template**

- **Use Global Approval User Template** to apply the user template specified in the **Admin Preferences**.

Note: If you have not explicitly selected the **Do not Use a Template** option or has any other user specified as the template, the global template will be applied by default.

- You can select a particular user as your template. In the drop-down you will see your own Users if you are a Project Manager and all Users if you are an administrator.

The following Preferences and settings of the template are copied to the newly created user:

1. Preferences:

- **Language**
- **Units**
- **Start Page**
- **User Menu**
- **My Work Setup**
- **Viewer Preferences**
- **Collada Viewer Preferences**
- **Workflow Editor Preferences**
- **Document Upload Preferences**
- **ArtiosCAD Preferences**
- **Download Formats**(copied only if the user creating the new user is an Administrator)
- **Group Memberships**(copied only if the user creating the new user is an Administrator)
- **Other Preferences** are the user preferences not mentioned above (for example: show thumbnails or not, search results layout, etc.).

2. The Authentication Settings ([Deactivation](#), SSO, etc.)

My Locked Documents

My Locked Documents shows documents you have locked to indicate that you are currently working on them. If other users try to download a locked document, they will have to confirm that they really want to download a locked document.

Note: In order to lock a document you need specific permissions.

Only the person who locked it, or the Project Manager, or a member of the Admins group can unlock a locked document.

To unlock a locked document, select the checkbox to the left of its name and click **Unlock**. The function **Upload New Version** of the document also unlocks the document.

My Locked Documents

Unlock

Document	Project	Locked Date
 Conbury_Cookie_Template3.chp	 NAPR0004	Sep 3, 2015

Upload New Version

Note:

Unlocking a document without uploading a new version does not make any changes to the document. In order to change it, you must lock it, download it, change it as desired, and upload it as a new version.

My Users

In case you are a project manager with **Create User** rights, you can see the users that you have created on the **My Users** page.

My Group's Tasks

In case you are the Group Task Manager for one or more groups, you can find the tasks assigned to your group(s) on **My Group's Tasks** page.

My Group's Members

If you are a Group Manager of a specific Group (or multiple Groups), you can use **My Group's Members** to manage your Group members.

Note: The administrator has to give you the Group Manager permission to access the Group members.

- If you are the Group Manager for more than one group, specify the group by the **Group Name**. This will allow you to see the members of the selected group.
- From this page, you can:

Manage Group Members

Group Name: NAPR_CAPP_GROUP2

Notification settings: Send notifications to a Group e-mail address

Group E-mail Address *

Group E-mail Language: (System default)

+ Add Users... Remove User(s) Search by Last Name

Username	Last Name	First Name	Company, Location
NAPR_CAPP_USER2	NAPR		
NAPR_CAPP_USER3	NAPR		CGI India, Bangalore
NAPR	Prakash		Napr_company1, bangalore

Save

- **Remove User(s)** from the members of the group.

Note: The group manager cannot remove himself / herself from the list.

Remember: If there are dependencies such as a pending approval associated with the member being removed, the removal will not be effective. You will be warned about those dependencies during your attempt to remove a member.

- **Add Users** to the group. Your permissions and visibility determine the potential users whom you can add as the group members.
If you are a :
 - **Project Manager**, your Visibility settings affect whom you can add as members.
 - **Normal User**, you can add the Users associated with the same Company..
- Select from **Notifications settings** to **Send notifications to a Group e-mail Address**. You can set the **Group E-mail address** and the language to be used in the group **Group E-mail Language** by selecting from the drop-down menu. All notification mails will be sent to this e-mail address.

My Delegates

If you have added delegates, you can view the delegates and the details of delegation on this page. See below:

- The name of your delegate(s)
- The start and end date of your delegation(s).
- Permanently active delegation(s) which are the delegations without a specified end date.
- Comments
- An option to Delete the delegation in progress
- An option to notify new delegates. This option when checked notifies the delegate of any changes you made to the relevant delegation.

Create

You can use this menu to create projects or users. You can only see it if you are a Project Manager. See [Project Management in WebCenter](#) on page 761 for more information.

Upload

Use this menu to upload documents into any WebCenter project for which you have upload permissions.

See [Different Ways to Upload Documents](#) on page 586 for more information.

4.2.4. Filtering Content

As more information is managed over time by WebCenter, some pages can potentially show large amounts of information. To reduce the time needed to show the page when it first loads, some pages have a filter.

To use the filter, enter a search string with an asterisk either before it, surrounding it, or after it in the **Search** field, and click . For example, on the **Companies** page, to only see those companies with the word Containers in their name, enter *Containers* and click .

When filtering users, use the last name of the user.

To show all the items, up to the truncation limit, click  with nothing in the field.

Note: The truncation limit prevents lists of thousands of items from impacting response time; if you know in advance that your search will return that many items, refine it with the filter. The truncation limit can be changed; contact Professional Services at your local Esko office for more information.

4.2.5. Using the Cart

My Cart is a dedicated placeholder for a single user to gather a specified set of Projects and Documents. You can add them to the Cart from the Project or the Document **Actions** menu. The Cart also lets you **Mail link to**, **Mail Download LinkRemove** or **Download** multiple items at once.

The contents of the Cart (the count is displayed next to the cart icon) are retained only for the current login session by default.

Note:

Your **Cart** contents can now be saved. You can disable the option **Clear Cart on Logout** in **My Preferences** to save the Cart contents for future sessions.

Click **Change in My Preferences** to clear/save cart on logout.

The Cart contents can also be cleared by clicking **Clear Cart** option on the top-right corner.

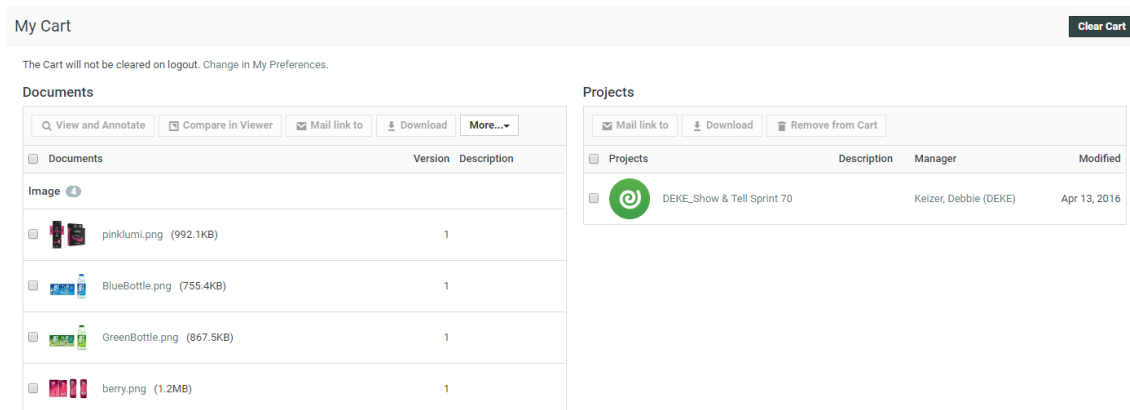

Note:

Downloading multiple documents at once or downloading projects requires having a decompression utility, or operating system support for opening compressed archives.

Mac OS X, Microsoft Windows XP, and Microsoft Windows 2003 Server have built-in support for opening compressed archives.

When e-mailing an object from the Cart, only a link to that object is placed in the body of the e-mail message. The recipient must have a username and password for your WebCenter site, so he or she can log in to the site and see the object after clicking the link.

Shown below is a sample Cart.

You may start the Viewer on documents in the Cart by selecting the desired documents and selecting **View and Annotate** or **Compare in Viewer** from the **Actions** menu.

4.3. Working with Projects and Documents

This section contains information on using WebCenter from an everyday use (non-Project Manager's) perspective.

4.3.1. View a Project

- To view a project, click its name in **Search, Search Results, My Work, Favorite Projects, Projects I Manage Projects I Am Invited to**.
- Click an underlined item to see more information about that item.
- Click a folder name to open a folder.
- Click a document name to see the Document Details page.

By default, clicking the document name leads to the Document Action History page, but if you click a different page, WebCenter associates that desired page with the document type for the duration of the session.

- You can use the **Actions** menu to perform various actions, based on the security settings you have in the project.

- To view a document in a project, you can either click its name on any of its Details pages, or you can download it to your computer if you have download permission. If you click its name, it will be handled by your browser’s default method for files of that type.

4.3.2. Add Documents

One of the main functions of WebCenter is sharing documents between project members in a safe and traceable way.

How Documents are Organized

Any document in WebCenter is placed at least in one project. The same document can however be used in different projects at the same time, and are called linked documents. Linked documents are used, when the same design needs to be re-used and synchronized between projects. If synchronization is not needed, it’s better to copy the document and each of the documents are placed separately in WebCenter. The vast majority of documents are in just one project.

Projects are organized in folders. Documents are put into a folder or on the root folder of the project.

Note:

Currently, WebCenter only allows going one level deep. In most circumstances, this is not a real limitation, unless you try putting too many documents into the same project. WebCenter is well equipped to work with extreme amounts of projects so it’s better taking advantage of this than creating projects with entire sub-projects put into a folder structure.

Note:

Document names within a project are unique. When trying to upload a second document with the same name in a different folder of the same project, you will get an error message.

WebCenter is fully “version enabled”. This means that each document can have multiple versions. By default, you’ll only see the latest version, but you can go back to previous versions. In addition, there is an action history showing when versions are uploaded and what actions took place on these versions (for example approval actions). The viewer also allows comparing versions graphically.

Document Types

The following document types can be uploaded in WebCenter:

Note: You can hover on any viewable file to view the expanded thumbnail. You can further click on the **Zoom** icon on the right top corner to view a larger thumbnail.

- **Graphic file:** WebCenter supports most common graphic formats. PDF, PS, EPS, AI, AP, EPF, DCS, PSD, CT, LP, TIF, TIFF, PAF, GRS, PNG and JPG will all be recognized.

After upload, WebCenter will calculate preview data for the WebCenter Viewer.

If you don't want this, you need to upload the graphic file as an "other" file type. Typical examples are office-based PDF files (manuals, quotes...) which are better viewed in Adobe Acrobat.

- **LENX:** LEN is a bitmap file format developed for Esko's Cyrel Digital Imager ("CDI"). LENX is a special version of the LEN file format developed for Esko's CDI Crystal Imager series and Crystal screens.

Note: You can also upload a ZIP file containing graphic files (a set of TIFF or LEN files, or LENX files or a PDF, GRS or AP file with external images) as a "graphic file", and view it directly in the Viewer.

- **ArtiosCAD:** Native files of Esko ArtiosCAD. The standard extension are .ARD(Design) , .A3D(3D), .MFG (Manufacturing) and .ACD(Canvas).
- **Cape:** Cape is a program to calculate pallets and truckloads. WebCenter allows two ways to upload files from Cape:
 - uploading a triplet of files (You need at least 2 files: the CLF and XML files. The report / diagram file (usually a JPG) is optional).
 - uploading a single ZCP file.

When you have uploaded a ZCP file, check the **Cape Information** tab in the In the **Document details** page to see the information from the XML document. To view the report / diagram file, click on the document thumbnail.

- **Collada:** Collada is an interchange file format for interactive 3D applications. Regular Collada files have .DAE extension, Zipped Collada files use .ZAE.
- **Page List:** a multi-page document that will be treated like a Page List in WebCenter. A Page List represents an imposed multi-page document, the individual pages of which can be approved and version-controlled separately in WebCenter.
- **CHILI Package:**

This is CHILI WebCenter document type. A CHILI Package version is linked to a native CHILI document on the CHILI server. Read more about [CHILI](#) on page 150 in Administrator Guide.
- **Text Content**

This Document Type is for Text Content in WebCenter. When **Text Content** Document Type is enabled, a .wcc will be recognized as Text Document.
- **Component:** Component is a unique file type which has no physical presence but acts a placeholder for all the documents related to the product. Read detailed about Component file type [Component File Type](#) on page 585 here.
- **Other:** any other file. Mostly these are office files like Microsoft Word, Excel, PowerPoint etc. Video files must also be uploaded as "other".
- **URL:** Here you can enter a link to another document anywhere on the network or on the Internet. WebCenter does nothing else than remembering this link and allowing to define attributes.

Component File Type

The Component document type in WebCenter is a document type for holding only a set of attributes. This can represent a non-file packaging component like a Copy Sheet or a Barcode, an alternative to a project or a placeholder document for holding a packaging specification.

For example a collection of all assets required for a Product Content Sheet(PCS), that includes images, symbols, Barcode, text statements, CAD files, 3D, Collada files and so on.

The Component document type shares most properties with other document types, but there are a few exceptions like

- This file type does not have a physical file and have zero size.
- Document type will change depending on the extension of the uploaded document, when a new version is uploaded
- Opening a Component will open a view of the Default attribute category

To Create/ Upload a Component Document

In the **Upload** page, choose the file type **Component** to create a new component type document. When the mandatory fields are filled, click **Save** to create a new Component document.

You can restrict the file that can be uploaded by specifying a file type for the first version.

When no extension is defined for the first version, the document type is changed according to the extension of the uploaded document.

Opening a Component document will allow you to view or update the attributes of the document.

Search for Component Document type

Component file type is available in the **Search for** drop down selector in the **Document Search** page.

The available criteria are the same as for the **All** selector, but the results are filtered with the **Component** document type.

Different Ways to Upload Documents

There are multiple ways to upload documents to WebCenter:

- Upload via **Upload Document**: use this if you only have a single document to upload, or to upload documents one by one.
- Upload via **Upload Multiple Documents**: use this to upload multiple files at once, if you do not want (or are not able) to use a Java applet.
- Upload via **Advanced Upload Applet**: This opens a HTML5 applet allowing you to browse or drag-and-drop multiple files. These files are all uploaded in one go.
- **Upload from a workflow system**: Automation Engine, Odystar and Nexus can also upload documents to WebCenter.

In many cases, it is beneficial to upload graphic files using a workflow system, because:

- It is quicker and automated.
- The workflow system can do calculation in advance.
- You have better control over the generation of the view data (when using Automation Engine).
- **Upload from ArtiosCAD**. Use this to upload CAD files. You can only upload one document at a time but you can make the project selection and document name automatic. This makes uploading a one-click operation.
- **Upload by Drag and Drop** Documents can be uploaded to projects or one of the folders of the project by dragging and dropping them from the user's file browser.

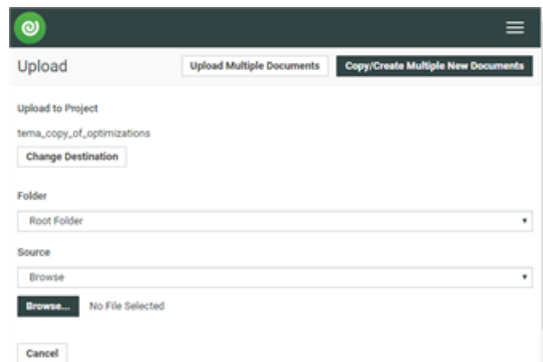

Uploading a Document via Upload

1. You can either go to the project/folder you want to upload the document into and click the  **Upload** button, or just click the **Upload** menu item from anywhere.
2. On the **Upload** page, select the **Project** and **Folder** you will upload the document into (if you are already in the project/folder, those are filled in automatically, but you can still **Change the Destination**).

Note:

You can also select:

- **Upload Multiple Documents** to use the [HTML5](#) upload. Just drag and drop files to upload them.
- **Copy/Create Multiple New Documents** to [add multiple documents at once](#) (either from your computer, from another project or from a template).

3. Select the document to upload as explained below.

If you want to...	do this...
<p>Upload a document saved on your computer or network.</p>	<p>Select Browse in the Source list and click the Browse... button to open a browser dialog.</p> <p>Note:</p> <p>If you are uploading Cape files, you can upload a single <code>.zcp</code> file.</p> <p>If you are uploading a Page List document, you must also specify the Name and Starting Index of the Page List.</p>

If you want to...	do this...
	<p> Attention:</p> <p>Graphic files must be self-contained and may not contain references to external files such as fonts or placed images. Make sure fonts are embedded.</p> <p>In case you upload native files (GRS or PDF Native), you should use the Automation Engine Publish on Web task.</p> <p>If you need to upload manually anyway, first make a self-contained file with Outright. You can also convert to PAF and upload the PAF file.</p>
<p>Copy a document from another project.</p>	<p>Select Copy in the Source list, then select the project to copy the document from, and the document to copy.</p>
<p>Add a link to a document.</p>	<p>Select URL in the Source list and type in or paste the URL to the document.</p>
<p>Create a document placeholder from a document template.</p> <p>Note: This is only available if the project has been created from a project/template containing document templates.</p>	<p>Select New in the Source list, select the document template to use in the pop-up, and fill in any attributes that may be required.</p> <p>Note: The document template's document type will be used for the document placeholder (except if that document type cannot be copied, like Page List).</p> <p>See Document Templates on page 157 in the Administration Guide for more information about document templates, and Assigning Document Attributes on page 601 for more information about attributes.</p>

4. If you browsed to a document, copied it from another project or created a placeholder from a template, the **Document Type** and document **Name** are automatically detected. You can still change them if needed (you cannot change the **Document Type** of a placeholder or a copied document).
5. Enter a **Description** (optional but strongly advised).
6. If you want to add this document to the Project's [Bill of Materials](#) on page 431, select **Add to BOM**, then enter the **Count** of this document (how many copies are needed for the BOM).

Note:

You can only do this if:

- you are an Administrator,
- you are the Project Manager,
- you have the **Change BOM** permission.

7. If the document has attributes, fill them in (at least the required ones).

Tip: The document has the attribute category associated with its document type in the **Configure > Document Creation** tab of the Project (see [Document Types](#) on page 162).

8. If you want to use the **default** approval settings of the project/folder for the document, select **Apply Default Approval Settings** (this is not available for document URLs).

Note:

You can also:

- Set the approval **Due Date** (only if you have the **Change Approval Setup** permissions): enter a date or pick one in the calendar, then choose an hour.
- Start the approval cycle.

9. Click the **Upload** button.

10. If you want to define approval settings **specific to this document**, click **Setup document approval**. This will bring you to the **Approval** tab of the document details page.

If you have the task management license, you can also upload a document to a task in a project.

You can upload documents the same way as described and the document will immediately be linked to the task.

Note: TIFF and JPG bitmap files using indexed color spaces or RGB are not supported by the WebCenter Viewer.

Note: When you try uploading a document which already exists in the project, the upload of this document will fail. You won't get a new version. Use **Upload new version** instead.

The first time you save a project document, you enter all its database information. The next time you work on that document, you can:

- [lock a document](#)
- [upload a new version or revision](#)

It is up to you to decide if it is a draft, revision, or version according to your company's best practices. Some people publish minor changes as revisions and major changes as versions; others do the opposite, and yet others just save drafts.

Copy / Create Multiple Documents

1. You can either go to the project/folder you want to upload the document into and click the

button, or just click the **Upload** menu item from anywhere.

2. On the **Upload** page, select the **Project** and **Folder** you will upload the document into (if you are already in the project/folder, those are filled in automatically, but you can still **Change the Destination**).
3. Click **Copy/Create Multiple New Documents**.

Note: From this page, you can also click **Upload Multiple Documents** to use the [HTML 5 Upload](#) to upload multiple documents.

4. Add a document as explained below.

If you want to...	do this...
<p>1.</p> <p>Upload a document saved on your computer or network.</p>	<p>Click Upload then click the Choose File button to open a browser dialog.</p> <div style="border: 1px solid gray; padding: 5px; margin-top: 10px;"> <p>Note: You cannot upload CAPE files, or upload PDF files as page lists when uploading multiple documents. Please use the normal Upload option for this.</p> </div>
<p>2.</p> <p>Copy a document from another project.</p>	<p>Click Copy, then select the project to copy the document from, and the document to copy.</p>
<p>3.</p> <p>Create a document placeholder from a document template.</p> <div style="border: 1px solid gray; padding: 5px; margin-top: 10px;"> <p>Note: This is only available if the project has been created from a project/template containing document templates.</p> </div>	<p>Click New, select the document template to use in the pop-up, and fill in any attributes that may be required.</p> <p>To collapse a document's attributes, click the square minus sign in front of the document. To collapse all documents' attributes, click Collapse All at the top of the page.</p> <p>See Document Templates on page 157 in the Administration Guide for more information about document templates, and Assigning Document Attributes on page 601 for more information about attributes.</p>

Documents

Source	Document Template	Name	Description
Upload: <input type="button" value="Choose File"/> berry.png	<input type="text" value="Please Select..."/>	<input type="text" value="berry.png"/>	<input type="text"/>
<input type="checkbox"/> New:	Box1.ard	<input type="text" value="Box1.ard"/>	<input type="text"/>

Select a Board:

Length: mm Width: mm Depth: mm

IsStandard

- Repeat for each document you want to upload.

Note: If you want to remove a document, click the delete button behind it.

- If you want to use the **default** approval settings of the project/folder for these documents, select **Apply Default Approval Settings** (they will not be applied to document URLs).

Note:

You can also:

- Set the approval **Due Date** (only if you have the **Change Approval Setup** permissions): enter a date or pick one in the calendar, then choose an hour.
- Start the approval cycle.

You cannot setup document-specific approval settings for several documents at once.

- Click the **Upload** button.

Note: When you try uploading a document which already exists in the project, the upload of this document will fail. You won't get a new version. Use **Upload new version** instead.

Upload Multiple Documents via the Upload Applet

You can **Upload Multiple Documents** in two ways:

- Click **Projects** on the Menu Header. Select the **Project** you want to upload the document to.
- Click the [Upload Multiple Documents](#) option. Select the **Target Folder** from the drop-down menu.
 - You can also select menu **Upload** and upload multiple documents. In this case, select the **Project** and the **Folder** you want to upload the documents to and click **Upload Multiple Documents**.
- You can either **Select Files** (one by one or by selecting a few) or drag-and-drop from any file browser into the applet window.

You can change the destination Folder of each document if you want to.

- If you want to use the default approval settings of the project / folder for these documents, select **Apply Default Approval Settings**.
 - Set the approval **Due Date** (only if you have the **Change Approval Setup** permissions): enter a date or pick one in the calendar, then choose an hour.
 - Start the approval cycle.

You cannot setup document-specific approval settings for several documents at once.

- Click **Upload**.

The upload will start and you will see a progress window. Depending on how many files and how big they are, this can take a while.

Note: You cannot upload ZIP files, individual CAPE files, or upload PDF files as page lists with the upload applet. Please use the normal **Upload** option in the Project for this.

Note: When you try uploading a document which already exists in the project, the upload of this document will fail. You can, however, upload it as a new **Version**.

Important: If your **Document Upload Preference** is set to **Java Applet**, your applet will be Java based. To change it go to [My Preferences](#) on page 573 and change the **Multiple Document Upload Type** to **HTML5**.

Upload from a Workflow System

You can upload documents to WebCenter from:

- a Automation Engine workflow, using the **Publish on Web** task,
- an Odystar canvas, using the **WebCenter Output** gateway,
- a Nexus workflow, using the **WebCenter Output** activity.

Note:

You can also start an approval cycle on your uploaded document directly from the workflow. It uses is the default approval cycle, inherited from the project or folder you upload the document into.

If you have the **Change Approval Setup** permission, you can also set the approval due date.

For details on how to upload documents from Automation Engine, Odystar or Nexus, please see the corresponding user manuals.

Upload from ArtiosCAD

For details on how to upload documents from ArtiosCAD, please refer to the ArtiosCAD user manual.

Note: You cannot start an approval cycle from ArtiosCAD.

Upload by Drag and Drop

You can upload documents to WebCenter by Drag and Drop. To do so, you can

1. Add a document into a project or folder by dragging from your browser.
2. A dialog is opened with the an **Upload Files to (Project Name)** window is opened along with the document that is dragged. It is behaves similar to HTML5 Advanced Upload Applet.

A dialog is opened with the HTML5 Advanced Upload applet and the dropped files

3. You can add more documents by dragging into this window or use **Select Files** to browse. Select **Upload** to add the documents to the project.

4.3.3. Working with Documents

Once a document has been uploaded to WebCenter, you perform a number of basic operations on it, such as copying, deleting, updating or locking it, to ensure it completes its lifecycle within the system.

Move a Document

Note:

When a document with approval settings is copied or moved to another project, the approval settings are not copied or moved.

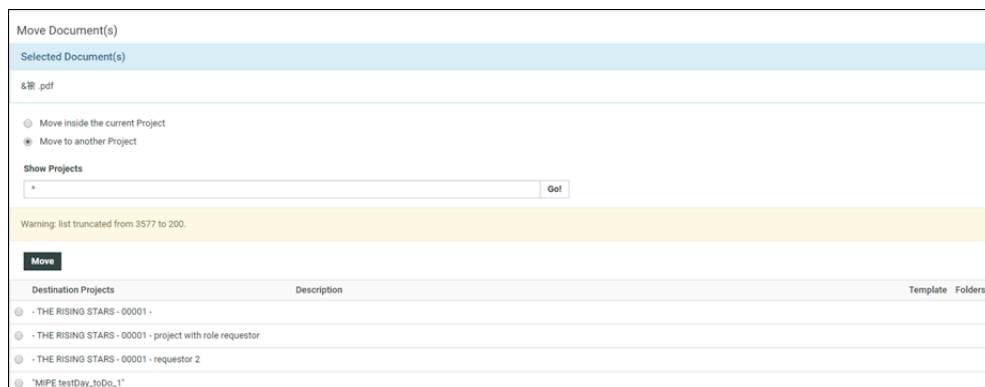

A document with a started approval cycle may not be moved or copied as a link until the approval cycle is stopped.

A locked document cannot be moved.

1. Open the project and folder containing the document to copy and select it. If desired, select more than one document by selecting their checkboxes.
2. Click **More....** Select **Move Document(s)** from the drop-down menu.
3. Choose to either **Move inside the current Project** or **Move to another Project**.
4. Do one of the following:

If you chose to move the document	Then you must...
in the same project,	Select the folder into which to move the document.
to another project,	<ul style="list-style-type: none"> • Choose the project into which to move the document. • If that project has folders, choose the folder into which to move the document.

5. Click **Move**.

Copy a Document

1. Open the project and folder containing the document to copy and select it. If desired, select more than one document by selecting their checkboxes.
2. Click **More....** Select **Copy Document(s)** from the drop-down menu.

3. Choose to either **Copy inside the current Project** or **Copy to other Project(s)**.
4. Select **Copy as Link** to copy a link to the destination folder or project.

Note: If you opt to **Copy as Link**, you will not be able to **Rename Document** or be able to **Copy Viewer Annotations**.

5. Do one of the following:

If you chose to copy the document	Then you must...
in the same project,	Select the folder into which to move the document, or provide a new name for the copy in the Rename Document field.
to another project,	<ul style="list-style-type: none"> Choose the project into which to copy the document. If that project has folders, choose the folder into which to copy the document.

6. Click **Copy**

The document is now available in both the source and target projects.

Delete a Document

Note: A document with a started Approval Cycle cannot be deleted. The Approval Cycle must be stopped before you can delete the document.

A locked document cannot be deleted.

If a document is used for a document reference attribute, it cannot be deleted

1. Open the project and folder containing the document to delete and select it. If desired, select more than one document by selecting their checkboxes.
2. Click **Delete Document(s)** in the **Actions** Header.
3. Click **OK** to confirm the deletion.

The selection is deleted. If any selection is a linked document, only the particular link that was selected is deleted; other instances of the link are not deleted.

Lock a Document

Locked documents are documents you have flagged as being in use so that other users do not download them and work on them at the same time.

1. Open the project and folder containing the document to lock.
2. Select the checkbox of the document to lock and click **More....**Select **Lock** from the drop-down menu. To lock more than one document at a time, select more than document. You may not lock URLs. The latest version of the document is selected for locking.

The document is now marked as locked . If other users try to download it, they will be asked to confirm downloading a locked document.

Unlock a Document

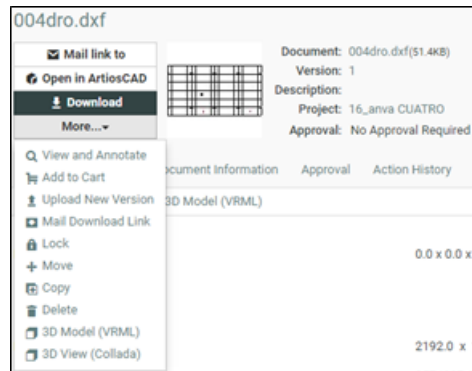

1. Click **My WebCenter > My Locked Documents**.
2. Select the document(s) to unlock.
3. Click the **Unlock**  button. The document(s) will no longer be shown on the list.

Upload a New Version or Revision of a Document

1. Open the project and folder containing the document to which you will **Upload New Version** or **Raise to Revision**.
2. In the **Documents** list, either:
 - Hover over the document link and click **More** or the **Upload** button to **Upload New Version**.

- click **Upload New Version** in the Actions Header.

Make sure you use the buttons on the document's row.

3. **Browse** to select the new version of the document.

For document types that have more than one file, specify multiple files as needed. The filenames can differ from the original file names, but they must of the same type (i.e. have the same extension) as the original document.

Note: By default, if the file name of the new version of the document is different from the filename of the previous version, WebCenter will use the filename of the original or previous version when you download the new version. This behavior can be changed; contact Professional Services for assistance.

4. In the **Version comment** field, enter your comments regarding the new version.
5. You can make the new version a **Revision** by enabling **Raise to Revision A**. This is only available if the admin has enabled this for you.

Note: The revisions will be denoted as A,B,C following the version number.

6. If this is a linked document, select the project(s) to check the document into.
7. When you upload a new version of a document which has an approval cycle ongoing, the approval cycle stops automatically. If you want to have the approval cycle restart immediately, select **Start approval cycle on new document version**.
8. If you have the **Change Approval Setup** permission, you can adjust the approval cycle's due date (in the **Specify New Due Date** option).

Note: If the document was in a **staged** approval cycle, **where** the cycle restarts from depends on the **When a new version is uploaded** setting. See [Define How to Handle a New Document Version](#) on page 792.

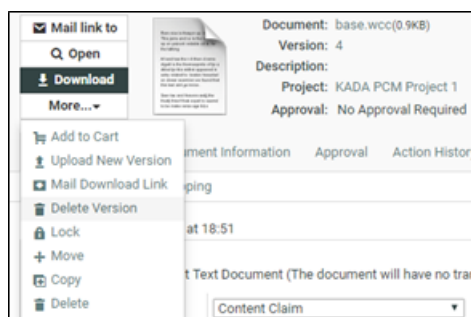

9. Click **Finish**.

Note: To access a previous version of the document, click its number in the **Version** column on the **Action History** page for that document.

Delete the Last Version of a Document

You can delete the last version of a multi-version document if:

- you are the Project Manager for the project containing that document, an Admin, or a project member with **Delete** permission
- the project containing the document is active
- the document is not checked out by another user
- the document has more than one version
- On the Document Details page, click **More Actions...** then **Delete Version**.

Confirm your choice by clicking **OK**.

Note:

If that document version is in a running approval cycle, WebCenter will show this message: There is a running approval cycle on this document version. Are you sure you want to delete this document version?

Clicking **OK** stops the approval cycle for that document version.

If the document came from Automation Engine, the Pilot will indicate the deletion.

If the deleted document version was linked in other projects, the link is updated (to link to the previous document version)

The document record indicating the last version index is decreased by one.

Update a Document across Projects

If you have a document that is linked in many Projects, and upload a new version into only one Project, the links in other Projects continue to reference the prior version.

Note: Project Managers may update entire Projects at once, not just the contents of a single folder.

To update a document in a Project to ensure it references the latest version, do the following:

1. Open the project and folder containing the document to update.
2. Select the document to update. To update more than one document at a time, select as many as desired.
3. Click **Update** from the **More** drop-down menu.

All documents in the folder that you selected for which you have Update permission are updated. A list is shown of the updated document(s), the containing Project, the old version number, and the new version number.

Open a Document

Opening a document means having WebCenter open the document using the document’s default application as defined in the Web browser. You need **View and Download** permissions to **Open** the document.

1. Navigate to the document by searching for the document and clicking its name in Search Results, or by clicking its name in a project.
2. Click **Open** on the Document **Actions** Header.
3. The **Open** button has different behavior for different document types.

Document Type	Behavior
CHILI	Opens CHILI Viewer in new window
PDF	Open button unavailable. Use Open in Acrobat .
ArtiosCad Design, Manufacturing, Canvas or 3D	Open button unavailable. Use Open in ArtiosCAD

Document Type	Behavior
Graphics	Open button unavailable. Use View and Annotate
Other (text,xml, MS Word, MS Excel...)	If the browser has a plug-in for the document format extension, it shows the contents of the file in a new window. If no plug-in is available, the document is downloaded.

Note: You can hover on any viewable file to view the expanded thumbnail of the document. You can further click on the **Zoom** icon on the right top corner to view a larger thumbnail.

Download a Document

1. Navigate to the document by searching for the document and clicking its name in Search Results, or by clicking its name in a project.
2. In the **Document**list, either:
 - Click **Download** in the **Actions** Header.
 - Hover over the document link and click **Download**

- If it is an ArtiosCAD document, choose the format in which to download it and click **Download**. You may only download in formats for which you have the **Download** permission.
- If it is a CHILI document, choose from the download options (CHILI Package, CHILI XML, PDF), and click **Download**.

You can enable the notification for **Document downloaded** to keep track of who downloaded a Document.

The document is downloaded and may be manipulated as desired.

Download Multiple Documents

You can download several documents on a same page (in a Project or a Search Result page) in one go.

When you select multiple documents for download, WebCenter automatically adds them to a compressed archive, and then the archive is downloaded (WebCenterDownload.zip).

To download multiple documents, do the following:

1. Select the checkboxes of the documents to download.
2. Click **Download** in the **Actions** Header.

Use a decompression utility to extract the documents from the archive. The documents are now on the hard drive and may be manipulated as desired.

Note: To download all of a project's documents, click **More actions...** then click **Download** in the header of the Project Details page.

Download Documents from Multiple Locations

To conveniently download documents from several projects, you can use the **Cart**. You can add documents to download to the cart as you are browsing the projects, then download them in a zip archive when you are done.

1. For each document that you want to download, click **Add to Cart** in the **Actions** Header.
2. Click the **Cart** button in the top row menu or next to a document name to go to the **Cart**.
3. Select the checkboxes of the documents to download.
4. If you are downloading ArtiosCAD or CHILI documents, choose the format in which to download them and click **Download** in the Actions Header. You may only download in those formats for which you have permission, and you may only choose one download format for designs and one for manufacturing files, respectively.

Use a decompression utility to extract the documents from the archive. The documents are now on the hard drive and may be manipulated as desired.

Viewing and Printing a Document's Annotation Report

You can view the annotation report page with an overview of annotations done in a document without opening the document in the viewer. To view the annotation report, go to:

- **Document details > Annotations.**

Note: This feature is only enabled for graphic files.

You can view all the details related to the annotations in this page. In addition, you can also filter based on **Review** status, **User** and **Report style**.

Click the **Print** link to print the Annotation Report.

Note: The print layout will follow your annotation filters.

This feature only works correctly in browsers supporting the HTML5 Canvas feature.

Online Document Editing with CHILI

Open CHILI Document in Editor

When a user opens a document, it will be opened in the CHILI Editor. In the editor, the user will be able to edit the parts of the document, based on Workspace and Constraints. Read also [Dynamically assign workspaces and constraints to CHILI Documents](#) on page 153

In the header bar, some document information will be shown. Below, the buttons "Return", "Save as Draft" and "Save as New Version" are shown. If the user who opened the editor is an approver, he can see the approval options and from there, he can do all available approval actions. When the user approved/rejected the document, the action button list will be updated.

NOTE: "Save as Draft" button is only available if the current User has 'CHECKOUT' permission for the CHILI document; "Save as New Version" button is only available if the current User has 'ADD' permission for the CHILI document.

Save a CHILI Document

When a user saves his document as a draft, it will be saved on the CHILI server. When he then reopens the document in the editor, the changes are still there. However, when downloading the document from WebCenter, the changes will not be visible. They are only visible in the editor.

In the document details page (header), a warning should be shown that there is a draft version of the document.

When a user saves his document as New Version, it will be saved on both the CHILI server and WebCenter. The previous version will be restored to its original state in case there was a draft version.

When saving as a new version, a version comment is required. It is also possible to start approval and set a due date. When saving a linked document, the user will also get the option to select in which projects the document needs to be updated.

Using and Updating WebCenter Attributes from the CHILI editor

In a CHILI document, variables can be defined. Filling out those variables will change certain fields in the document.

When loading the document in the CHILI editor, attributes can be pushed to the editor. If an attribute in WebCenter (either project or document attribute, where document attribute gets priority) has the same name as a variable in the CHILI document, the value in CHILI can automatically be filled out. The user will be asked if he wants the variables to be updated when opening the editor on a clean document (without a draft version). After this, the user will always be able to synchronize the values on demand by clicking the "load attribute values" button. This update button can be clicked at any time.

Note: This panel and button will only be shown when there are actual matches between attributes and variables.

When an attribute name and a variable name match, and that variable is edited, it is possible to save these values back into the attribute category again when saving as a new version. When saving the Document as a new version, a popup window will come in which the user can specify a version comment and restart approval. In the same window you will have two check boxes to specify if you want to update project and document attributes. Note that for linked documents, it is not possible to save project attributes.

Note: For a lot of the variable types, conversions are foreseen in WebCenter. However, there are some limitations:

- There is no conversion between the WebCenter Rich Text Attributes and CHILI's Formatted Text variable.
- Multivalued Text attributes in WebCenter cannot be imported into the CHILI editor's list variable.

Viewing References of a Document

If your current Document (including all versions of the Document) is being referenced in other Documents, you can view the details in the **References Tab**.

This tab will list the Documents referencing the current Document Version as a Document Reference.

Design Information	Document Information	Approval	Action History	Annotations	Projects	Attributes	References	Characteristics	More... ▾
Version 3 (Current Version)									
Documents	Project		Version		Uploaded				
 Sandwich Salmon & Soft Cheese.pdf (11.7MB)	KSJ Document Reference test		1		Jul 3, 2016 at 12:34 PM ADMIN (ADMIN)				
<input checked="" type="checkbox"/> Show parent references for all versions									
Version 2									
Documents	Project		Version		Uploaded				
 Sandwich Salmon & Soft Cheese 2.pdf (11.7MB)	KSJ Document Reference test		1		Jul 3, 2016 at 1:31 PM ADMIN (ADMIN)				

This tab provides a view of:

- the Documents in which they are referenced,
- the Projects in which those Documents reside,
- the Version
- and details on who Uploaded the Document (Version)

If the document has additional versions and one or more of these are explicitly referenced, a checkbox **Show parent references for all versions** will be displayed. Enable this to view a list for each version that are referenced.

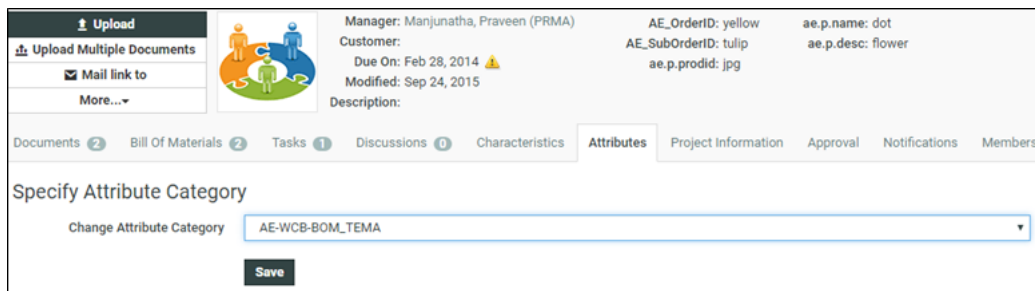

4.3.4. Assigning Document Attributes

Attributes are a way to assign user-configurable fields and their values to documents and projects. They can be restricted to a group of preset values, or can be prompted so that the user has to set a value each time it is used.

Attributes need to have been created by an Administrator before you can use them (see the Administration Guide for more information).

Assign Document Attributes

1. Open the project and folder containing the document to change and click its name.
2. Click **Attributes**.

3. **Specify Attribute Category** by selecting from **Change Attribute Category** drop-down. Click **Save**.
4. In the **Attributes in Category** page, fill in the desired values for the Attributes and click **Save**.

Change Document Attributes

1. Open the project and folder containing the document to change and click its name.
2. Click **Attributes**.
3. Change the Attributes values as desired and click **Save**. The values are changed.

Change an Attribute Category

Attribute Categories are related Attributes grouped together for convenience. If you change an Attributes Category, the previous values are not saved.

1. Open the project and folder containing the document to change and click its name.
2. Click **Attributes**.
3. Click the **Change Category** link.
4. Select the new Attributes Category to use and click **Save**.
5. Enter the values for the new Attributes and click **Save**.

Export Attributes to JDF

To make working with other systems easier, you can export and import document Attributes by using JDF (Job Definition Format) files. You can export the Attributes, modify them in another system, and then import their changed values back into WebCenter.

Note that you cannot add more Attributes to a document this way; this only lets you change the values for existing Attributes.

1. Navigate to the document with the Attributes to export.
2. Click **Attributes**.
3. Set the values for the Attributes as desired and click **Save** to set them. If they are already set as desired, skip this step.
4. Click **Export....**

WebCenter automatically names the file <document name>_attrs.jdf. Any periods in the document name will be converted to underscores.

5. Save the file in the desired location.

Import Attributes from JDF

Important:

If you want to import Attributes that are not generated by another WebCenter system, you should generate a sample JDF file for the people using the other system to use as a reference, so that they format their JDF file correctly.

The important lines are the ones similar to `<eg:SmartName Name="Attribute Name" Value="Value"/>`; there must be a Value tag for each Name tag.

To import a JDF file containing Attributes with changed values for a document, do the following:

1. Navigate to the document with the Attributes to import.
2. Click **Attributes**.
3. In the **Import from JDF file** field, enter the path and name of the file, or click **Browse...** and select it that way.
4. Click **Import**.

The values for existing Attributes are updated if necessary. If there are either too few or too many Attributes defined in the file as compared to the document, WebCenter will mention it in a status message.

4.3.5. Viewing Document References of a Document

4.3.6. Assigning Document Characteristics

Characteristics are descriptive tags that can be assigned to projects or documents to make them easier to find.

Characteristics are hierarchical. This means there can be different levels of characteristics for various product lines so that you can drill down through the information to find the exact characteristic desired when searching the database.

Note:

Characteristics are linked to the document itself and not to a specific version.

So changing the characteristics of a linked document will affect all versions of the document, in all projects that have the document linked (including inactive projects).

You can only assign characteristics to a document if:

- you are an Admin,
- you are the Project Manager,
- you have **Change Properties** rights for that document.

Important: If the project is inactive, you will not be able to edit a document's characteristics if your Admin has not enabled **Allow changing attributes and characteristics of inactive projects** in the Preferences (see the Administration Guide for details).

1. Open the project and folder containing the document to change and click its name.
2. Click the **Characteristics** tab of the Document Details page.

You can also find CAD design Characteristics (associated to ARD files) in the **Characteristics** tab.

When using ArtiosCAD Enterprise, the CAD design Characteristics you assign in WebCenter will be reflected back in ArtiosCAD.

3. Select the checkboxes of the desired Characteristics. The selected Characteristics will appear in the list of Characteristics. Click the **+** plus sign next to a Characteristic to see its child Characteristics.
4. Click **Save**. The selected Characteristics will be associated with the document.

To remove Characteristics from a document, do the same as described above, but deselect the checkboxes of the Characteristics to remove them from the list.

4.3.7. Downloading a Project

Note:

Only those documents in a project for which you have **Download** permission are included when downloading a project.

To download a project:

1. Open the project.
2. Add the project to the **Cart** by clicking **Add to Cart** on the **Projects** Header bar.
You can also select multiple projects in a project list and click **Add to Cart** in the **Headerbar** to download them all at once.
3. Click the **Cart**  button.
4. Select the project(s) to download and click **Download** in the **Header** bar.
5. If prompted, choose where to save the files and click **Save**.

The project is saved as a compressed ZIP archive with the same name as the project. Use the decompression software of your choice to open it; some operating systems can open compressed archives without the need for a separate program.

When downloading multiple projects, individual projects are compressed into their own archives and then those archives are nested together in one master archive.

Your system may be configured to download and open the archive automatically, in which case you can extract the files as desired.

4.3.8. E-Mailing Links to Documents and Projects

You can send links to documents and Projects with any MAPI-compliant messaging program.

Note:

The recipient(s) must be able to log in to your WebCenter system and have the appropriate permissions to view the Documents or Projects referenced by the links. You can **Mail link To** single or multiple Documents and Projects.

1. To Mail link To single Project or Document:

1. Navigate to the Document or Project.
2. Click **Mail link To** from the Project or Document details page.

2. To Mail link To Multiple Projects or Documents:

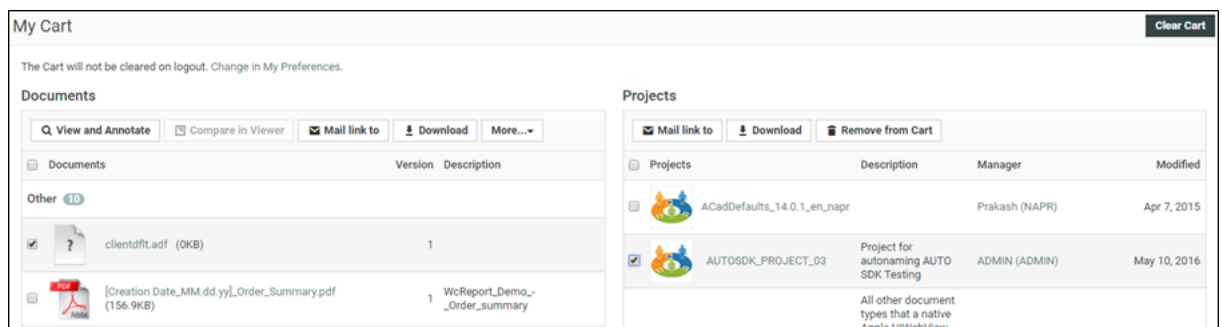

3. Select the Documents/Projects you want to send. Click **Add to Cart** in the **Document** or **Project** Header bar.

You can also add multiple documents or Projects to the cart. Simply repeat this step.

4. Click the **Cart**  button.

5. Select the Documents or Projects you want to send.

6. Click **Mail link To** in the **Header** bar.

A message opens containing links to the documents or Projects in the body of the e-mail.

7. Address the message as desired and send it as usual.

Tip:

To send only one message containing links to both Documents and Projects, leave both messages open and cut and paste links between messages as desired.

4.3.9. E-Mailing Links to Download Documents

You can send a link to download a certain document (or multiple documents) to non-WebCenter users. This link will only enable the recipient to download one specific file and has a fixed validity (number of days that the link is available).

To use this functionality, an Admin user first needs to enable it and set the validity for the download link (see the Administration Guide for details).

This functionality is available to Project Members that have Download permission for a given Project Document Version and to the Project Manager of the parent Project.

The following steps describe how to send a download link(s) to a non-WebCenter user:

1. Select the checkboxes of the document / documents to download.
2. Choose **Mail Download Link** from the **Header** bar.
Your default e-mail client will open with an e-mail containing a link (URL) generated by WebCenter.
3. You can add a recipient and edit the content of the e-mail message.
4. Send your e-mail.

Note: You can also **Mail Download Link** from the pages below:

- **My Cart**
- **Document Search Results**
- **Project Details** documents
- **BOM** documents
- The recipient of the e-mail will be able to use the download link to download the file for as long as the link is valid. In case the link is no longer valid, the recipient will be informed it has expired.
- When a recipient clicks a link that is invalid, expired or tampered with (for example if the URL was changed), he/she will see a web page stating that the link is invalid.

4.3.10. Viewing the Action History

The **Action History** page for a document shows all actions performed on the document such as version Uploads and Approval Actions.

- To view the action history, click the **Action History** link on a document.

The page displays these document details:

Version	Event	Status	Stage	Date	User	Comment
	Lock Document	🔒		May 9, 2016 at 2:50 PM	Prakash (NAPR)	
▼ 1	Upload Document			May 4, 2016 at 5:12 PM	Martinez, Teresa (TEMA)	
Stage Stage2 Overview - Pending						
	Approval stage started			May 9, 2016 at 2:10 PM	Prakash (NAPR)	
	Approval requested for User				Prakash (NAPR)	--
Stage Stage1 Overview - Approved						
	Approval stage started			May 9, 2016 at 2:10 PM	Prakash (NAPR)	
	Approved	✓	Stage1	May 9, 2016 at 2:10 PM	Prakash (NAPR)	
View Generation						
	Check and register	📄		May 4, 2016 at 5:12 PM		Finished Successfully May 4, 2016 at 5:12 PM Show Task Details

- **Version:** An overview of document versions
- **Event:** An overview of:
 - Details of Upload Document/Upload Document Version, Approval, Lock document...
 - **View Generation** (for Graphics only) with a link to **Show Task Details**.
 - **Annotations** which display date, time, user and annotation comments.

Note: The document uploaded event also includes the description of the document. When a document is copied from another project to the current project, the source project information is also mentioned.

- **Status** displays the current status of the document (Approved, Rejected, Locked...) and their icons.
- **Stage:** displays the Approval stage
- **Date** displays both Date and Time of action performed.
- The **User** that uploaded the Document/Document Version.
- **Comment:** displays Version/Approval/Annotations comments.

Note: The Document **Action History** varies according to the document types. Some display page information too.

The changes done to the attributes of a document when uploading the document are also tracked in the project history (under the attribute changed event type)

You may print a printer-friendly report of the **Details** page by clicking **Print** in the header. A new page will open showing the entire Action History which you can print using the browser's **Print** command.

4.3.11. Viewing ArtiosCAD meta-data

You can see the meta-data associated with the new ArtiosCAD Design (ARD) and Manufacturing (MFG) documents uploaded via the WebCenter interface or via an ArtiosCAD Enterprise client version 14.0.2 (or later).

In the **Design Information** tab (for design files) or in the **Manufacturing Information** tab, you can see:

- the **Grain / Flute Direction**
- the **Default Side** for the Design (ARD) and Manufacturing (MFG) documents.

Note:

Older document versions or document versions uploaded from ArtiosCAD Enterprise client 14.0.1 or earlier will not show these data.

4.3.12. Viewing Project History

You can view the history of various events in the Project by navigating from **View History** page. You can navigate from **Project > More > View History**.

Any user with access to a Project, can see the events history of the particular project. Based on the notifications setup for the project or the template for various events, records are added to the project history.

Events are added when a Project was created and information like Project name, Project description, customer, customer location and Project Manager of the project are logged.

Any change of the information status, due date, attribute, attribute category or permission changes are also logged as events in the project history.

You can filter or sort the events by the date, time, user, or event type. You can also print the **View History** page.

4.3.13. Running a Project Report

You can run pre-configured project reports from the projects you have access to if your Admin has given you access to these reports (see the Administration Guide for more information).

Note: This only includes project reports. *System-wide reports* are available from the **Search** menu.

1. In the project, go to **More actions...** > **Run Project Report**.
2. If you can run several reports for this project, select the desired report on the **Run Report for Project** page.
3. If the report requires parameters, specify them (mandatory parameters are marked by an *) and click the **Run Now** button.

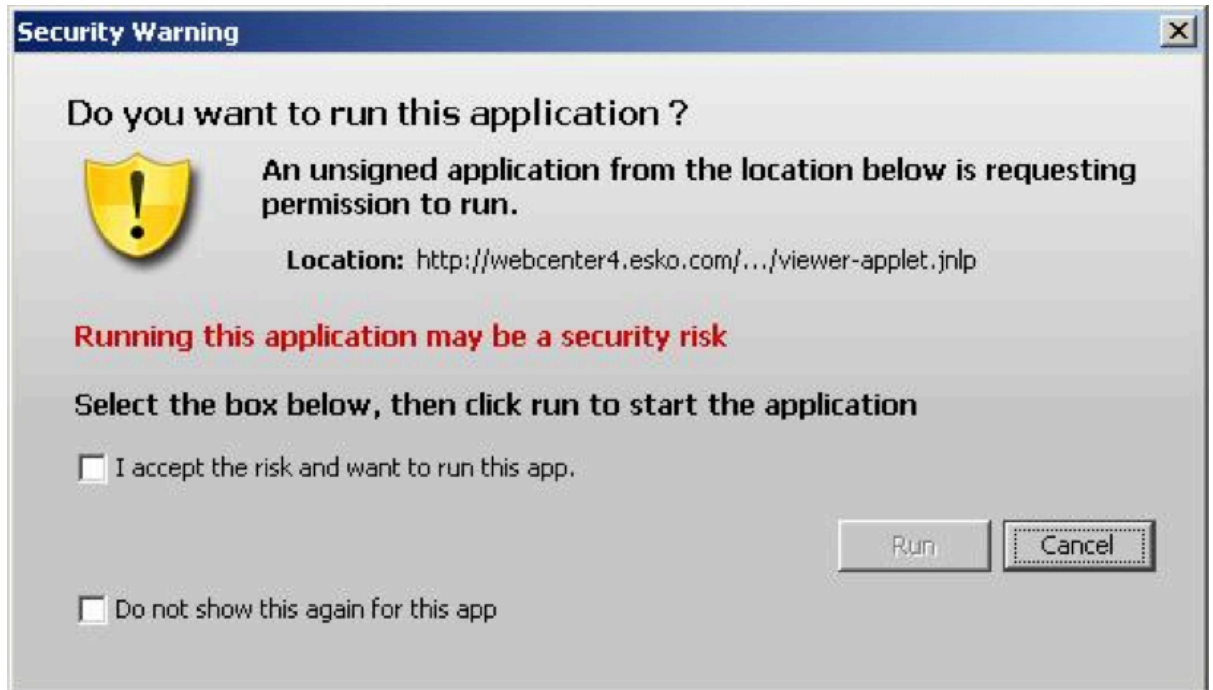

4.4. The WebCenter Viewers

4.4.1. The Java Viewer

Opening a Document in the Java Viewer

To open a document in the Viewer:

1. Click the document's thumbnail or the  button.
You can do this from:
 - the **My Work** page (under **My Approval** if you have documents to approve or under **Approvals to Follow Up** if you are an **Approval Master**),
 - the **Documents** tab in the project,
 - the header of the Document Details page.
2. If you see a security warning, you need to allow the Viewer applet to run on your computer. Depending on what is set in the *Preferences*, you will see a different security warning:
 - If you see...

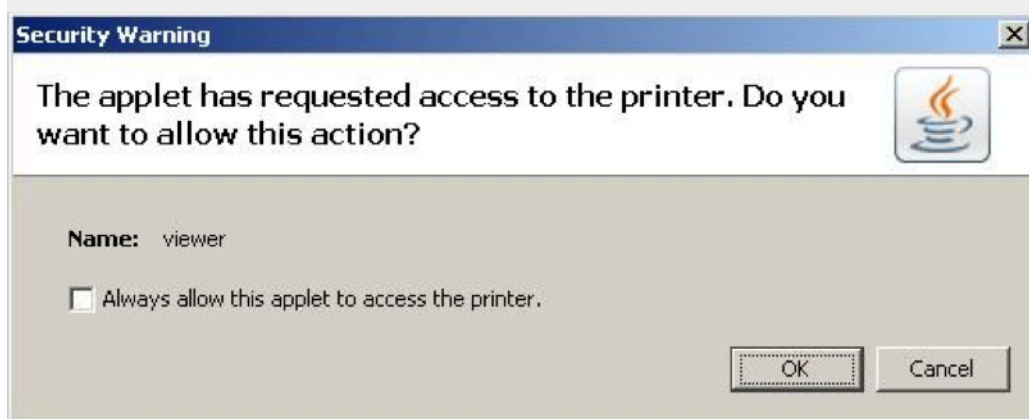

... you need to:

1. click **I accept the risk and want to run this app**,
2. optionally, click **Do not show again for this app** (if you don't want to see this security warning the next time you open a document in the Viewer),
3. click **Run**.

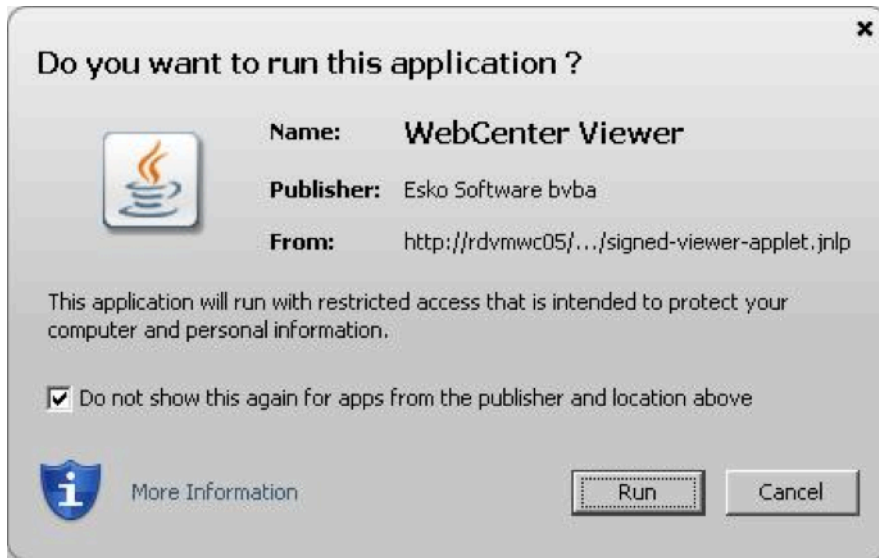

Note:

You will also see a warning when trying to print from the Viewer. You will just need to click **OK** to be able to print.

Note that due to a bug in Java 1.7.0_21, you need to leave **Always allow this applet to access the printer** deselected or you will get a security error (Printing failed java.lang.SecurityException: checkPrintJobAccess).

- If you see...

... you need to:

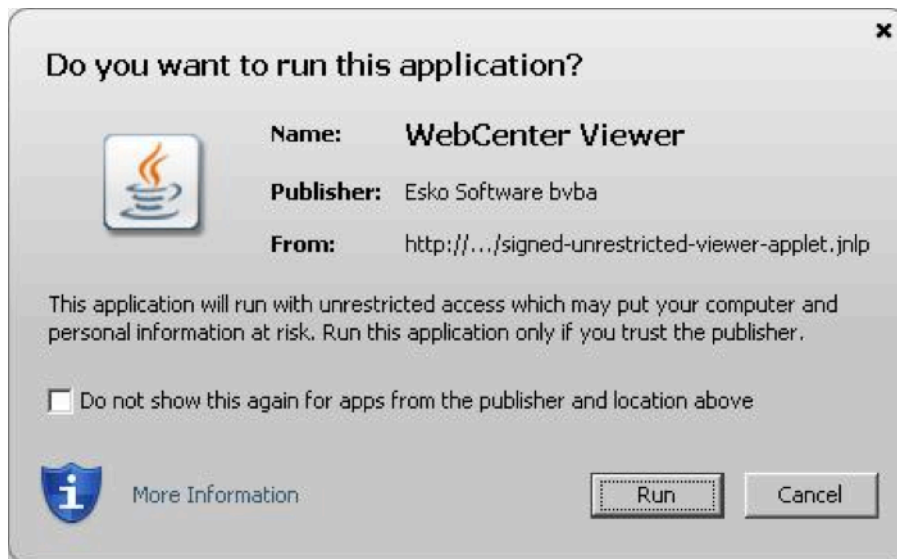

1. optionally, click **Do not show again for apps from the publisher and location above** (if you don't want to see this security warning the next time you open a document in the Viewer),
2. click **Run**.

Note:

You will also see a warning when trying to print from the Viewer. You will just need to click **OK** to be able to print.

Note that due to a bug in Java 1.7.0_21, you need to leave **Always allow this applet to access the printer** deselected or you will get a security error (Printing failed java.lang.SecurityException: checkPrintJobAccess).

- If you see...

... you need to:

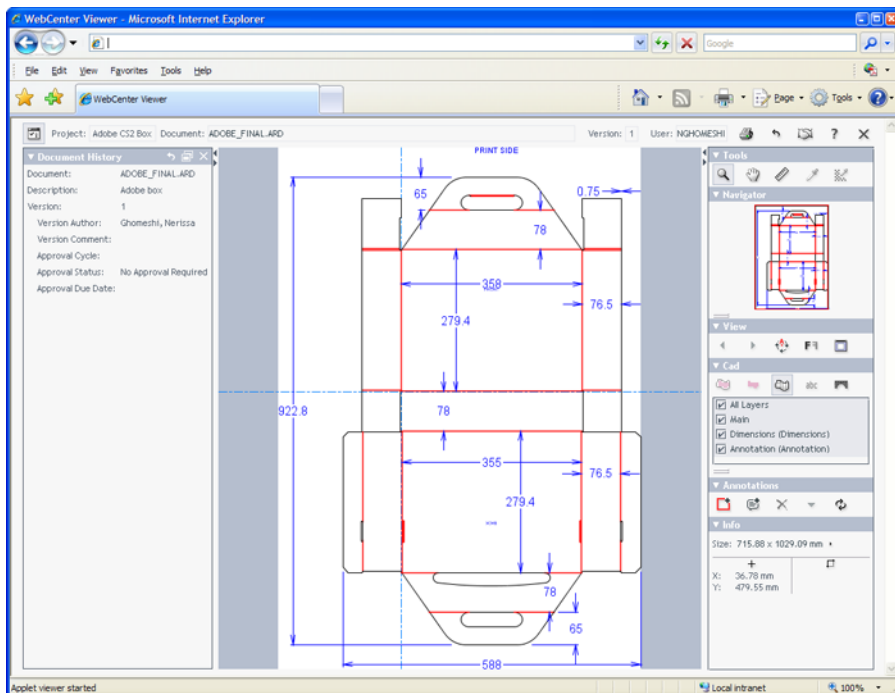

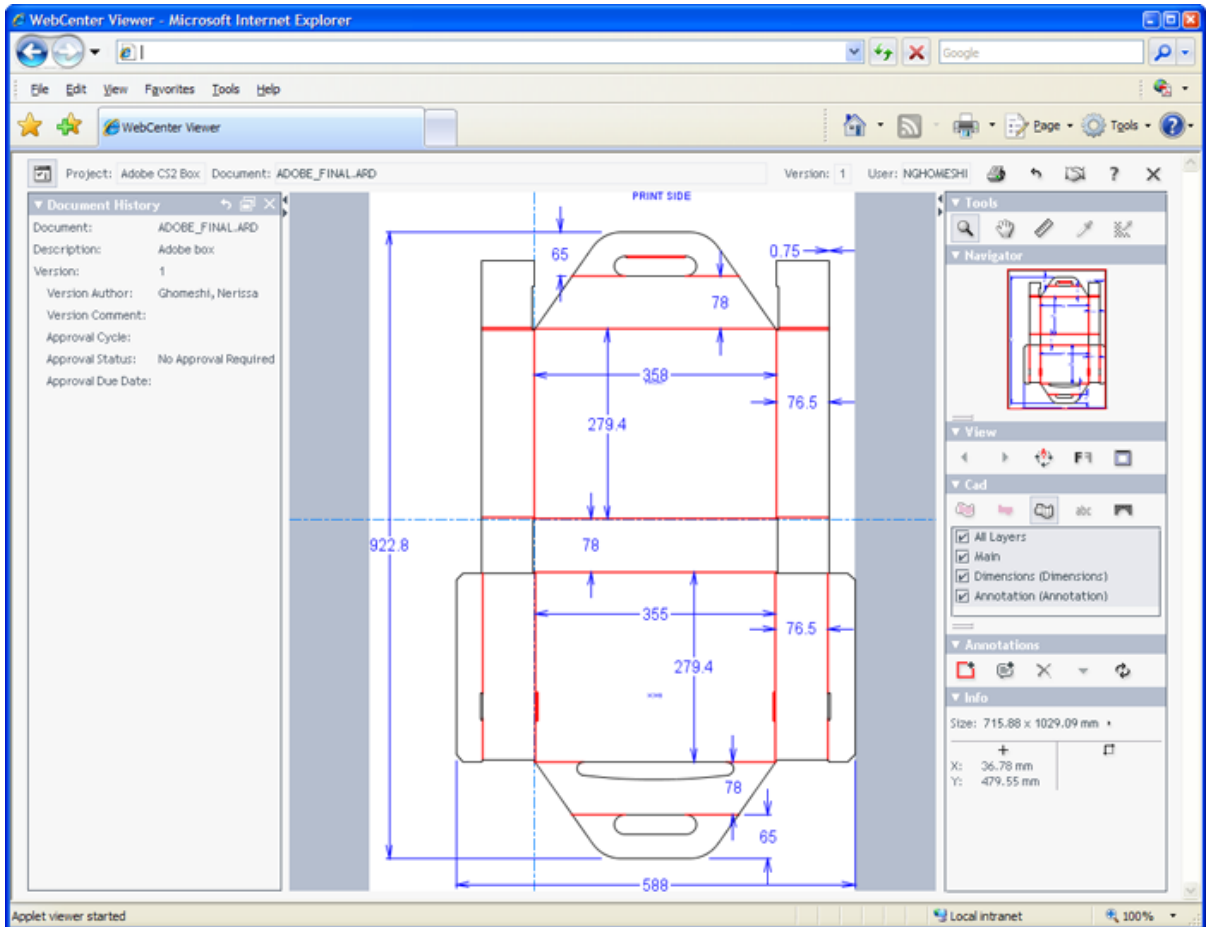

1. click **I accept the risk and want to run this app**,
2. optionally, click **Do not show again for this app** (if you don't want to see this security warning the next time you open a document in the Viewer),
3. click **Run**.

Note:

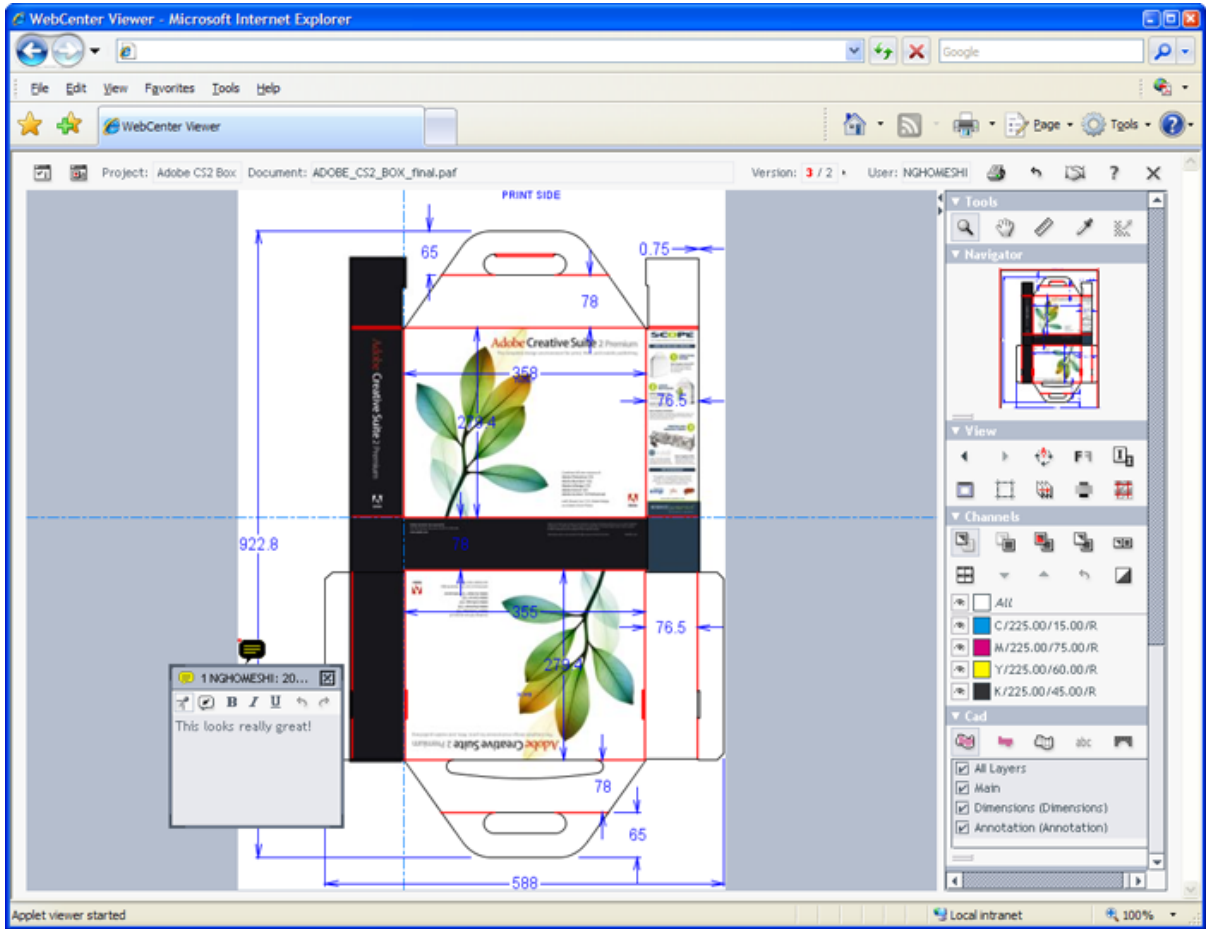

- You can only view the latest two versions of a document.
- If a document of type **ArtiosCAD**, **Graphic File**, or **Other** did not have view data generated when it was uploaded, or does not have view data for some other reason, WebCenter will ask you to create the view data when trying to view it. You must have **Update** permission on a document to generate its view data after it is uploaded.

Viewer Samples

An ArtiosCAD workspace in the Viewer

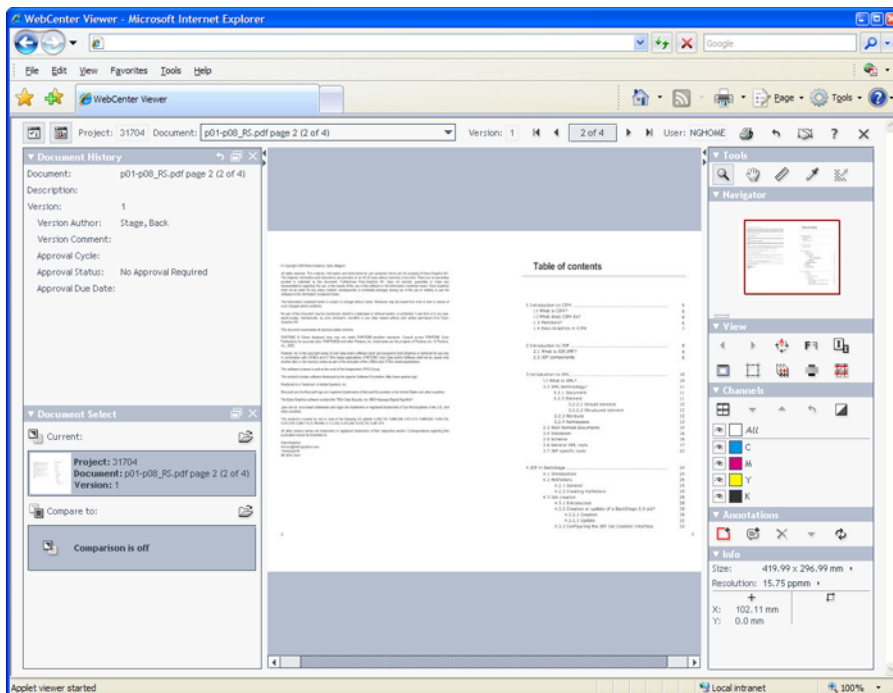

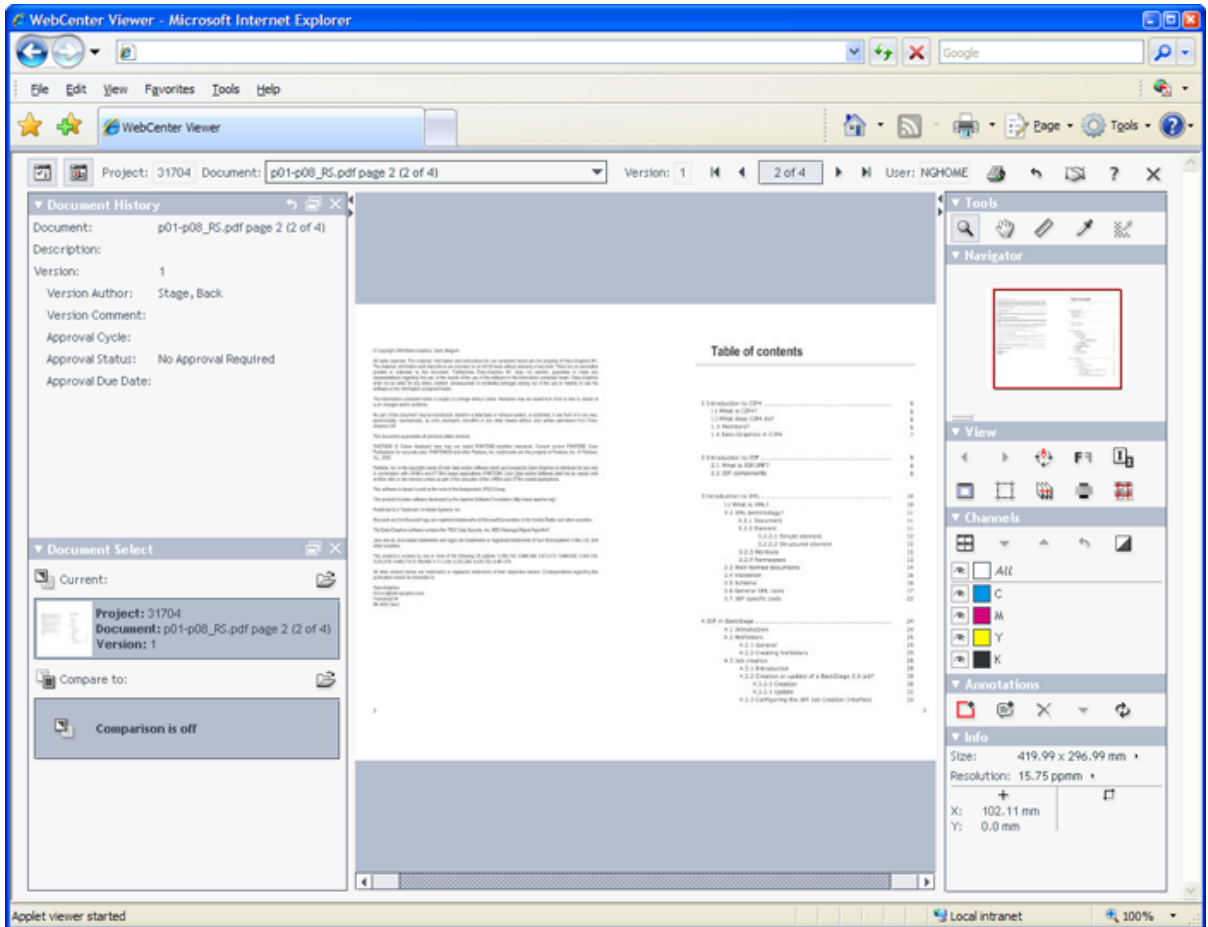

A Packed Archive Format (PAF) file containing both CAD and Graphics data

A multi-page PDF file uploaded by BackStage / Automation Engine

More Help with the Viewer

Help

To learn more about using the Viewer, click the question mark at the top right of the screen.

Note: Some browsers consider the Help window to be a pop-up. Either turn off the browser's pop-up blocker or add the WebCenter Web server to the browser's list of allowed sites.

Document types

For a **Graphics** document to show CAD data, it must reference the ArtiosCAD file. The Viewer does not show graphics contained in an ArtiosCAD document.

For the Viewer to show **multiple pages of a PDF file**, it must have been uploaded as a **Page List** document: either through the user interface with the Upload document feature, or uploaded to WebCenter by Automation Engine.

For Page List documents, the Viewer offers a list of all the pages as a navigation aid, and a reader spread mode to evaluate impositions.

Multiple documents

To view multiple documents at once, select their checkboxes, and click **View and Annotate** in the **Actions** menu (inside a project or the Cart) or the  symbol at the top (on your **My Work** page).

Navigate between documents using the drop-down list box in the **Document** field or the navigation arrows in the information bar across the top of the Viewer.

Zoom

To zoom in, click inside the document or draw a rectangle around the area to enlarge with the Zoom tool .

To zoom out, hold down shift or ctrl while the Zoom tool is active. The symbol inside the magnifying glass cursor will change from a plus sign to a minus sign.

To make the view scale to fit the space in the browser window, right-click the Zoom tool and select **Fit document in view**.

Microsoft ISA Proxy server

If you will be using the Viewer through a Microsoft ISA proxy server using authentication in an HTTPS session, use Java 1.4.2 on your machine, not Java 1.5.

To check the version of Java installed on your machine, double-click the Java applet in **Control Panel** and click **About**.

If needed, download the J2SE Java Runtime Environment (JRE) 1.4.2 from the following URL: <http://java.sun.com/j2se/1.4.2/download.html>.

You must be able to download and install Java applets automatically for the Viewer to work properly. If Java is installed but a red X appears in the browser, consult your system administrator to see if a firewall or proxy blocks Java downloads.

Returning to WebCenter

To leave the Viewer and return to WebCenter, click the x at the top right of the Viewer next to the question mark. Do not close the Web browser window by accident!

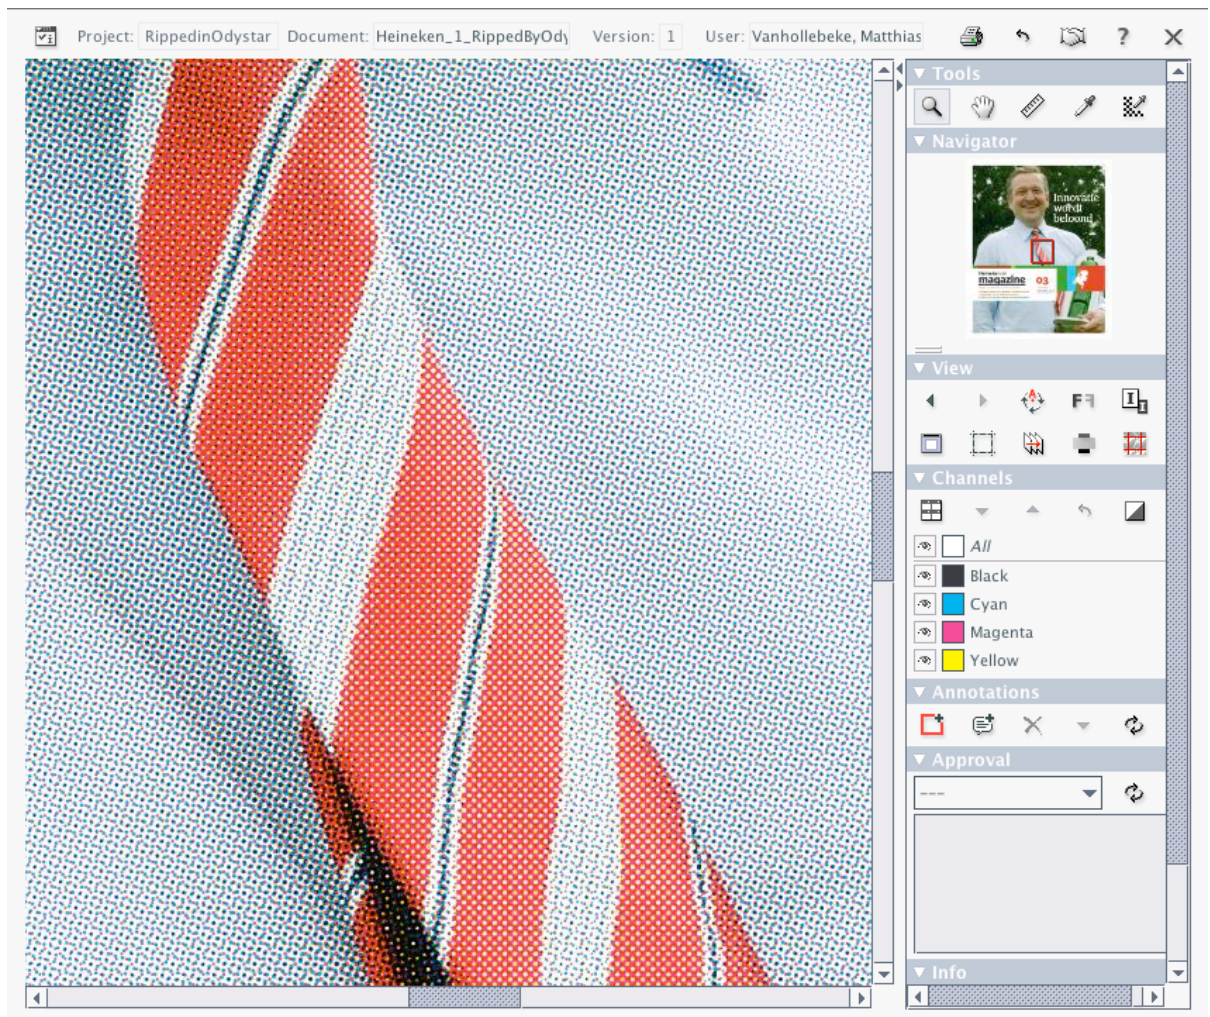

Viewing RIPPed Data in the WebCenter Viewer

You can view RIPPed data from Odystar or Nexus (TIF or LEN files) in the WebCenter Viewer. This allows you to approve RIPPed files in the powerful Viewer.

Workflow Overview

To make sure WebCenter recognizes your RIPPed TIF and LEN files as digital film, use the following workflow:

1. In Odystar or Nexus, **set up a flow** that contains the following stages:
 - **Split Pages**, to split the pages of a multi-page PDF document;
 - **RIP**, to RIP every page to separated TIF or LEN files;
 - **Compress**, to gather the separations back into a ZIP file that WebCenter will recognize as digital film;
 - **WebCenter Output**, to upload the ZIP files into the WebCenter project of your choice.
2. **Submit a PDF document** to the flow.
3. Log on to WebCenter and **navigate to the project** you specified in the **WebCenter Output** stage of your Odystar or Nexus flow.
4. Click a ZIP file in the document list to view the RIPPed page in the WebCenter Viewer.

Note:

Of course, you can build on this basic workflow to include approval, or even use workflow folders in WebCenter to send PDF documents to Odystar or Nexus hot folders at the start of the flows.

Prepare the Odystar Canvas

- Set up the following Canvas:

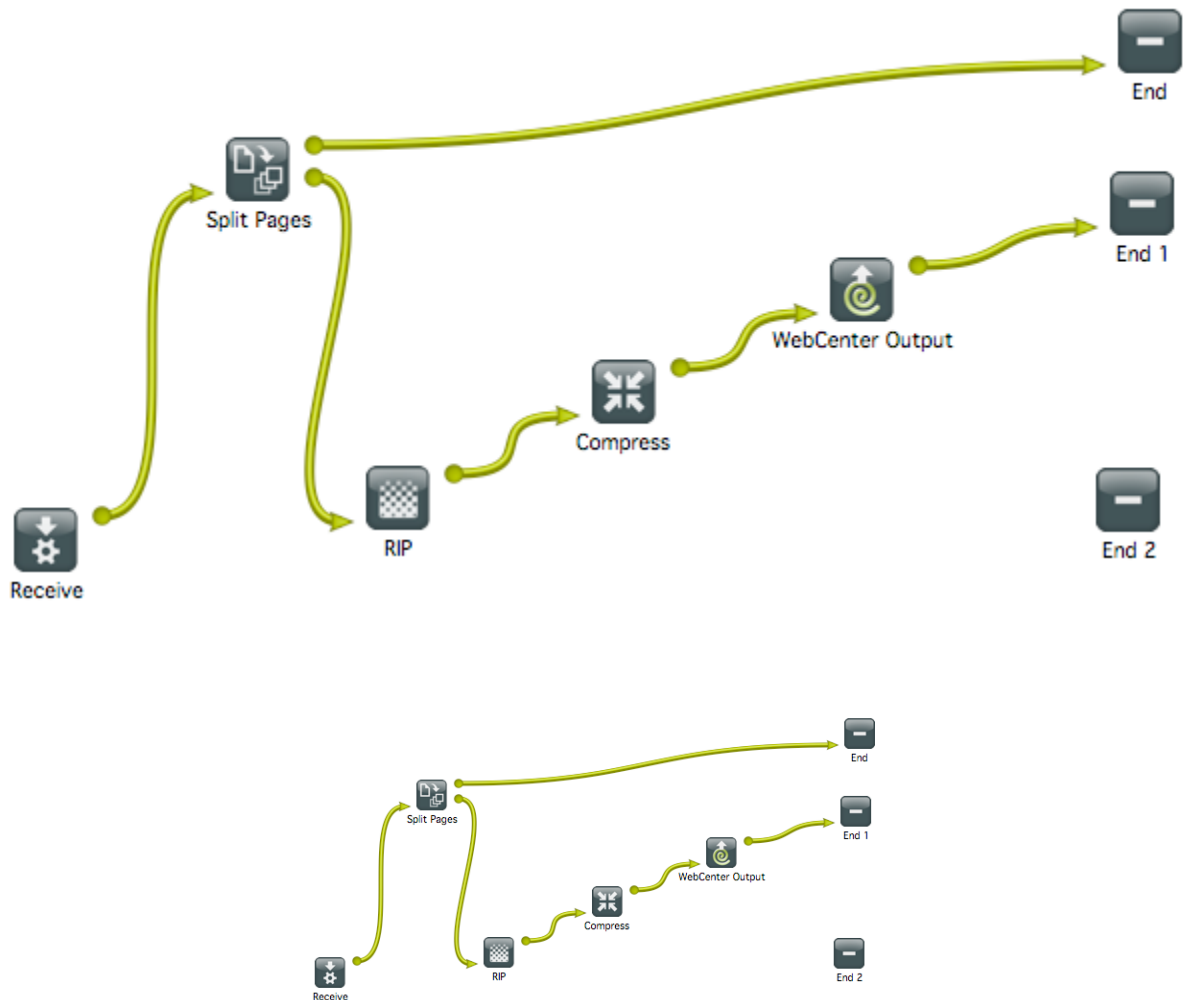

Table: Gateway details

Gateway	Notes
Split Pages	Splits the pages of submitted multipage PDF documents, so they are sent to the RIP gateway page by page.
RIP	RIPs the pages to TIF files.
Compress	Collects the separated RIPped TIF or LEN data and gathers it in a ZIP archive.
WebCenter Output	Selects the ZIP file and uploads it to the desired WebCenter Project.

Prepare the Nexus Workflow

- Set up the following workflow:

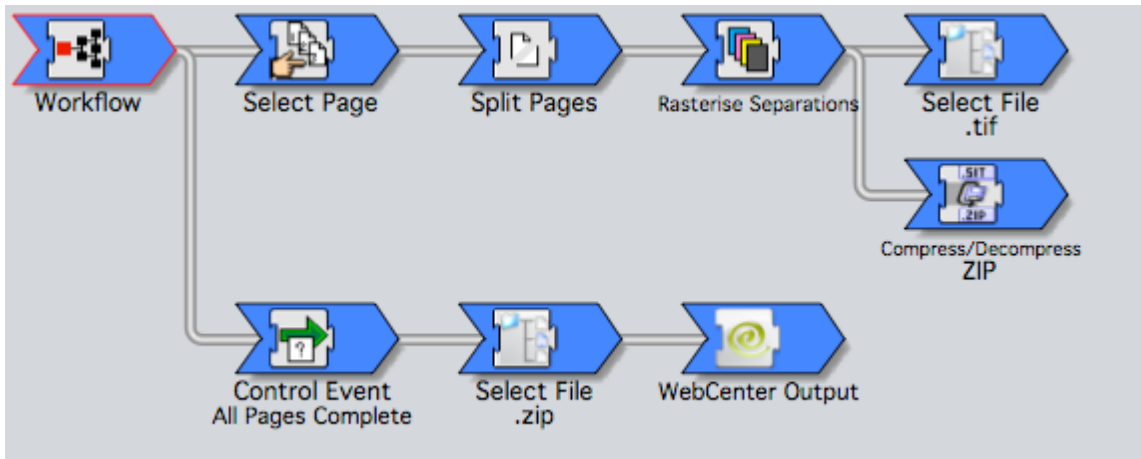

Table: Activity details

Activity	Notes
Split Pages	Splits the pages of submitted multipage PDF documents, so they are sent to the RIP gateway page by page.
Rasterise Separations	RIPs the pages to TIF or LEN files.
Compress/Decompress ZIP	Collects the separated RIPped TIF or LEN data and gathers it in a ZIP archive.
WebCenter Output	Selects the ZIP file and uploads it to the desired WebCenter Project.

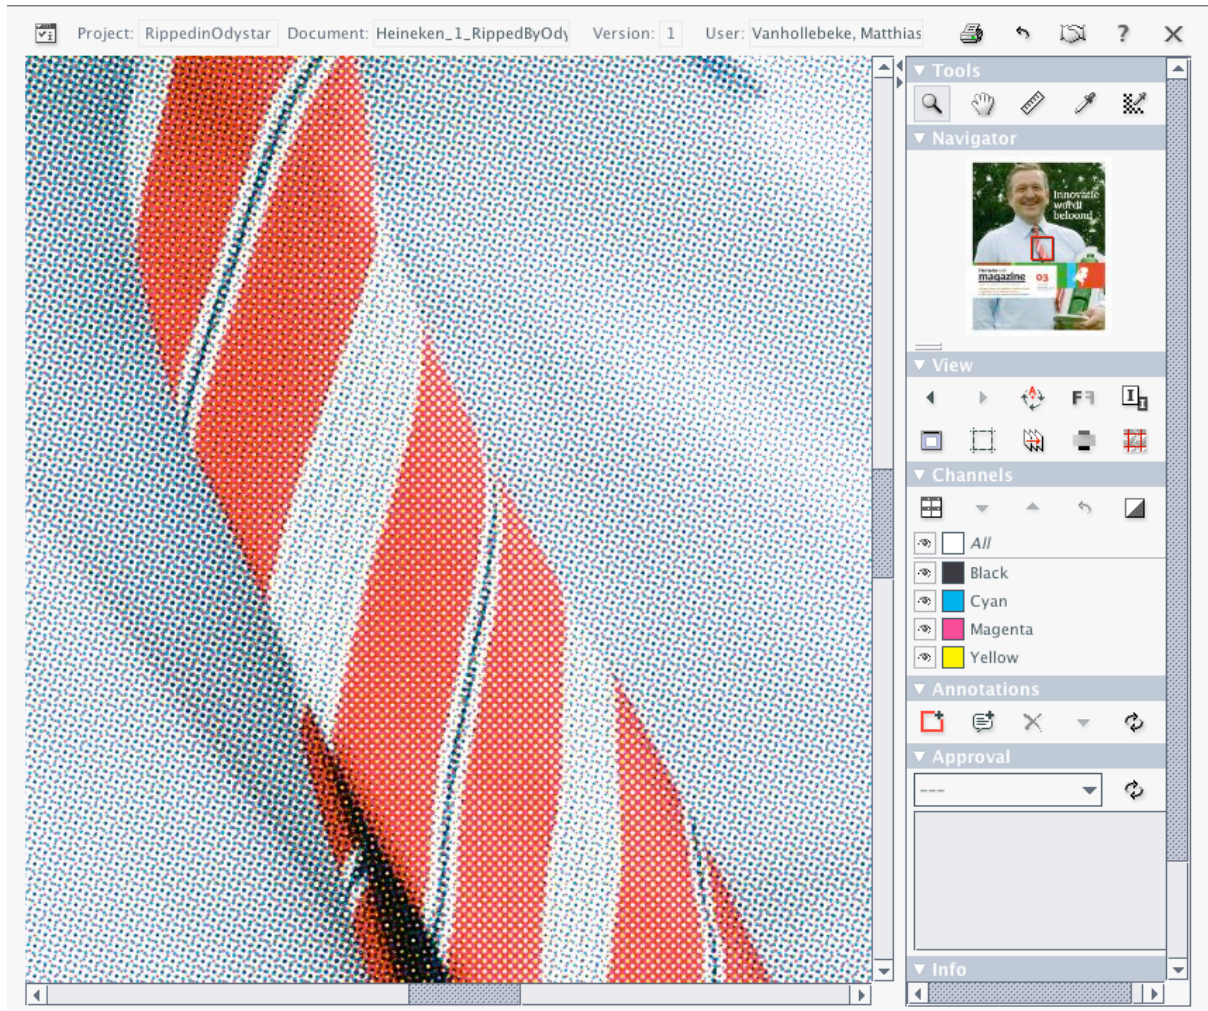

Submit Files and View

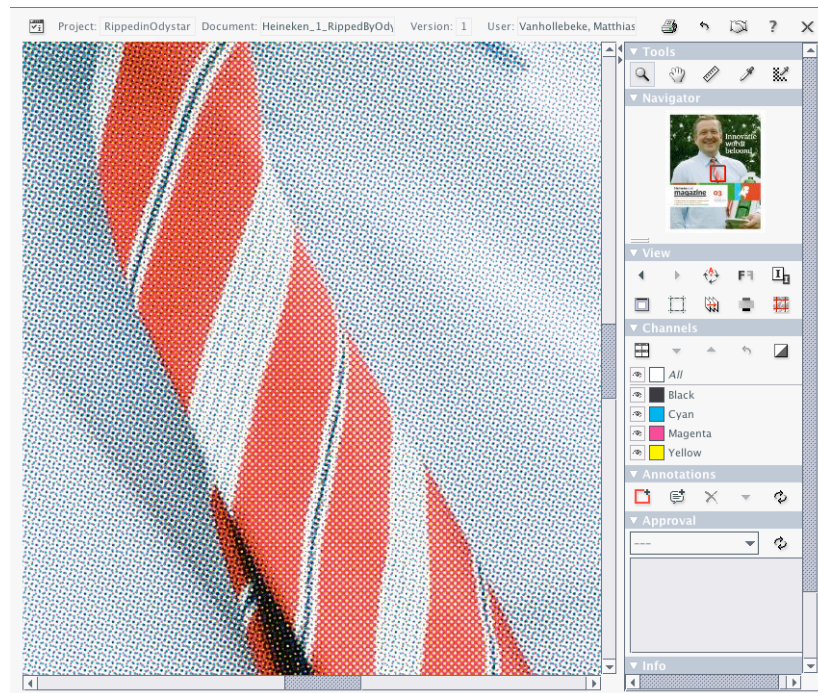

Once you have set up your Odystar or Nexus workflow, you can submit PDF documents.

The submitted documents will be RIPped and uploaded to WebCenter in the form of ZIP files, which can be recognized by WebCenter as digital film files.

Log on to WebCenter and navigate to the Project you selected as the upload destination in the **WebCenter Output** gateway/activity. You should see the digital film files appearing in the document list, with thumbnails being generated on the fly.

Click a document thumbnail to view it in the Viewer. Use the Viewer to zoom in, compare to previous versions, annotate or approve the RIPped page.

Combine with a Workflow Folder Configuration

You can combine the workflow to view RIPPed data in the WebCenter Viewer with the workflow folder feature, to create a user-friendly digital film viewing and approval solution.

Note: Workflow folders are sometimes also referred to as “push-through folders”. More information can be found in [About Workflow Folders](#) on page 408.

To achieve this, proceed as follows:

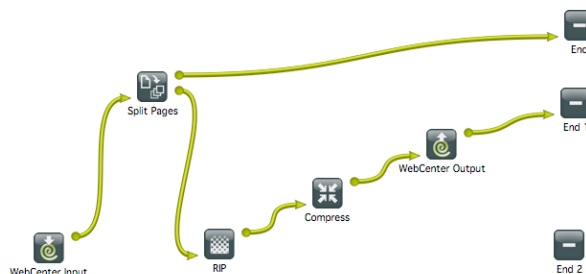

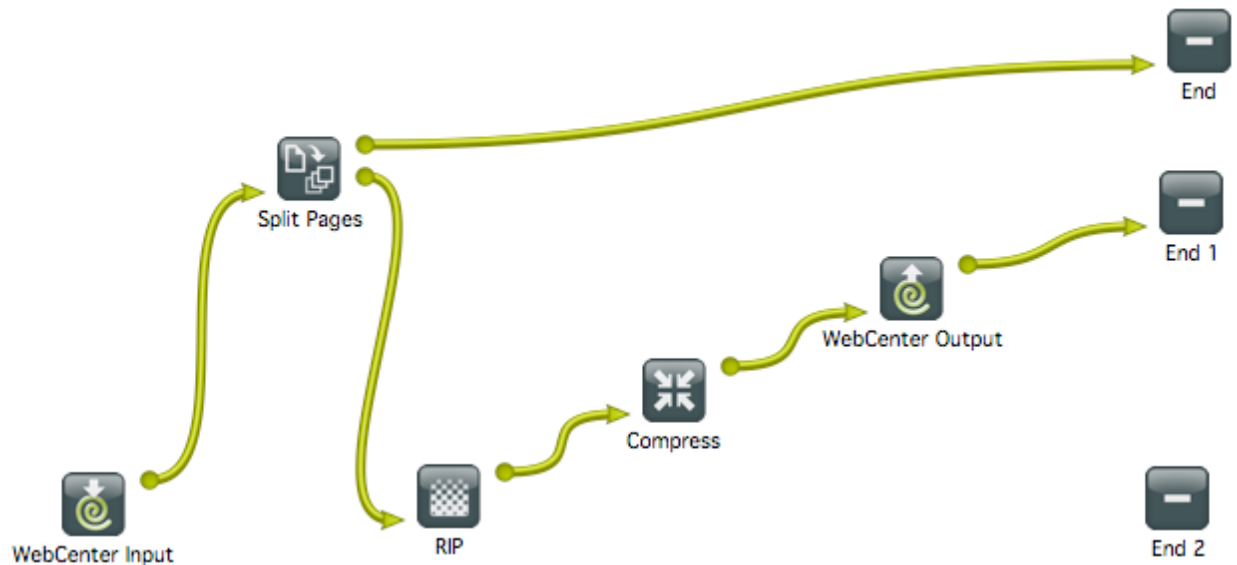

1. Log on as a WebCenter administrator, and in the **Admin** mode, go to **Configuration > Push Through Configuration**.
2. To create a workflow folder, click **New Push Through Configuration** and, in the **Destination UNC** field, specify the path to the **Hot Folder** of your Odystar or Nexus server that will be RIPping your data.

Also, make sure you select the correct **workflow type** (Odystar, Nexus or Automation Engine) from the corresponding list.

Note: For detailed instructions on setting up workflow folders, see [Configure Push-Through Configurations for Workflow Folders](#) on page 408 in the Administration Guide.

3. Create a new folder in your WebCenter project, and in the **Folder Properties**, select the **Workflow Folder (Advanced)** option. Then select the push through configuration you just created.
4. Modify your Nexus or Odystar flow to include the **WebCenter Input** activity or gateway. Make sure the settings point to the same Hot Folder you specified in the push through configuration in WebCenter.
5. Upload a PDF document to the workflow folder in WebCenter.

If you set up the whole workflow correctly, the files you upload will be copied to the Odystar or Nexus hot folder, where they are picked up by the WebCenter Input. The flow will RIP the pages, collect them into ZIP files and return them to the WebCenter project, where you can view and approve them.

4.4.2. The HTML5 Viewer

About the HTML5 Viewer

The HTML5 Viewer is a fast and comprehensive viewing tool introduced in WebCenter 14.

From 14.1.1 onwards, the HTML5 Viewer is the default WebCenter Viewer. However, you may choose to work with the Java Viewer (default) by changing it in the **Viewer Preferences**.

What does the Share and Approve ViewerHTML5 Viewer offer you?

- Speed: fast viewing for Graphics and CAD files. High speed 3D viewing (14.1 and later).
- Compatibility: high speed performance on the new client browsers.

Browser	Supported Version - Windows OS	Supported Version-Mac OS
Internet Explorer	9.0 or higher	-
FireFox	4.0 or higher	4.0 or higher
Chrome	5.0 or higher	5.0 or higher
Safari	-	5.0 or higher

- Reliability: high accuracy in displaying your data.
- Detail: advanced zoom to see finest details, measuring exact distances. Fast zooming.
- Customizable widgets. You can even restrict access to certain features depending on the user preferences.
- Keyboard shortcuts. To see all of them, press ?
- Easy access to help and knowledge base. Search in the **Help** widget or press **F1** to access help.

Note: The default Viewer in the WebCenter *Viewer* on page 93s upto 14.1 will be the Java Viewer. You can set the preferred Viewer as the HTML5 Viewer in the General or User Specific **Preferences**. Read more in About Viewer Preferences.

Note: The HTML5 ViewerShare and Approve Viewer does not offer live collaboration or working together at the same time. You can use *annotation threads* for discussions.

What is New in the HTML5 Viewer 18.1

- Combine Collada structure and PDF graphics into attractive 3D directly in the Viewer (link Viewable Components)
- Preview advanced print effects in 3D without a structure with the new 2.5 D
- Finishing Profile
- Text Content Widget in Viewer

The Simplified Viewer

Two types of desktop layouts can be viewed when you open the viewer in a normal browser: the HTML5 Normal Viewer and the Restricted (New Look)/ the Simplified Viewer. This new viewer presents a cleaner, less complicated and clutter-free look.

Viewing Simplified Viewer

The leaner viewer offers easy navigation through some of these features:

- The Simplified Viewer comes with all the enhanced features available in the HTML5 Viewer.
- In the Simplified Viewer the side panels are collapsed by default. You can open the specific widgets that you need.
- The new viewer allows you to resize the opened widgets (even as the side panels remain collapsed).
- With some configuration, it also allows each widget to be hidden.

Opening the Viewer in Simplified Mode

In **Viewer Preferences**, select the Restricted (New Look) as the **Viewer Style** to open the Simplified Viewer layout. It is set to **Normal** by default.

This layout consists of four sections: center, top bar, right and left side panels:

- The Information bar on the top consists details of the document, the user and buttons to execute other actions [The Information Bar](#) on page 633
- Below the information bar, you have the top tool panel with all the toolbar components. Activating these help you perform different functions on the document. Read more in: [Top Tool Panel](#) on page 636
- You have the View area in the center.
- The collapsible side panels contain the **Viewer Widgets** which are collapsed by default.

Ordering and Collapsing Widgets in the Side Panels

The widgets display document information and help perform different functions. To facilitate ease of view, you can adjust them in many ways:

- Click the **Widget Header** to collapse or expand the widget.
- You can drag the widgets to either of the two side panels. The height of each widget is automatically adapted by the side panels.
- The side bars do not disappear on collapsing but remain as a thin bar containing the widgets icons that represent the widgets. Click the icon needed. It opens next to the side bar.

Note: You can open only one widget per side bar at a time. If you click another icon on the same bar, the first widget closes.

Collapsing and Resizing Side Panels

The side panels contain all the widgets and can be manipulated in different ways to maintain the leaner look:

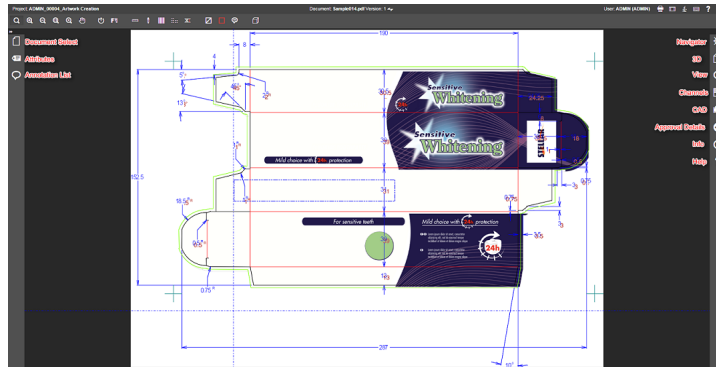

- Resize and collapse side panels by using the  or  **Toggle Right/Left Side Bar**. The side panel becomes a thin bar containing only the icons.
- When you click the expand toggle, the panels expand to fit in both side panels and the viewport.
- To revert the side panels to their original size, click the toggle button.

Resizing Widgets in the Simplified Viewer

You can choose to have a full or partial view of the widgets when you:

- Resize opened widgets even when the side panels are collapsed
- Drag the widget borders horizontally or vertically. You can also resize by dragging the bottom corner. The width and height are saved and the widget will retain these dimensions when you open the viewer the next time.
- Restore the widget to its default size by double clicking the respective icon on the side panel.

Tools in Simplified Viewer

The Simplified Viewer offers tools that are similar to the Normal Viewer:

- [The Information Bar](#) on page 633

- [Top Tool Panel](#) on page 636

- Use or to Toggle Side Panels.
- To open the widgets, click the corresponding icons:

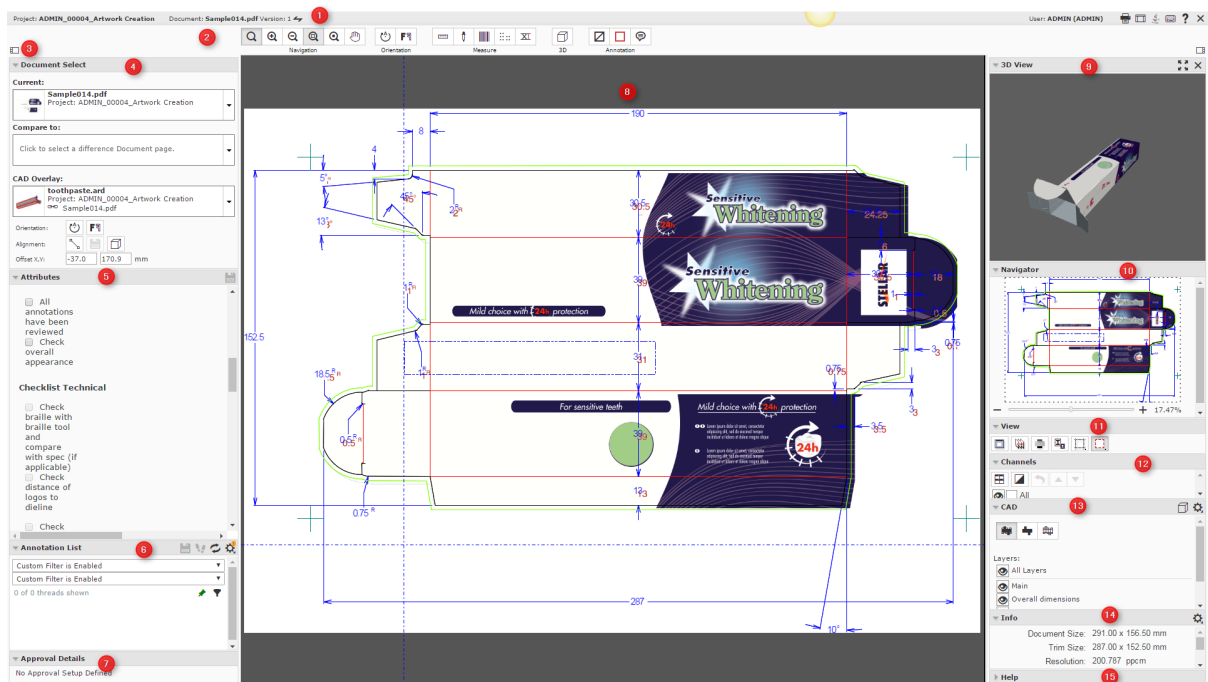

- [Navigator](#) on page 660
- [3D View](#) on page 658
- [View](#) on page 662
- [Channels](#) on page 672
- [CAD](#) on page 675
- [Approval Details](#) on page 656
- [Info](#) on page 661
- [Help](#) on page 678
- [Document Select](#) on page 650
- [Attributes](#) on page 671
- [Annotation List](#) on page 654

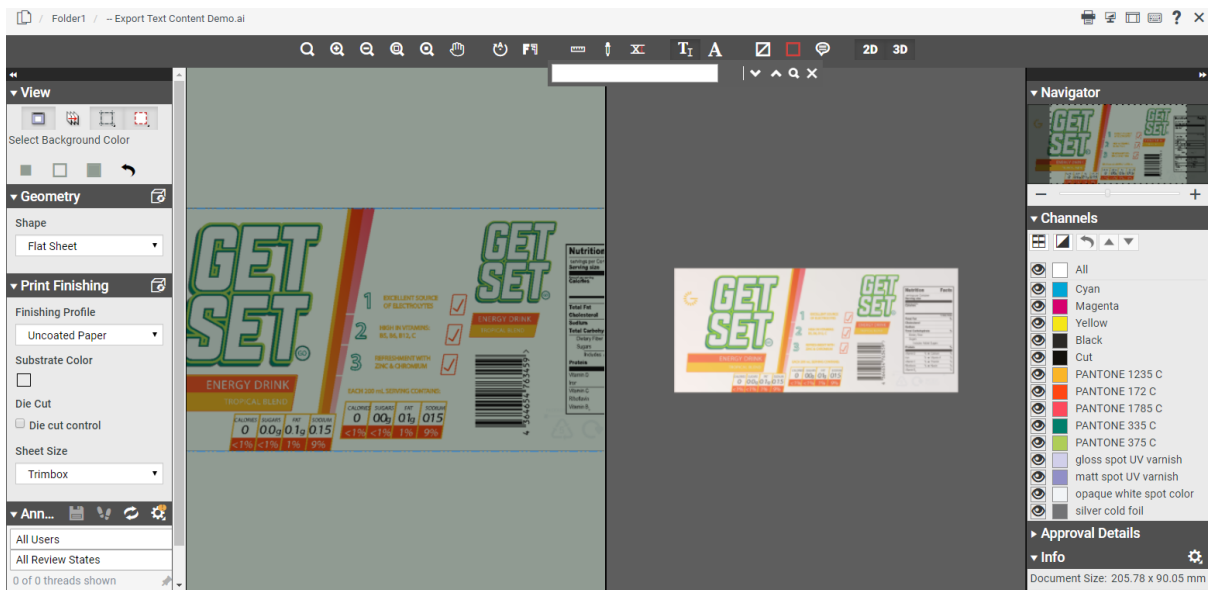

The Viewer Window

The HTML5 ViewerShare and Approve Viewer comes with a number of powerful tools that make it easy to navigate, view and compare your artwork and design files.

In the Viewer Window, you can:

- quickly scan for information regarding the active document. For example, you can view the document size, resolution and the axes in the *Info* widget.
- inspect the document using the *top tools* and *the Navigator widget*. The channels of the document will be visible in the *Channels* widget.
- compare the document to a reference selected via *the Document select widget*.
- browse and inspect individual pages of your Page List using *the Page List widget*.
- view the *approval details* of your document.
- *approve or reject* your document
- view CAD design and CAD layout files. You can see the available layers in the *CAD* widget.
- *view the annotations* and comment on them. You can also *annotate* on your documents.
- *view, compare, annotate* and *approve* Page Lists and multi-page documents.
- view *CAD Overlay referred in Graphics*.
- view *document attributes and document reference attributes*, edit and save them.
- open the *HTML5 Collada Viewer* to view documents in 3D. *Viewing 3D in the HTML5 Collada Viewer* on page 721

1. [The Information Bar](#)
2. [Top Tool Panel](#)
3. [Toggle Side Bar](#)
4. [Document Select](#)
5. [Attributes](#)
6. [Annotation List](#)
7. [Approval Details](#)
8. The View area
9. [3D View](#)
10. [Navigator](#)
11. [View](#)
12. [Channels](#)
13. [CAD](#)
14. [Info](#)
15. [Help](#)

See also: [HTML5 Viewer video tutorial](#).

The Viewer Window Layout

The Viewer window will be in the desktop layout if it is opened in a HTML5 compatible desktop browser.

When you open the Viewer in a tablet or a smart phone, you will get a mobile optimized layout.

This example layout has:

1. the top panel containing [the information bar](#) and [the top tool panel](#).
2. the central panel where you will see the document / image being viewed.
3. the left sidebar

4. the right sidebar
5. collapsed widgets.
6. a modal widget

Customizing the Viewer Window Layout

You can customize your window to suit your needs. You can:

- click-drag:
 - a widget to the center of the window (outside of the side panels).
This will make this widget a modal window. You can make a widget modal when you want this to always appear in the Viewer even when the browser window becomes small. The widget will remain modal even when you restart the Viewer.
 - a widget up or down in the same panel.
 - a widget from one panel to the other.
- collapse or expand a widget by clicking on its header. The sizes of the widgets in the side panel will adjust according to its contents. The scroll bars will help you navigate within the widgets.
- adjust the width of the side panels by dragging the border line.
- use the **Toggle Sidebar**  option to collapse the sidebars.

Note: Your layout settings will be saved for your next use.

See also [The Viewer Window](#) on page 630.

Note: If your browser window becomes too small, the sidebars will be collapsed automatically. Make your window larger to view the sidebars again. The modal widgets will stay in its location.

Opening a Document in the HTML5 Viewer

To **View and Annotate** in the HTML5 ViewerShare and Approve Viewer, you have to set your **Viewer Type** in the Preferences.

- To open a document in the Viewer, click the document's thumbnail or the  button.
You can do this from:
 - the **My Work** page (under **My Approvals** if you have documents to approve or under **Approvals to Follow Up** if you are an **Approval Master**)
 - the **Documents** tab in the project
 - the header of the Document Details page.
 - the **View and Annotate** link in the Documents/Bill Of Material page
- To load multiple documents into the Viewer, select them and choose **Actions > View and Annotate** .
- To open a document in 3D, click  from the [CAD](#) on page 675 widget or the [Document Select](#) widget. Read more in: [Opening Documents in the 3D Viewer](#) on page 723 and [Viewing 3D in the HTML5 Collada Viewer](#) on page 721.

The Information Bar

The Information bar displays:

- The **Project** name
- The **Document** name
- The **CAD info icon**: If your CAD files were saved using ArtiosCAD 14.0.2 or newer, you will see CAD info icons . The icons are:
 - Grain/Flute direction (Horizontal or Vertical)

- Side (Inside or Outside)
 - Die Side (Die Knife Side or Back Side, only for MFG files)
- The **Version** number and the **Revision** letter.

Note:

In **Compare** mode, the two document names and version (revision) details will be visible separated by */*.

compare1b.pdf (Version: 1) / compare1a.pdf (Version: 1)

- The **User Name**

Note: This will be used in **Annotations** and **Approvals**

Page Navigator

This is only available when a multi-page document is active.

Use this to navigate through the pages of open documents. Or navigate to a page by typing in the number and pressing **Enter**.

Read also [Viewing Multi-Page Documents and Page Lists](#) on page 710

- The **Print**  button. This opens the *Print Dialog*.
- The **Reset**  button. Use it to reset the layout of the viewer to the default.
- The **Java Viewer**  button. Use this to switch to the Java viewer.
- The **Show Keyboard Shortcuts** button . Click this or type in **?** to see the keyboard shortcuts.
- To **Display Help Pages**  button to open help pages.

Tip: To access online help, use the keyboard shortcut **F1** or click .

- The **Close** button . Use this to close the viewer and return to WebCenter. If changes have been made to *annotations* or to the *approval* state, the user will be prompted to save or discard the changes.
- We also have a print button and a button to switch between 'light' and 'dark' style viewers

The Information Bar

The Information bar displays:

- The **Document** name
- The **Print**  button. This opens the *Print dialog*.
- The **Reset**  button. Use it to reset the layout of the viewer to the default.
- The **Show Keyboard Shortcuts** button .
Click this or type in **?** to see the keyboard shortcuts.
- To **Display Help Pages**  button to open help pages.

Note: To access online help, use the keyboard shortcut F1 or click **?**.

- The **Close** button . Use this to close the viewer.
- You also have a print button and a button to switch between light and dark style viewers

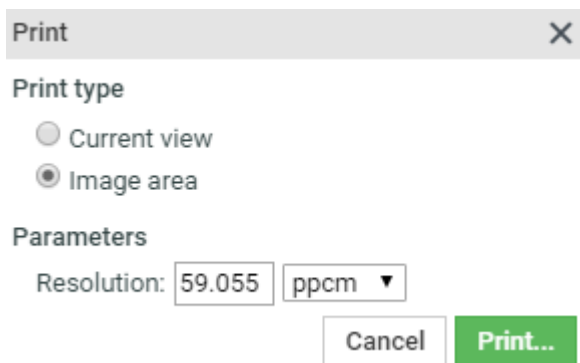

Print Dialog

Use the **Print**  to print:

- the current view
- the selected image area
- the annotation overview

When you click on the Print  button, the **Print** dialog opens. Specify your **Print Type** in this dialog.

Print Current view (default): Select this option when you want the entire view area to be printed. Your print preview will contain:

- all panels in the split view mode with borders
- visible ruler end point and read-outs
- annotation shapes and annotation note icons. The floating annotation text boxes are not printed.

The resulting Print preview changes the background color and the titles of the windows to white.

If only some of the channels are selected, select the **Print only selected channels** option. You will get all the channels in the print, if this is unchecked.

Print Image area:

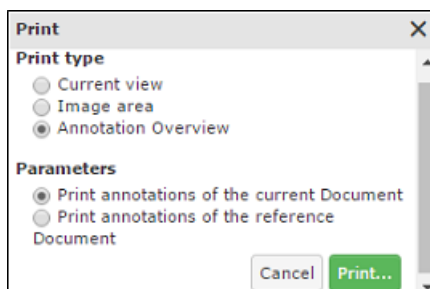

Choose this print mode to get a clean print of the current document page without the annotations, visible ruler endpoints or ruler read-outs. When multiple windows are active, either the composite of all the channels or the selected channels will be printed.

When you select this option, you have to specify the following **Parameters**:

- **Resolution:** Specify the resolution and resolution units (ppmm = pixels per millimeter, ppcm = pixels per centimeter or ppi = pixels per inch) here. The default value is 150 ppi converted to ppmm.
- **Print Current View** : Enable this to print only the current view area. Do not check this when you want the entire image to be printed.
By default, this remains unchecked.
- **Print only selected channels:** If only some of the channels are selected, select the option. You will get all the channels in the print, if this is unchecked.

Print an overview of all the annotations:

If you use this option, you get the same result as from the WebCenter annotations printing. If the viewer is in compare mode, choose to:

- **Print annotations of the current document**
- **Print annotations of the reference document**

You will be prompted to save the annotations before printing. The unsaved annotations will not be printed.

When you click **Print** in the dialog, a print preview will open in a new tab or window. Use the **Print** link from this preview.

Note: The paper size is not considered in this setting. This has to be specified in the print setting of the browser.

Note: Only Annotation Overview can be printed for video documents with annotations.

Top Tool Panel

The Top Tools Panel contains some of the Viewer's most used tools. They help you in document interaction.

Navigation Tools

-  Zoom tool
-  Zoom in tool
-  Zoom out tool
-  Zoom to 1:1 Pixel
-  Zoom to Actual Size
-  Fit Document in View tool
-  Pan tool

See [Interactive Zooming](#) on page 638 for more information.

Orientation Tools

-  Rotate view tool
-  Mirror view tool

See [Rotate and Mirror](#) on page 640.

Measure Tools

-  Ruler tool to [Measure Distances and Angles](#) on page 640
-  [Measure Color Percentages](#) on page 643 (densitometer) tool
-  [Check Bar Codes](#) on page 646 tool
-  [Check Braille](#) on page 644 (Powered by Global Vision) tool
-  [Caliper](#)

3D Tool

- If you have opened a document in the [HTML5 Collada Viewer](#) once, the top tool panel will show an **Open 3D View**  button.

Annotation Tools

-  [Hide Annotations](#) on page 689 tool
-  [Add Annotation](#) on page 678 tool
-  [Note Annotation](#) on page 682 tool

See [Annotating in the Viewer](#) on page 678 for more information.

Page List Tools (only when viewing a page list / multi-page document)

-  Reader Spread view
Read more in [Reader Spread View](#) on page 711
-  Arrows to navigate between pages or spreads
-  Mark the active page. A yellow star indicates that the active page is marked.
-  Clear Mark from the active page.

Compare Tools (only when comparing)

You can only see the **Compare** tools when you have two documents open to compare (see).

-  View Current Version
-  View Reference Version
-  View Both- Blinking
-  View Both-Show on Top
-  View Both-Show Difference
-  View Both- Side by Side

See [Compare Documents in the Viewer](#) on page 696 for more information.

Approval Tools (only when an Approval Cycle is set up)

The Approval tools are only available when an **Approval Cycle** is set-up and you are an approver for the document. The number of Approval tools may vary depending on the approval setup.

-  Approve
-  Reject
-  Comment

If you are the Project Manager in WebCenter, you have tools to

-  Force Approve
-  Force Reject

See [Approval](#) on page 693 for more information.

Interactive Zooming

You can use the **zoom** tools from the [Navigation Tools](#) to view the fine details of your file.

Activating the zoom

Select the Zoom tool  to activate the zoom. Alternatively, activate the Zoom tool by pressing the **Z** key.

When Zoom is activated, the mouse pointer changes to  icon. Use the following shortcuts to effectively use the zoom function.

Click	Zoom in by a factor of two
Right -click	Zoom out by a factor of two
Alt + click	Reverse the zoom to Zoom out 
scroll	Zoom in/out with the location of the mouse as center.

Tip: Double-clicking on the zoom tool  will fit the document back to view from whatever zoom factor it was in.

Zooming into a specific area

Use Click-drag action to zoom into a specific area to examine the finest details of your document. When you hold the left mouse button and drag, a selection rectangle will appear. You can change the size of the selection rectangle by dragging the mouse without releasing the left mouse button.

To move the selection rectangle around, hold the left mouse button and **space** bar while dragging.

When the left mouse button is released, the viewer zooms to fit this rectangle.

If you are zoomed in with a ratio 1:10 or more, each document pixel is displayed with a small border as a grid. In compare modes, you will see the active document area as grid.

Zoom to 1:1 Pixel

When you have artwork with a defined resolution, you can use it to zoom to the image resolution.

- Right-click on  and select from:
 - **Zoom to 1:1 Pixel:** use this to view the image in its rasterized resolution.
 - **Zoom to Actual Size:** use this to view your artwork or image in the size corresponding to the printed size. You may need to set your monitor resolution to make this accurate.

Note: When the monitor resolution is not set or when the image resolution is not set, the Viewer takes 72ppi as default.

- **Set Monitor Resolution:** use this option to set your monitor resolution. Your set monitor resolution will be stored in the Viewer.
 - You can specify the resolution as a decimal number (e.g. 36.05 ppcm) or as a fraction in the `pixels / size` format. Read more about this in the [Knowledge Base article](#).

Note: Your settings will be saved for your later use.

Using the Pan Tool

To pan the view, click the  Pan tool or activate the Pan tool by pressing the **H** key. The pan tool lets you grab a location in the document and drag it to a new location.

Tip:

- You can pan the document by holding the **space** bar and dragging a line in the Viewer window. When you release the **space** bar, it returns to the previous mode.
- For a single pan action, use the .

Tip:

While panning, you can zoom in/out with the mouse point as the center in the following ways:

- double-click to zoom in
- right-click to zoom out
- scroll to zoom in/out

Using the Navigator

When you are zooming in the document, the navigator shows the highlight area as the zoomed area. To pan the document, hold the mouse and drag this selected rectangle around. The central view port will display the area correspondingly. Clicking outside the rectangle will move the rectangle to the clicked point and update the current visible area.

When the **zoom** is not activated, you may use these short-cuts to work with the zoom.

Ctrl + / Cmd +	Zoom in one step
-----------------------	------------------

Ctrl - / Cmd -	Zoom out one step
Ctrl 0 / Cmd 0	Zoom to fit. This will adapt the zoom to fit the entire image in the current window.
Double click the zoom tool	Zoom to fit

Rotate and Mirror

You can rotate or mirror the document in view using the [Orientation tools](#)

-  **Rotate view:** Rotates the current view by 90 degrees clockwise.
-  **Mirror view:** Mirrors the current view.

Use this to flip the document vertically from the center of the screen. If you are zoomed into an area, the center of this area will be used as the reference.

Tip: The shortcut **Ctrl+M** can be used to flip the view.

Measure Distances and Angles

The **Ruler** tool calculates the distance between any two points in the work area with a click-drag-release action.

When you measure from one point to another, a line is drawn and you can see measurement information such as:

- The starting location (X and Y).
- The angle measured relative to the axis (A).
- The total distance (D), the Horizontal Distance (W) and the Vertical Distance (H).

in a pop-up in the View.

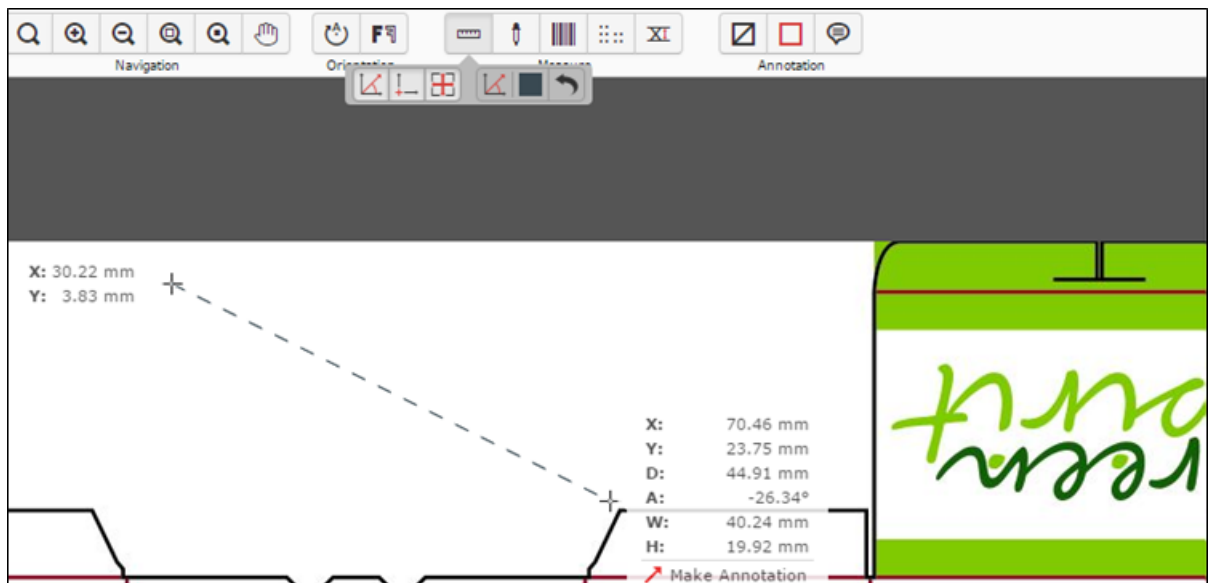

Measuring the distance

1. Select the  Ruler tool.
2. Specify the measurements in the pop-up tool bar that appears below.
 - : Displays the Angle (A) and the Distance (D)
 - : Displays the starting and end location (X and Y)
 - : Displays the horizontal (W) and vertical (H) distances traveled from the x- and y-axes.

Note: You can choose to display all of the measurements by selecting all of the above. If you select just one, corresponding measurements will be displayed.

- : Displays the Angle (A) positive upwards (Counter Clock Wise)
- : Displays the Angle (A) positive downwards (Clock Wise)

- : Changes the color of the Ruler line in the View
 - : Resets the color of the Ruler
3. Drag from the start to the end point.
 An information pop-up located at the end point will display the measurements. The location  will be visible at the start point.
 You can drag the line to another point and the ruler will update its measurements. To move, drag the start or end point to another location.

Note: While viewing CAD data, then the **Ruler** will snap to the end points of most line segments in the CAD drawing.

Tip: The Ruler tool can be combined with different view tools. You can for example indicate a certain point, then change the view by zooming out, navigating, and then indicate the second measuring point.

To make an annotation from this pop-up, click on the **Make Annotation** option. You will get an arrow annotation with the current measurements as its content.

Measure Screen Ruling

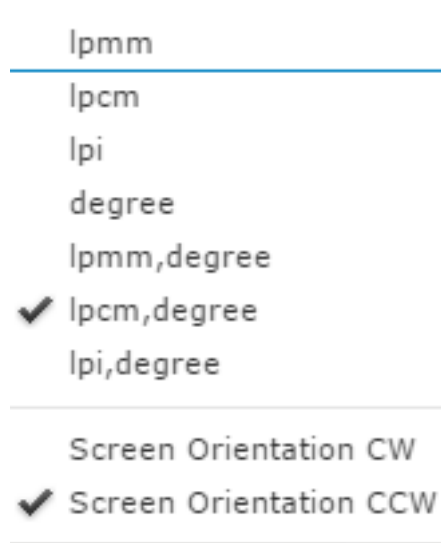

You can use the **Screen Ruling and Angle**  tool to measure the ruling and angle in digital film files.

Click  to activate the tool and then select a point in your file or drag it to measure within an area. The measurements are shown in [the Channels panel](#) and in a pop-up near the point or area you measured.

For each measured channel, you can see the lines per millimeter (lpcm) and the angle (degrees) of the line in the pop-up. When there is no screen in a channel, the value will be blank.

You can change the units of the measurements from the information pop-up. Click the **settings**  button and select your preferred units. Your units will revert to the User Preference settings when you close the active session.

To change the orientation of the angle to either clockwise (**Screen Orientation CW**) or counter clockwise (**Screen Orientation CCW**).

To make an annotation from this pop-up, click on the **Make Annotation** option. You will get a rectangle annotation with the measurements as its content.

Measure Color Percentages

You can use the densitometer  tool to measure ink coverage at a certain point or at the selected area.

Click in your file with the densitometer tool to measure the color percentages at a certain point, or drag it to measure densities within an area. The densities are shown in [the Channels panel](#) and in a pop-up near the location you measured.

You can also click the  tool button to make a measurement based on the current view. In this case, the densities are only visible in the **Channels** panel.

Note:

While viewing Digital Film files, you can change the units of the information pop-up. Click the **Unit Settings**  button and select your preferred units. Your units will revert to the User Preference settings when you close the active session.

To make an annotation from this pop-up, click on the **Make Annotation**  option. You will get a rectangle annotation with the measurements as its content.

Check Braille

Check Braille  tool allows you to analyze and interpret the Braille text in the selected language.

Note: The tool is visible only when the system has an Advanced Approval License.

Select the area around the Braille text with a click-drag-release action. You can also select the Braille text area and click the  tool to interpret the selection. The result appears in [The Channels Panel](#) and in a pop-up near the location you measured.

You can choose the language from the language list by clicking on the current language visible under the braille tool.

Note: By default, English is selected. See also: [Braille Languages Supported in the Viewer](#) on page 645

The tool checks the validity according to the Marburg Medium Braille Specification. A green tick-mark indicates a valid Braille. If the selected Braille contains at least one regional code that doesn't pass these checks, you will see a warning.

Note:

The validation check has a Tolerance of +/- 0.1 mm and a dot diameter range of 1.3 – 1.6 mm. See details below:

- 2.5 mm horizontal dot to dot
- 2.5 mm vertical dot to dot
- 6.0 mm from cell to cell
- 12.0 mm from cell to cell with single space in between
- 10.0 mm line spacing

When multiple lines are present in the Braille text, a line number in square brackets will be shown before the text of each line. For example, [1] for the first line.

 [1] boots cold and flu [2] relief echinacea

To make an annotation from this pop-up, click on the **Make Annotation**  option. You will get a rectangle annotation with the measurements as its content.

Braille Languages Supported in the Viewer

// 1: English

// 2: French

// 3: Polish

// 4: Portuguese

// 5: Russian

// 6: Spanish

// 7: Finnish

// 8: German

// 9: Italian

// 10: Latvian

// 11: Romanian

// 12: Slovene

// 13: Swedish

// 14: Hungarian

// 15: Dutch

// 16: Maltese

// 17: Danish

// 18: Greek

// 19: Bulgarian

// 20: Czech
// 21: Estonian
// 22: Lithuanian
// 23: Irish (Gaelic)
// 24: Albanian
// 25: Basque (Spain)
// 26: Belarusian
// 27: Catalan (Spain)
// 28: Croatian
// 29: English (UK)
// 30: Faroses (Denmark)
// 31: French (Traditional)
// 32: Galician (Spain)
// 33: Greenlandic
// 34: Icelandic
// 35: Kazakh
// 36: Norwegian
// 37: Serbian
// 38: Slovakian
// 39: Turkish
// 40: Ukrainian
// 41: Uzbek

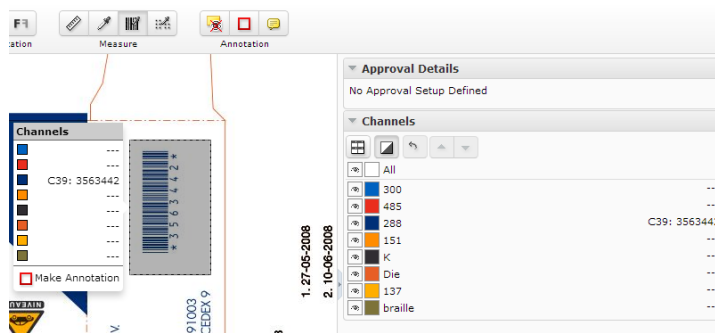

Check Bar Codes

Use the Check Bar Code  tool to analyze and interpret the Bar Code text in the selected language.

Select the area around the bar code with a click-drag-release using the left mouse button. You can also select the area and click the  tool to check the bar code. The result appears in [The Channels Panel](#) and in a pop-up near the bar code.

The following information will appear in a pop-up:

- **Type:** The bar code type
- **Value:** The encoded value
- **Magnification:** The bar code magnification in percentage (visible only when the value is not 100%).
- **Bar Width Reduction:** The line width compensation in mm. (visible when the value is not 0).

Note: The information will be displayed in the following order :
 <Type>: <Value> <Magnification> % [<Bar Width Reduction> mm]

The tool is visible only when the system has an Advanced Approval License.

To make an annotation from this pop-up, click on the **Make Annotation**  option. You will get a rectangle annotation with the measurements as its content.

Caliper

Use the **Caliper**  tool to measure and standardize the height or width of aligned objects in the Viewer. For example, you can use this to check the text height in your artwork. You can create a **Preset** to customize your Caliper to your standardization and compliance needs.

Click the Caliper  button from the **Measure** tools to activate the tool. You will get the **Free** style as the default Caliper form. In the sub tool bar, you can:

- select the **Style**. Choose from the **Style** options:
 - **Free** (Default)
 - **Fixed**
 - **Preset**
- specify the **Gap** Size which is the distance between the start and end lines. If your selected **style** is:
 - **Free**, changing the **Gap** size will alter the end line.
 - **Fixed**, the distance between the start and end lines update according the **Gap** size.
 - **Preset**, the saved **Gap** size will be applied
- define the orientation as either vertical ( **H**) or horizontal ( **W**).
- **Save** the **Gap** size and orientation as a **Preset**. The saved **Presets** will be added to the **Style** drop down. Use the **Delete Gap** option to delete the saved **Presets**.

Free (Default option):

- Hold down the left or right mouse button to draw the start line and drag to the end line. Release the mouse when the desired width or height is achieved.
- To adjust the height / width, simply drag the lines. You may also move the caliper form from one location to another.

If the horizontal distance between two selected points is larger than the vertical distance, you will get a vertical form to measure the width.

If the vertical distance measures more than the horizontal, you will get a horizontal form to measure the height.

Note: The Caliper tool will switch to horizontal or vertical orientation corresponding to the direction of your mouse movement.

A pop up will display the current gap size and the X / Y coordinate of the end line. The information is updated when you move the lines of the Caliper.

- You can **Save/Delete** the **Gap** size and the H / W as a **Preset** on your profile. This allows you to have a customized Caliper form for your future use.

Fixed:

In this mode, you can specify a fixed **Gap size**. Use this when you want to standardize your artwork object to a pre-determined size. For example, if you have a certain text height needed in the artwork, specify that as the gap size and check the artwork text.

- Specify the **Gap** size.
- Use **H** or **W** button to fix the Caliper orientation.

Note: When it is fixed, the your mouse movement will not alter the Caliper orientation.

- Hold down the left or right mouse button to draw the start line and the end line will be drawn according to the **Gap** size.
- Click **Save** to create a **Preset** with the current measurements (the gap and the orientation).

Preset:

Select your saved **Preset** in the **Style** selector. Hold down the mouse to draw the lines with your preset **Gap** size and **Style**.

Note: In the **Fixed** and **Preset** mode, you can grab the start or end line to drag the form to another position.

Press **Esc** to revert to initial state (no lines drawn).

Text Selection in Viewer

You can select the text in the document by clicking on **Text Selection** button for any PDF, AI files and documents with SVG perspective in the Viewer.

When you select the text, you can also

- **Search in text:** Search for specific text in the sub toolbar of the text selection tool. The searched text is highlighted which you can zoom to or navigate to the selected text using the previous and next buttons in the sub toolbar.
- **Select all text:** Select all the text statements in the document using the **Select All** . You can also alternatively select all the text using Ctrl+A keys in the keyboard. Right click on the selected text to either highlight the text or add an annotation or copy.

You also have an option to find the font and the font sizes used in the document.

- **Detect Font :** Click on this icon and then click on a selection of text to detect the font in the selected text. A pop over is shown with the Font, Font Size, Selected text and an hyperlink to make annotation.

- **Check Font Sizes:** Click on this icon and then select the font size using the text box or slider to detect text which text is smaller than the selected font size.

Text Edit Mode

You can edit the text in the artwork document with the **Switch to Edit Mode** icon. This would be helpful to correct or change the text instantly from the WebCenter Viewer.

Click on the **Switch to Edit Mode**  icon, to switch to edit mode. Following widgets are enabled when you Switch to Edit mode.

- Annotation Widget
- **Files marked for edit widget**
- **Actions widget**
- Channels widget
- Navigator widget
- Info widget
- Help widget
- Zoom/Pan tools
- Rotate/Mirror tools
- Text Selection tools
- **Switch back to view mode and save button**

You can choose the files where the text has to be edited in bulk in **Files Marked for Edit** widget.

Open 3D View

If you have opened a document in the [HTML5 Collada Viewer](#) once, the top tool panel will show an **Open 3D View**  button.

Click this to generate the [3D View](#).

Finishing Profile

When you select the 3D button in the top bar, two new widgets appear namely

- **Print Finishing**
- **Geometry**

When your document is a PDF or AI Document, it is possible to simulate the Finishing effects in the 3D Viewer. To do that, the user can select a **Finishing profile** when a 3D structure is selected in the **Compare** Widget.

The Finishing Profile is a file that can be exported by Studio. When stored in the same project as the Graphic Document or in the StudioManager project, it will be possible to select it in the Viewer.

Note: Generation of the Graphics with a Finishing Profile may take a while.

2.5 D

You can preview your artwork with finishing effects without having a Collada file available. In the **Document Select** Geometry widget in the viewer, you can navigate to **Structure Document** Shape option.

There is a built-in Structure Document curved sheet that is used to see how the artwork would render in a 3D environment. You can change the angle of the curve as per requirement.

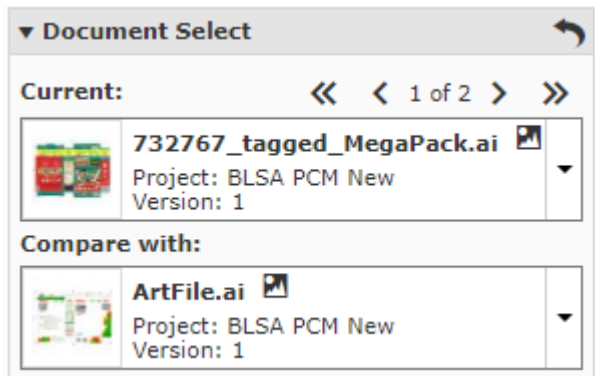

Click on the **Open 3D view** **Update 3D Model** button, to show a surface in the angle that was chosen. The surface contains the graphic, which will follow the selected Finishing Profile.

Document Select

The **Document Select** panel allows you to select the **Current** view from the multiple files (documents or document versions) loaded into the Viewer.

The panel will contain three document lists:

- **Current**
- **Compare with**
- **Structure Selector** (only available with Graphic Documents)

From the **Current** list, select the file you want to view. You can switch to different documents view from this list.

You can also add new documents in both Current or Compare With to the list by clicking on **Find More Documents**. This opens a **Select Document** pop up window. You can filter the document based on the Document Name or Project Name.

Note: If you do not want to compare documents or versions, leave the **Compare with** field empty.

Compare To

The **Compare To** list contains the possible reference documents. Select the reference document from this list to compare to the **Current**.

When a reference document is selected from the **Compare to** list, the lower part of the panel will display controls for adjusting **Channel Matching**, **Orientation** and **Alignment**.

Read [Compare Documents in the Viewer](#) for more details.

Selecting Documents

You can select the current and the reference versions using the two document selectors in the **Document Select** panel.

Note: The reference document type has to be the same as the active document type. For Example, when a CAD document is active only other CAD documents can be selected as the reference.

The [The Information Bar](#) displays the selected active and reference document name and version.

The Viewer will start the last used compare mode except the **Show Current** and **Show Reference** modes.

Selecting Multi-Page Documents

You can select the **Current** and **Compare to** pages using the two document selectors in the **Document Select** panel.

While comparing multi-page documents, a **Reset**  button is enabled in the **Document Select** header. If you have defined a special mapping for [comparing pages of multi-page documents](#), you can use this to reset the mapping. You have to specify whether to reset the mapping of the active page or for all pages.

Read also [Channel Matching, Orientation and Alignment in Compare Mode](#).

Structure Document Selector

While viewing a [graphic file with CAD reference](#), the **Document Select** widget will have:

- a Structure Document selector listing all the CAD documents and 3D Documents opened in the Viewer and the [CAD references](#) associated with the graphics file.

If a Structure /CAD reference is found, you will see this in the [document select](#) panel with

a link  icon. You can select this to view together with the graphics document. If the graphics file does not have a XMP link, you can use the [document references](#) feature to link them.

To remove the CAD link from the graphics file, click **Turn off CAD Overlay** in the **CAD Overlay** selector and **Save**.

Read more in: [Viewing CAD with Graphics](#).

- **Open 3D View**  button. Click this generate a [3D View](#).

Note:

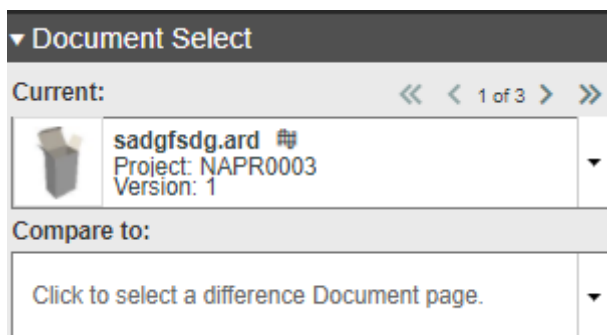

The 3D button will be available in this widget only when it is possible to generate a 3D from the current Graphics and the selected or referred CAD overlay.

Use **Ctrl+S** to switch between Show Current and Show Reference compare modes

Multiple Documents Select option

You can view multiple documents one by one in the viewer. To view, select the multiple documents in the **Documents** panel and click **View and Annotate**. In the Viewer, **Document Select** panel, you can choose the documents in the **Current** and **Compare to** options.

You have the option to go the first document, previous document, next document or to the last document chosen with the arrow keys.

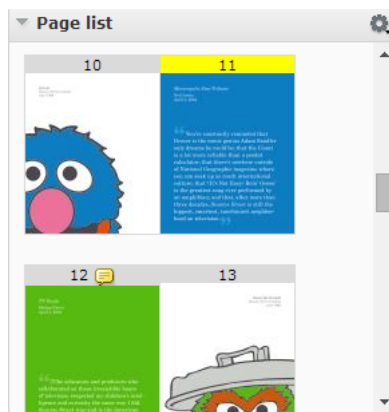

Current selected Document Index displays the number of documents selected and the number of the current document displayed.

Page List

The **Page list** panel will be available when you open multi-page or page list documents.

The **Page list** panel will be available when you open multi-page documents

Here you can:

- see the thumbnails of all the pages. Each row will contain two thumbnails.
- configure size to **Small Thumbnails**, **Medium Thumbnails** or **Large Thumbnails**
- view a specific page by clicking the corresponding thumbnail. The thumbnail of the active page will be highlighted.
- view the page name or folio for the thumbnails. This allows you to select a page corresponding to a folio or page name.
- view which pages are annotated. These pages will have a note on the thumbnail.
- view the approval status of individual pages of a Page list. A blue circle indicates the pending approvals on a page. Read also [Approval in Page Lists](#) on page 713.

Note: You can define page by page approval in a page list. For a multi-page document, the approval set-up is for the entire document.

- view the blank and empty pages as thumbnails. The blank pages of a page list will be displayed as white thumbnails and the empty pages as crossed thumbnails.

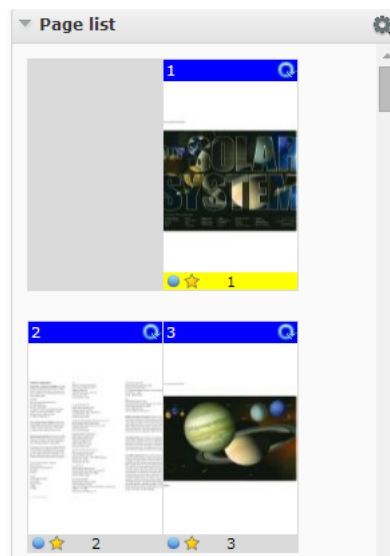

Note: You cannot view empty pages. You can view the blank pages, but you cannot annotate or compare them.

Tip: You can collapse other widgets to make more space for Page List panel while viewing large multi-page or page list

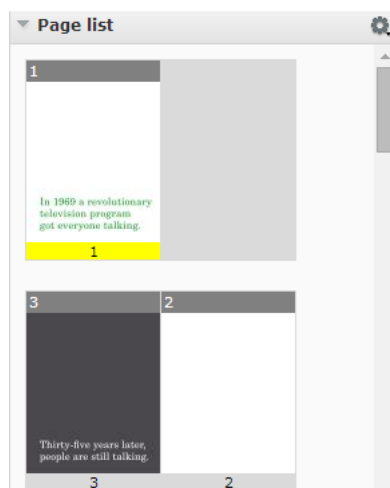

Read also [Viewing Multi-Page Documents and Page Lists](#) on page 710

The page thumbnails of a page list or multi-page document are displayed according to the binding type:

- Left edge binding: the first page and the odd numbered pages are displayed on the right. The even numbered pages will be on the left.

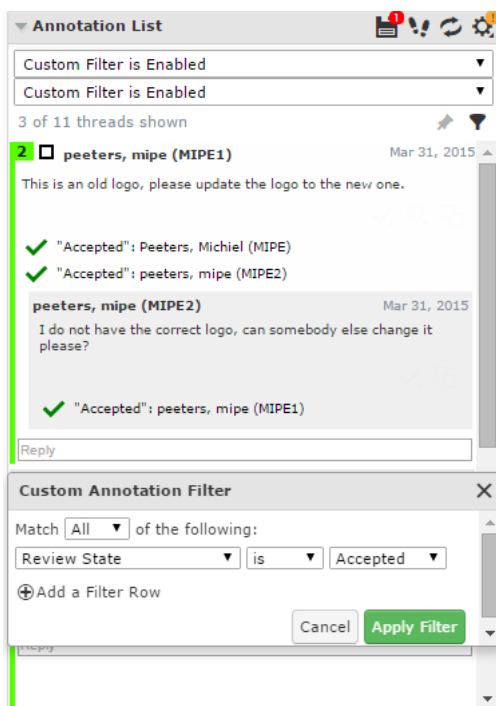

- Right edge binding : the first page and the odd numbered pages are displayed on the left. The even numbered pages are displayed on the right.

Annotation List

The Annotation list panel provides a listed view of the existing annotations in the currently viewed image. You can collapse this panel to hide the annotation list panel.

You can see them in the created or modified order depending on the [setting](#) and filters. Replies are visible immediately below the corresponding annotation in the created/modified order.

The Annotation list panel has tools to:

- [Save annotations](#)
- [Step through annotations](#)
- **Reload :**

You can **Reload** the annotations of the active image. This reloads all annotations without restarting the viewer. You will be warned about unsaved annotations while reloading.

- [Annotation Options](#)
- [Filter Annotations](#)
- [Create Custom filters for annotations](#)

If you select an annotation either in the annotation list or in the viewport, this will be highlighted in the annotation list. You will also see the possible options concerning the annotation and its replies.

Note:

The time will be displayed as **5h ago**, yesterday, 2d ago... To see the exact time, hover over the displayed time.

Note: In video annotations, start time and end time of the annotation is displayed in the list.

Tip:
If you click and hold the left mouse button on an annotation in the annotation list, the annotation becomes highlighted in the view.

From within the Annotation list panel, you can:

- **Set Review State**  of the annotation
- **Zoom to annotation** 
- If you are the author you can perform more actions via **More actions** 
 - **Edit Annotation**
 - **Duplicate Annotation**
Use this to make a variation (e.g. correction) of an annotation made by another user.
 - **Save Annotation**
 - **Delete Annotation**
You can only delete comments that you have authored. All the replies to the deleted comments will also be deleted, irrespective of the author.
- Filter annotations by **User** or **Review State**.
- Click  **Edit Custom Filter** to get the **Custom Annotation Filter** window.
- **Lock Filter** by clicking the **pin** .

If you lock a custom filter, it stays active for other documents and consequent viewer sessions.

Approval Details

In **Approval Details**, you can see:

- the current approval status
- the approval actions
- approval info.

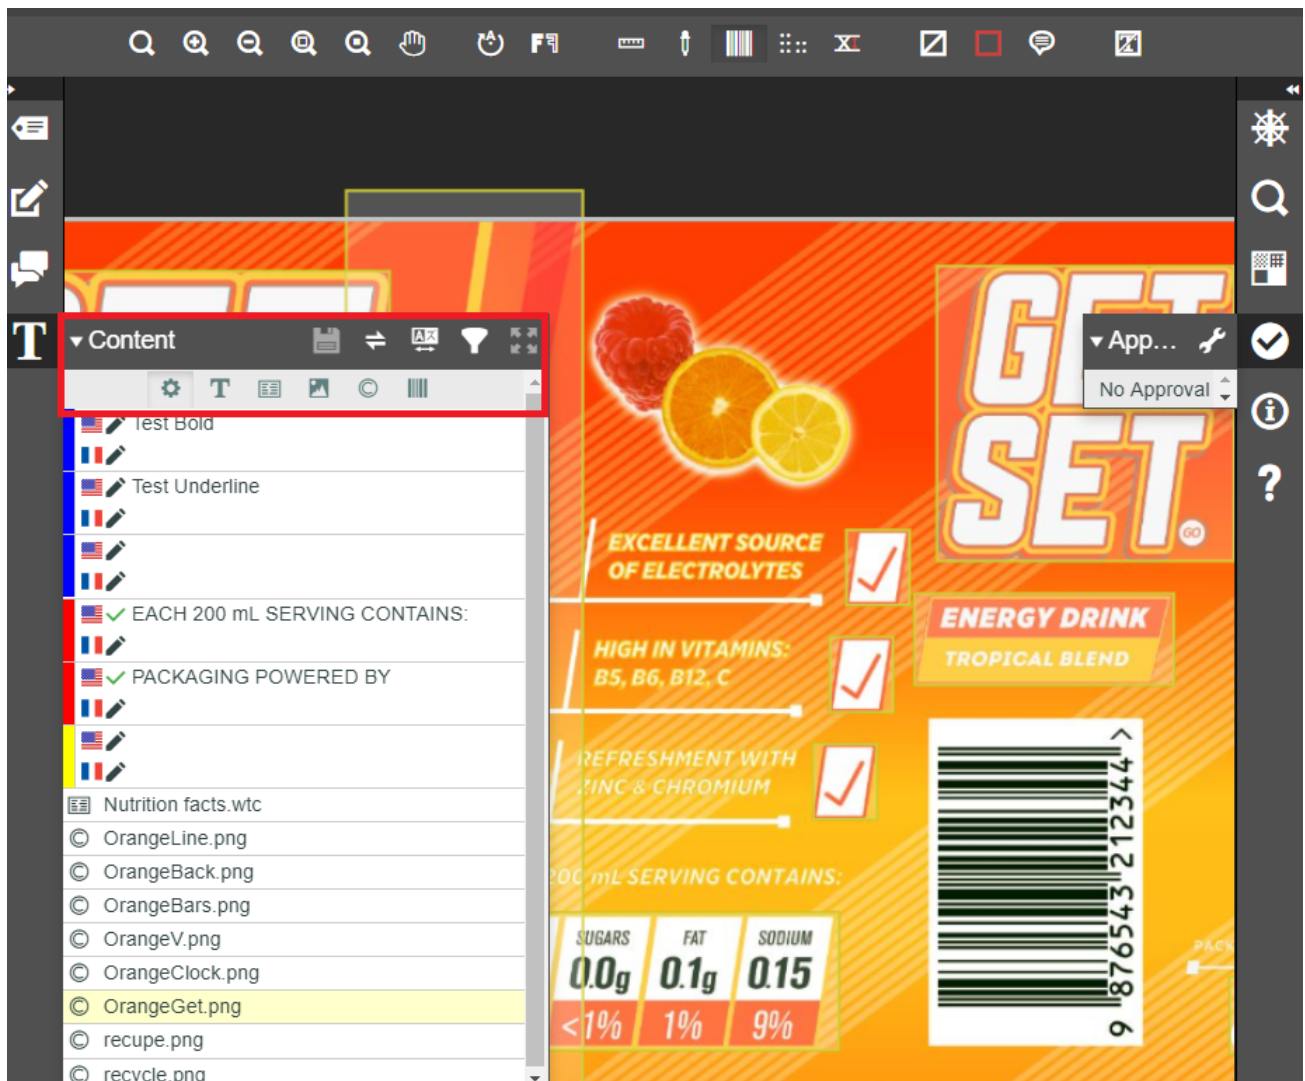

You can collapse/expand this widget and drag it around.

Content Widget

Artwork documents that contain Images, Symbols, Tables, Text Contents and Barcode as reference documents can be viewed in the viewer. You can view all the above content or filter the specific content to view in the Content Widget.

If the artwork (AI or normalized pdf) contains location information for any of the dynamic elements, then an annotation is shown around the dynamic element.

View and Filter Content

By default, when an artwork is viewed in the viewer, all the contents of the artwork are visible without any filtering.

You can view all the content in the artwork or you can view and filter the contents based on

- Text Content
- Tables
- Images
- Symbols and
- Bar codes

Note: If there are no document references used in the artwork, then the content widget will not be shown.

Map Locale to Languages

You can view the **locale id** present in the artwork and map it to the languages existing in the project. If either the Project or the Document attribute category contains the hard-coded attributes **LOCALE_XX**, then locale mapping will be automatically taken from these attributes. If no locale id are mapped to languages in the project or document attributes, then user can manually assign the values in the viewer.

3D View

The **3D View** widget always shows the HTML5-version of the 3D viewer. After the 3D generation, you can view the 3D mockups in this widget.

From within this widget, you can:

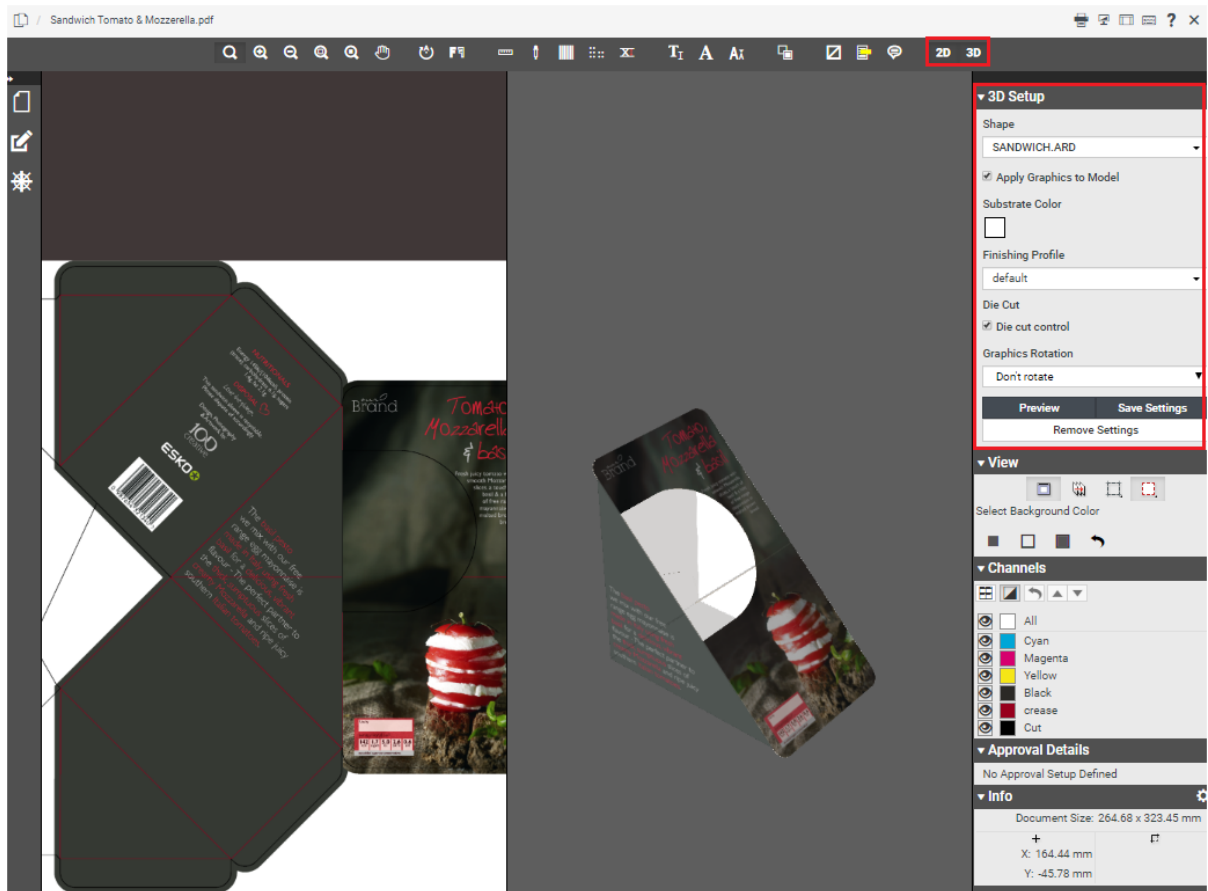

- **Open the 3D Viewer**  in a new window
- close the **3D View** widget.

3D Setup in Share and Approve Viewer

You can open any graphical document such as a pdf or an AI document in Viewer and view the document in 3D. You can also view the 3D setup of a graphical document along with the structural document (like Collada) by selecting the documents together from the same folder and clicking on **View and Annotate**.

You can visualize the document with 3D features like transparency, reflection and using the mouse to rotate, zoom in or zoom out.

Click the 3D toggle button to enable the **3D Setup** Widget, and save the settings.

You can add the **Shape**, **Finishing Profile** and **Substrate Color** for the document viewed in the 3D Setup Widget and preview the same in the viewer. The options available are:

- **Shape:** Choose one of the options in the drop down namely **Flat sheet** or **Curved Sheet** or Find Documents in the folder.
 - When the option **Curved Sheet** is chosen you can specify the angle of the curvature in degrees.
 - Choose one of the printable parts.
- **Substrate Color:** Choose the color from the color palette depending on the substrate it is printed on.
- **Finishing Profile:** Choose the profile from the drop down list to view your graphics document in the chosen profile. You can also configure a Separation Mapping.
- **Die Cut Control:** Choose to show the Die cut lines in the 3D graphics document.
- **Sheet Size:** Choose the sheet size from the drop down.
- **Graphics Rotation:** Choose the Rotation angle from the drop down, if you want to rotate the graphics on the 3D model.

You can choose **Preview** to view the settings instantly in the 3D Viewer. You can also **Save Settings** or **Remove Settings**.

Save Settings and **Remove Settings** options are available for **Approval Master** and **Editor** Roles.

How to Configure Custom finishing Profile

Esko Share and Approve viewer can visualize 3D simulations of specific finishing effects, such as varnish. A Finishing Profile defines how the separations of a given PDF are mapped to these effects.

Share & Approve comes with nine default Finishing Profiles and each profile maps to the operations that is suitable for the substrate.

Share & Approve allows you to use custom Finishing Profiles made by Esko Studio visualizer. You can read more on how to use the Custom Finishing profile [here](#).

How to Configure a Separation Mapping

When visualizing graphics in 3D in Share & Approve, users may select a **Finishing Profile** from a list of defaults. This **Finishing Profile** maps separation names to the 3D effects. The list of default finishing profiles available in the Share and Approve may not suffice your requirements. When you want to add your own custom Separation Mapping, follow the steps given in the Knowledge base article [here](#).

Note: Ensure that other users have access to your separation mapping when saving the settings by placing them in the same folder as the graphical document.

Navigator

When you open a document in the Viewer, you can view its thumbnail in the **Navigator**. This gives an overview of the current view position. Use this widget to quickly navigate through the entire document.

The navigator highlights the area visible in the view port with a dotted rectangle. If the zoom is not active, the dotted rectangle will be around the entire document.

When you are zooming in the document, the navigator shows the highlight area as the zoomed area. To pan the document, hold the mouse and drag this selected rectangle around. The central view port will display the area correspondingly. Clicking outside the rectangle will move the rectangle to the clicked point and update the current visible area.

You can see the current zoom percentage at the slider bar located below the document thumbnail. You can adjust the slider or click the + or - to adjust the zoom level.

Note: By default, this widget is available on the right sidebar. You can drag this widget to the center or to the other sidebar.

Info

This widget displays information about the document being viewed. You can see the following info:

- the size of the active document
- the size of the trim box of the current page
- the resolution of the active document. If you are in compare mode, it will display the resolutions of the current and reference documents.
- the current mouse position in the document
- the current selection within the current page document when using measuring tools

In this widget you can change the units for resolution and measurements. To change, click  and select your preferred units.

Note:

The changes made will be applied to all of the Viewer measurements for the current session:

- Offsets in Compare panel
- Information Pop-ups of all measurement tools and Caliper tools

Note:

The changes made from the info widget are applied only to your current session. The next time you start the Viewer, the units will be reset to the WebCenter User settings.

Note:

To switch units for resolution and measurement, use shortcut keys. While switching, it takes the values of the next unit from the drop down list.

- **Ctrl+U** to toggle the units for the sizes used in the Viewer.
- **Ctrl+Shift+U** to toggle the units for the current resolution and screen ruling units.

▼ Info 	
Document Size: 214.00 x 305.00 mm	
Trim Size: 210.00 x 297.00 mm	
Resolution: 185.039 ppcm	
+	
X:86.32 mm	X:91.45 mm
Y:200.41 mm	Y:107.26 mm
	W:87.60 mm
	H:101.27 mm

View

This widget contains advanced tools for view manipulation such as:

- *changing the background color of the image or window*
- *view from the back*
- *highlighting overprint with colours*
- *viewing or hiding the trimbox (margins) and clipping to trim box*
- *viewing in inverse colors*
- *compensate distortion and scaling while viewing*

Change Background Color of the Image or Window

You can use this tool to manipulate the view with a different background color other than white. This is especially useful when you are evaluating an image that will be printed in a colored background.

When you click the **Change Image or Window Background Color**  tool, you will get an additional row of tools in the View widget.

- **Change Image Background Color...** 

When you activate this option, you will get a color picker. Select the image background color and click  to return.

Tip: You can also click outside of this color picker to close the color picker and inspect the image with the new background.

- **Change Window Background Color...** 

Select your color as described above and inspect the image with the new window color.
- **Change Both Image and Window Background Color...** 

When you activate this option, you will get a color picker to select a color for the image and window background. Select the image background color and click the  to view the result.

Note: Your color choices are remembered for your next session. When you enable the background color options, the same colors will be available.

- **Reset Background Colors** 

Note: The Viewer retains the last used colors for your next session. However, if you select different background colors for different pages or documents, those will be remembered only in the current session.

To turn off the tool and view the image with white background, click the  again.

View from Back

Use the **View from Back**  to mirror the view. You can see the image from the back and the channel sequence will be reversed.

This is a useful tool if you are inspecting an image to be printed on a transparent medium.

Set Overprint Highlight Color

The **Set Overprint Highlight Color**  lets you select a mask color to display in all areas where two or more active channels are overlapping. This allows you to check if trapping is done correctly.

Click the  tool on or off to have the overprint color highlight on or off.

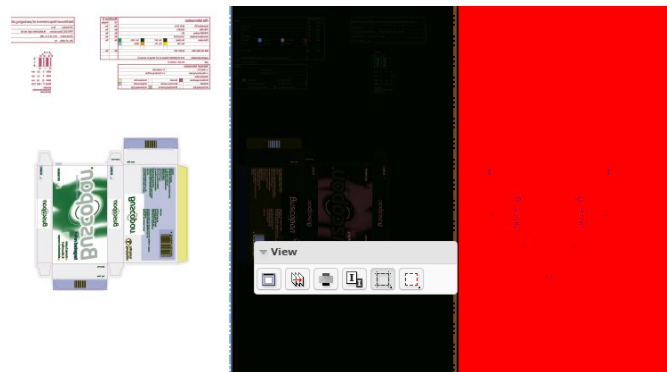

Note: Click **Ctrl+H** to switch between No Overprint display and Overprint display with the last selected color

Invert View

Use the **Invert View**  option to invert the image or images being viewed. While comparing, if you enable **Invert View** option, both the images will be inverted.

The *orientation and alignment tools* in the **Document Select** widget has **Invert Reference Image**  option. When this is enabled, the reference image will be inverted.

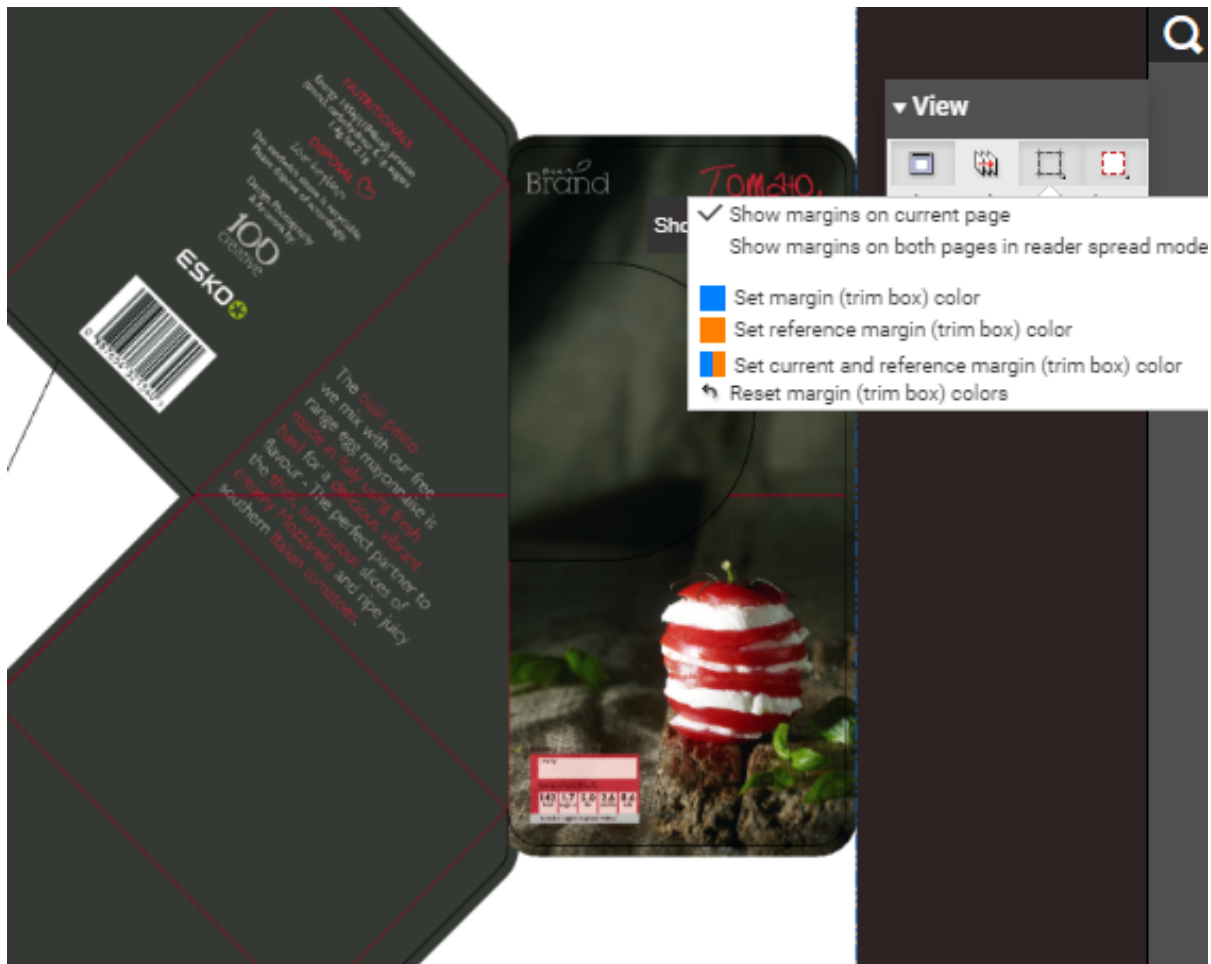

Note: If you enable the **Invert View** option in the View widget after inverting the reference image, your reference image will be displayed in the original state.

Show or Hide Margins (Trimbox)

The **Show/Hide Margins(Trim Box)**  option allows you to toggle the margin (trim box) lines on or off.

While viewing an image with trim box information, this option will display the trim box as colored margin lines. If there is no trim box, the margin lines will follow the image outline (media box).

Right-click on  for options:

- **Show margins on current page**
- **Show margins on both pages in reader spread mode**

- **Set margin (trim box) color** sets the margin color for the current image while comparing two images.
- **Set reference margin (trim box) color** sets the margin color for the reference image while comparing two images.
- **Set current and reference margin color** sets the margin color for both images while comparing.
- **Reset margin colors** reverts to the viewers default margin color settings.

Clip Document to Margin

The **Clip Document to Margin (Trim Box)**  option limits the content to the trim box (margin).

Right-click on  to get more options:

- **Clip Document to margin (trim box) in reader spread mode only** prevents overlapping page margins with image content in **reader spread** view mode. This option is useful while viewing multi-page documents.
- **Clip Document to margin (trim box)** clears the content outside the trim box. This is the same as a simple click on the **Clip document to margin**  button.

Compensate Distortion and Scaling

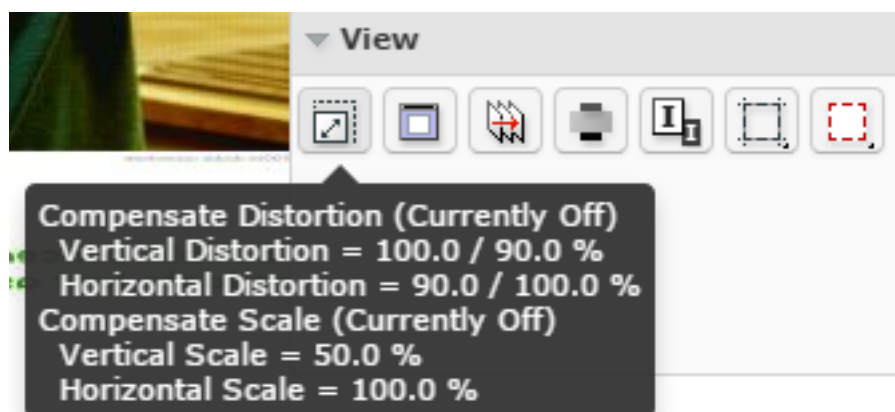

Distortion is a technique used to pre-compensate graphics which will be printed with a non-uniform printing technology. Distortion is typically done during the RIP'ping process. In some workflows scaling is used in place of distortion to pre-compensate for distortion in printing process.

The **Compensate Distortion**  tool allows to compensate both distortion and scaling.

You can use this tool while comparing files with and without distortion or with different distortion values.

Note: This tool is available in the **View** widget only when the active or reference file has a distortion and/or scale.

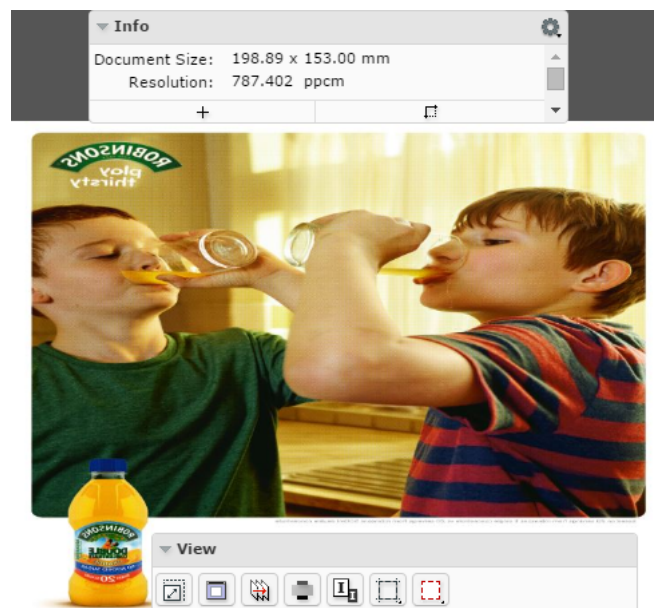

Hover on the tool to see the current distortion and scale values for the documents.

Use this tool to compensate:

- the distortion of the active and reference document when the documents only have distortion
- the scale if the active documents only have scaling
- both the distortion and scale of the documents if the active documents have both.

To activate the tool, click on the **Compensate Distortion** tool.

You can:

- **Compensate distortion only**

View

- Compensate Distortion (Currently On)
- Vertical Distortion = 100.0 %
- Horizontal Distortion = 90.0 %
- Compensate Scale (Currently Off)
- Vertical Scale = 50.0 %
- Horizontal Scale = 100.0 %

Info

- Document Size: 220.99 x 153.00 mm
- Resolution: X: 708.661 ppcm
- Y: 787.402 ppcm

- Compensate scale only

- **Compensate both distortion and scale**

You can activate or deactivate one of these options by clicking on that option.

After the compensation of distortion or scale or both:

- the tool tip displays the updated distortion and scale information.
- the [Info](#) widget displays the updated resolution and size.

Attributes

If the document in the Viewer has an **Attribute Category** with a Viewer specific View, you will see the **Attributes** widget in the Viewer.

Note: If the document does not have any **attribute category** or an attribute category with Viewer optimized view, you will not see this widget.

When you have multiple Views, they are listed alphabetically and the first applicable view is enabled by default. You can:

- **Save Attributes**  from this widget.

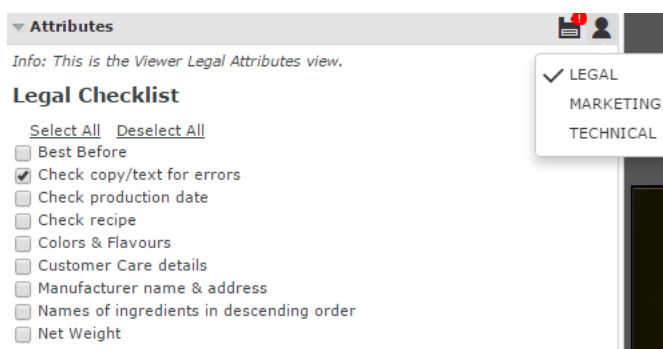

Note: Only the users with **Project / Folder level Change Properties** permissions can change and save attributes from the [attributes](#) widget.

If the user does not have permissions to edit the attributes, the editing and saving is disabled in the widget

Your unsaved changes will be notified with a **Save attributes**  warning. Click this to **Save**. When the data is saved, you will see a notification.

- **Switch View**  when you are a member of multiple Roles and/or Groups with dedicated Viewer views. Refer this [table](#).

Save your attribute changes before switching to another View. You will be warned if you try to switch views without saving your changes.

Channels

The **Channels** panel shows the file's channels and offers separation viewing possibilities.

Viewing Separations

Click the **View channels in separate windows** button  to switch to a tiled view of the individual separations. The separations will be visible in the same order as in the channel list.

The **composite** view will always be shown as the first view followed by the visible channels in the displayed order. Right-click  to choose from :

- **Automatic tiling**
- **Horizontal tiling**
- **Vertical tiling**

Viewing and Hiding Channels

Channels Widget displays the channel list in the printing sequence. The first in the list is a channel **All**. The list displays:

- activated channel  button
- channel swatch indicating the color of the channel. In the case of **All**, swatch box will be white.
- the channel name

for each channel.

Use  button next to the channel name to hide it.

Note:

By default all channels are enabled.

Viewing a single Channel

Right-click on the eye  button of a particular channel to view it as a single channel.

When all the channels are displayed, clicking on **All** will show only the first channel.

Tip:

Deselect the selected channel to select the next one. This allows stepping through the channels one by one

From single channel viewing, click **All** to view all the channels.

Tip:

Alt + 1, Alt + 2 ..., Alt + 9

To select a particular channel in the sequence (from channel 1 to channel 9)

Ctrl + Alt + 0, Ctrl + Alt + 1... Ctrl + Alt + 9

To select a particular channel in the sequence (from channel 10 to channel 19)

Alt + N

To view a single channel.

Use this to view the first channel when multiple channels are displayed. Also use this to step to the next channel while viewing a single channel.

Alt + A

To view all channels.

Editing the Channel Color in the Viewer

Click the color swatch next to the channel name to open the **Channel Colors** window. You can redefine the channel colors in the **Viewer**.

Original color definition: This section displays the name, the RGB values, the opacity and the color swatch of the original channel color.

You can redefine all these parameters in **Display color definition**.

Display color definition: This section allows you to edit the color. You can choose a new color from the drop-down, edit the RGB values and make the color **opaque**. The color swatch will display the new channel color.

The **Revert** button resets the color definition back to the original.

The left  and right  arrows let you to step through all the channels from within the dialog.

Note: Editing color definitions in the viewer does not change the actual image file.

Viewing a Channel Opaque

Click on the **Show Single Channel as Black**  button to make the selected separation/channel opaque.

Note: This setting is remembered the next time you open the Viewer.

Right-click  to get the options:

- **show single channel in channel color**
In this setting, you see the separation in its original color.

- **show single channel as black**
You can view single channels in black instead of its defined display color.

- **show single channel as black with show all effect :**

This eases the detection of areas with small dots by using black rather than a grey value for a display pixel that represents a partially covered area in the channel.

Changing the Channel Order

Select the channel you want to move and click either **Shift the active channel up** ▲ or **Shift the active channel down** ▼ arrow. You may also drag a channel to a different position to change the order.

Moving the channels down will put them later in the printing sequence. This would cover the other colors printed before.

Note: This only changes the order in the Viewer and does not influence the actual printing sequence.

Reverting the Changes

Reset channel order and color definitions button  will undo all display color edits by default. Right-click to specify :

- **Reset channel order only**
- **Reset color definitions only**
- **Reset all channel information**

CAD

The **CAD** panel will have options depending on the file you opened in the Viewer.

While Viewing CAD files and Manufacturing Data

CAD panel contains a list of layers and classes. You can select the parts of the CAD data to be displayed in the view. This panel is only available if the viewed document contains CAD data.

When you open a CAD document in the Viewer, this panel displays:

- Layers** list:

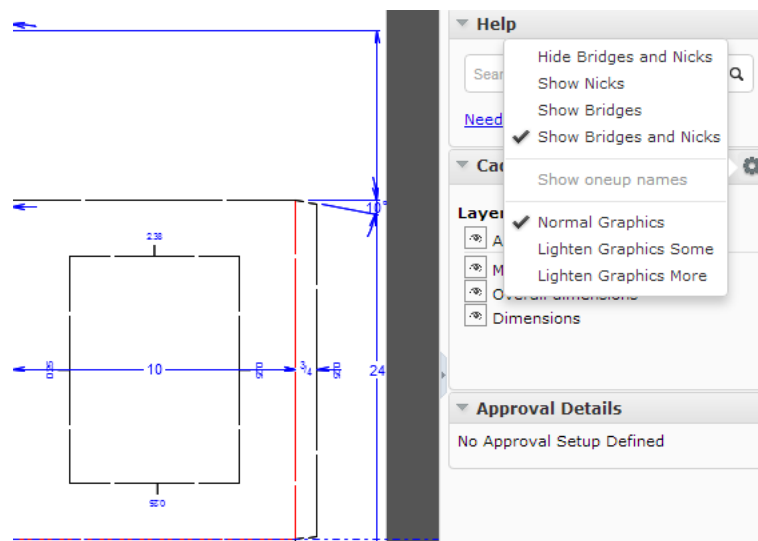

Here you can turn each CAD layer off so that it is hidden from the view. Only layers present in the CAD data are shown in this list.
- Classes** list:

Manufacturing data usually contains a number of one-up designs consisting of a number of layers. These layers belong to a layer class. In the **Classes** list, you can turn off the layer classes.

 - Click **All Layers / All Classes** to view or hide all data at once.
 - Use the eye button to select the layers or classes in view.
 - Right-click on the eye next to a layer or class to view just that one. All other layers / classes will be hidden from the view.

Note: The order of these layers and classes is defined in the CAD file.

CAD Options

You can choose to view or hide Nicks and Bridges in the CAD file :

- **Hide Bridges and Nicks** or **Show Bridges and Nicks**
- **Show Nicks**
Enable this to view Nicks in the display. You can also see the size of the nicks
- **Show Bridges**
With this option, you can view the bridge-gaps.
- **Show one-up names**
While viewing manufacturing data, you can see the names of the One-ups using this option. This option is turned off by default. This button is disabled when displaying a single design file.

While viewing CAD linked with Graphics

When a Graphics file with a reference CAD file is opened, the CAD line work is shown on top of the graphics file in the view. You have also options in the **CAD** panel to:

- **View both Graphics and CAD data** 
- **View Graphics only** 
- **View CAD data only** 

In CAD options, you can also set various degrees of dimming the graphics data to make the CAD data more visible:

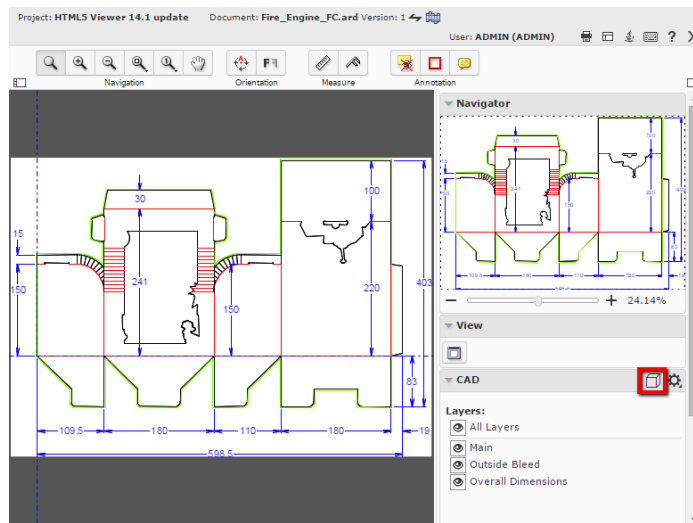

- **Normal Graphics**
- **Lighten Graphics some**
- **Lighten Graphics more**

Note: When you re-open the viewer, CAD line work will be displayed on top of the graphics file. The modes in the CAD widget are not persistent.

While viewing CAD in 3D

While viewing a CAD design file (or a *graphic file with CAD reference*), the CAD widget will have an **Open 3D View**  button.

Click  to open the file in the *HTML5 Collada Viewer*. The 3D Viewer will open up in the *3D View* widget.

Note:

Once you have opened the file in 3D, the **Open 3D View**  button is added to the top tool panel.

Help

You can search for information in the **Search Knowledge Base** panel from within the Viewer window.

Tip: To access online help, use the keyboard shortcut **F1** or click .

Annotating in the Viewer

You can use the Viewer *annotation tools* to add annotations or comments to the Viewed image.

To add an annotation, Click on either the  *Add Annotation* on page 678 button or the  *Note Annotation* on page 682 button.

Click the  to get a list of additional annotation options. If you select a different annotation type, this button will change to the selected annotation type.

Add Annotation

- Click the  **Add Annotation** button. This opens a sub-menu of different annotation tool options. You can use these with a click-drag-release action:
 - **Rectangle Annotation Tool** : Use this to select a rectangular area where you can annotate.

- **Oval Annotation Tool** : Use this to select an oval area within the image.
- **Freehand Annotation Tool** : Use this to make a freehand marking within the image.
- **Line Annotation Tool** : Use this to make a line marking on the image.
- **Arrow Annotation tool** : Use this to create an arrow marking on the image. The arrow head will be at the place where the mouse is released.
- **Highlight Annotation Tool** : Use this to select an area and highlight it in transparent yellow overprint.
- **New Global Rectangle** : Click on this to create a rectangle annotation surrounding the entire image without the dragging action. You may create multiple global rectangles. You can also re size this global rectangle.
- **Change default annotation line color...** 

When you click this color block, a window opens from which you can select a new color. This new preference is saved for all future annotations.
- **Reset default line color...** 

When you reset the color, a message asks if you want to update all the annotations with this color.
- From the [sub-menu](#), select the type of annotation.

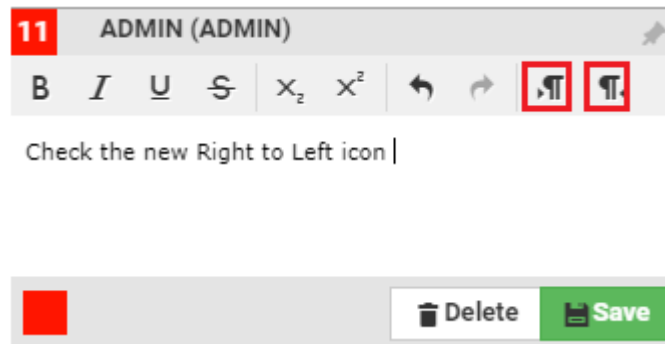

The Viewer remembers the selected tool until another tool is selected.
- Optionally, change the color of the annotation line. Otherwise, the default color (red) will be used.

You can change the annotation line color from the [annotation window](#) as well.
- Click, drag and release within the image.

You can type and format your annotation in the [Annotation Window](#) on page 679. You may also **Change Color** of the annotation.
- Enter your comment inside the annotation window and save. Read also [Annotation Window](#) on page 679.

Annotation Window

While creating an annotation, an annotation window appears where you can add comments.

You can emphasize parts of the text using the formatting options. You may also undo and redo any changes you made in the text.

You can also change the direction of the text based on the language used for annotations. For example, you can use right to left or right to left buttons when working with languages like Arabic or Hebrew.

Tip: You can *move* the window to move the annotation to a new position.

Annotation Pop-up

If you select an existing annotation, the corresponding annotation pop-up opens. The pop-up contains :

- the *type of annotation*
- the annotation sequence number
- the annotator's name
- the annotation text
- the list of replies
- the list of review states

In the annotation pop-up you can:

- **Pin** the annotation pop-up.

By default, the annotation pop-ups are unpinned. Use the  **Pin** icon to pin the annotation pop-up to the location. To unpin, click on the **Unpin**  button. The setting you choose will be remembered.

- **Close** the annotation.
- **Set the review state**  of the annotation
Choose the review state from the sub-menu.

The annotation list panel will display the new review state including the name of the reviewer. Save your changes after setting the review state.

- **Zoom to annotation** 
- do more actions via **Actions Menu** 
 - **Edit annotation**
 - **Delete the annotation**
You can only delete comments that you have authored. All the replies to the deleted comments will also be deleted, irrespective of the author.
 - **Duplicate the annotation**
Use this to make a variation (e.g. correction) of an annotation made by another user.
 - **Save the annotation**

Note: Only the original author can edit, delete or save.

- **Reply.** Click on the **Reply** field to get a rich text editor and type in your reply. You can either **Save** or **Cancel** the typed reply.
These replies are visible in the annotation window as well as in the [Annotation List](#).

Tip: Only two of the latest replies are visible in the window. Click **Show x more replies** to view the rest of the replies. To view less replies, click on the **Show less replies** button.

Note:

In the **Show only selected annotation** setting, the annotation pop-ups of the selected ones are shown.

When this setting is turned off, select **Show only selected annotation pop-up** to view the selected one's pop-up and all other annotation markings. This setting overrules the **Pinning**.

Read more in [Annotation Options](#) on page 685.

Note Annotation

You can create a text annotation at any specific point on the image using the  **Note Annotation** tool.

- Select the  Note annotation tool
You can also set the color using :
 - **Change Default Note Annotation Color**. The default is yellow.
When you click this color block, a window opens from which you can select a new color. This new preference is saved for all future note annotations.
 - **Reset Default Note Annotation Color** 
- Click on the point on the image where you want the note.
The [Annotation Window](#) on page 679 will appear where you can enter your note.

The annotation will be marked by a small note icon in the image.

Note: When you select a note annotation, it will be displayed in inverted colors within the view.

Editing Annotations

You can edit or move the annotations in the Viewer.

- You can select your [annotations](#) by:
 - grabbing the annotation shape. When you hover near an annotation shape, the mouse pointer changes to a select arrow.
 - selecting it in the [Annotation List](#) on page 654. T

Note:

When selected,

- the annotation is highlighted in the annotation list with a yellow background.
- the annotation shape border thickness becomes double.
- the annotation shape displays handles to enable resizing.
- the [Note Annotation](#) on page 682 color is inverted in the view area.
- a rectangle, line, arrow, oval and highlight annotations display **anchor points**.

- You can drag the annotation using the mouse.
 - You can move a [Note Annotation](#) on page 682 or a Rectangle annotation by dragging it. When you hover near a note annotation, the mouse pointer changes to a select arrow.
 - To resize **rectangle annotations**, click the anchor point and drag either one of the four border lines. You can also grab one of the four corners and resize with the help of a resize cursor. To move a rectangle annotation, click and drag it to the new location.

Note: Highlight annotations can be modified in the same way as Rectangle annotations.

- To change an **oval annotation** shape, use any of the anchor points. Click and drag to move the annotation.
- Hold and drag the end-points to modify **line annotations** or **arrow annotations**. You can also select and drag the line or arrow to another location.
- Select and drag **freehand annotations** to change its location within the image. However, the size and shape cannot be changed.
- You can use **More actions > Edit annotation** in the annotation window (or in the [Annotation List](#) on page 654) to edit the annotation or reply text.

Note: This is only possible if you are the author of the annotation/reply.

After editing, you can either **Save** or **Cancel** the text changes.

Linking Annotations

You can add multiple annotation areas to a single annotation note.

The linked annotations share the same text, sequence number, replies and review state. This helps you to draw multiple areas to one single annotation.

1. Select the annotation to be linked with the new annotation shape.
2. Click on **Add Annotation** and choose the annotation shape.
3. Create the new annotation holding the **Shift** key.
The new annotation is linked to the selected annotation. The new annotation will share the same annotation pop-up. You can connect many locations in the same image to one annotation this way.

Duplicate Annotations

You can duplicate annotations that were created by you or another user.

- To duplicate an annotation created by another user, click the Duplicate icon 
- To duplicate your own annotation, use **More actions > Duplicate Annotation** in the [Annotation Pop-up](#) on page 680

The annotation (and any linked annotations) from which you duplicated will be made into a new annotation thread with your name as the author and the current time. The text will be duplicated as well.

The color of the duplicated annotation will be the your default color for that annotation type.

Delete Annotations

You can delete your own annotations using the **delete** key. You cannot delete replies to your annotations this way.

You can also delete annotations using **Annotation List > More actions > Delete Annotation**. From the [Annotation Pop-up](#) on page 680, use **More actions > Delete annotation**.

You have to confirm the deletion when you are deleting an annotation. However, if you are deleting replies, a confirmation is not required.

Save Annotations

Your annotations and changes to annotations are not automatically saved to the server.

If you

- create a new annotation
- add/edit a reply
- move the pop-up
- pin/unpin pop-up
- change the annotation color
- set a review state
- edit text
- delete an annotation or a reply

the **Save** in the [Annotation List](#) on page 654 warns that there are unsaved annotations (or unsaved deletions). Save these annotations or changes by either clicking this icon, or by using the Save option in the [Annotation Pop-up](#) on page 680.

A message will indicate that the messages were saved successfully.

Viewing Annotations

When you open an annotated document, the annotations will be visible on the document and the [Annotation List](#) on page 654 widget.

If you select an annotation either in the annotation list or in the viewport, this will be highlighted in the annotation list. You will also see the possible options concerning the annotation and its replies.

Note:

The time will be displayed as **5h ago**, yesterday, 2d ago... To see the exact time, hover over the displayed time.

Note: In video annotations, start time and end time of the annotation is displayed in the list.

Tip:

If you click and hold the left mouse button on an annotation in the annotation list, the annotation becomes highlighted in the view.

Step Through Annotations

You can step through all the listed annotations using the  button. By default it will step through each annotation. After the last one, it will return to the first annotation again.

Tip: Hold the **Shift** and click  to step backwards.

When you select an annotation, its comment window will appear.

You can set your preferred step through setting in [Annotation Options](#) on page 685. You can set your preference as any of the four options available.

- **Step by Thread:** This is the default mode. Will step through each annotation, but not through the replies to the annotations.
- **Step by Decreasing Date:** This mode will step through all annotation comments and replies sorted according to their modification dates.
- **Step by Thread - Fit View:** Same as "by thread", but will zoom the view to fit the selected annotation.
- **Step by Area/Position - Fit View:** Will step through all positions/areas of linked annotation and zoom the view to fit the selected annotation part.

Annotation Options

Step through Options

You may choose to step through the annotation in any of the following ways.

- **Step by Thread:** This is the default mode. Will step through each annotation, but not through the replies to the annotations.

- **Step by Decreasing Date:** This mode will step through all annotation comments and replies sorted according to their modification dates.
- **Step by Thread - Fit View:** Same as "by thread", but will zoom the view to fit the selected annotation.
- **Step by Area/Position - Fit View:** Will step through all positions/areas of linked annotation and zoom the view to fit the selected annotation part.

Show only Annotations

Use these two options to set the visibility of annotation and annotation pop-ups in the view. This helps in simplifying the view by displaying only targeted annotations.

- **Show only selected annotation:** Only the selected annotation is shown in the View and the pop-up appears when the annotation is selected.

In this setting you will see a warning.

Warning! Only the selected annotations is shown.

- **Show Only Selected annotation pop-up**

You can choose this option when the **Show only selected annotation** is unchecked.. All the annotations will be in the View, but only the selected pop-up will be present in the view.

Note: This setting overrules the *Pinning*.

- A warning message will indicate your current setting.

Warning! Only the pop-up of the selected annotation is shown.

Always show Annotation pop-ups

- Enable **Always Show Annotation Pop-ups** the *Annotation List* on page 654 settings. This setting is persistent and will show the pop-ups when you reopen the Viewer.

When this setting is enabled, the **Close** button will not hide the pop-ups.

Show or hide sequence label on the annotation

Use this option to show or hide the sequence number of annotations.

Unlinked annotations with sequence label:

For linked annotations, the sequence number remains the same for all linked parts. A second number after a hyphen indicates different annotation areas.

Show or hide character and line count

You can track the exact number of characters and lines in the annotation texts using this option.

When you enable this, the character and line count will be shown in the [Annotation pop-up](#) and in [Annotation List](#) panel.

To turn this off, disable this setting in the **Annotation Options**.

Fit View to the selected Annotation

Use this option to automatically fit the view and the zoom to the selected annotation. The Viewer will remember this setting and will return to this view when you reopen.

Ordering the Annotations

You can order the annotations in the [Annotation List](#) in two ways:

- **Ordered by creation date:** All annotation comments and replies will be sorted according to their creation dates.
- **Ordered by modification date:** All annotation comments and replies are sorted according to their modification dates.

Filter Annotations

In the [Annotation List](#) on page 654, you can :

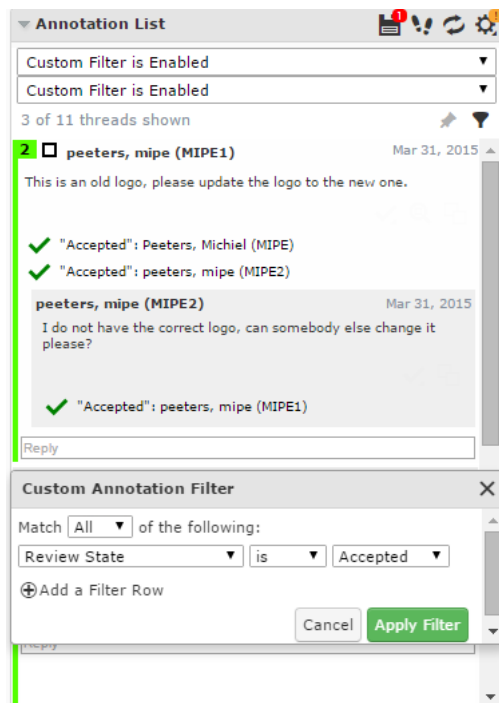

- filter annotations by user / author.
When you select a single author, only the annotation threads and replies made by this author is displayed.
- filter annotations by its review state.
 - **Any Review State** will select all where there is a review state on the main annotation or any of the replies made.
 - **No Review State** will select all where there is no review state on the main annotation. If the review state is "None", it will not be shown.
 - **Accepted** will select all annotations and replies with Accepted review state.
 - **Rejected** will select all annotation threads and replies where the review state is Rejected.
 - **Cancelled** will select all annotation threads and replies where the review state is Cancelled.

- **Completed** will select all annotation threads and replies where the review state is Completed .
- **None** will select all annotation threads and replies where the review state is None.
- You also can filter using :
 - **All Except Accepted**
 - **All Except Rejected**
 - **All Except Cancelled**
 - **All Except Completed**
 - **All Except None**
- customize your own filter combining the author and review state. Read in [Custom Filters for Annotations](#) on page 688.

Custom Filters for Annotations

Use custom filtering to create advanced filters.

Click the **Custom Filter**  button to enable this option.

In the **custom annotation filter** dialog, you can combine the basic **Author** and **Review State** filters with a logical AND/OR operator.

Click **Apply Filter** to apply the changes and close the dialog. An active custom filter will show a message **Custom Filter Enabled** in the normal filter.

Locking the custom filter

Click the pin  button to lock the custom filter. If you lock a custom filter , it stays active for other documents and consequent viewer sessions.

Note: You can always switch back to the basic filter by selecting a value from the drop down.

Hide Annotations

To hide annotations, you can click  **Hide annotations** in the toolbar. You can view them again by clicking on the same button.

Viewing Annotations in Compare

The annotations are hidden by default when comparing two documents. Set **Show Annotations for:**

- **Current**
- **Reference**

to display annotations from either the current or the reference version.

In **Blinking** compare mode, the annotations are hidden.

Note:

You can edit the annotations from the current document, but not from the reference document.

Viewing External Annotations

You can view annotation information in the Viewer even when the annotations are created by external tools such as Global Vision nodes of Automation Engine.

The Global Vision nodes create these five different types of annotations in an Automation Engine workflow:

-  **Barcode Annotations**
-  **Braille Annotations**
-  **Spell Check Annotations**
-  **Artwork Compare Annotations**
-  **Text Compare Annotations.**

The Viewer also supports:

-  Acrobat Annotations from Adobe Acrobat
-  Editor Annotations from the Esko editors
-  External Annotations coming from an unknown external tool.

Note: To view an external annotation in WebCenter Viewer, you have to ensure that the .xfdf files are uploaded along with the pdf document.

When a document has Global Vision annotations, a group of buttons is shown in the **Annotation Widget** of the Viewer. Select any of them to see their information.

There is also a button for  **User Annotations**. Learn more in [Viewing Annotations](#) on page 684.

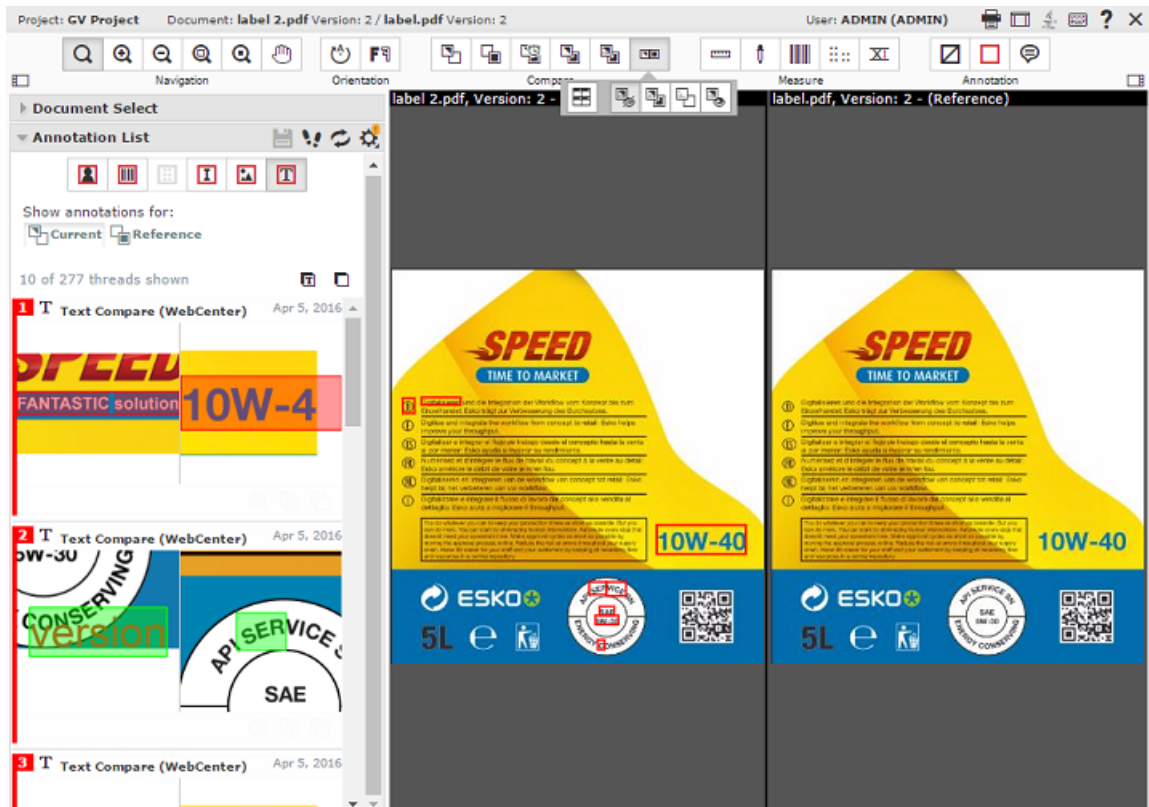

Note:

- Global Vision annotation buttons are only active when the document contains such annotations.
- The other annotation buttons are only shown when the document contains such annotations.
- All these externally created annotations are read-only. You cannot reply to them.
- The **Filter** option is only displayed for user created annotations.

- You can view the **Braille**, **Barcode** and **Spelling** annotations on a single document checked in Automation Engine.

- **Artwork Compare** and **Text Compare** annotations are available when you have compared documents in Automation Engine.

Creating User Annotations out of External Annotations

Creating User Annotations out of External Annotations

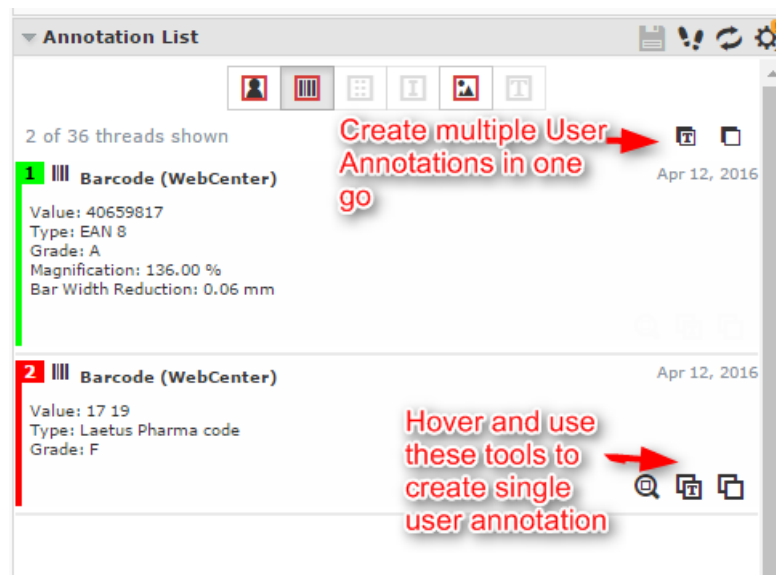

You can copy and create new **User Annotations** out of the external annotations that a document contains. You can choose to create from any one or all the external annotations; with or without text.

Note: You cannot create text annotations from Global Vision **Artwork Compare Annotations**.

To create such **User Annotations**:

- Click  **Create a User Annotation Here** button on an external annotation thread. The annotation is created.
- Click  **Create a Blank User Annotation Here** button on an external annotation thread. The annotation is copied, but without the text.
- Click  **Create User Annotations From All Annotations** button located on the **Annotations Widget**, when filtering on a type of external annotation. This creates **User Annotation** out of all currently displayed annotations.
- Click  **Create Blank User Annotations From All Annotations** on the **Annotation Widget**, when filtering on a type of external annotation. This creates **User Annotations** out of all currently displayed annotations but without the text.

The newly created annotations have the same properties and are shown in the **User Annotations** list.

Annotating in a Multi-page / Page List Document

While [Viewing Multi-Page Documents and Page Lists](#) on page 710, you can make annotations:

- on the active page
- on the adjacent page
- across both pages

When you draw annotations in the non-active page area, a message will ask you to confirm if you want to draw an annotation outside the current page. This warning does not appear when you draw an annotation across both pages.

Note: *Reader Spread View* on page 711 displays only the annotations from the currently active page.

Approval

You can evaluate and approve the documents in approval cycle from the Viewer using the *approval tools*.

You can view the status of the approval in the viewer.

Clicking on any of the *approval tools* opens the approval pop-up.

- You may set a condition for your approval (if the approval cycle allows this). Select **Set approval condition** and type in your condition.

- You can give a reason for your rejection in the text box.

For example, if you reject a document because of a specific image detail, use *annotations* and add this as an approval comment.

- You may also just **Comment** without approving or rejecting. Then the status of the document is in Pending, until you approve or reject it later.
- **Commit** button to save your approval or rejection and comments to the server.

The approval status will be displayed in the top toolbar in the place of Approval tools. This status will be **Pending** if the **Approval Cycle** is still on-going.

Remember:

If you are in the Compare mode, you can only do the approval actions on the current document page.

Read also [Evaluate a Document in the Viewer](#) on page 694

Evaluate a Document in the Viewer

When you evaluate a graphic file or a page list (see [Document Types](#) on page 584 for information about the supported file types), you can first open it in the Viewer to look at it in detail. You can then approve, reject, add a stage or comment it directly from the Viewer.

1. Click the document's thumbnail or the  button.

You can do this from:

- the **My Work** page (under **My Approval** if you have documents to approve or under **Approvals to Follow Up** if you are an **Approval Master**),
- the **Documents** tab in the project,
- the header of the Document Details page.
- the viewer

2. In the top toolbar, click:

-  to approve the document,
-  to reject it,
-  to comment it,
-  to forward approval request
-  to force approve it if you are a Project Manager
-  to force reject it (if you are a Project Manager).

Alternatively these options are also available in the **Approval Details** widget. This is available only if the user has **Change Approval** permissions.

Note: You can view the status of the approval of the document in top tool bar.

3. In the pop-up that opens, do the following:

if you are...	you can...
approving or force approving the document	set a condition for your approval if the approval cycle allows this (see Allow Conditional Approval or Not on page 794): select Set Approval Condition and type your condition in the box.
rejecting or force rejecting the document	type a reason for your rejection in the box.
commenting the document	type your comment in the box.

4. If the user has **Change Approval** permissions, then the user can access the **Approval**

Setup in the Approval details widget. Click  to open the **Document Approval Setup** pop-up window. User can perform all actions as specified in

[Defining Approval Settings](#) on page 786

5. Enter your password, if your WebCenter server requires it.

In case, the approval cycle is completed and the document is in Approved state, then the user cannot make any changes to the approval cycle from the viewer.

6. Click the **Commit** button.

A warning message is shown, if unsaved annotations are present, when you try to **Approve / Reject / Comment** on a document.

Once you have approved or rejected the document, you may not change its approval status later (only a **Pending** status allows future changes).

If you have entered an approval condition, a rejection reason or a comment, it will be shown in:

- the **Approval** tab of the Document Details page,
- the **Action History** tab of the Document Details page,
- the Java **Viewer's Document History** panel.
- the **Approval Details** panel.

To see all the documents you have recently evaluated, go to **My Work > My Recently Submitted Approvals**.

Note: If you cannot see **My Recently Submitted Approvals**, go to **My Work** and add it to your **My Work** page.

Forwarding Approvals in Viewer

An Approver can forward the document for approval to another Approver/ (s) who may be registered or an unregistered users from the viewer itself. Forwarding option is enabled based on the preferences set by the site administrator and also by the Approval Master.

Forward Approvals setup by the Site Administrator

Site administrator can choose the following options in the **Approval Preferences** based on which forwarding option is enabled in the viewer.

- **Don't Allow:** Does not allow you to forward any documents by the approvers.
- **Allow Approval Forwarding to registered users:** Allows forwarding only to the existing users
- **Allow Approval Forwarding to registered and unregistered users:** Allows forwarding to both existing and new users
 - **Make your choice as default:** you can check this box to make any of the above options as default except **Don't Allow**.

Forward Settings by Approval Master

Approval Master can override the Approval preferences given for the current document setup or choose to inherit the preferences from the folder setup. The options to modify Forward Approvals is available in **Setup Approval** only when the site administrator has not chosen **Don't Allow**.

Following options are available for the Approval Master for Forward Approvals

- **Allow Approval Forwarding to registered users:** Allows forwarding only to the existing users

- **Allow Approval Forwarding to registered and unregistered users:** Allows forwarding to both existing and new users
- **Don't Allow:** Does not allow forwarding by any of the approvers.

When the Approval Setup is modified by the Approval Master when the approval is in progress, the approval stages already in progress are not affected and only the stages setup after the change are affected.

Checklist for Approval in Viewer

You can set up validation fields which are to be filled mandatory, before the approval in the viewer. To set up validation, ensure that you have assigned an attribute category with a Viewer view of a document that contains required attributes.

In case, the validation fields are not filled, then you cannot approve the document, although comments may be updated.

- The validation criteria may be set based on the role in which the user is approving. For example, Artwork Designer Role may have to enter the answer for the question1 and 2, while Marketing Role has to answer for question 3 and 4.
- If there is only a Viewer View, then the view is validated regardless of role. If there is a specific view for the role, then that view is validated.
- If there are views for multiple roles that the user has, then the user approves on behalf of each of the role and all the role views are validated.
- If there is no view for the role the user is approving, but there are views for other roles the user could approve as, no validation is done.

Note: **Force Approve** and **Force Reject** options override filling the mandatory fields.

Compare Documents in the Viewer

You can compare two versions of a document or two documents in the Viewer. Use the different comparison modes to have a close look at the differences between the two files. First, [select the documents](#) to compare and then [align](#) them as required.

Once you have opened the documents to compare, there will be extra comparison modes buttons in the [Top Tool Panel](#) on page 636, [Channels](#) on page 672, **Orientation and Alignment** and **Annotation List**.

Click...	to...
View Current Version 	view the current version (the file in the first document selector). See: Show Current and Show Reference Modes on page 705
View Reference Version 	view the reference version (the file you opened in the second document selector). See: Show Current and Show Reference Modes on page 705
View Both - Blinking 	keep switching from the first to the second file rapidly. Read details in View Both - Blinking on page 705
View both - Show on Top 	view both files on top of each other.

Click...	to...
Difference Compare Mode 	view both files on top of each other and highlight the differences in red. Read more in: Difference Compare Mode (View both highlight differences) on page 706
View both - side by side 	view both files side by side.

Note: Comparison of 3D files are possible with all the options above except **Difference Compare Mode**. You can read more on 3D compare at [Comparing 3D documents](#) on page 709

Note: This feature is not available for video files.

Channel Matching in Compare Mode

Channel Matching in Compare

The **Channel Matching** influences the way differences in images are displayed while comparing them. For example :

- differences in display color of the same channel in the **current** and **reference** document
- differences in ink names. For example, a design ink name could be different from its production ink name.

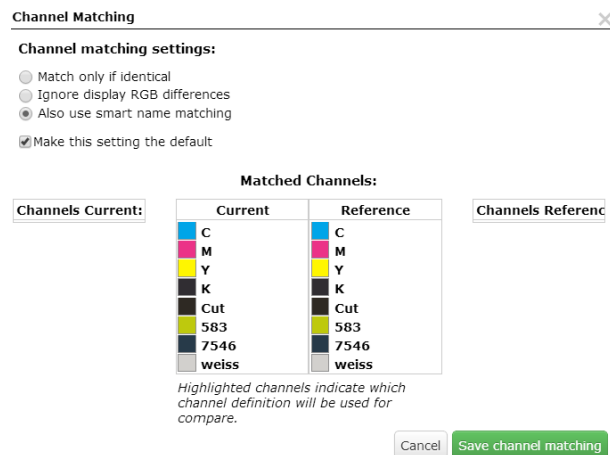

When a **Compare To** (reference) document is selected, a message may prompt you to open the [Channel Matching Dialog](#) on page 697. This happens only when there are unmatched channels in one of the documents.

Alternatively, click on the **Channel Matching**  button to open the [Channel Matching Dialog](#) on page 697.

Channel Matching Dialog

channel matching allows linking channels that have been changed in one of the documents/versions while comparing. Channel matching can be done automatically or manually.

There are three settings:

- **Match only if identical:** Select this to match only the channels with identical names and display colors.
- **Ignore display RGB differences:** Select this to match channels with matching names. This setting ignores the display color differences.
- **Also use smart name matching:** Select this to match the channels with related names. For example :
 - when the names differ in the letter case (Magenta - magenta)
 - when the names differ in color book specification (660 - Pantone 660 C and Cyan-Process Cyan)
 - when the names are known abbreviations. Example C – Cyan

Note: This setting ignores display color differences.

Note: The selection of a particular channel matching setting applies only to the current document. To make it default, enable the **Make this setting the default** check box.

It is possible to edit channel definitions of the current image to match those of the reference image (or vice versa). Read in [Manual Channel Matching in the Viewer](#) on page 698

Manual Channel Matching in the Viewer

The [Channel Matching Dialog](#) on page 697 displays four channel columns listing:

- the **Channels Current** and the **Channels Reference** columns display the unmatched channels.
 - the **Current** and the **Reference** columns represent the matched channels. Matched channels are displayed next to each other.
1. Drag the channel to be matched from the **Channels Current** column to the **Current**.
 2. Drag the corresponding channel from the **Channels Reference** column to the **Reference**.
 3. Click on the Channel from which the definition has to be copied. The clicked channel will be highlighted in the dialog. This indicates that the corresponding channel copies the definition of the highlighted one.

Matched Channels:

Channels Current:	Current	Reference	Channels Reference:
<ul style="list-style-type: none"> anva 350 C anva 877 Artios Crease 	<ul style="list-style-type: none"> C Y K M Artios Cut 	<ul style="list-style-type: none"> C Y K M Cut 	<ul style="list-style-type: none"> 583 7546 weiss

Highlighted channels indicate which channel definition will be used for compare.

- Click **Save Channel Matching**. After saving, the modified channel is marked with an asterisk * next to the name.

Matched Channels:

Current	Reference
 C	 C
 Y	 Y
 K	 K
 M	 M
 Cut *	 Cut

Highlighted channels indicate which channel definition will be used for compare.

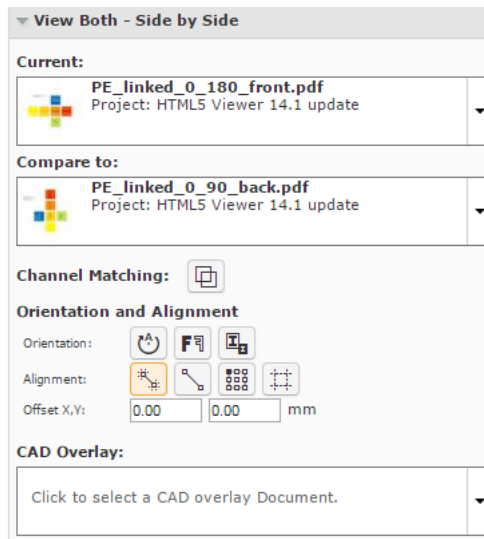

Note:

Channels displayed in bold in the matched columns cannot be unmatched.

If you manually move the channels from the matched lists to the unmatched lists, the channel definitions are reset.

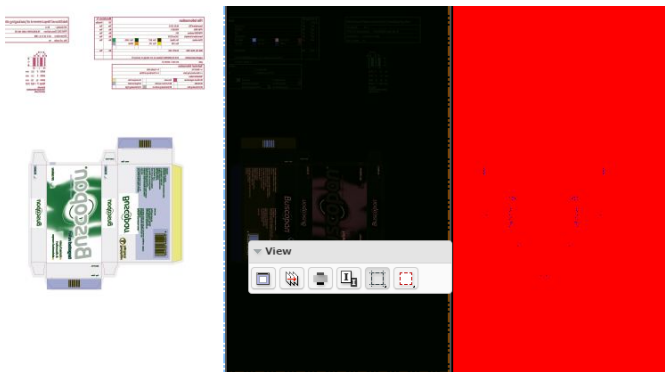

Using Orientation Tools while Comparing

Use the **Orientation** tools to rotate, mirror or invert the reference document / version relatively to the current document / version.

Use:

- **Rotate**  to rotate the reference document.
- **Mirror**  to mirror the reference document.
- **Invert**  to invert the reference document.

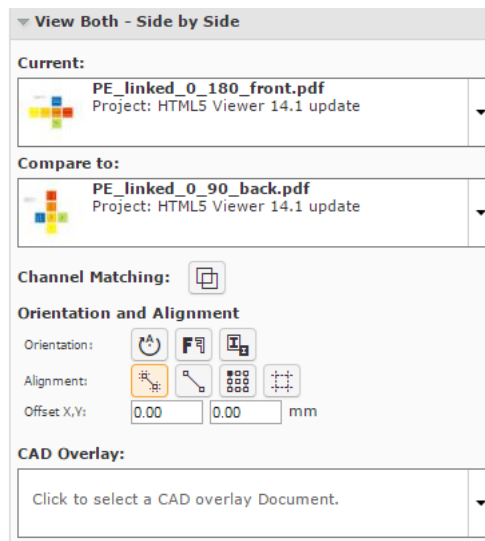

Tip: Use this when comparing a positive and negative version of the same document.

Note: The buttons indicate whether the rotation / mirroring / inverting of the reference document is currently on or off.

Aligning Files

You will get Viewer tools to align files in the **document select** panel while:

- comparing two graphics / CAD files.
- viewing a graphics file and a linked CAD Overlay. Read in: [Aligning CAD overlay and Graphics](#) on page 719.

You can align the current and reference files during compare using:

- [auto-align](#)
- [anchor points](#)
- [corners, margins \(Trim-boxes\) or offset values.](#)

Auto-aligning Files while Comparing (Graphics)

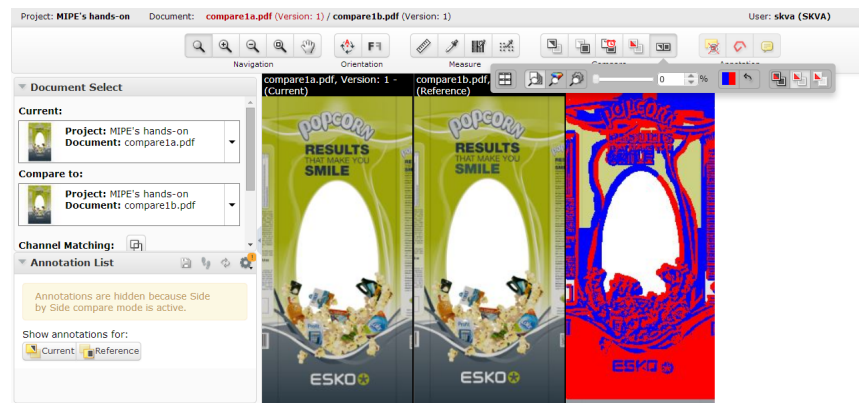

Auto Align  aligns the currently visible view of the two compared images automatically.

Tip: Using this tool along with the **zoom in** function is a quick way to align the current and reference images in the Viewer.

You can also use this to align the CAD overlay on the graphics correctly.

1. Select the files to compare from the **documents**.
2. Click **Actions > Compare in Viewer**.
3. Select the **Current** and **Reference** documents in the [Document Select](#) on page 650.

The viewer starts the last used Compare mode (except the **View Reference Version** or **View Current Version** modes) with those documents.

4. Select your preferred Compare mode, for example, **View both - side by side**  view.
5. Zoom-in to a specific area and use **Auto-align** .

Auto Align uses the currently visible view of the two compared images to attempt an automatic alignment.

Note: The **offset** values are filled in automatically.

Tip:
Using this tool repeatedly with one or more zoom-ins can be a very convenient and quick way to align two images.

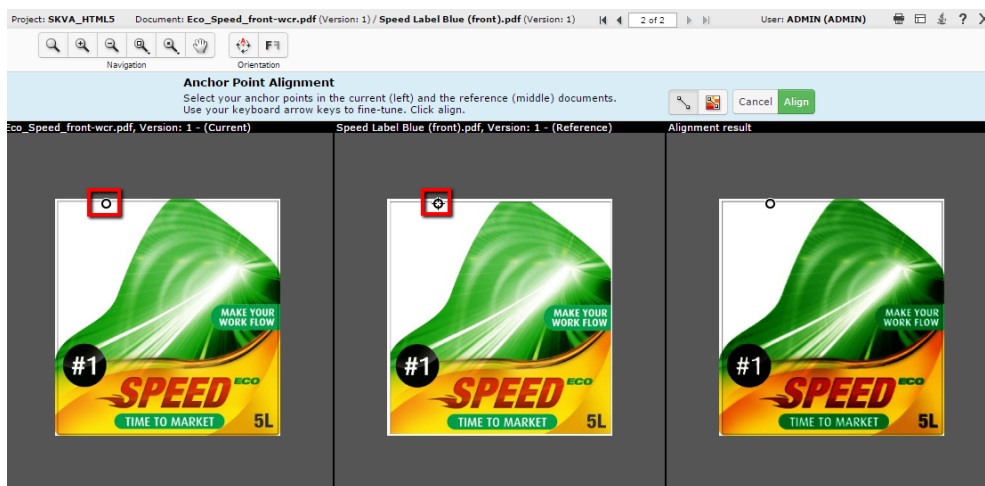

Using Anchor Points

1. Select and load your documents to the Viewer.
2. Select the **Current** and **Reference** documents in the *Document Select* on page 650.

The viewer starts the last used Compare mode (except the **View Reference Version** or **View Current Version** modes) with those documents.

Your **document select** panel will have **Orientation and Alignment** tools when you select two documents to compare.

3. Select your preferred Compare mode, for example, **View both - side by side**  view.
4. Click on the **Anchor Point Alignment**  tool.
The Viewer will transform to the anchor point alignment mode. You can access the **navigation** and **orientation** tools in the top panel. You can also use the **Auto-align**  function in combination with the anchor points.

Note: The active anchor can be recognized by the crosshair icon.

5. Select your anchor point in the reference document displayed in the middle.
 - click to select a point.
 - use the arrow keys to fine-tune your anchor points
 - you can also drag the selected point to another location.

Note: Use zoom tool to help you in finding the anchor point.

6. Check the result on the right pane. Click **Align** to confirm.

Tip: If you click **auto align** after selecting the anchor points, it will start auto-aligning by moving the reference .

The Viewer will return to its original state when you click **Align/Cancel**.

Aligning Graphic Files Using Corner, Trim box or Offset

You can use the **Alignment** tools to align two graphics files.

1. You can align the files to compare using the **Choose corner for alignment of the**

reference  option. To specify the corner point for alignment, click  and select your reference corner from the alignment drop-down.

2. Click on the **Use margins (trim boxes) for alignment**  option to align the images relative to the trim-boxes of the compared documents. When this option is not on, the alignment will be relative to the document boundaries.

Note: If the trim-box information is not included in the document XMP, the document boundary will be used for aligning files.

When you do a specific corner alignment after clicking this option, the trim box alignment will be remembered.

3. You can specify numbers in the **Offset X** and **Y** fields. This offset is added to the corner alignment.

Note:

If you are aligning two graphics files, the offset will be the distance between the **current** and the **reference** according to the graphics coordinate system (positive horizontal is set to the right and positive vertical is pointing downwards).

For CAD overlay and graphics, the offset is taken as the distance between the CAD overlay and the graphics page using the CAD coordinate system (positive vertical pointing downwards).

While aligning two CAD files, the offset is the distance between the **reference** and the **current** document page (in that order) according to the CAD coordinate system.

Aligning CAD files

- To open multiple CAD documents, select them and click **Actions > Compare in Viewer**. The documents will open in the **compare mode**. Read details in: [Compare Documents in the Viewer](#) on page 696
- Use the **Rotate Reference**  tool to rotate it with respect to the **current** document.
- **Mirror Reference Image** will flip your reference (from the centre of the view) with respect to the current document.
- Use the [anchor point](#) alignment tool to align two CAD files correctly.

- a) Click on the **Anchor Point Alignment**  tool. The Viewer will transform to the anchor point alignment mode. You can access the **navigation** and **orientation** tools in the top panel.

Note: The active anchor can be recognized by the crosshair icon.

- b) Select the anchor points in the **current** and **reference** documents. Use the arrow keys to fine-tune your anchor points. You can also drag the selected point to a new location.
 - c) Click **Align**.
- **Offset X,Y** fields allow you to enter precise offsets for accurate alignment.

Note:

If you are aligning two graphics files, the offset will be the distance between the **current** and the **reference** according to the graphics coordinate system (positive horizontal is set to the right and positive vertical is pointing downwards).

For CAD overlay and graphics, the offset is taken as the distance between the CAD overlay and the graphics page using the CAD coordinate system (positive vertical pointing downwards).

While aligning two CAD files, the offset is the distance between the **reference** and the **current** document page (in that order) according to the CAD coordinate system.

Compare Modes

Show Current and Show Reference Modes

If you click the **View Reference Version** or **View Current Version** button, the tools update their information accordingly. The annotations are also changed to the current document in view.

The [Approval Details](#) on page 656 will be updated as well. In the **View Reference** mode, you will still be able to perform the approval actions of the **current** document.

View Both - Blinking

In this mode, you will see the two selected document pages rapidly one after the other.

- All annotations will be hidden

- Approval details will be unavailable
- If the channels are split in different views, in each view the documents will rapidly change.
- If measure tools are active, the information pop-up will be updated rapidly depending on the visible page.

View Both on Top

You can view the documents to be compared on top of each other in this mode. You will not see the difference view in this mode.

Difference Compare Mode (View both highlight differences)

In **Difference Compare Mode**, you can view a combination of the current and the reference channels in the same window. When you select this mode, you will see an additional tool bar.

Selecting the Compare color space

You can use compare color space tools to judge the nature of the differences between the compared documents.

- **Compare: Channels** - This is the default mode. Use this to compare Channels one by one. The added and subtracted content is displayed in highlight colors.
- **Compare: HSV** - This mode compares the HSV color of the two documents and you can see the relative differences in a graded color overlay. The common parts among the compared documents are shown in a neutral gray color.

The overlay color will be a grade of the selected "Subtracted" color with the strength depending of the magnitude of the difference. Use this to compare documents where the channels are not the same. For example, a CMYK document and a Pantone spot color document.

- **Compare: Automatic** - In this setting, Channels will be used as compare color space if the definition of all the visible channels is the same in the two compared documents. If this is not the case, HSV compare will be used.

Change the difference threshold

You can change the precision of difference detection using the slider tool. You can also enter a percentage [0-100%] value. If the threshold is higher than 0 is set, you will see a message warning about the hidden differences.

Note:

Your **difference threshold** will be saved for your next compare session.

Change Difference highlight colors

Depending on your documents to compare, you may want to change the highlight colors. You can do this by clicking on the color block tool and selecting your preferred colors.

By default,

- the added channels and objects on common channels are displayed in blue to highlight the differences. The left part of the color block button indicates this highlight color.
- the subtracted channels and deleted objects on common channels are displayed in red. The right part of the color block button indicates this.

You can:

- **Change added highlight color**
- **Change subtracted highlight color**
- **Change both highlight colors**

There is a button to reset the changed highlight colors back to red/blue.

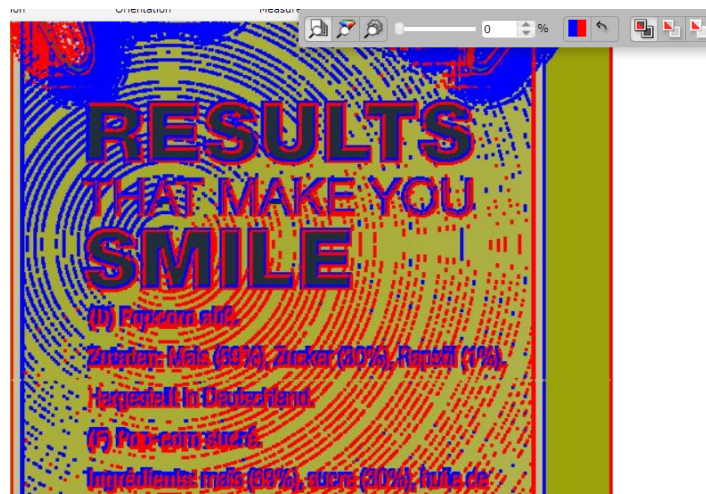

Difference Compare Modes

You can select different compare modes for effective comparison of documents. These modes differ in how they display the unchanged parts in the compared documents. Select from:

- **View both (default)** 

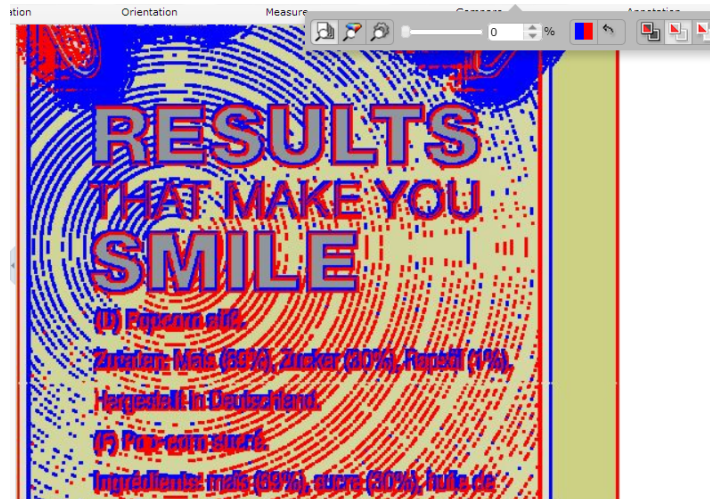

This mode displays the unchanged image parts as it is in its normal colors and changes in its highlight colors.

- **Channels** only present in the current version is indicated with a + after the channel name.
- **Channels** only present in the reference version is indicated with a - after the channel name.

- **View both - highlight difference** 

This mode hides the unchanged parts. Select this to view unchanged image parts with lightened colors. This way, you can spot the differences in a colorful image.

View both - show difference

The unchanged image parts are displayed in white. In this mode, you can see the differences in its highlight colors and the rest of the image in white. This way, you can spot even small changes easily.

Note: View Both on Top and **Difference Compare Mode** are not possible when comparing SVG files.

Compare Modes for different file types

Compare Modes	Graphics	SVG	3D
Current Document	Possible	Possible	Possible
Reference Document	Possible	Possible	Possible
Blinking	Possible	Possible	Possible
Side by Side	Possible	Possible	Possible

Compare Modes	Graphics	SVG	3D
View Both on Top	Possible	Not possible	Not possible
Difference Compare Mode	Possible	Not possible	Not possible

Annotations in Compare Modes

By default, all annotations are hidden and you cannot make new annotations in compare modes. However, in the **annotation list**, you can specify the **Show annotations for:** as either **Current** or **Reference**. Select:

- **Current** to view and make annotations in the current document.
- **Reference** to view the annotations present in the reference document. You cannot draw new annotations in the reference document.

Comparing 3D documents

You can compare the 3D view of two versions of the same document or reference to a 3D view of another document. When a 3D file is selected as the **Current** version, the Document Selector **Compare To** displays all the other files that have a 3D view to compare with.

Selecting one of the files as **Reference Version** will activate the side by side comparison of the 3D views.

Following compare modes are available for 3D documents

- **View Current Version**
- **View Reference Version**
- **View Both Blinking**
- **View Both Side by Side**

When a **Graphics file with 3D perspective** is compared with :

- **Another 3D Document**

This can be another 3D file or a graphics file with a 3D perspective. Selecting one of the reference versions in the difference selector activates the side by side comparison of the 3D views.

- **Graphics file with a 3D perspective**

If a graphics file with a 3D perspective is chosen as reference version, the default 2D compare mode is used.

When in a 2D compare mode, clicking the 3D button enables the 3D version of that compare mode.

When in a 3D compare mode, clicking the 2D button enables the 2D version of that compare mode and the Difference compare modes for 2D are available.

Lock Images to Compare

When you compare the 3D perspectives in the viewer, you can lock the view of both the **Reference Document** or the **Current version** by enabling the Lock Movement tool.

One of the document is locked while you can rotate the other. The angle reset option synchronizes the view of reference 3D object with respect to the current 3D object.

Update View in Real Time

This option is enabled by default and you can view the current and the reference document aligned with respect to the each other.

However, when the option is disabled, the viewer only synchronizes after the interaction has stopped.

Compare SVG Documents

You can compare two different SVG files or versions of the same file with each other or a SVG with a graphic file. The supported compare modes are **Blinking Mode** and **Side-by-Side**.

Note: The **Channels** Widget is hidden when SVG documents are opened.

Viewing Multi-Page Documents and Page Lists

The Viewer has a number of features that make working with Page List and Multi-page documents intuitive: like [this](#) Widget

- [Reader Spread View](#)
- [Page List Widget](#)

When you open a Page List or Multi-page document, the Page List widget displays its pages as thumbnails. You can switch the main view to a specific page by clicking on the corresponding page thumbnail.

Special thumbnails are used for Blank and Empty (Non-available) and pages of a Page List. An empty page cannot be selected as the active page.

Note: Blank and Empty page thumbnails are only available for Page Lists.

You can see the page name and folio of each page below its thumbnail. A yellow color bar below the page thumbnail indicates the currently active page. The bar above the thumbnail contains the page number (index) and icons to indicate the page's approval state. In addition to the icon, a *color code* indicates the primary approval state.

Use the Viewer to [compare](#), [annotate](#), inspect and [approve](#) the pages.

Reader Spread View

The Reader Spread view  allows you to see pairs of pages from a multi-page or page list in the Viewer. This enables you to visualize the document matching the appearance of the final document in print.

Note: Reader Spread View is not available in compare mode.

You can turn this on or off by clicking on the  button. You can use   arrows to navigate between reader spreads.

When one of the two pages is absent, the active page is displayed with an empty area next to it.

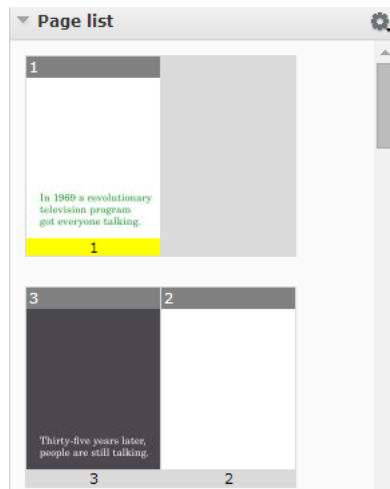

Note: Although you can view two pages at the same time, there can only be one active page. You can make a page active by clicking on its thumbnail.

The pairs will be displayed according to its binding:

- Left edge binding: the first page and the odd numbered pages are displayed on the right. The even numbered pages will be on the left.

- Right edge binding : the first page and the odd numbered pages are displayed on the left. The even numbered pages are displayed on the right.

Read also [Marking Pages in a Page List](#) on page 715

Comparing Multi-Page / Page Lists Document Pages

1. Load the Multi-page / Page List documents into the Viewer by selecting them and clicking **Actions > View and Annotate** or **Actions > Compare in Viewer**.

Special thumbnails are used for Blank and Empty (Non-available) and pages of a Page List. An empty page cannot be selected as the active page.

Note: Blank and Empty page thumbnails are only available for Page Lists.

2. Select specific pages in **Current** and **Compare To** document selectors.
The pages are grouped by document version. Use **Hide all pages** in the **Current** and **Compare To** document selectors to have the display aggregated.
A dialog opens up where you can set your comparison mode.
3. In this dialog, define how the pages of the active document are mapped to the reference pages. Click **OK**.

- **Current page only** : to map the current active page to the selected reference page. The other pages will follow page number mapping.
- **Current and following pages**: to map the current active page to the selected reference page. This mapping will be used for the next reference pages.

Note: If there are no following reference pages, the last one will be set as the **Compare To** page.

- **All pages**: to map all pages of the two documents. The previous **current** pages will be mapped to the respective reference pages.

Note: If there are no previous **reference** pages, the first one will be set as the **current** page.

Any changes in the active page will lead to a corresponding change in the reference page (as defined in the dialog). If you have not defined any comparison mode, the page numbers will be mapped.

4. You can use [the Compare mode](#) tools to compare the details of the pages.

Approval in Page Lists

You can set up approval cycle on individual pages of a Page List. However, for multi-page documents, the approval cycle is only possible for the entire document. You will see the approval tools when the loaded document is in an approval cycle.

Tip: A color coded bar on the page thumbnails display the approval state of the document.

- Grey bar: no approval cycle
- Blue bar: pending approval
- Green bar: approved or force approved
- Red bar: rejected or force rejected

In addition, a blue circle at the bottom of the thumbnails informs you that you need to approve the document.

[Approval Details](#) on page 656 widget will display the approval information regarding the active page. The widget updates the information when you view a different page of a Page List. When an approval status is submitted, the approval status will be updated for all visible pages.

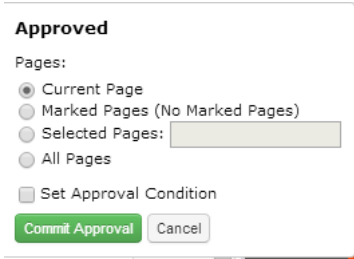

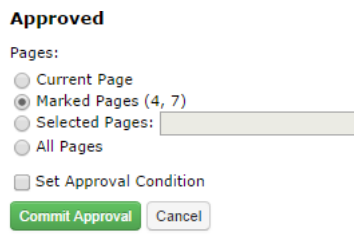

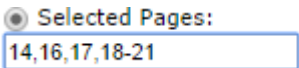

Read also [Evaluate a Page List in the Viewer](#) on page 713

Evaluate a Page List in the Viewer

1. Navigate to the Page List in a Document list, and click on its thumbnail image. The **Viewer** opens, displaying the Page List in the Page List widget.
2. In the Viewer tool bar, click:
 -  to approve the document,
 -  to reject it,

-  to comment on it,
-  to force approve it (if you are a Project Manager),
-  to force reject it (if you are a Project Manager).

3. In the pop-up that opens, choose to approve / reject / comment the :

Options	Description
<p>Current Page</p>	 <p>Select this option when you intend to approve only the active page.</p>
<p>Marked Pages</p>	 <p>You can <i>mark pages</i> while evaluating to do approval actions in bulk.</p>
<p>Selected Pages</p>	<p>You can approve / reject the selected pages in one go by specifying them :</p> <ul style="list-style-type: none"> • as a page range • or separated by commas 
<p>All Remaining Pages</p>	

Options	Description
	<p>Approved</p> <p>Pages:</p> <p> <input type="radio"/> Marked Pages (No Marked Pages) <input type="radio"/> Selected Pages: <input type="text"/> <input checked="" type="radio"/> All Remaining Pages </p> <p> <input type="checkbox"/> Set Approval Condition </p> <p> <input type="button" value="Commit Approval"/> <input type="button" value="Cancel"/> </p> <hr/> <p>If you are clicking on the Approval tools from an Approved /Rejected page, you will get an option to approve / reject all the remaining pages.</p>

a) Optionally:

if you are...	you can...
approving or force approving the page(s)	set a condition for your approval if the approval cycle allows this (see Allow Conditional Approval or Not on page 794); select Set approval condition and type your condition in the box.
rejecting or force rejecting the page(s)	type a reason for your rejection in the box.
commenting the page(s)	type your comment in the box.

- b) Enter your password if your WebCenter server requires it.
- c) Click the **Commit** button.

Marking Pages in a Page List

When you need to approve pages of a page list, you can first open it in the Viewer to inspect. You can then mark the pages ready to be approved, rejected or commented. This allows you to do bulk approval actions on marked pages.

Note: You cannot mark pages in a multi-page document.

- Select the page you want to mark and click on the  **Mark** button (from the **Page list**) tools to mark the active page. For more options, right-click :
 - **Mark**
 - **Mark all pages**
 - **Clear marks on all pages**
- You can also right-click on any of the page thumbnails in the Page list widget to get the following options :
 - **Mark / Clear Mark**
 - **Mark all pages**

- **Clear marks on all pages**
- To clear the mark or marks, click on the  **Clear Mark** button For more options, right-click :
 - **Clear Mark**
 - **Mark all pages**
 - **Clear marks on all pages**

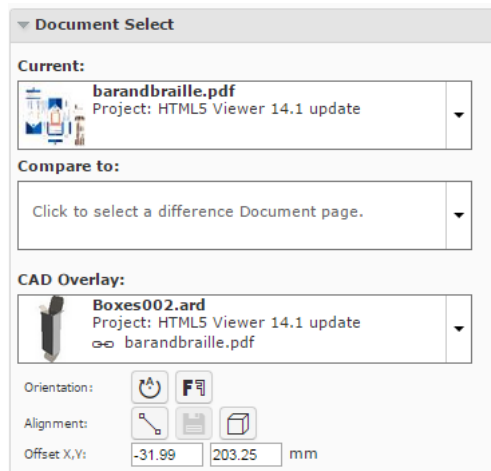

Viewing CAD with Graphics

You can view a graphics document with its CAD overlay for reviewing purposes.

When you open a normalized graphics document (PDF) in the viewer, WebCenter will check the meta-data (XMP) for a linked ArtiosCAD (ARD) resource.

Note: This link between graphics and CAD can be made in a desktop application like DeskPack or PackEdge. Here the relative orientation and offset is determined and saved together with the graphics file meta data (XMP).

If a Structure /CAD reference is found, you will see this in the *document select* panel with a link  icon. You can select this to view together with the graphics document. If the graphics file does not have a XMP link, you can use the *document references* feature to link them.

Linking a CAD with Graphics using Document References

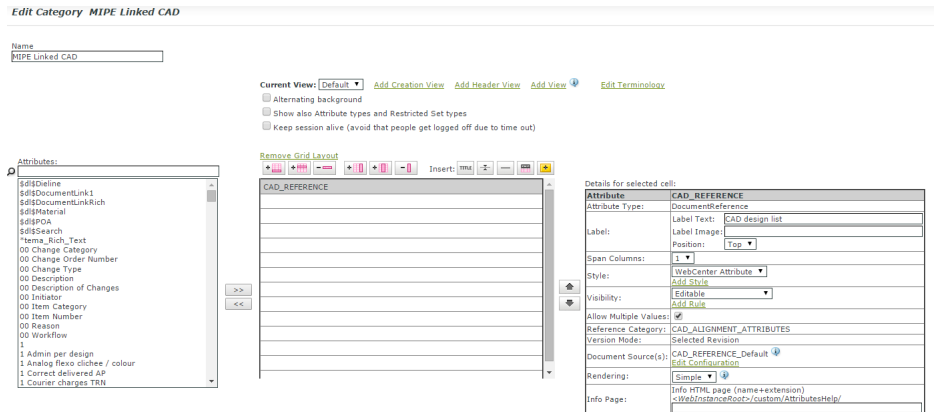

You can assign a **Document Reference Attribute** in your graphics file to refer to a CAD Overlay. To use this feature, you need a few **Attributes** with **specific** names. These are created automatically during installation or update of your WebCenter.

- CAD_OFFSET_X (**distance**)
- CAD_OFFSET_Y (**distance**)
- CAD_ORIENTATION (**integer**).
- CAD_REFERENCE (**document reference**)
- CAD_PRINTABLE_PART
- CAD_PRINTABLE_PART_SIDE

- CAD_FINISHING_PROFILE
- Add the CAD_REFERENCE attribute to a new category or an existing category. You can name this category according to your needs.

a) Configure a document source for your CAD overlay files.

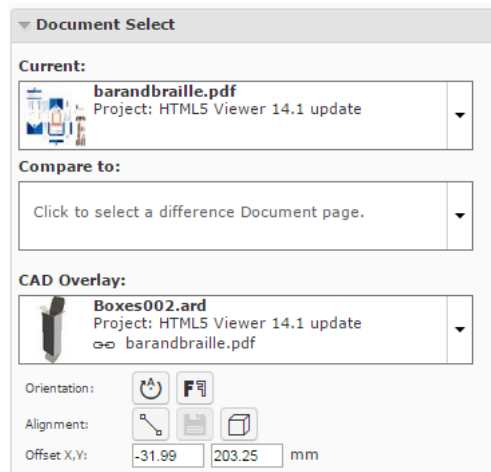

Read in: [Adding Document Sources for a Document Reference Attribute](#) on page 364.

- Assign this **attribute category** to a graphics file.
Alternatively, **configure document types** in your Project/Template and assign your attribute category containing CAD_REFERENCE as the **default attribute category** for graphics.
- Select or upload a CAD overlay file to the category of your graphics document.

- Open the Graphics file in the Viewer once the View files are prepared. The Viewer will load the linked CAD reference in the **CAD Overlay** section of the **Document Select** widget.

If the CAD reference is stored via a **Document Reference Attribute**, the user can alter and save the CAD Overlay settings to the graphical document.

When a graphics document is opened with the `CAD_REFERENCE` attribute, you can **Save**  the alignment changes made in the viewer.

Note: You need the rights to change a document attribute to get the  option. The administrator has to enable **Document > Security Change properties** option for you.

The **Save**  option is enabled when:

- you change the alignment. For example, new offset values.
- you select a new CAD overlay.

If you select another CAD file as the overlay, the previous file (with link icon) is deleted from the document selector. You will see the new overlay in the selector with an active link.

The new orientation and offset will be saved to the `CAD_REFERENCE` attribute of the graphical file.

To remove the CAD link from the graphics file, click **Turn off CAD Overlay** in the **CAD Overlay** selector and **Save**.

Read also:

- [Aligning CAD overlay and Graphics](#) on page 719

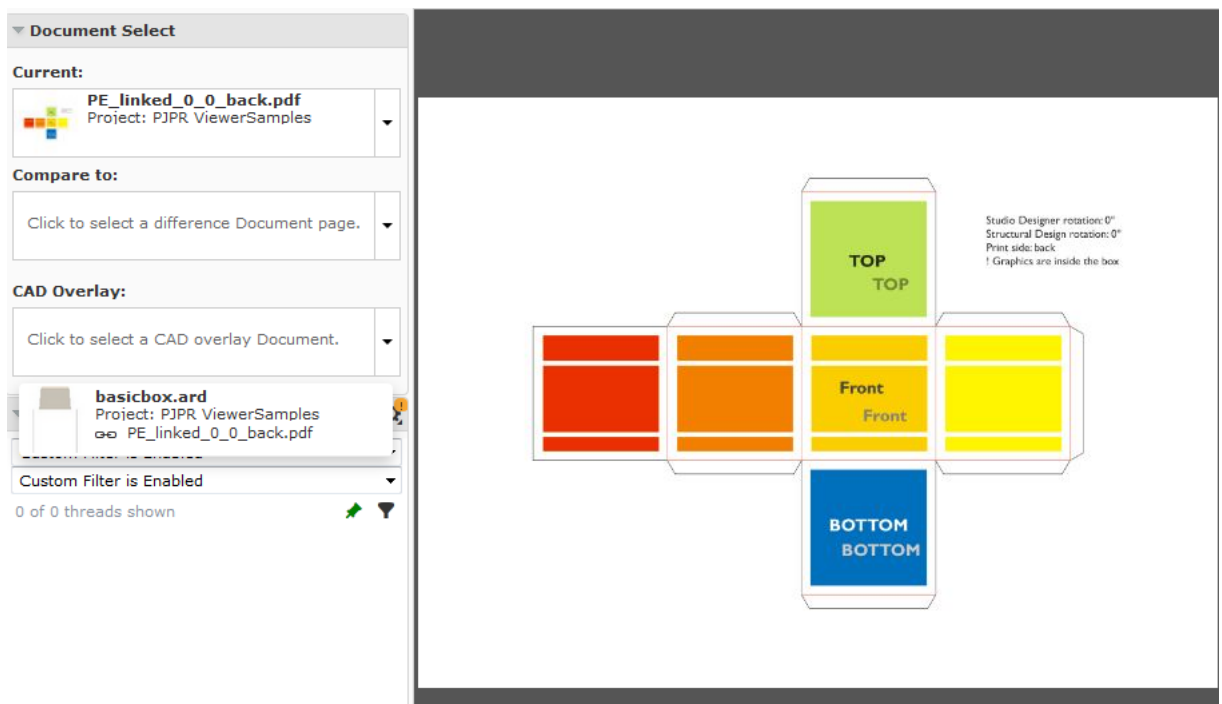

- [Viewing 3D in the HTML5 Collada Viewer](#) on page 721

Aligning CAD overlay and Graphics

- To open multiple documents (both Graphical and CAD), select them and click **Actions > View and Annotate**.

You will see a graphics document as the current document.

If the active document has a *linked* overlay, the Viewer will display this as the linked CAD overlay in the document selector.

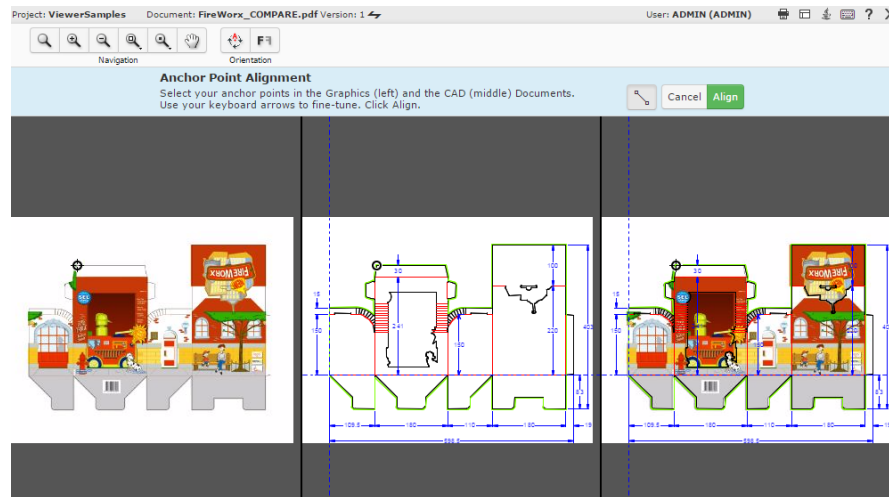

- Select the corresponding CAD overlay from the **CAD Overlay** selector drop down. This drop down will display all the available CAD files including the linked CAD files. The Viewer will display the selected CAD file on top of the graphics file. The **Orientation and Alignment** tools in this view allows you to position the overlay accurately on the graphics file.

- **Anchor Point alignment**  for CAD overlay.

Note: The respective buttons indicate whether the rotation / mirroring / inverting of the reference document is currently on or off.

- **Offset X,Y** for CAD overlay
- Use the **Rotate CAD Overlay**  tool to rotate the overlay to match the graphics correctly.

- **Mirror CAD Overlay**  will flip your overlay with respect to the graphics document. This will show you the opposite side of the CAD overlay. If the current view is the inside of a box, flipping will display the outside view.
- Use the **anchor point** alignment tool to align the CAD overlay on graphics correctly.
 - a) Click on the **Anchor Point Alignment**  tool. The Viewer will transform to the anchor point alignment mode. You can access the **navigation** and **orientation** tools in the top panel.

Note: The active anchor can be recognized by the crosshair icon.

- b) Select the anchor points in the Graphics and CAD documents. Use the arrow keys to fine-tune your anchor points. You can also drag the selected point to a new location.
 - c) Click **Align**.
- You can change the values in the **Offset X,Y** fields to be precise.

Note:

If you are aligning two graphics files, the offset will be the distance between the **current** and the **reference** according to the graphics coordinate system (positive horizontal is set to the right and positive vertical is pointing downwards).

For CAD overlay and graphics, the offset is taken as the distance between the CAD overlay and the graphics page using the CAD coordinate system (positive vertical pointing downwards).

While aligning two CAD files, the offset is the distance between the **reference** and the **current** document page (in that order) according to the CAD coordinate system.

- **Save** the alignment changes.
- After aligning the tools, you can generate a **3D**. You can also use the tools in the **CAD** on page 675 widget to further refine the display.

If you did not save the alignment changes before generating 3D, you will see a message:

Do you wish to change your CAD overlay alignment?

Click **Save** to generate 3D.

Viewing 3D in the HTML5 Collada Viewer

You can view 3D digital mockups in the HTML5 Collada Viewer. This is very useful when your browser does not support Java Applet. You can set the 3D Viewer as the HTML5 Collada Viewer in the [My preferences](#).

This will help you to:

- Enhance artwork and shape approval with its 3D representation.
- Communicate the final packaging in the most realistic form.
- Use WebCenter as an online medium to share 3D mockups.

Note: The HTML5 based Collada Viewer does not offer the same rendering quality as the Java applet Viewer for Collada files. The advanced material and lightning visualization is not yet available.

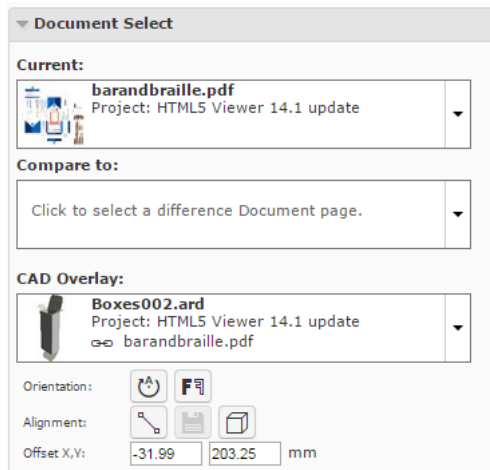

In the HTML5 Collada 3D Viewer, you can view the following:

- Collada. When you open Collada files, it will open the HTML5 3D Viewer if your **Preference** is set as HTML5 Collada Viewer
- Aligned CAD and Graphics [Viewing CAD with Graphics](#) on page 716
- CAD [Viewing CAD Design files as 3D](#)

Browser Version Requirements

Browser	Minimum version
Chrome (Desktop, Mobile)	30
Firefox (Desktop, Mobile)	4
Internet Explorer (Desktop, Mobile)	11
Safari (Desktop)	6
Safari (Mobile (iOS))	8 (iOS 8)

Generating a 3D View from a Graphics file with CAD reference

- Open a graphics file with a CAD reference. Align the CAD overlay correctly on the graphics file.

Read: [Aligning CAD overlay and Graphics](#) on page 719.

When you open a graphics file with a CAD reference in the Viewer, the *document select* panel will show a  button.

Note: The link between graphics and CAD can be made in a desktop application like DeskPack or PackEdge or using *document references*. [Aligning CAD overlay and Graphics](#) on page 719

- Click the **Open 3D View**  button.

The Viewer will open the *3D View* widget with a message.

Loading the 3D model...

The **3D View** widget always shows the HTML5-version of the 3D viewer.

After the 3D generation, you can view the 3D mockups in this widget.

From within this widget, you can:

- **Open the 3D Viewer**  in a new window
- close the **3D View** widget.
- After the 3D perspective is generated, the **Open 3D View**  button is available in:
 - the [top tool panel](#)
 - the [CAD widget](#)
 - the **Documents** list and from all pages where the **document operations** area available.

- To generate a 3D Perspective from the **Document Details** page, go to **Document Information > More Actions**. Choose **3D View(Collada)**.
- To delete a 3D Perspective, go to **Document Details > Document Information > More Actions**. Choose **Remove 3D View**.

Opening Documents in the 3D Viewer

Once you have a generated a 3D perspective by opening it in the HTML5 3D Collada Viewer, you can open this again from different pages in WebCenter.

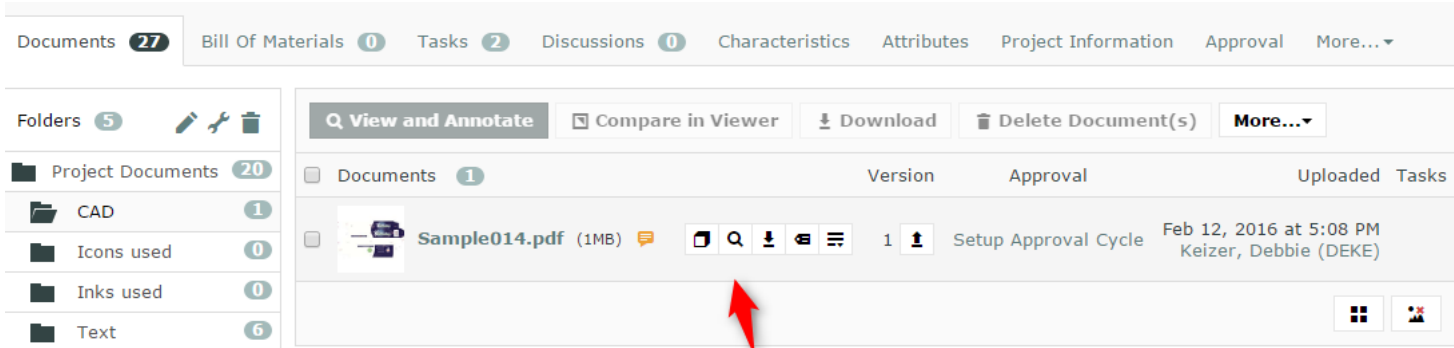

You can also generate a 3D Perspective from the **Document Details** page. To do this, go to **Document Information > More Actions** and choose the **3D View(Collada)** option.

You will have the **Open 3D View**  button next to the normal **document operations**. You will have this option for:

- Graphics Files with aligned CAD reference
- ArtiosCAD Design and Canvas files
- ArtiosCAD 3D files

To open a 3D view, click  from:

- The **Task** execution page:

- The **My Work > My Approvals** page:

- The Document search results:

Note: For this option to be available, enable **Search > Documents > Show Result Layout Options > Document Operations > View**. Read more in: [Document Operations in Search](#).

(if View is an enabled Document Operation in the search Result Layout Options) – grid and list view

Annotations and the 3D Viewer Positions

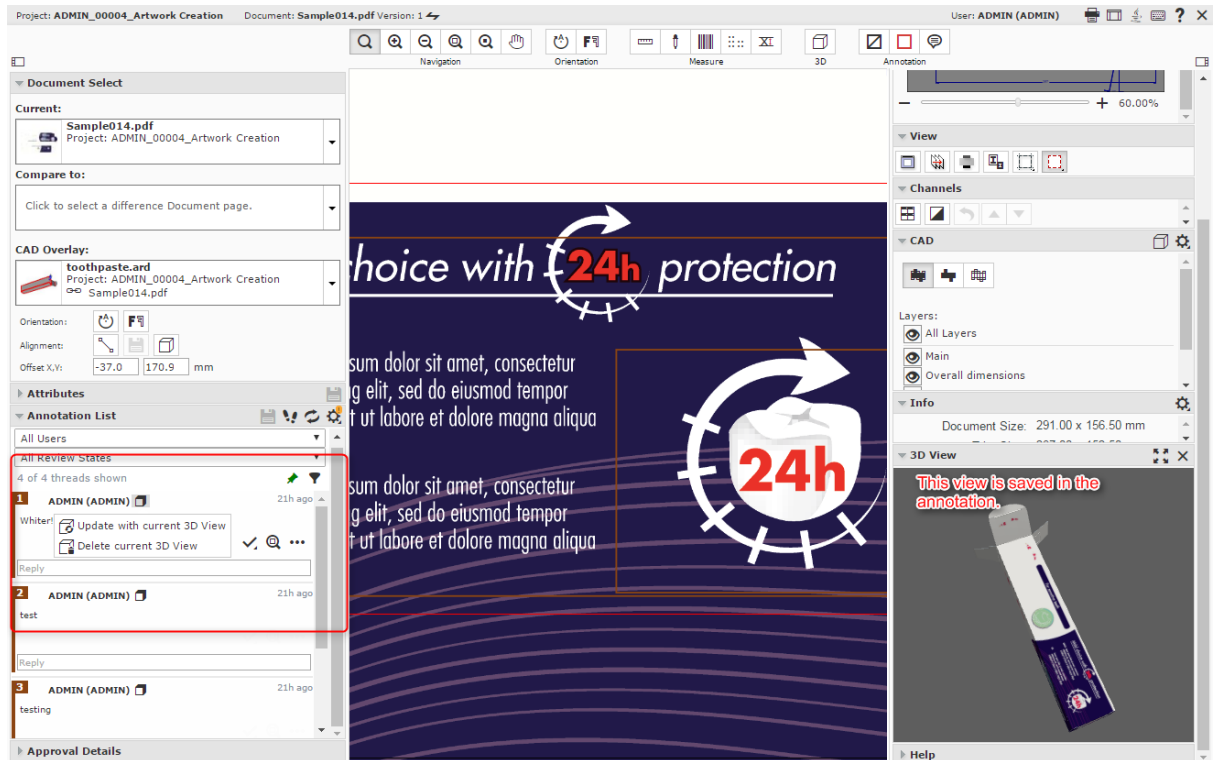

The 3D Viewer can remember its view position when you create annotations in the Graphics document.

Note: The 3D view that will be remembered along with an annotation will be the view that is currently on. For this feature to work, the 3D view widget has to be open in the Viewer.

- To save a camera position of the 3D viewer into an annotation:

- a) Open the **3D View** widget by clicking  button on the Top Tool Panel.
- b) Add your Annotation in the view port and click **Save**. The view position in the 3D view is now linked and saved with the annotation

Note: You cannot add a 3D View position to replies or linked annotations.

- When a 3D view is saved to an annotation, use the  icon in the Annotation List widget to delete or update the 3D view:
 - a) Select the saved annotation in the Annotation List.
 - b) Use the **Update with current 3D view** from the Actions List from the Annotation List widget or the Annotation pop-up and save the annotation. You can also do this even when there is no previous camera position saved in the annotation.

Note: The 3D widget should be open to update or save a new 3D view.

- c) Use **Delete Current 3D View** from the Actions List to delete the stored 3D position and save.

Viewing Component Document in the Viewer

A component is considered “viewable” once it meets the following conditions:

- Contains 1 or more document reference attribute
- The attributes contain in total at least 1 document

“Viewable” components can be opened in the viewer. The documents attached to the component are loaded in dynamically and are visible in the document selector.

If the documents attached to the component are not viewable, then opening the component in viewer throws an error.

Component Widget

The component widget displays the configured document references on the component and the documents that it contains.

By clicking on a document in the tree structure, it becomes selected and behaves as if it would have been selected in the document selector.

The component widget stays visible if the currently shown document is part of a component structure.

If the component has the CAD_REFERENCE attribute with at least one document, and the component is the current selected page; then the 3D document present in the first row of that document reference is shown in the viewport.

If the first document is not a 3D document, then the loading of the 3D documents fails in the viewport.

Combining 3D + graphics view

When the component is the active document then it shows the combination of all graphical files that are linked to the same CAD_REFERENCE document as the component CAD_REFERENCE document. To apply graphics to a 3D structure, see function WCR_HTML5Viewer_1935.

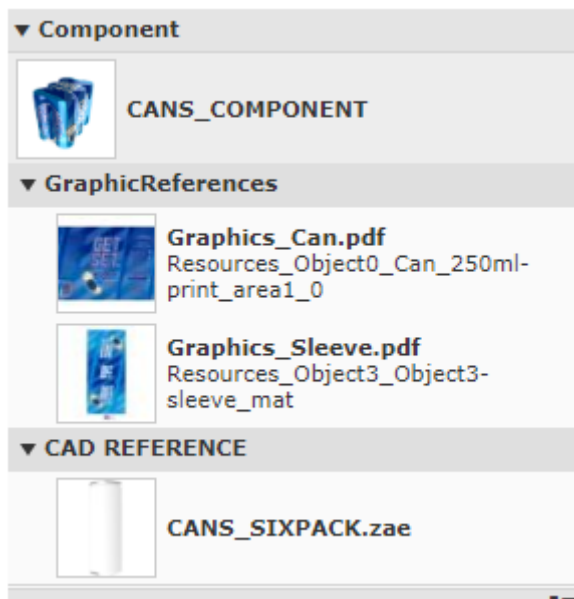

Following requirements must be met:

- Graphic files must be referenced from the component in a document reference attribute
- Graphic files must be linked to a structured 3D document with a specified printable part
- Both component and graphic document must point towards the same CAD_REFERENCE

This is useful to see multiple different graphical files being applied on the same 3D structure.

Viewing Component File in Viewer

Component documents can be opened in the viewer, if it has a document reference attribute containing at least a single document. On opening a component document with reference, this widget will be populated and will display the attached documents.

The component widget displays the configured document references and the documents that it contains. If the component document has a document reference namely, CAD_REFERENCE attribute containing a 3D viewable file then it displays that 3D model when the component becomes the current selected document.

The component widget stays visible if the currently shown document is part of a component structure.

View Graphics with 3D

You can view graphics with 3D files in the viewer. For this link the 3D file to a Graphics Document.

To link the 3D document to a graphics document, use the steps as given in [Linking a CAD with Graphics using document references](#).

- Ensure the graphics file has the **CAD_REFERENCE** (Document Reference) Attribute.
- The document is opened in the viewer as a 2D document.
- When there are 3D files loaded in the Viewer, you can link a 3D file to the Graphic Document using the **Structure Document** selector. Read more here [Structure Document Selector](#) on page 652

Viewing Attributes

If the document in the Viewer has an **Attribute Category** with a Viewer specific View, you will see the **Attributes** widget in the Viewer.

The administrators can create such Viewer specific views. Read in: [Add Viewer Views](#) on page 303

For example, you can create **attribute category** based checklists for different **roles / groups**. When a **user** from that **role** or **group** views the documents with that **category**, this attribute checklist will be visible in the viewer. Read more about this use case in: <https://wiki.esko.com/pages/viewpage.action?pageId=170047115>.

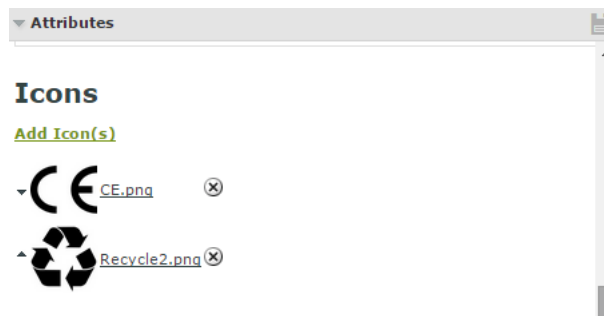

As an another example, you can use this to view your document references in the Viewer. If you have more than one CAD document references associated with your graphics file, you can create a Viewer view for these attributes with specific *source* and *rendering* configurations. Your user will then be able to change a reference from the Viewer and save this configuration.

Note: Only the users with **Project / Folder** level **Change Properties** permissions can change and save attributes from the *attributes* widget.

If your document has *document references attributes*, you can view them from the **Attributes** widget. You can also do the *document operations* specified while configuring the document sources for the reference.

Note: The administrators can create a Viewer view for the document reference attributes with specific *source* and *rendering* configurations.

You can change a reference from the Viewer and save this configuration. This is only possible when you have **Change Properties** permissions.

Video Support for files stored in MediaBeacon

Viewer supports video files from the Asset Management Connection, MediaBeacon. Video files can be opened like any other document or image file in the project. You can select the video from the document list in the Project Details tab and select **View and Annotate**. Videos files can be approved in the workflow directly.

Note: To set up MediaBeacon as the Asset Management connection, refer to *Configure Asset Management Connections* on page 407

Note: To import any file from the Asset Management, refer to *Document Creation Settings* on page 160

Viewing Videos

Opening Video in Viewer

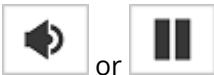

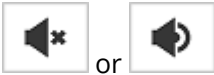

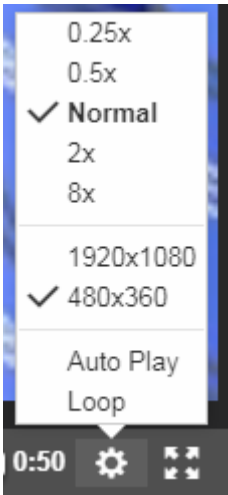

You can open video files by either clicking on the document thumbnail in the document list or by choosing **View and Annotate** for the selected video.

Video Toolbar

Toolbar for video viewer has specific video controls. Detailed description of the other tools can be read at [Top Tool Panel](#) on page 636

Note: Viewer displays the tools which are relevant for videos.

Controls to View Video and Advanced Video Settings

Select	Button	Performs
	Play or Pause	Depending on the video state the button toggles to Play/Pause
	Mute / Unmute	Mute or Unmute the volume in the video. Use the slider to increase or decrease the volume.
	Timeline Slider	Helps to slide through the video and displays the total length of the video at the end. You can slide forward to watch the video ahead.
	Settings	Videos can be set to play in Auto Play which plays on opening of the viewer , or you can start the video manually on opening. Loop allows to play the video in loop until manual intervention. Speed can be chosen as .25x , .5x, Normal, 2x or 8x. Quality of the video display can be chosen if the video has multiple display resolutions.
	View Full View / Exit Full View	Toggles to either view full screen or exits from full screen Note: Alternatively use Esc key to exit full screen

Options in Viewer for Video files

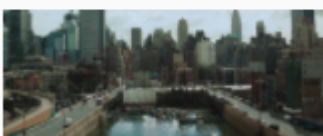

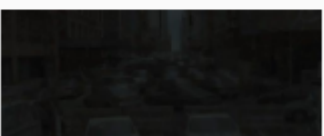

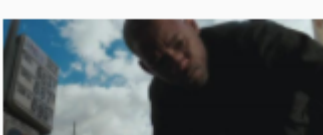

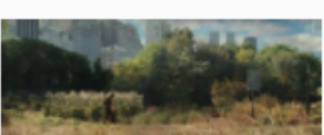

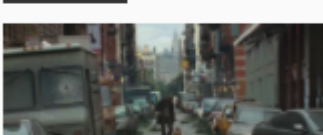

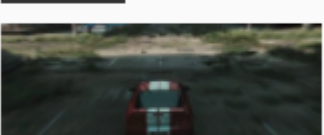

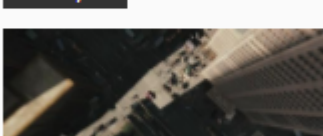

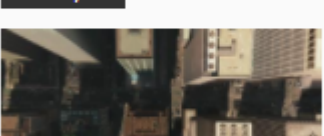

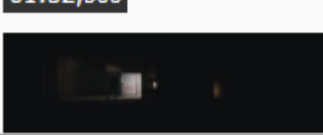

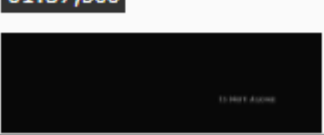

Following are the widget options available for video files

- **Approval Details** widget functions the same way to document approval. Refer to [Evaluate a Document in the Viewer](#) on page 694
- **Info** has the details of the document viewed. Refer to [Info](#) on page 661
- **Help** to learn more about the viewer.
- **Key Frames** refer to [Keyframes](#) on page 730
- **Annotation List** refer to [Annotation List](#) on page 654

Keyframes

Keyframes widget displays the preview of different frames at regular intervals from the video in sequential order. This helps to easily navigate and locate any frame in the video. You can choose any frame displayed to jump to that point in the video.

▼ Keyframes

 00:22,500	 00:27,500
 00:32,500	 00:37,500
 00:42,500	 00:47,500
 00:52,500	 00:57,500
 01:02,500	 01:07,500
 01:12,500	 01:17,500
 01:22,500	 01:27,500
 01:32,500	 01:37,500
 01:42,500	 01:47,500

Note: If you are viewing an annotation and select a key frame that is outside the range of the annotation, the annotation is deselected. If the key frame is inside the range of the annotation, the annotation remains selected .

Annotations for Video

Add Annotations in a Video

A note or comment can be added to the video file as an Annotation. To add an annotation in a video file, use the **Add Annotation** from the toolbar. For detailed information on **Annotations**, refer to [Annotating in the Viewer](#) on page 678.

In video files, adding an annotation pauses the video. The **Start Time** and **End Time** of the annotation is taken as the current time in the video. This can be edited manually by modifying the time and saving the annotation.

Note: Annotation List in videos also displays the start and end time of the Annotations.

Viewing Annotation

Annotations are displayed only when the current time in the video is within the specified start and end time of the annotation. You can view all the annotation in the video file by selecting Annotation List. Refer to [Annotation List](#) on page 654 for details.

Timeline Slider

The Timeline slider displays three indicators, representing the Start Time, Time within the Video and the End Time.

You can also edit the **Start Time** and **End time** by selecting the Annotation in the **Annotation List** by dragging the Start and End time indicators in the Timeline Slider.

Colored markers in the timeline slider show all the available annotations in the video. These markers are visible, only when no annotation is selected.

If the start and end time of the selected video are different, then the video is played in loop. To continue playing the video, close the annotation pop up.

Note: If the start and end time is same for an annotation, then the video is paused.

Unified Viewer

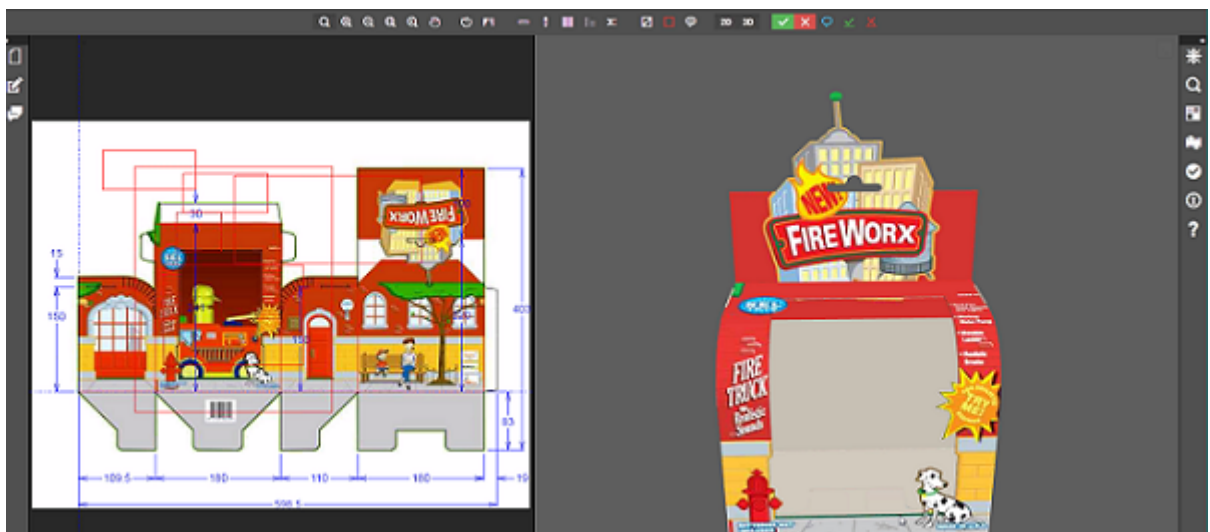

View 2D and 3D versions together

Viewer allows to view both the 2D and 3D perspectives in the center pane. You can use toggle buttons to switch between 2D and 3D view. When you choose to view the 3D perspective in the center pane, 2D perspective is displayed on the side panel and vice versa.

When 3D perspectives are opened in the viewer, all the other toolbar elements and other widgets are collapsed in the viewer except for **Document Selector** and **Approval Details**.

Using toggle buttons, you can simultaneously view both 2D and 3D in the center pane.

Limitations in the HTML5 Viewer

Following features are not available in the HTML5 Viewer yet:

- Advanced View features such as Seamless View or Advanced Flexo tools for screened data.
- Collaboration mode

See <https://wiki.esko.com/display/KBA/KB90866114%3A+WebCenter+-+HTML5+Viewer+known+limitations> for a feature matrix.

About the HTML5 Viewer

The HTML5 Viewer is a fast and comprehensive viewing tool introduced in WebCenter 14.

From 14.1.1 onwards, the HTML5 Viewer is the default WebCenter Viewer. However, you may choose to work with the Java Viewer (default) by changing it in the **Viewer Preferences**.

What does the Share and Approve Viewer HTML5 Viewer offer you?

- Speed: fast viewing for Graphics and CAD files. High speed 3D viewing (14.1 and later).
- Compatibility: high speed performance on the new client browsers.

Browser	Supported Version - Windows OS	Supported Version-Mac OS
Internet Explorer	9.0 or higher	-
FireFox	4.0 or higher	4.0 or higher
Chrome	5.0 or higher	5.0 or higher
Safari	-	5.0 or higher

- Reliability: high accuracy in displaying your data.
- Detail: advanced zoom to see finest details, measuring exact distances. Fast zooming.
- Customizable widgets. You can even restrict access to certain features depending on the user preferences.
- Keyboard shortcuts. To see all of them, press **?**
- Easy access to help and knowledge base. Search in the **Help** widget or press **F1** to access help.

Note: The default Viewer in the WebCenter *Viewer* on page 93s upto 14.1 will be the Java Viewer. You can set the preferred Viewer as the HTML5 Viewer in the General or User Specific **Preferences**. Read more in About Viewer Preferences.

Note: The HTML5 Viewer Share and Approve Viewer does not offer live collaboration or working together at the same time. You can use *annotation threads* for discussions.

Using 3D file as 3D perspective

You can use any 3D file as a 3D perspective of a graphics file in the WebCenter viewer. You can also view both the graphics document and the 3D file next to each other.

To view the files in the viewer, ensure there is a document reference attribute called **CAD_REFERENCE** in the graphics document. Follow the steps below to open a structure document.

You can use the structure document in the Structure document selector.

After selecting a 3D Document as 3D perspective, save the link using the save button next to the Structure Document Selector.

Note: This is only possible if the Document has the Document Reference Attribute **CAD_REFERENCE**, in which the link is stored.

If a printable part is selected and the alignment options are saved, then the 3D widget displays the 3D shape along with the graphic file applied to the specified printable part.

Note: The printable part is saved in the document reference properties **CAD_PRINTABLE_PART** and **CAD_PRINTABLE_PART_SIDE** of the **CAD_REFERENCE** attribute that points to the 3D file.

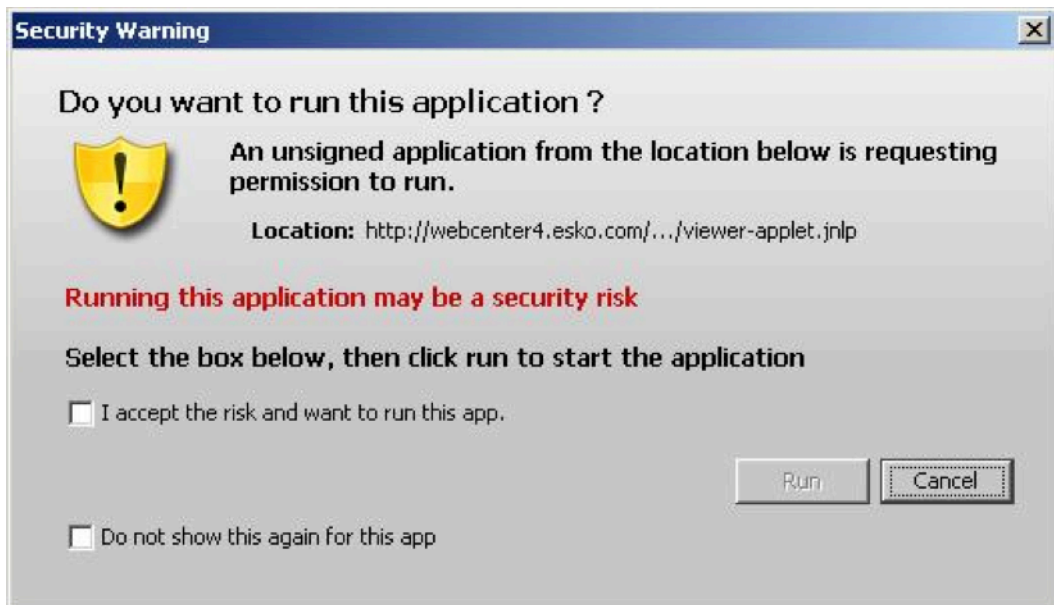

Viewer

- Select your **Viewer Type**. You can set your preference to the *HTML5 Viewer* or keep at the default (*Java Viewer*).

Note: You can always switch to *Java Viewer* from *HTML5 Viewer* using the  button.

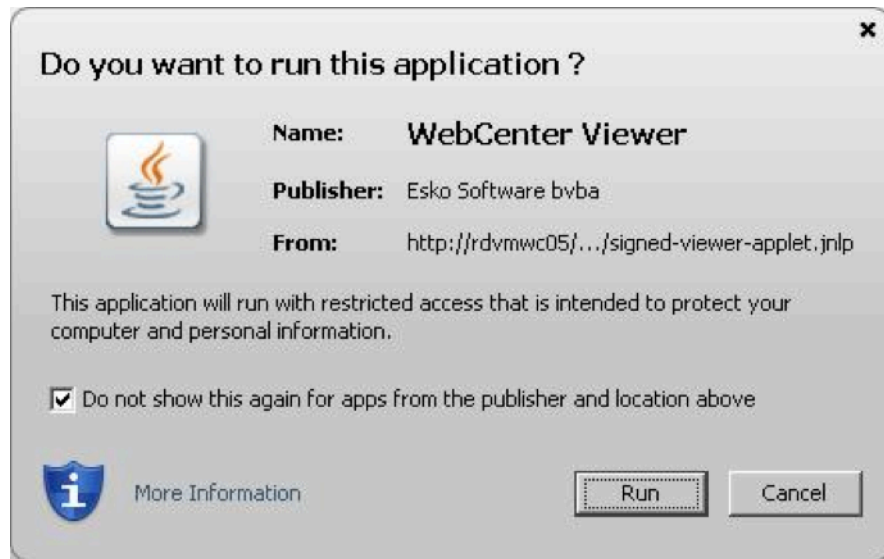

- **Viewer and Workflow Applet:** When *opening a document in the Viewer* or when *creating a workflow*, WebCenter will download a Java applet to your computer.

From Java 1.7.0_21 (for Windows and Mac OS X 10.7 or later), you will get a security warning as the one below when the applet is downloaded. This makes the WebCenter applet look like a security risk for your computer.

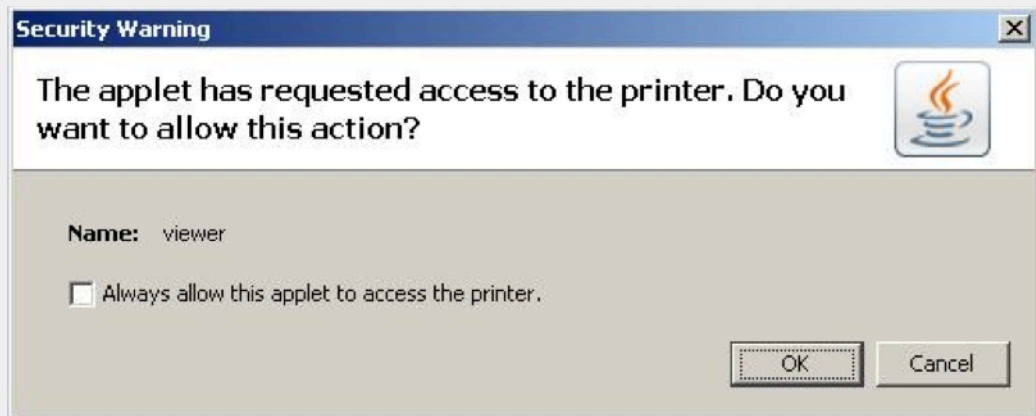

You can adapt how this security warning will look like when downloading the applet. In **Viewer and Workflow Applet**, choose either:

- **Signed (sandboxed)** if you want to run the applet in a strict sandboxed environment (with no access to your computer's resources). As the applet is signed by Esko, the security warning looks less threatening.

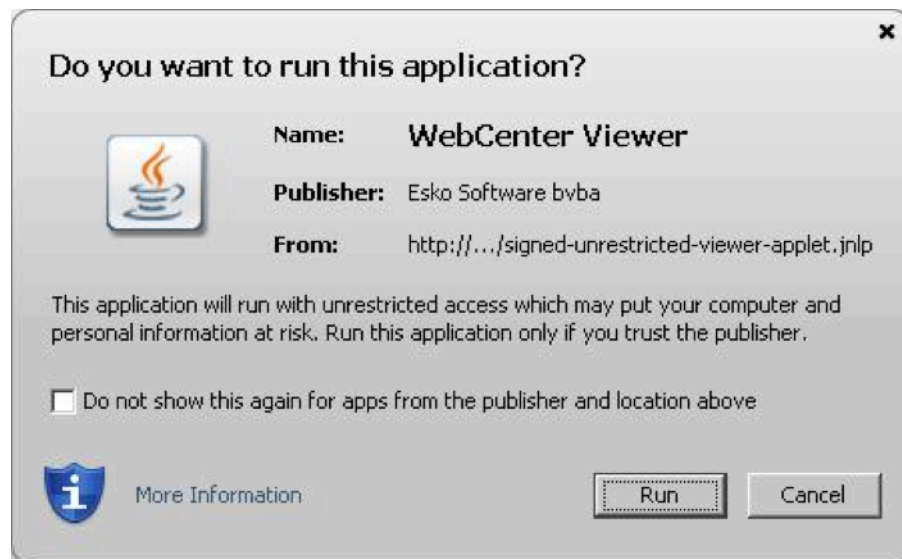

Note:

As the applet is sandboxed, it will also show a warning when trying to print from the Viewer. You will just need to click **OK** to be able to print.

- **Signed (not sandboxed)** if you want to run the applet without restricting it to a sandbox (the applet can request additional access to your computer's resources). This means that you will not get an additional warning when printing from the Viewer.

As the applet is signed by Esko, the security warning looks less threatening.

- **Unsigned** if you want to run the applet as a default unsigned applet. You will get the default security warning that does not mention Esko, but the applet will be sandboxed. This means that you will have an additional security warning when printing from the Viewer, as for the **Signed (sandboxed)** applet.

Tip:

By default, the applet is set to run as **Signed (sandboxed)**. This will work fine for most users.

More frequent users may want to switch to the **Signed (not sandboxed)** option to avoid always having to click an extra warning away when printing from the Viewer.

Mac OSX 10.6 users running Java 1.6.0 may also want to switch to the **Signed (not sandboxed)** option to avoid getting a warning when closing the Viewer by clicking .

With the latest versions of Java 1.7 installed, most browsers block unsigned applets by default. In this situation, it is recommended to use one of the signed settings instead.

- **Viewer Style** sets the Viewer mode as:
 - **Normal** (Default): All HTML5 Viewer features are available in this mode.
 - **Restricted**: In this mode, the user cannot access features such as [Channels widget](#), [CAD widget](#) and [View widget](#).
The side panels displaying the widgets will be in a collapsed format by default.
 - **Advanced** (Java Viewer only): All HTML5 Viewer features are available in this mode. In Java Viewer all features are activated.
 - **Restricted (New Look)** comes with all the enhanced features available in the HTML5 Viewer. This new viewer presents a cleaner, clutter-free look.
- Specify the **Viewer Quality** as:
 - **Best Performance** (Default):
In this mode, the Viewer uses less compression to transfer images. These images are transferred faster but may contain small compression artifacts.

- **Best Quality:**

In this mode, the Viewer uses less compression to transfer images. It takes longer to transfer these images. However, you can view them without compression artifacts.

Note: This setting is applicable to both the HTML5 and Java Viewers.

- **Annotation Color** sets the color in which annotations will be displayed in the Viewer (you can set **Viewer Default** or choose a color from the list).
- **Annotate Approved Documents** sets if and how the users are allowed to annotate documents that are already approved.
 - Select **Enabled** if you want the users to be allowed to annotate approved documents.
 - Select **Warn if Approved** if you want to display a warning before allowing the users to annotate approved documents.
 - Select **Read-Only if Approved** if you don't want the users to be allowed to annotate approved documents.
 - Select **Warn if Approved or Rejected** if you want to display a warning before allowing the users to annotate approved or rejected documents.
 - Select **Read-Only if Approved or Rejected** if you do not want the users to be allowed to annotate approved or rejected documents.
- **Annotate Documents under Approval** sets who can add annotations in the documents under approval.

Note: A document version is considered under approval as soon as an approval cycle is started

Choose from the following settings:

- **All Users:** This is the default setting. All users with view access to a document can annotate that document once the approval cycle has started.
- **All Approvers and Approval Master:** The Approvers and Approval master defined in the document approval setup (all stages) for the current version can annotate during the approval cycle.
- **All Approvers:** All approvers defined in the document approval setup (all stages) can annotate the document while it is being approved.
- **Pending Approvers and Approval Master:** Only an approval master or approvers who can submit an approval state (Approve or Reject) for the current version can annotate the document during the approval cycle.
- **Pending Approvers Only:** Only approvers who can submit an approval state (Approve or Reject) for the current version can annotate the document during the approval cycle.
- **Log out user when inactive** option can be checked, to log out the users whose sessions are not active for a period of time. Option is given to log in again and continue when the user returns to the viewer.
- **Show Discussions in Viewer** Enable this option to view discussions widget in the viewer and view all the discussion posts about the document viewed.

Note: Project Managers who can Force Approve or Force Reject is not considered an approver. They can add annotations only if the setting is **All Users**.

4.5. Approving and Rejecting Documents

You can see documents waiting for your approval on the **My Work** page, under **My Approvals**.

Note: If you cannot see **My Approvals**, go to **My Work > Edit My Work Setup** to add it to your **My Work** page.

You can approve, reject or comment a document:

- from the **My Work** page,
- from the **Viewer**,
- from the document details page (**Approval** tab).

Note: Project Managers have more options when approving or rejecting documents. They can **Force Approve** or **Force Reject** a document. See [Forcibly Accept or Reject Documents](#).

Approvals, rejections and comments are shown on the **Action History** page.

Note: If you need to setup an approval cycle to have other users approve or reject a document, see [Defining Approval Settings](#) on page 786.

4.5.1. Evaluate a Document in the Viewer

When you evaluate a graphic file or a page list (see [Document Types](#) on page 584 for information about the supported file types), you can first open it in the Viewer to look at it in detail. You can then approve, reject, add a stage or comment it directly from the Viewer.

1. Click the document's thumbnail or the  button.

You can do this from:

- the **My Work** page (under **My Approval** if you have documents to approve or under **Approvals to Follow Up** if you are an **Approval Master**),
- the **Documents** tab in the project,
- the header of the Document Details page.
- the viewer

2. In the top toolbar, click:

-  to approve the document,
-  to reject it,
-  to comment it,
-  to forward approval request
-  to force approve it if you are a Project Manager
-  to force reject it (if you are a Project Manager).

Alternatively these options are also available in the **Approval Details** widget. This is available only if the user has **Change Approval** permissions.

Note: You can view the status of the approval of the document in top tool bar.

- In the pop-up that opens, do the following:

if you are...	you can...
approving or force approving the document	set a condition for your approval if the approval cycle allows this (see Allow Conditional Approval or Not on page 794): select Set Approval Condition and type your condition in the box.
rejecting or force rejecting the document	type a reason for your rejection in the box.
commenting the document	type your comment in the box.

- If the user has **Change Approval** permissions, then the user can access the **Approval**

Setup in the Approval details widget. Click  to open the **Document Approval Setup** pop-up window. User can perform all actions as specified in [Defining Approval Settings](#) on page 786

- Enter your password, if your WebCenter server requires it.

In case, the approval cycle is completed and the document is in Approved state, then the user cannot make any changes to the approval cycle from the viewer.

- Click the **Commit** button.

A warning message is shown, if unsaved annotations are present, when you try to **Approve / Reject / Comment** on a document.

Once you have approved or rejected the document, you may not change its approval status later (only a **Pending** status allows future changes).

If you have entered an approval condition, a rejection reason or a comment, it will be shown in:

- the **Approval** tab of the Document Details page,
- the **Action History** tab of the Document Details page,
- the Java **Viewer's Document History** panel.
- the **Approval Details** panel.

To see all the documents you have recently evaluated, go to **My Work > My Recently Submitted Approvals**.

Note: If you cannot see **My Recently Submitted Approvals**, go to **My Work** and add it to your **My Work** page.

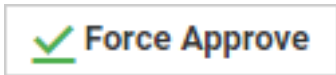

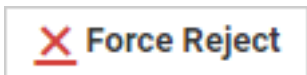

4.5.2. Evaluate a Document in the Document Details Page

When you need to evaluate an office file (like Microsoft Word, Excel, PowerPoint etc.), you can first download it and open it in the corresponding application, then evaluate it from the **My Work** or the Document Details page.

To approve, reject or comment a document from the Document Details page:

1. Go to the **Approval** tab.

2. Click:

-  to approve the document,
-  to reject it,
-  to comment it,
-  to force approve it (if you are a Project Manager),
-  to force reject it (if you are a Project Manager).

3. In the pop-up that opens, do the following:

if you are...	you can...
approving or force approving the document	set a condition for your approval if the approval cycle allows this (see Allow Conditional Approval or Not on page 794): select Set Approval Condition and type your condition in the box.
rejecting or force rejecting the document	type a reason for your rejection in the box.
commenting the document	type your comment in the box.

4. Enter your password, if your WebCenter server requires it.

In case, the approval cycle is completed and the document is in Approved state, then the user cannot make any changes to the approval cycle from the viewer.

5. Depending on your choice, click **Commit Approval**, **Commit Rejection** or **Commit Comment**.

Once you have approved or rejected the document, you may not change its approval status later (only a **Pending** status allows future changes).

If you have entered an approval condition, a rejection reason or a comment, it will be shown in:

- the **Approval** tab of the Document Details page,
- the **Action History** tab of the Document Details page,
- the Java **Viewer's Document History** panel.
- the **Approval Details** panel.

To see all the documents you have recently evaluated, go to **My Work > My Recently Submitted Approvals**.

Note: If you cannot see **My Recently Submitted Approvals**, go to **My Work** and add it to your **My Work** page.

4.5.3. Evaluate Multiple Documents at Once

If you have several documents to approve or reject, and you have made the same decision about all of them (you want to either accept them all or reject them all), you can do this in one operation.

1. Go to your **My Work** page.
2. In the **My Approvals** section, select the documents to approve or reject.

Tip: To select all the documents at once, select the check box at the top of the documents list.

3. At the top of the document list, click:
 -  to approve the documents (you cannot use conditional approval on several documents at once),
 -  to reject them,
 -  to comment them.

Note:

- Use the buttons at the top of the list and not the ones beside a document, or you will only approve / reject / comment that document.
- If you are not Project Manager for some of the documents you selected, **Forced Approve** and **Forced Reject** are not available.

4. If you are commenting the document, type your comment in the pop-up's box.
If you are rejecting the document, you can enter a rejection reason in the pop-up's box.
5. Enter your password, if your WebCenter server requires it.
In case, the approval cycle is completed and the document is in Approved state, then the user cannot make any changes to the approval cycle from the viewer.
6. Depending on your choice, click **Commit Approval**, **Commit Rejection** or **Commit Comment**.

The status of the approval action is displayed, listing any documents that could not be updated.

Note: You can also do this from within a project (in the **Documents** tab, select the project's documents to approve or reject, then click **Approve / Reject** in the **Actions** menu).

4.6. Working with Page Lists

4.6.1. About Page Lists

What is a Page List document?

Page Lists are a special type of multi-page PDF documents in WebCenter that represent imposed books or magazines. As such they are an important tool for commercial printers.

Page Lists PDFs are generated in Automation Engine from FastImpose imposition files (*.imp), and uploaded to WebCenter from the Automation Engine production server.

If you are not using a Automation Engine production server, you can also upload Page Lists using the **Upload** feature in WebCenter. You cannot upload imposition files (*.imp).

Page List documents have two major advantages over other multi-page PDF files:

- You can **upload either the complete document, or specific pages** only (for example, pages 6-12);
- **individual pages can be approved or rejected** in WebCenter (for example, you can approve pages 3, 5 and 7-16 of a 16-page Page List).

Note: A multi-page PDF file can only be approved or rejected as a whole.

Working with Page Lists

Page List documents are **displayed as a single document** in document lists. Click the Page List name to view its pages and details in the dedicated Page List views.

Tip:

Only FastImpose impositions are recognized as Page Lists in WebCenter. Multi-page files uploaded from within WebCenter (except multi-page PDFs uploaded specifically as a page list), or from Odystar, Nexus, or even other Automation Engine documents will never be treated as Page Lists. Instead, they are considered regular multi-page PDF documents.

4.6.2. Page List Views

When you want to examine, approve or reject a Page List, you have the choice of a number of views in which to do so:

Page List

Displays the pages in the imposition in a table.

For every page, the Folio, Sheet Name, Sheet Side (for page lists uploaded from Automation Engine), Thumbnail, Page Version, List Version, and Uploaded Date are displayed.

Finally, the approval status per page is listed, and pages that have annotations are marked with a post-it icon.

Page List Information									
Document Information

<input type="checkbox"/>	<input checked="" type="checkbox"/>		2	2	May 11, 2015 at 12:54 PM	✓ ✗ ↻		Upload New Version	
<input checked="" type="checkbox"/>	6		2	2	May 11, 2015 at 12:54 PM			Upload New Version	

Page Gallery

Displays the pages in the imposition in a gallery view. This gives you a quick overview of the approval status of the different pages:

- Pages topped with a blue bar and icon have not been approved or rejected yet;
- Pages topped with a green bar and icon have been approved;
- Pages topped with a green bar and icon have been approved with a condition;
- Pages topped with a red bar and icon have been rejected;
- Pages topped with a green bar and icon have been force approved;
- Pages topped with a red bar and icon have been force rejected.

Page List Information

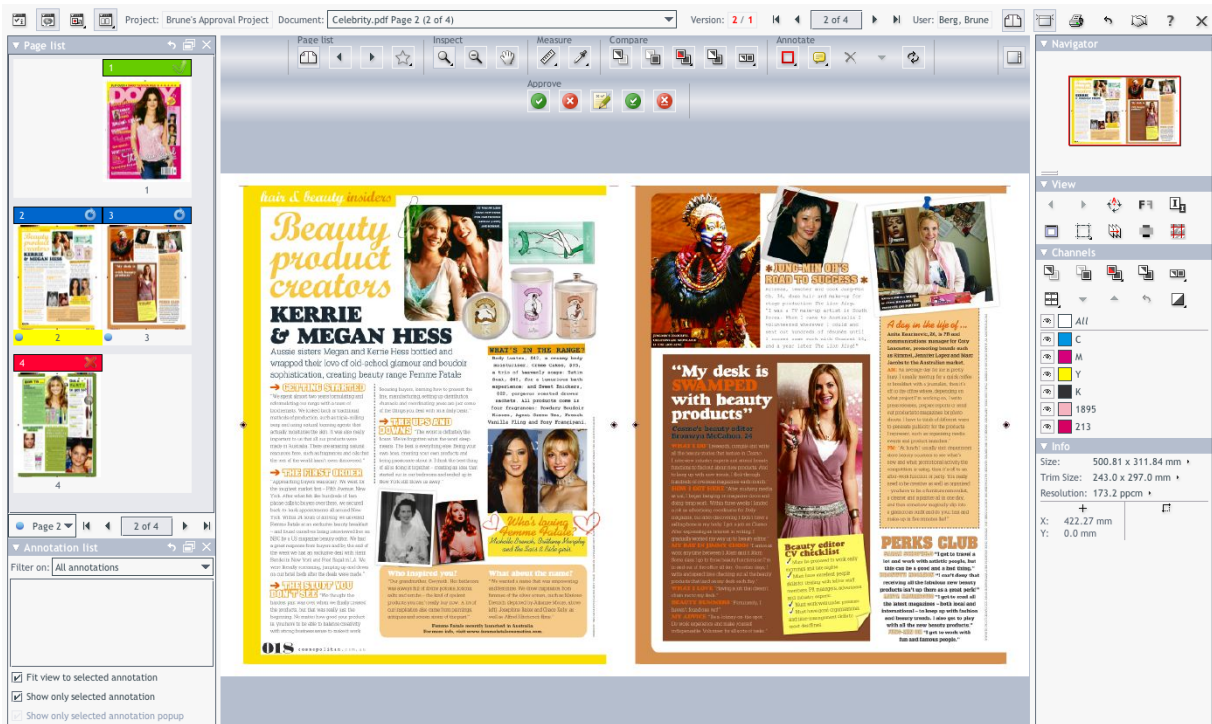

Displays basic information about the Page List (number of pages, binding...). This information is editable for documents that were uploaded using the WebCenter Upload feature.

4.6.3. Page Lists in the Java Viewer

Page List-specific features

The Viewer has a number of features that make working with Page List documents even more intuitive:

- Reader spread mode
- Page List panel
- Show margins (Trim boxes) option

Reader Spread view

Click the **Toggle Reader Spread View** button in the top toolbar to activate the Reader Spread view mode.

Page List panel

Click the **Display Page List Panel** button in the top toolbar to display the Page List panel. This panel shows thumbnails of all the pages in the Page List document. Click on a page in the panel to display it in the viewer.

Tip: You can dock and undock this panel to optimize your workspace in the Viewer.

Show Margins option

Click the **Show Margins (Trim Boxes)** button on the View toolbar on the right hand side of the Viewer to display the trim boxes for the displayed page(s). Trim boxes are displayed in blue.

For more information, see the Viewer's online help.

4.6.4. Notes on Page Lists and Approval Cycles

Page Properties

Index

Represents the sequential position of the page in the Page List.

Folio

Represents the "name" of the page as it is used in FastImpose.

Page Version

Represents the version of the individual page in the Page List.

List Version

Represents the version of the complete Page List. The List Version is updated every time you upload a new version of the imposition from Automation Engine.

Index versus Folio

For example, the page with Index 7 may have *vii* as its Folio, or the page with Index 1 may actually be page 3 when the cover is not part of the imposition.

List Version versus Page Version

When new versions of a selection of pages are uploaded, the List Version number and the Page Version number of the uploaded pages are incremented.

As a result, in very asynchronous workflows (e.g. magazine printing), you can easily have 15 Page List Versions.

Every update to the Page List increments this version number. However, most of these updates will only affect certain pages: their Page Version will be incremented.

By the time you reach Page List Version 15, many pages will be at version 3 or higher, but some will still be at Page version 3.

Empty and blank pages

Empty pages are ignored for approval.

For example, if you upload a 32-page PDF file as a Page List, but change the Number of pages to 64 afterwards, creating 32 empty pages at the end of the Page List. These 32 empty pages are ignored - you cannot approve or reject them.

Blank pages require approval. WebCenter detects when PDF pages have been added to the imposition that have no visible content. The blank pages need to be approved just like any other pages.

When is a Cycle Finished?

The approval cycle's status is changed to `Finished` when any one of the following conditions are met:

- all Approvers have either approved or rejected it,
- the Project Manager or an Admin has Forced Approved or Forced Rejected it.

Note that in this case, the final status is `Forced Approved` or `Forced Rejected` instead of `Finished`.

A finished approval cycle may not be stopped or started without uploading a new version of the document.

These **status rules apply to each individual page in the Page List**.

Only when **all the pages in the Page List document** have reached their `Finished` (or `Forced`) approval status, will the **Page List** get the `Finished` status.

4.6.5. Approve or Reject a Page List

To approve the pages in a Page List, you can choose from a number of different methods.

Use the Viewer

1. Navigate to the Page List in a Document list, and click on its thumbnail image. The **Viewer** opens, displaying the Page List.
2. In the Viewer tool bar, click:
 -  to approve the document,
 -  to reject it,
 -  to comment on it,
 -  to force approve it (if you are a Project Manager),
 -  to force reject it (if you are a Project Manager).
3. In the pop-up that opens:

Approved

Pages:

- Current Page
- Marked Pages (No Marked Pages)
- Selected Pages:
- All Pages
- Set Approval Condition

- a) Choose to approve / reject / comment either the **Current Page**, the **Selected Pages** or **All Pages**.
- b) Optionally:

if you are...	you can...
approving or force approving the page(s)	set a condition for your approval if the approval cycle allows this (see Allow Conditional Approval or Not on page 794): select Set approval condition and type your condition in the box.
rejecting or force rejecting the page(s)	type a reason for your rejection in the box.
commenting the page(s)	type your comment in the box.

- c) Enter your password if your WebCenter server requires it.
- d) Click the **Commit** button.

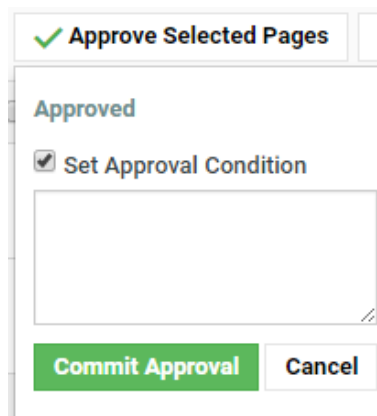

For more information, see [Page Lists in the Java Viewer](#) on page 745.

Use the Page Gallery View

1. Navigate to the Page List in a Document list and click on its name.
The Document Details page appears.
2. Select **Page Gallery** from the menu.
3. Select the pages you want to approve or reject and then click **Approve Selected Pages** or **Reject Selected Pages**.

You can also choose to **Approve All Pages** or **Reject All Pages**.

4. In the pop-up that opens:

- a) Optionally:

if you are...	you can...
approving or force approving the page(s)	set a condition for your approval if the approval cycle allows this (see Allow Conditional Approval or Not on page 794): select Set Approval Condition and type your condition in the box.
rejecting or force rejecting the page(s)	type a reason for your rejection in the box.
commenting the page(s)	type your comment in the box.

- b) Enter your password if your WebCenter server requires it.
- c) Click the **Commit** button.

Use the Page List View

1. Navigate to the Page List in a Document list and click on its name.
The Document Details page appears.
2. Select **Page List** from the menu.
3. Select the pages you want to approve or reject and then click **Approve Selected Pages** or **Reject Selected Pages**.

You can also choose to **Approve All Pages** or **Reject All Pages**.

4. In the pop-up that opens:
 - a) Optionally:

if you are...	you can...
approving or force approving the page(s)	set a condition for your approval if the approval cycle allows this (see Allow Conditional Approval or Not on page 794): select Set Approval Condition and type your condition in the box.
rejecting or force rejecting the page(s)	type a reason for your rejection in the box.
commenting the page(s)	type your comment in the box.

- b) Enter your password if your WebCenter server requires it.
- c) Click the **Commit** button.

4.6.6. Uploading and Updating Page Lists

Requirements for Page Lists

Page Lists are supported in WebCenter from version 7.1 onwards.

To publish an imposition from Automation Engine to WebCenter, use the **Publish Imposition on WebCenter** ticket.

WebCenter and Automation Engine must be in the same LAN, or use a Tunnel and Approval client.

Upload an Imposition as a Page List from Automation Engine

Only FastImpose impositions are recognized as Page Lists in WebCenter. Multi-page files uploaded from within WebCenter (except multi-page PDFs uploaded specifically as a page list), or from Odystar, Nexus, or even other Automation Engine documents will never be treated as Page Lists. Instead, they are considered regular multi-page PDF documents.

Proceed as follows to upload an imposition file as a Page List from Automation Engine to WebCenter:

1. Start the Automation Engine Pilot and log on to the production server.
2. Browse to the FastImpose imposition file (*.imp) you want to upload, or create a new imposition in the Pilot.
3. Right-click the imposition and select **New Task > Publish Imposition on WebCenter**.
If the **Publish Imposition on WebCenter** task does not appear in the context menu, choose **More Tickets** and select the task in the **Select Ticket** dialog.
4. Modify the settings for the **Publish Imposition on WebCenter** ticket (the first ticket in the chain) if needed.
5. Modify the settings for the **Send Book to WebCenter** ticket (the second ticket in the chain):
 - a) On the **Destination** tab, select the WebCenter **Site** from the list.
 - b) Enter the **Project**, **Folder**, **Document** and **Project Template** names. You can use SmartMarks to populate these fields.
 - c) Enter your **User Name** and **Password** for the selected WebCenter site.
 - d) Click the **Approval** tab and enable **Approval** if required.
6. Click the **Launch** button to upload the imposition to WebCenter.

Note: This automatically adds the imposition to the Pilot's **Pages** view at the same time.

Upload an Imposition using the WebCenter Upload Feature

1. Either go to the project/folder you want to upload the document into and click the  **Upload** button, or just click the **Upload** menu from anywhere.
2. On the **Upload** page, select the **Project** and **Folder** you will upload the document into (if you are already in the project/folder, those are filled in automatically, but you can still **Change the Destination**).
3. Select **Browse** in the **Source** list and click the **Browse...** button to open a browser dialog and select your file.
4. Select **Page List** in the **Document Type** list.
5. Type the index number of the first page in the file in the **Index of First Page** field.

For a new document, this will typically be 1, but it might not be, if you plan on adding additional pages later, or if you are updating a selection of the pages in an existing Page List.

6. The document **Name** is automatically detected. You can still change it if needed.
7. Optionally, specify a **Description** for the document.
8. Click **Upload**.

The Page List is uploaded to WebCenter. You can still edit some properties of the Page List in the **Page Information** view (such as the number of pages, the binding edge, etc.).

Update Pages in a Page List

You can update a specific page or range of pages in a Page List, either from Automation Engine or through the Upload feature in WebCenter.

To Update One or More Pages from the Pilot

1. In the Automation Engine Pilot's **Imposition Gallery**, select the pages in the imposition that you want to update.
2. Right-click one of the selected pages and re-launch the exact same **Publish imposition on WebCenter Chain** ticket you used to upload the original Page List.

To Update Individual Pages from WebCenter

1. Navigate to the folder in which the original Page List resides.
2. Click the name of the Page List to open the Document Details page for the Page List.
3. Click **Page List** to open the Page List view.
4. Click the **Upload New Version** link in the row corresponding to the page you want to update.
5. Browse for the PDF document containing the new version of the page you want to update and click **Finish** to upload the new page.

The **Index for First Page** field is already filled in, because you are only updating a single page (at the listed index).

To Update Multiple Pages from WebCenter

1. Navigate to the folder in which the original Page List resides.
2. Click the name of the Page List to open the Document Details page for the Page List.
3. Click **Page List** to open the Page List view.
4. Click the **More Actions...** button and select **Upload New Version**.
5. Browse for the PDF document containing the new versions of the pages you want to update.
6. Provide the **Index of First Page** information: pages from the new PDF you are uploading will update the existing pages in the Page List starting at the Index you specify.

For example, if you upload a four-page PDF document to a 16-page Page List, and enter 5 as **Index of First Page**, WebCenter will update pages 5, 6, 7 and 8 in the Page List with the newly uploaded versions.

7. Click **Finish**.

4.7. Working with 3D Files

With WebCenter, you can upload, view and approve 3D files. This is an option available with the **Advanced Approval** module.

This is based on Esko's **Visualizer** technology, and enables you to:

- Communicate the final packaging in all its realism to clients.
- Use WebCenter as an online medium to share 3D mockups.
- Enhance artwork and shape approval with its 3D representation.

4.7.1. About 3D Files

WebCenter works with **Collada** (.dae) and **Zipped Collada** (.zae) 3D files.

Collada is an interchange file format for interactive 3D applications. It is an open standard based on XML, managed by the Khronos Group (a not-for-profit technology consortium). For more information, go to <http://www.khronos.org/collada/>.

A Zipped Collada file is a zip file containing:

- a Collada file,
- a `manifest.xml` file with a specified format,
- optionally, other assets such as backgrounds.

Note: WebCenter supports having a preview embedded in the archive file and extracting this automatically as a default thumbnail.

4.7.2. Creating and Exporting 3D Files

You can create Collada files from **Studio Visualizer** and / or **ArtiosCAD**.

In Visualizer

Studio Visualizer can build 3D models based on the following structural design file formats:

- **ArtiosCAD *.ard** files;
- **Studio Toolkit for Flexibles *.bag** files for flexible packaging such as bags and wrappers;
- **Score! *.vlm** files.
- **Collada *.zae archives** with arbitrary 3D shapes, with printable areas defined (if supplied by Esko products). Collada archives created by non-Esko products can be used in Studio Visualizer but will not have a printable area.

1. Open the **artwork** in Illustrator, ArtPro or PackEdge.
2. Place and align the **structural design file**.
3. Then choose **Open in Visualizer** from the **File** menu.
4. Set the **Substrate** material.

5. Edit your design as necessary:
 - add process and / or spot colors,
 - add special finishes,
 - add an environment (background).
6. Export your 3D design to a **Zippered Collada** (.zae) file using the **Export 3D file for Viewing** option.

You can choose to **Create a preview image file alongside** the Collada file. This will be a .jpeg thumbnail image.

Note: If your model includes graphics, saving to .zae and not .dae ensures you have everything in one file (WebCenter doesn't support using multiple files for one 3D design).

See the Visualizer manual or online help for more information.

In ArtiosCAD

Since ArtiosCAD 7.6, any 3D file can be output to Collada. The output includes the graphics, floor shading etc.

Note: This might require additional licensing.

1. Create your model using the ArtiosCAD 3D functionality.
2. When it is ready, go to **File > Outputs-3D > Collada** to export it.
 - Set the **Graphics resolution**.
 - To export a thumbnail with the Collada file, choose either **PNG** or **JPEG** in the **Include bitmaps as** option (you can select the **Quality** for **JPEG**).
 - Save the file as a **.ZAE file**.

Note: If your model includes graphics, saving to .zae and not a .dae ensures you have everything in one file (WebCenter doesn't support using multiple files for one 3D design).

See the ArtiosCAD manual for more information.

4.7.3. Uploading 3D Files to WebCenter

Collada (.dae) and Zippered Collada (.zae) files can be uploaded to WebCenter using the normal upload functionality available within WebCenter, via Automation Engine or through the WebCenter SDK.

WebCenter automatically recognizes Collada files as the Collada document type.

Working with 2D and 3D Files

We advise using the same name for related 2D and 3D documents, and putting them in the same folder.

Creating a Thumbnail

By default, WebCenter shows the default Collada thumbnail for Collada files: .

To add your own thumbnail:

- use the **Create a preview image file alongside** when exporting the Collada file from Vizualiser (see [Creating a 3D File in Visualizer](#)).
- choose either **PNG** or **JPEG** in the **Include bitmaps as** option when exporting the Collada file from ArtiosCAD (see [Creating a 3D File in ArtiosCAD](#)).
- upload your own thumbnail in WebCenter:
 - a) in the **Document Details**, go to the **Document Information** tab,
 - b) click **Thumbnail** and upload your thumbnail image.

Note: The best sizes for thumbnails in WebCenter are 100x100 and 200x200 pixels.

4.7.4. Viewing 3D Files

Hyper realistic 3D viewing experience is now available in WebCenter. You can view 3D in Unified Viewer.

- the Java Collada Viewer
- the HTML5 Collada Viewer
- Click the thumbnail of a Collada file to open WebCenter's 3D Viewer. As a regular user, you need to have both View and Download rights to use the Collada Viewer.

Approve
 Reject
 Comment
 Force Approve
 Force Reject
 ?

Note:

If your Collada file contains a background environment (.env file), you will see it in the background.

WebCenter supports all the default Visualizer environments.

- The HTML5 3D Viewer launches much faster than the Java based Viewer and it works on mobile devices. You can use your mouse or touch to perform actions. Read about HTML5 3D viewing in [Viewing 3D in the HTML5 Collada Viewer](#) on page 721.
 - Makes use of 3D capabilities that are built into modern browsers (WebGL) depending on your browser.
 - Supports the same lighting, print and finishing effects as Java version and the desktop Studio application.
 - For Collada files that are written in Studio, the Viewer will show the lighting environment as configured there. For other Collada files, it will use a neutral photo studio lighting (different from the Java-based Viewer).

System Requirements (Java 3D Viewer)

About System Requirements

The following system requirements only apply to the Java 3D Viewer. It is however recommended to use the newer HTML5 3D Viewer (the default 3D Viewer since WebCenter

16.0), since this has better browser support and offers a better experience. The system requirements for using the HTML5 3D Viewer are the same as WebCenter usage in general, no special additional requirements.

For PC Clients

System	32-bit or 64-bit
Memory	1GB RAM minimum, 4GB RAM recommended
Java version	Java 1.5 or higher
Video card	<p>DirectX9 compatible 3D graphics board from ATI or NVidia supporting fragment shaders and with at least 256MB video memory.</p> <p>For example:</p> <ul style="list-style-type: none"> • NVidia GeForce FX series, GeForce 6 series, GeForce 7 series, GeForce 8 series, GeForce 9 series. • ATI Radeon 9600, 9700, 9800, Radeon X series, Radeon HD series. <p>Note: ATI FireGL boards and Intel embedded graphics are not supported!</p>

For Mac Clients

System	32-bit or 64-bit
Memory	1GB RAM Minimum, 4GB RAM recommended
Java version	Java 1.5 or higher
Video card	<p>For Intel Macs:</p> <ul style="list-style-type: none"> • NVidia GeForce 6600/6800/7300/7600/7800/8600/8800, Quadro FX 4500/5600. • ATI Radeon 9600/9700/9800, Radeon HD 2400/2600, X600/X800/X1600/X1900. <p>For PowerPC Macs:</p> <ul style="list-style-type: none"> • NVidia GeForce FX/6600/6800/7800. • ATI Radeon 9600/9700/9800/X800/X1900. <p>For example: Power Mac G5, iMac G5, PowerBook G4 (from 2004 or later).</p>

Browser Limitations

The Collada 3D viewer is currently not supported for use on Firefox 4 for Mac and Chrome for Mac.

With Firefox 3 for Mac there is a known problem when using tabs: when the Collada 3D viewer is open, opening extra tabs will also display the Viewer image in those tabs.

4.7.5. Using 3D file as 3D perspective

You can use any 3D file as a 3D perspective of a graphics file in the WebCenter viewer. You can also view both the graphics document and the 3D file next to each other.

To view the files in the viewer, ensure there is a document reference attribute called **CAD_REFERENCE** in the graphics document. Follow the steps below to open a structure document.

You can use the structure document in the Structure document selector.

After selecting a 3D Document as 3D perspective, save the link using the save button next to the Structure Document Selector.

Note: This is only possible if the Document has the Document Reference Attribute **CAD_REFERENCE**, in which the link is stored.

If a printable part is selected and the alignment options are saved, then the 3D widget displays the 3D shape along with the graphic file applied to the specified printable part.

Note: The printable part is saved in the document reference properties **CAD_PRINTABLE_PART** and **CAD_PRINTABLE_PART_SIDE** of the **CAD_REFERENCE** attribute that points to the 3D file.

4.7.6. Approving 3D Files

Collada files can be approved like any other document in WebCenter. You can approve, reject or comment a Collada file from:

- your **My Work** page,
- the project's **Documents** tab,
- the document's **Approval** tab,
- the 3D Viewer (at the bottom left of the window).

4.7.7. Annotating in 3D Files

When the current document is a 3D file, the 2D annotations are created relative to the view port and are shown in the annotation report. Adding an annotation is not possible during comparison of 3D models or on 3D perspectives that are linked to graphic documents. When the annotation tool is active, you

- Cannot move or rotate the 3D object. To rotate or move the 3D object, turn off the annotation tool.
- Add an annotation, the camera angle of the 3D model is linked to the 2D annotations. Selecting an annotation, will result in the 3D model rotating to the same camera angle where the annotation was added.

An annotation is only visible, when it is currently selected by the user from the widget.

You can read more on Annotations here [Annotations and the 3D Viewer Positions](#) on page 724

4.8. Working with ArtiosCAD Documents

You can open your document in the ArtiosCAD application directly from the WebCenter server.

Note:

This is possible if:

1. the document is recognized as any of the following types :
 - Design: .ARD and other structural design formats supported by ArtiosCAD
 - Manufacturing: .MFG and other structural manufacturing formats supported by ArtiosCAD
 - 3D: .A3D
2. you have been granted rights to download the native ArtiosCAD files by the system administrator.
3. you have been given the download permission to the project folder where the document resides.
 - From the Document Search Results page, you may see the **Open in ArtiosCAD** link even when you do not have the download permission. When you attempt download, you will receive an error message.
4. [WebCenter Preferences > General Preferences > ArtiosCAD > Open ArtiosCAD documents](#) is set to either the ArtiosCAD Standard Edition or the ArtiosCAD Enterprise edition.

4.8.1. Canvas

The ArtiosCAD Canvas type document is a container for designing multi-part displays. These individual parts in the Canvas may differ in the board format.

The parts of a Canvas can be saved as separate design files into WebCenter and then referred in a **document reference attribute** with the name `Canvas Parts`.

Note: This document reference attribute is available in WebCenter by default. Read [Canvas related Attribute Categories](#) on page 150

The Canvas document will also contain the meta-data about its parts.

Note:

- You cannot use the Canvas documents to run a Standard.
- A canvas document cannot be used to create 3D view with aligned graphics. However, you can view the 2D model with aligned graphics in the Viewer.

Canvas Information Tab

The **Document Details > Canvas Information** page has four sub-tabs:

- **Geometry** tab containing:
 - Detailed design information
 - Dimensional details
 - Board and flute information,
 - Print item details
 - Design preview
- **Parts** tab displays the information regarding each part. The information displayed on this tab will depend on whether these parts are managed by WebCenter or saved to WebCenter:

Parts

Part	Document	Project	Version	Board
Part 1	PRMA_ACAD_CANVAS1*01.ARD	PRMA_ACAD_Canvas_1	1	DECE
Part 2	PRMA_ACAD_CANVAS1*02.ARD	PRMA_ACAD_Canvas_1	1	DECE
Part 3	PRMA_ACAD_CANVAS1*03.ARD	PRMA_ACAD_Canvas_1	1	DECE
Part 4	PRMA_ACAD_CANVAS1*04.ARD	PRMA_ACAD_Canvas_1	1	qi-20

- the **Part** name as defined in ArtiosCAD
- the **Document** file name (when not managed in WebCenter) or a WebCenter document name if it is managed in WebCenter.
 - If the current user has the rights to view the document, it will be displayed as a hyperlink to the referenced document's details.
 - If the document is not found, you will see a warning listing the possible causes.
- the **Project** name if the document is managed (separately saved to WebCenter). This will be displayed as a hyperlink to the referenced project's details.
 - If the project is not found, a warning will be shown hinting at possible causes.
 - If the part is not managed in WebCenter, the Project field will be empty.
- the **Version** number for the parts managed in WebCenter.
 - The number will be "0" for the documents not managed in WebCenter.
- the **Board** name
- the **Board Description** – details of the board assigned to this specific part.
- **2D View** tab shows a 2D view of the canvas file (default side)
- **3D View (Collada)** tab shows the 3D view of the document with mouse controls.

Note: If 3D view cannot be created, then an error message will be generated.

- **3D Model (VRML)** tab:

- When you click on this tab, a VRML file (extension .wrl) will open in the browser generating a 3D view.

Note: The browser needs a plug-in for VRML format (e.g. Cortona) to generate the 3D view of the document. If this is absent, the browser will download the VRML file.

Note: The Canvas documents should have folding angles to be able to render them in 3D. You will see an error message if this information is missing.

4.8.2. Opening Documents in ArtiosCAD Standard Edition / Enterprise Edition

Set your **My WebCenter > My Preferences > ArtiosCAD Preferences** as either:

- ArtiosCAD Standard Edition to download an ArtiosCAD document from the WebCenter site and open it in your ArtiosCAD desktop application.
 - ArtiosCAD Enterprise Edition to open the document in the installed ArtiosCAD Enterprise Edition
1. You may open your design / manufacturing /3D file you want to edit in ArtiosCAD desktop application from:
 - the **document details** page using the **Open in ArtiosCAD** button.
 - the **Project Details- Document Overview** page, using the open  button.
 - the **Task Execution – Documents section** page, using the open  button.

- the **Document Search Results** page, using the open  button shown next to the document name from the list view / grid view, or when you hover over the document in card view.

2. If your preference is set as ArtiosCAD Enterprise Edition, the system will launch the ArtiosCAD Enterprise desktop application. To open documents in ArtiosCAD Enterprise edition, use the same buttons as described. Also enter your login credentials for the WebCenter server.
The document will be loaded to the ArtiosCAD Enterprise workspace in **manage document mode**. In this mode, you can publish the updated version to the same WebCenter project to which the document belonged.

4.9. Project Management in WebCenter

Users designated as Project Managers in their profile have a **Projects I Manage** link on their **Projects** menu. In these projects, they have access to a number of additional features that allow them to manage the projects.

Project Managers can:

- Create projects, either blank or from a Template.
- Invite members to the project and uninvite them.
- Create project folders and add documents.
- Set Characteristics and Attributes on the project and its documents.
- Forcibly Accept or Reject documents requiring Approval.
- Set the security on the project.
- Manage Roles in their project.

Note: Only Project Managers who are members of the Admins group can save a project as a Template. See the Administration Guide for more information.

Whenever a project is created, an event is logged in the audit trail and can be viewed in the project history.

Basic information about the newly created project details like the **Project Name, Project Description, Project Manager**, project was created from template are all mandatorily recorded .

4.9.1. Creating Projects and Folders

Project Managers and **Project Creator** users can create new projects from a project template, or from an existing project. Project Manager users also have an option to create from zero and they can create new folders inside projects they manage.

Project Creators have to necessarily assign a project manager for the projects they create.

Create a Project from Zero

1. Log in as a **Project Manager** or **Project Creator**.
2. In the **Create** or **Projects** menu, click **Create Project**.
3. Choose **Start from a Blank Project** in the **Create** list.
4. Fill in the new project's **Details**.
 - a) Enter the **Name** of the new project.
 - b) If you are a **Project Manager** user, by default you are the **Project Manager** of the project you created. If you are a **Project Creator**, you can make another user or user group as the Project Manager for this project by selecting the user name or group name from the Project Manager list.
 - c) To make the project active, leave the **Status** on **Active**.

Note:

If you are not sure that the project will be going forward (you need somebody else to decide first), you can either:

- Make the project **Non Active** or **On Hold**,
- Make the project active (if you have the Task Management module), make the decider a project member, and assign him/her a task to confirm/authorize the project as first project task.

See [Task Management in WebCenter](#) on page 819 for more information about tasks.

- d) If desired, specify a **Customer** for the project, and that customer's **Location**.
- e) To use a custom thumbnail, click **Change** beside the default **Thumbnail**.
Select **Specify New Thumbnail** and enter the complete path and filename in the associated field or **Browse** for it. To use the default thumbnail, leave that choice selected.
- f) If desired, enter a project description in the **Description** field.

- g) To specify an optional due date, click the calendar at the end of the **Due Date** field and select the desired due date. To set the due time, click the drop-down list to the right of the calendar control.
- 5. To add **Documents** to the project, click **Add Item** in the **Documents** section and either:
 - **Browse** to the document to add,
 - **Copy** a document from another project (select the project then the document to copy).

Tip: Use the  icons to search for a project or document name.

You can then change the document's **Name** and add an optional **Description**.

- 6. Invite members to the project: select each member, role or group to invite in the **Invite members** list

Note: You can **Create and Invite New User** to the project from the **Invite Members** drop down list.

To remove a member, role or group, click the associated minus sign.

- 7. Click **Create**.

This brings you to the new project's details page.

Creating a project adds an event and this is stored in the Project History.

This event will add following information to the Project History:

- The Project/Template from which the new Project is created.
- The name.
- The Project Manager.
- The Salesperson (if there is any).
- The Customer (if there is any).
- The Location (if there is any).
- The description (if there is any).

Note: When a project is created from a template or an existing project, then only the changes (like deletion of attribute values or adding a new document) from the template or existing project is logged in the events.

Create a Project from a Template

1. Log in as a **Project Manager** or **Project Creator**.
2. In the **Create** or **Projects** menu, click **Create Project**.
3. Choose **Use a Project Template** in the **Create** list.
4. Select the **Template** from which you want to create the new project.

Tip: To view the contents of a Template, click **Show Details**. This opens the Template in another window. Explore the contents as desired and click **Close Window** to return to the **Create Project** page.

Note: Depending on the template you choose, the fields you need to fill in may vary.

5. Fill in the new project's *Details* and if the project is created by a Project Creator user, then the Project Manager's name has to be filled in mandatorily.
6. If desired, add *Documents* to the project.
7. Add *Members* to the project.
8. If the template has attributes defined, fill them in the *Attributes* section.
9. Click **Create**.

This brings you to the new project's details page.

Creating a project adds an event and this is stored in the Project History.

This event will add following information to the Project History:

- The Project/Template from which the new Project is created.
- The name.
- The Project Manager.
- The Salesperson (if there is any).
- The Customer (if there is any).
- The Location (if there is any).
- The description (if there is any).

Note: When a project is created from a template or an existing project, then only the changes (like deletion of attribute values or adding a new document) from the template or existing project is logged in the events.

Note:

The project is created with the same folder structure, documents, discussions, characteristics, attributes, landing page, members, and security as in the template.

Any documents in the template are copied into the new project as new standalone documents, even if they were linked documents in the template.

The list of Approval Users is copied if it is applicable; if there are conflicts, a warning appears and you will have to configure new approval settings.

Fill in the Project Details

In the **Details** section of the **Create Project** page:

1. Enter the **Name** of the new project.
If the option **Use Automatic Naming** is enabled, then the **Name** field is disabled.
2. When creating a project, you can choose another **User/Group** to be the Project Manager. Also, when you copy from an existing project, you can also copy the Project Manager.
In such cases, you will not have visibility to the project once it is created.
3. To make the project active, leave the **Status** on **Active**.

Note:

If you are not sure that the project will be going forward (you need somebody else to decide first), you can either:

- make the project **Non Active** or **On Hold**,
- (if you have the Task Management module) make the project active, make the decider a project member, and assign him/her a task to confirm/authorize the project as first project task.

See [Task Management in WebCenter](#) on page 819 for more information about tasks.

4. If desired, specify a **Customer** for the project, and that customer's **Location**.
5. To use a custom thumbnail, click **Change** beside the default **Thumbnail**.
Select **Specify New Thumbnail** and enter the complete path and filename in the associated field or **Browse** for it. To use the default thumbnail, leave that choice selected.
6. If desired, enter a project description in the **Description** field.
7. To specify an optional due date, click the calendar at the end of the **Due Date** field and select the desired due date. To set the due time, click the drop-down list to the right of the calendar control.

Add Documents to the Project

1. To add **Documents** to the project, click **Add Item** in the **Documents** section of the **Create Project** page and either:
 - **Browse** to the document to add,
 - **Copy** a document from another project (select the project then the document to copy).

Tip: Use the  icons to search for a project or document name.

- Create a document **placeholder** from a document template: select **New** in the **Source** list, select the **Document Template** to use, and fill in any attributes that may be required.

Note: This is only available if your Admin has defined document templates.

See [Document Templates](#) on page 157 in the Administration Guide for more information about document templates, and [Assigning Document Attributes](#) on page 601 for more information about attributes.

2. You can then change the document's **Name** and add an optional **Description**.

Add Project Members

In the **Members** section of the **Create Project** page, you can either:

- Invite members to the project: select each member or group to invite in the **Invite members** list.

To remove a member / group, click the associated minus sign.

- If the template / project you are copying from contains **roles**: you can assign user groups or individual users.

You can see roles the template / original project contains, and are available for assignment at project creation time, in the **Members** section.

- To assign a role to a user group:
 1. Select that user group in the **Group** list.
 2. Select who in the group will be the **User / Assignee**.

Note: Leave the option **Select User** if you want **any** user of the group, or **all** of the group users (depending on what was set when adding the role to the template / original project) to be **Approver / Task Assignee**.

Note:

If you are using filtering (the role's name is the first word of the name of the group you want to replace it with), you will only see the groups matching that filter in the **Group** list. In the example below, the role is called *Agency*, and the list shows all groups starting with *Agency* (followed by a space).

If no group matches the filter you will see the whole list of groups.

- To assign a role to an individual user:
 1. Leave **---Select Group---** in the **Group** list.
 2. Select the individual user in the **User / Assignee** list.
 3. Make sure **Invite Group** is deselected.

Note: You can **Create and Invite New User** to the project from the **Invite Members** drop down list.

- To assign a role to a group with a specific user as assignee:
 1. Select a Group in the **Group** list.
 2. Select the individual user that you want to be the assignee in the **User / Assignee** list.
 3. Make sure the **Invite Group** checkbox is enabled.
- To assign several users and groups to the same role (this option may be enabled/ disabled in the parent project or template):
 1. Select a user or group assignee you want to assign to the role.
 2. In the **Actions** column, click the **+** icon to add another row for this role.

3. You can now assign the same role to multiple users and/or groups, using the + every time you need to add a row and using - icon to remove a row.

You can also assign roles later if you don't have the user information ready.

Define Project Attributes

- If the template has attributes defined / you copied attributes from the existing project, you can still edit them (if they are **editable**) in the **Attributes** section.

Attention: Certain attributes can be **required**. Those have a red asterisk (*). If the template / project you copied from contains required attributes, you cannot create the new project without filling them in.

For more information about attributes, see [Assigning Document Attributes](#) on page 601.

Uploading documents in project creation

Create a Project Based on Another Project

1. Log in as a **Project Manager** or **Project Creator**.
2. In the **Create** or **Projects** menu, click **Create Project**.
3. Choose **Copy setup from an Existing Project** in the **Create** list.

Note: This option is not available for Project Creator users

4. Select the **Project** to copy from.

Note: You can only copy from projects you manage. If you are a project manager, you can also copy a project from the project details **More Actions...** menu.

5. In the **Copy setup from an Existing Project** pop-up, select what you want to copy from the old project into the new project (and deselect what you don't want to copy).

Copy setup from an Existing Project

- Copy Project Manager
- Copy Members
- Copy Approval Settings
- Copy Folders
 - Including Documents
 - Including Bill of Materials
- Copy Attributes
- Copy Characteristics
- Copy Tasks From Source Project ▼
- Copy Security Settings
- Copy Notifications
- Copy Discussions

Cancel
OK

For Tasks, you can choose to copy the **Tasks** from the original Template or from another Template by typing in the template name. The default setting is to copy Tasks from the Project that is being copied.

Click **OK**.

6. Fill in the new project's *Details*.
7. If desired, add *Documents* to the project.
8. Add *Members* to the project.
9. If the template has attributes defined, fill them in the *Attributes* section.
10. Click **Create**.

This brings you to the new project's details page.

Creating a project adds an event and this is stored in the Project History.

This event will add following information to the Project History:

- The Project/Template from which the new Project is created.
- The name.
- The Project Manager.
- The Salesperson (if there is any).
- The Customer (if there is any).
- The Location (if there is any).
- The description (if there is any).

Note: When a project is created from a template or an existing project, then only the changes (like deletion of attribute values or adding a new document) from the template or existing project is logged in the events.

Automatic Project Thumbnail Images from Documents

When a new graphics, ArtiosCAD or CHILI document is being uploaded to a Project or Template, the user can have an option to check if the document image needs to be taken as the Project Thumbnail.

If this option is checked, the Project thumbnail will be set as the document image after **checking and registering**.

You have to enable **Make project thumbnail** during the upload of documents to use this feature. You can do so by setting up a document attribute with the exact name 'Make project thumbnail', using a restricted set with values 'yes' and 'no' (to create a checkbox).

Note:

When a document with the **Make project thumbnail** attribute set to "yes" is moved or linked or copied to another project, that project's thumbnail will also be changed to the thumbnail of this document.

Remember: This attribute has no effect when the document's thumbnail is manually changed to another thumbnail.

Notes on Thumbnail Images

When specifying a custom thumbnail, consider the following:

- WebCenter automatically scales the thumbnail as needed to two sizes depending on where it is used. The larger size is 100 x 100 pixels; the smaller, 50 x 50 pixels.
- The maximum file size of a thumbnail is 1 million bytes, whether it is custom or generated. This limit is configurable; contact Professional Services for more information.

Create Folders in a Project

You may only create one level of folders in a project under the **Project Documents** folder.

1. Log in as a **Project Manager** or **Project Creator**.
2. Open the project you manage which will contain the new folder.
3. If it is not selected already, click **Documents** on the **Details** menu.
4. In the **Folders** column at left, click **Add Folder** in the **Actions** menu.
5. Enter the name of the new folder in the **Folder Name** field.
6. Optionally, you can:

- Select **Workflow Folder (Advanced)** and select a workflow folder from the **Configuration** list.

This will turn the folder into to a **Push Through Folder**. A *workflow folder* automatically copies the files uploaded into it to another folder (on the same or another server).

Typically this other folder is a hot folder for a workflow application such as BackStage / Automation Engine, Nexus or Odystar.

- Click **Specify New Thumbnail** to use a custom thumbnail for the folder. Enter the complete path and filename in the associated field, or **Browse** for it.

To use the default thumbnail, leave that choice selected.

7. Click Create.

The folder is created. Project Manager can keep track of any changes made to the Project folders, by enabling the notifications for **Project Folder changed**.

About Workflow Folders

What is a workflow folder?

When creating a folder the Project Manager can define it as a **workflow folder**, using a push-through configuration defined by the Admin.

Any file that is uploaded into this folder will be automatically copied to a location defined in the configuration. For this reason, workflow folders are sometimes also referred to as “push-through folders”.

Workflow folders are particularly useful when that other location is a hot folder of a workflow system such as Nexus, Automation Engine or Odystar, so that the file will automatically be processed by the workflow system.

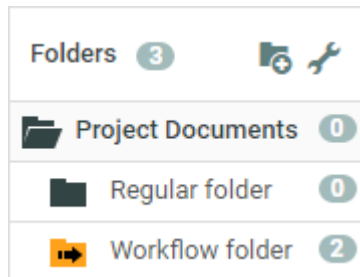

Note:

The Configuration for workflow folders needs to be defined by an Administrator.

Project Managers can then select one of the defined configurations when they create a new folder.

Recognizing workflow folders

Workflow folders have a yellow icon with an arrow on it.

The files in a workflow folder have two extra icons:

- The first shows whether the copy of the file was successful or not.
- The second is a button to copy the file again to the location defined in the configuration.

Synchronize the Project with a Workflow Job

If the Admin has defined a workflow connection, you can create projects that automatically create a workflow job (see "Configure Workflow Connections" in the Administration Guide for more information).

The workflow jobs created will be automatically synchronized to the linked WebCenter projects when certain events occur (as defined by the Admin).

However, if the Admin has enabled this possibility, you can also synchronize the workflow job to the linked project (that you manage) whenever you need to.

- To do this, click the synchronization  icon in the project header.

Create a Project from Automation Engine

With the **Create WebCenter Project** Automation Engine task, you can create an Automation Engine Job and a corresponding project in WebCenter at the same time.

You can also retrieve information from WebCenter (Project Template, Customer Company...) and associate it with the project you are creating, directly from Automation Engine.

This avoids double entries and duplication errors, and can be triggered from an MIS system for even more automatization.

In this task:

1. Select your **WebCenter Site** (it must be defined in the **Configure** tool).
2. In the **Site Logon** area, fill in your WebCenter **User Name** and **Password**.

You can choose to type in your password (which is then **Encrypted**) or to **Use SmartNames** that resolve into your password.

Note: The user you enter here must be a Project Manager in WebCenter to be able to create projects.

3. Enter the **Project Name** and **Project Description** to give the new project.

Tip: An interesting choice for the project name is the SmartName [JobName]. By selecting the job name as SmartName for the project you can map the jobs in Automation Engine to the projects in WebCenter.

4. In **Project Manager Username**, enter the user name of the WebCenter Project Manager that will manage the newly created project.

Note:

- This user must already exist in WebCenter.
- This can be the same user as the one you logged on with, or a different one.
- The user you logged on with must have **at least as much visibility** in WebCenter as the Project Manager you enter here.

5. Click the Refresh  buttons.
6. The **Project Template**, **Customer Company** and **Customer Location** fields should now contain a list of the WebCenter Project Templates / Customer Companies / Customer Locations visible to that Project Manager.

Choose the **Project Template**, **Customer Company** and **Customer Location** of your choice.

7. Click **Launch**.

4.9.2. Editing Projects

Project Managers can:

- edit the project's general information in the **Project Details > Project Information** page,
- add specific information to the project, like characteristics and attributes,
- update the links to documents in the Project,
- change the Project status.

Note: Only Administrators can save Projects as a template, so that other Projects can be created based on it. See the Administration Guide for more information.

Add a Salesperson

Project Managers can associate a **Salesperson** with the project. This can be any user in the system, but has no specific rights in the project.

1. On the **Project Details** page, click **Project Information**.
2. Click **Salesperson**.
3. Select a salesperson and click **Finish**.
4. Click **Save**.

Note: The salesperson does not gain access to the project unless he/she is invited as a user, Project Manager or is part of the Admins group.

It is possible to search for all projects associated with a certain salesperson across WebCenter.

Note: Project Creator user can be set to a Salesperson after the project was created. This is possible only if the Admin user has enabled **Project Creator becomes Salesperson after Project Creation** option in the **Project Creation** page.

View Project Source

Projects can be created in multiple ways, like from project template or from another project or a blank project. When the projects are created from a template or from another project, some of the project properties like the **Documents, Tasks, Attributes, Characteristics, Discussions, Notifications, Members** can be copied to the new project.

In such cases, especially **Tasks** can be copied either from the project template or from the project source.

Project Source is the existing project, which is used to create a new project.

Project Template will remain same for the existing project and any newly created project from the existing project.

Project Template and **Project Source** information of a project is useful for the Project Managers and Admin users to understand the origin of the tasks or documents or attributes.

Example

There are two projects and one template created. The name of the template is T1, the names of the projects are P1 and P2. The projects are created in following order:

- P1 is created from T1
- P2 is created from P1

Following table shows the resulting values of the Project Template / Project source field

Project / Template	Project Source	Project Template
T1	None	None
P1	T1	T1
P2	T1	P1

Whenever a project is created using an existing project, the new project created has the same **Project Template** as that of the existing project.

To view the **Project Source** of any project :

- Navigate to **Project Details** page, click **Project Information** tab.

Specify Project Characteristics

1. Log in as a **Project Manager** or **Project Creator**.
2. Open the Project whose Characteristics you want to specify.
3. Click **Characteristics**.
4. Select the checkboxes of the desired Characteristics. The selected Characteristics will appear in the list of Characteristics. Click the + plus sign next to a Characteristic to see its children Characteristics.
5. Click **Change**. The selected Characteristics will be associated with the Project.

To **remove Characteristics from a Project**, do the same as described above, but deselect the checkboxes of the Characteristics to remove them from the list.

Specify Project Attributes

1. Log in as a user who is a Project Manager, or as a user who has the **Change Properties** permission on the root level of the Project.
2. Open the Project whose Attributes you want to specify.
3. Click **Attributes**.
4. Choose the **Attribute Category** and click **Change**.
5. Set the values for the Attributes as desired and click **Change**.

The Attributes are assigned to the Project.

About Exporting and Importing Attributes

To make working with other systems easier, you can export and import project Attributes by using JDF (Job Definition Format) files.

You can export the Attributes, modify them in another system, and then import their changed values back into WebCenter.

Note: You cannot add more Attributes to a project this way; this only lets you change the values for existing Attributes.

Important:

If you want to import Attributes that are not generated by another WebCenter system, you should generate a sample JDF file for the people using the other system to use as a reference, so that they format their JDF file correctly.

The important lines are the ones similar to `<eg:SmartName Name="Attribute Name" Value="Value"/>`; there must be a Value tag for each Name tag.

Export Project Attributes

WebCenter automatically names the exported file `<Project name>_attrs.jdf`.

Note: Any periods in the project name will be converted to underscores.

1. Log in as a **Project Manager** or **Project Creator**.
2. Open the project with the attributes to export.
3. Click **Attributes**.
4. Click **Export**.
5. Click **Save**, browse to the desired location, and click **Save**.

Import Project Attributes

1. Log in as a **Project Manager** or **Project Creator**.
2. Navigate to the project with the attributes to import.
3. Click **Attributes**.
4. In the **Import from JDF file** field, enter the path and name of the file, or click **Browse** and select the JDF file.
5. Click **Import**.

The values for existing attributes are updated if necessary.

Note: If there are either too few or too many attributes defined in the file as compared to the project, WebCenter will mention it in a status message.

Update a Project

If you have a document that is linked in many Projects, and upload a new version into only one Project, the links in other Projects continue to reference the prior version.

1. Open the Project to update.
2. Click Update on the Project **Actions** menu.
3. All documents in the Project are updated.

A list is shown of the updated document(s), the containing Project, the old version number, and the new version number.

Tip: To update more than one Project at once, get a list of the Projects, select them, and click **Update Project(s)** in the **Actions** menu.

Project Statuses

The **Project Status** feature allows you to review the current project standing. This feature can be accessed by an Admin user or a member of the Admin group, Project Managers and an User.

An administrator can add statuses in WebCenter. This works similar to task statuses (whereas the statuses are not shared). A status has a name, an icon and a type. The types are Non-active, Active and Completed. The WebCenter has the functionality to limit the actions possible in not-active and completed projects. It is most typical to add active statuses, for example: **Briefing, Design, Prepress, Printing**. An administrator can limit the statuses for a project and this can be done for every project separately.

The project status is displayed in the project header (and in available other locations such as search):

Note: This can be set as read only. Read more at [Prevent direct changes to Project Status](#) on page 170

The Project Manager can perform following:

- Set the Project Status.
- View Project Status.
- Search Project Status and Filter projects based on Project Status.

An administrator can limit the statuses for a project and this can be done for every project separately. Go to a project or a template as an administrator and click on the **Configure** tab. By using **Add Project Statuses** and Remove Project statuses (select with the check boxes and take remove from the action drop down), you can get a specific set of statuses.

An Administrator can link milestones to project statuses to see the timeline of projects in a [calendar view](#) by setting up a date/time attribute for project statuses. Each active status can have a date/time attribute linked and the same date/time attribute can be used multiple times with different offsets. The linked date indicates the intended end of the project phase, but will not trigger an automatic project status change. The actual date will depend on the related attribute value in the project context.

The administrator can decide the sequence of the statuses. This sequence is purely used for sorting. When the projects are sorted based on Project Status, this is the sequence used. The sequence is system wide.

Apart from showing the Project Status in many project overview pages (and also in the search results), the project statuses can be used in the Workflows. For example: To decide different operations or assignees depending on the current project status.

Note: By using the **Set Project Status** node in Workflow, you can set the status for the current project.

In the following example, let us consider five statuses allowed for this project. The Project Statuses are set as 01 - Briefing, 02 - Concept, 03 - Artwork, 04 - Prepress and 05 - Closure. The WebCenter has many more statuses, but only these statuses are allowed for this project. The statuses are in this sequence in the entire system.

Note: You can only decide per project whether you can have these statuses, but you cannot change the sequence of the statuses per project.

Name	Active	Color	Icon
01 - Briefing (Complete)	Active	Esko Green	Briefing > Concept > Artwork > Prepress > Closure
02 - Concept (In Progress)	Active	Esko Green	Briefing > Concept > Artwork > Prepress > Closure
03 - Artwork (In Progress)	Active	Esko Green	Briefing > Concept > Artwork > Prepress > Closure
04 - Prepress (In Progress)	Active	Esko Green	Briefing > Concept > Artwork > Prepress > Closure
05 - Closure (In Progress)	Active	Esko Green	Briefing > Concept > Artwork > Prepress > Closure

Change the Project Status

A project can have different statuses. For example:

- **Active**
- **Non Active**
- **Completed**

In addition to the standard statuses, custom statuses may have been defined by the system administrator. A project or template can have its own specific set of available project statuses. Every project requires at least one active status.

The project manager can set the project status from the project details header, or in the **Status** list on the **Project Information** page.

When searching, you can search for all projects, or projects that have a specific status like Active, Not Active, or Completed. It is also possible to search for All Active, All Not Active or All Completed projects, this type of search would include different (custom) statuses of the same type.

Displaying a Project Status

The Project Status can be viewed by an Administrator, Project Manager and a Project Member.

The status of a WebCenter project is displayed in following ways:

- The status is displayed in the project header of each page of the project.
- The status is displayed in the columns of the project overview pages (Project I am Invited to, Favorite Projects and Projects I Manage).
- The status is displayed in project search results if this column is requested to appear in the search result.

If an icon is available, the Project Status is displayed as an icon with its status name. If no icon is available, the project status is displayed as a name only. If the option **hide thumbnails** is active, only the status name is shown. The icon is displayed in true size.

Customizing a Project Status

An Administrator can set allowed statuses for Templates or for Projects. By doing this an Administrator can limit the number of Project Statuses to be used for a specific project. When adding a new project status to the system, this status will be also added to all projects and templates. When a project is created from a template or from another project, it inherits the allowed statuses from its source. This happens only once and does not happen when the template changes later.

1. Log in to WebCenter as an Admin user.
2. Click the **Admin > Project Management** and select **Projects** or **Templates**.
3. Click the required Project or Template link from the list.
4. Click the **Configure > Project Statuses**. This displays a table with the current allowed statuses for this Template or Project.
5. Select the required Project Status from the list and then click the **Add Project Statuses** link.

Note: By default a blank Project will get the list of all statuses as allowed statuses.

6. Click the **Save** button to make changes.

Note: The Project Status cannot be re-ordered here, the order is inherited from the system order.

You can remove allowed statuses for a template or project by selecting the status and select **Remove** from the **Actions** menu.

Set a Project Status using the User Interface

An Administrator or a Project Manager can set the Project Status for the current project using WebCenter UI. A Project Status is changed by selecting a new project status from the status drop down list in the header of the project pages. The drop down only contains the allowed statuses.

Set a Project Status when creating a Project

An Administrator or a Program Manger can set the Project Status while creating a new Project. When creating a new project through the WebCenter User Interface, there will be a drop-down allowing to set the project’s initial status. The drop-down will default to the first Active status.

Note: The Completed statuses are not shown because you cannot create a Project in a completed status. In case the Project is created from a Template (or a copy of another Project) it may be possible that the Project Status field is hidden. If so, the newly created Project will get the first Active status.

Searching based on a Project Status

You can search for projects based on their Project Status. Choose **Search** from the menu bar and select Project or Tasks and Approvals. On the (advanced) Project Search page and the Task Search page, the list box will contain the list of all the Project Statuses.

In addition to all individual project statuses, the list also contains the following:

- Show All (default): show all projects (or tasks of all projects).
- Show All Active: show only projects or tasks of projects with an active status.
- Show All Not Active: show only projects or tasks of projects with a non-active status.
- Show All Completed.

Project Name	<input type="text"/>
Description	<input type="text"/>
Project Status	Show All <input type="button" value="⌵"/> <input type="button" value="⌵I"/>
Created	Show All Active <input type="button" value="⌵"/>
Modified	Show All Not Active <input type="button" value="⌵"/>
Due	Show All Completed <input type="button" value="⌵"/>
Customer/Location	Non-active <input type="button" value="⌵"/>
Salesperson	Active <input type="button" value="⌵"/>
Project Manager	Concept Art (at risk) <input type="button" value="⌵"/>
Manager's Location	Briefing (at risk) <input type="button" value="⌵"/>
Add Role	Briefing (on track) <input type="button" value="⌵"/>
Attributes...	Concept Art (on track) <input type="button" value="⌵"/>

You can also search on **Project Status Started, Project Status Due, Project Status Completed, Project Status Duration, and Project Status Time Left** in the **Project Search** page.

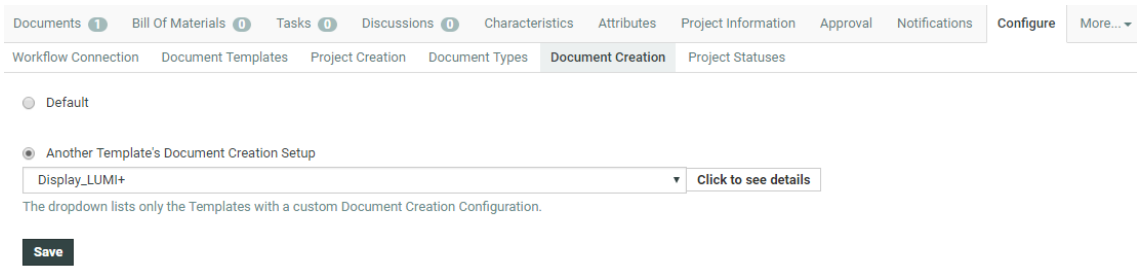

Filtering based on Project Status

In **Favorite Projects, Projects I Manage, and in Projects I am Invited to**, you can filter on all Project Statuses individually. You can also use the filters to look for a combination of statuses: Show All, Show All Active, Show All Not Active, Show All Completed.

Document creation settings in a project

In a project, go to the **Configure > Document Creation** to view the template from which the document upload configuration is taken.

To change this, select the template from the drop down list. You will see a list of templates with a custom document creation configuration. This will update the project document creation settings with the selected template's settings.

4.9.3. Managing Project Members and Permissions

Project Managers are responsible for managing who gets access to their Projects: they can add members to a Project, remove members from a Project, and set their permissions.

Roles

Roles are created at a global level which the Project Managers (or the selected Project Managers) can use in individual projects and templates. You can invite these **Roles** just like **Users** and **Groups**.

Roles are effective after real members (**Groups** or/and **Users**) are assigned to each of the **Roles**. A project Role assignee will be treated like a standard project member. Once you assign the **Role** to a project, these take over the role's security setup, approval setup and task assignments.

Multiple assignments of **Roles** are possible. For example, if you have a "Designer" **Role**, you can invite this Role to all the Projects that require a designer either after creating a Project or via the Project Template with assigned Roles.

Note: You need administrator rights to create Roles. The visibility of the Roles can also be determined by the administrators.

Read more about Roles in the WebCenter Administration Guide in [Roles](#) on page 283.

Role Assignments in a Project

The Project Manager and all the Members of a project can view all existing Role assignments in a project in the **Project Members** page.

Note: You can filter on the **Users**, **Roles** and **Groups** in the **Members** tab. Alternatively you can search using the Role name in the field.

Members 3

Groups
 Roles
 Users
 Company

Members in Project		Role Assignment
Users		
<input type="checkbox"/> Piro, Pieter-Jan (RJPPI)	 PRINTER	Change Permissions
Roles		
<input type="checkbox"/> AGENCY		Change Permissions
<input type="checkbox"/> DESIGNER		Change Permissions
<input type="checkbox"/> PRINTER		Change Permissions
Groups		
<input type="checkbox"/> AGENCY GHENT	 AGENCY	Change Permissions
<input type="checkbox"/> DESIGNER GENT	 DESIGNER [Assignee: Keizer, Debbie (DEKE)]	Change Permissions

Role members are displayed in the list as regular members under the **Roles** project member type section.

You can see the Roles assigned to the Users and Groups in the **Role Assignment** column for user and group project members.

Note: When assigning users to a Role, the drop down also shows the deactivated users that you can reactivate while assigning the role. Admin users can activate any users whereas Project Manager and other users with Create User rights can only activate the users they created.

If a User is specified from the Group for a particular Role, this information is displayed next to the Role reference in the **Role Assignment** column as **[Assignee: USERNAME]**.

Managing Roles in a Project

If a project has at least one role among its members its Project Manager can access the **Manage Roles** page to define role assignment within the project.

1. Log in as a user who is a Project Manager.
2. Open the project for which you want to manage the roles.
3. Click the **Members** tab. A list of the current members is displayed.
4. Click **Manage Roles** link in the column header.

Manage Roles

For each Role, first select the Group to be assigned or leave it on 'Select Group' to specify a User Assignee (use the second list for that). Use Invite Group checkbox to specify a Group User Member Assignee when assigning to a Group.

Role	Group	User / Assignee	Invite Group	Actions
_REQUESTOR	Please select or start typing...	Jensen, Kim (KSJ)	<input type="checkbox"/>	<input type="button" value="⊖"/> <input type="button" value="⊕"/>
AGENCY	Please select or start typing...	skva (SKVA)	<input type="checkbox"/>	<input type="button" value="⊖"/> <input type="button" value="⊕"/>
AGENT	Please select or start typing...	Beckner, Briann (BIBE)	<input type="checkbox"/>	<input type="button" value="⊖"/> <input type="button" value="⊕"/>
APM	Please select or start typing...	Please select or start typing...	<input type="checkbox"/>	<input type="button" value="⊖"/> <input type="button" value="⊕"/>
APPROVER(S)	Please select or start typing...	Please select or start typing...	<input type="checkbox"/>	<input type="button" value="⊖"/> <input type="button" value="⊕"/>

Removing a Role Assignment

Each Role assignment is represented as a separate project member on the **Members** page. It can be deleted from the project by uninviting it as in the case of removing a project member.

You can also remove the existing role assignments from the **Manage Roles** page.

Removing a Role from a Project

You can remove a Role from a project in the same way as removing a User or Group. By deleting the entry for the User or Group with the Role combination, you can remove the Roles

Note: When you have Roles assigned to Users or Groups, you have to delete the assignments (assigned regular members) before being able to uninvite the Roles from the project.

1. Login as a Project Manger.
2. Open the Project from which you want to remove Roles.
3. Click **Members**.
A list of the current members is shown. If desired, use the filter to refine the list.
4. Select the Roles which need to be uninvited from the Project. Select the User or Group entries assigned to these Roles to unassign them from this role, if the Roles are already assigned.
5. Click **Remove** from the **Actions** in the header.
6. Click **OK** to confirm the removal. The selected Role(s) and its assignments will be removed from the Project.

Using Roles in Approval Setup

You can use Project Roles in approval directly as an **Approval master** and/or as an **Approver**. When adding a Role to an Approval setup as an approver the user doing so has to choose between two options for the **Type**:

- **One of Role:** Only one of the role assignees needs to approve on behalf of the Role. This is the default setting.

Tip:

It is possible to change Role assignments after starting the Approval cycle if you select **One of Role** option. Use **One of Role** if there is only one role assignee.

- **All of role – One per Group:** All of the User and Group Role assignees will replace the Role as Approvers. When you choose this, for each Group, its representative Role assignee will become the approver on behalf of the whole group.
- **All of Role:** When you select this, all the User and Group role assignees will replace the role as Approvers. In this case all the members of the Role-Groups will become the approvers.

Project Approval Setup

Approval setup has changed since last Save

Due Date: No Due Date

Approval Master: Me

E-mail Notifications: No Notifications

Convert to Staged Approval

--- Add Approver ---

Approver	Type
DESIGNER	All of Role - One per Group

Allow conditional Approval

When one User rejects: Stop Approval cycle after every approver decided

Require review state on all annotations: No

Note: You cannot start an Approval cycle with unassigned Roles in the project. When the approval cycle starts, all the Role- approvers are replaced as their assignees and the Roles will no longer be visible in the **Approval Setup**.

If a Role is set as the Approval master, all the Role-assignees(Users and members of the Group) become the real Approval masters.

Changing Role Assignments

From WebCenter 14 onwards, you can easily change Role assignments within a Project.

- Go to **Project > Members**. Click on **Manage Roles** to get to the Role Management page. You can see the list of **Roles** associated with the Project. You may also access this page from **Project Creation** page.

In the **Manage Roles** page, you can see the existing Role assignments. You can change or remove the existing Role assignments from here.

- You can :
 - add a Group to the Role
 - create a new assignment for the existing Roles. Use the **User/Assignee** dropdown to choose another User as the new Role assignee.
 - add /delete members from the same Role. Use the + and - controls respectively.

When an existing Role Assignment is changed, all the Role dependent Task and Approval assignments will get transferred to the new Assignee. This transfer of assignments only happens if the current Assignee loses access to the Project by getting unassigned from the Role.

In situations where a User or a Group is only invited to the Project via a Role Assignment, a Role reassignment will result in that user's /group's removal from the project. Approval

and Task related dependencies are checked to prevent leaving the Project workflow in an inconsistent or blocked state.

Delegating Roles

Go to the **Manage Roles** page. If you have been given permissions to assign Members of a Role or to change Role assignments, it will be displayed.

If you do not have the permissions to manage any roles, a message will indicate this.

Add Members to a Project

Users and Groups need to be added to a project before they can access and use it.

1. Log in as a **Project Manager** or **Project Creator**.
2. Open the project to which you want to invite members.
3. Click **Members**.
A list of the current members is shown.
4. Click **Add Members** in the column header.
5. **Add Project Members** window is opened, where you can select and add new member to the project from the **New Project Members** drop down.
6. Select the role for the newly added user from the **Assign to Role** and click **Continue**.

Note: You can **Create and Invite New User** to the project from the **New Project Members** tab from the drop down.

7. Set the project permissions as desired. These permissions apply to all members being added in this step. Then click **Finish**.

A successful status message appears along with a list of suggested subsequent tasks.

Note:

If the project already has any number of roles among its members a drop-down list containing these roles is displayed at the top of the 'New Member Selection' step of the 'Add Member to Project' wizard.

By selecting a project role while specifying users/groups to be invited to the project the project manager can at the same time assign the desired new members to the selected roles.

The **Set Project Security for New Members** step fills up the security matrix with the original setup of the selected role.

Take into account that you cannot assign a role to another role in a project – any role objects selected from the list of the desired new project members will be disregarded (they won't even be invited to the project) if a 'role assignment' is specified using the appropriate drop-down list while picking up new project members.

By introducing roles than can be assigned to multiple user or group members it is now possible to have a same user or group member invited into the project via different role assignments (i.e. Joe Designer can be invited into a project both as assigned to DESIGNERS role and independently without any role assignment). Every such combination of a member and its assignment is considered (and presented) as a separate project member.

Remove Project Members

Note: You may only remove Project members who are not Approvers in an active Approval Cycle.

1. Log in as a **Project Manager** or **Project Creator**.
2. Open the Project from which you want to remove members.
3. Click **Members**.

A list of the current members is shown. If desired, use the filter to refine the list.

4. Select the users, groups and roles to uninvite from the Project. In case you want to unassign a user or group from a role, select the specific entry for this combination.
5. Click **Remove** in the actions menu.
6. Click **OK** to confirm the removal.

The member(s) are removed from the Project.

Note: Project Manager can enable the **Remove Project Members** notifications to ensure an event is saved in project history and also to notify involved people or other members of the project.

User, Group and Role Permissions in a Project

When a user is invited to a project several times (as an individual user through the **Add Members** function, as part of a Group and/or as part of a Role), his/her permissions on the project are calculated as follows:

- As a general rule, all permissions are added so that the user has the most permissions. For example:
 1. The user is invited to the project with the **View** and **Download** permissions.
 2. He is added to a Role that has the **Add** permission on this project.
 3. Then the user will have the **View, Download** and **Add** permissions on this project.
- Exception 1: when a user is already invited directly (as an individual user) to a project, re-inviting him/her through a Group doesn't change his/her permissions.
- Exception 2: when a user is only invited to a project through a Role or Group, you can change his/her permissions when re-inviting him/her as an individual user. This allows you to either restrict permissions for a specific user, or give him/her more access.

Note:

In this case, when inviting the user individually, his/her existing Group or Role permissions for the project will be suggested, and you will see a warning explaining that changing the user's permissions at that point may interfere with his/her ability to perform project tasks.

For example if the user has a "Designer" role, and you remove her **Add** permission, she won't be able to upload designs to the project!

4.9.4. ArtiosCAD Default Projects

You may see WebCenter projects with names starting with `ACadDefaults_`.

Do not modify these projects as they are automatically created by ArtiosCAD (and Cad-X) to store defaults.

They are named with the following patterns:

- `ACadDefaults_<version>_<language-code>_Shared`, where `<version>` can be for example `12.0` and `<language_code>` `en`.

These projects are created when you run the ArtiosCAD Defaults Installer. ArtiosCAD users should have View and Download rights on these projects.

Do not delete these projects as this would take away some CAD functionality!

However, if you want to install new defaults, or in case the defaults installation was interrupted, you will have to delete the corresponding `ACadDefaults_` project before reinstalling the defaults (which will create a new `ACadDefaults_` project automatically in WebCenter).

- `ACadDefaults_<version>_<language-code>_<login_name>`, where `<login_name>` is the login name of an ArtiosCAD Enterprise (and WebCenter) user.

These projects are created when a WebCenter user logs into ArtiosCAD and defines defaults to work with. ArtiosCAD will update them automatically if that user changes his/her preferences (in ArtiosCAD).

4.9.5. Defining Approval Settings

Document, Folder and Project Approval Settings

You can define approval settings at the document, folder or project level. You can also define approval settings on a number of documents in a folder or project.

Note: Defining approval settings for a project (or folder) does not mean the project (or folder) itself is being approved. Rather, it means that users adding documents to the project can use these pre-defined settings to save time and reduce the chance for error.

When you want to setup an approval cycle for a document, you can:

- define document-level approval settings, that will only be used for that document (**Setup Approval** or **Setup Staged Approval**),

- load the enclosing folder's approval settings, if the document is in a folder that has approval settings defined (**Load Folder Approval Setup**),
- load the project's approval settings, if it has approval settings defined (**Load Project Approval Setup**),
- use the default approval settings for that document (**Start Default Approval Cycle**). Those are: the enclosing folder's approval settings (if the document is in a folder with approval settings), or otherwise the project's approval settings (if they are defined).

Exceptions

- URL documents may not have approval cycles.
- An approval cycle may not be started on documents in Templates.
- An approval cycle may not be started on linked documents.

Permissions Needed

- You need the **Change Approval** permission to create or edit an approval setup.
- You need the **Start / Stop Approval** permission to start or stop approval cycles. This is the same as the **Lock / Update** permission.

The project manager and the administrator can always define / edit the approval settings (at the project, folder and document level).

For more information about permissions, see [Project and Document Security](#) on page 809.

Simple Approval and Staged Approval

What is Simple Approval?

When a person or a number of people need to approve your document(s) in no particular order, you can use simple approval.

All approvers are notified at the same time and get the same due date (if a due date is defined).

What is Staged Approval?

When your document(s) need(s) to be approved by several people or groups of people, in a sequential order, you can use staged approval.

The staged approval cycle works with approval **stages**, and each stage only starts when the previous stage is finished.

This allows you to be as close as possible to your company's real life approval process, while taking advantage of WebCenter's automating and tracking capabilities.

For example, if a document needs to be approved by the marketing, finance, and legal departments, you can use three approval stages.

- In the first stage one or several people from the marketing department will be asked to approve the document.
- In the second stage the finance department will have to approve or reject the document,
- In the final stage the document will be sent to the legal department for approval.

Setting Up an Approval Cycle

WebCenter enables you to define a number of approval settings like who can approve the document? when? what happens when the document is rejected? etc.), to match your real-life business process as closely as possible.

Note:

You need the **Change Approval** permission to create or edit an approval setup.

To get to the simple approval setup page (for a project, a folder or a document):

1. Go to the **Approval** tab:

For...	click...
a project	<p>... the project page's Approval tab.</p> <p>Tip: If your project has (sub)folders, go to the project page's Documents tab first, and click the top-level folder at left (called Project Documents). This ensures you have selected the project, and not one of its (sub)folders.</p>
a folder	<p>... the folder you want to define approval settings for on the project page's Documents tab.</p> <p>Then click the Approval tab.</p>
a document	<p>... the Document Details page's Approval tab.</p> <p>Note: You can also get to the Approval tab by:</p> <ul style="list-style-type: none"> • clicking Setup document approval right after uploading the document to the project, • clicking the Setup Approval Cycle link corresponding to the document on the project's Documents tab.
several documents	<p>... Actions > Setup Approval Cycle after selecting the documents in the project or folder.</p> <p>Note: This will start the approval setup from zero, even if some of the documents selected already have an approval setup.</p>

2. Click **Setup Approval**.

You will see the **Approval Setup** page where you can configure a simple or staged approval.

3. Define **Settings** such as the [due date](#), [approval policy for the new version](#), [approval master](#) and [notifications](#).
4. Click on the  **Show Stage Configuration Details** to set up [conditional approval](#), [document rejection policy](#) and [annotation review requirements](#).
To set up a staged approval, you need to [add an approval stage](#) and specify stage specific [configuration](#) and approvers.
5. [Add Approvers](#) on page 797
6. [Save](#).

Note:

- You can only set up an approval cycle for a project/folder/document that does not already have a started approval cycle.

Add an Approval Stage

Your approval cycle already has one approval stage by default.

1. Define **Settings** such as the [due date](#), [approval policy for the new version](#), [approval master](#) and [notifications](#).
2. Click **Add Stage**. Give the stage a name. The names are set by default as **Stage 1**, **Stage 2**, etc.
Users with change approval permissions, can change the stage name by changing the text in the edit field.
3. Click on the  **Show Stage Configuration Details** and:
 - a) Decide to **Allow conditional approval** or not (see [Allow Conditional Approval or Not](#) on page 794).
 - b)
 - c) Define what to do **when one user rejects** the document (see [Define How to Handle Document Rejection](#)).
 - d) Define [annotation review requirements](#).
4. Add **approvers** to the stage (see [Add Approvers](#) on page 797).
5. Click **Add Stage** to add another stage.

Note: This adds a stage after the last stage. To add a stage before the current stage, click **Insert Stage** above the current stage instead.

6. Repeat steps 2 to 4 for each stage.
7. If necessary, you can drag a stage up or down to reorganize your stages.
To remove a stage, click the minus button in front of it.

Approval Cycle Settings

WebCenter allows you to define a number of approval settings (who is the master approver? when? what happens when a new version is uploaded? who should be notified? etc.)

To define these, use the **Settings** section in the Approval Setup page.

Set the Approval Due Date

For a simple approval, you can set a single due date, which is the same for all approvers. Choose how to define the **Due Date** in **Settings**:

- Choose **No Due Date** if you do not need a due date for your approval cycle.

Note: Approval cycles tend to take longer when they don't have a due date.

- Choose **Fixed Due Dates** if you want to give a fixed due date to your approval cycle.

Choose a due date from the calendar, or type it using the one of the following formats: 2 May, 2010, 5/2/2010 or 5/2, 2010.

Then choose a due hour from the list.

When there are multiple stages involved, then the **Due Date Calculation** can be done in multiple ways. Read more about [Due Date Calculation](#) on page 792 here.

- Choose **Lead Time** to define how much time the approval cycle should take (as a maximum).

Define the **Lead Time** in **Days** and / or **Hours**. It is added to the date the cycle starts, to define the cycle's due date. For example if the cycle starts on May 2nd and has a 2 days lead time, it is due to be completed on May 4th.

Attention: WebCenter only takes week days into account. So if you start the cycle on a Friday with a 3 day lead time, it will be due the next Wednesday and not the next Monday. By default, Saturday and Sunday is considered as weekend. However, it is possible to switch the weekend days to Friday and Saturday. The due date calculation will ensure that the due date will always be on a weekday.

- Choose **Lead Time with Final Due Date** to give your approvers a lead time and give a final due date for the approval cycle.

If the document has to be re-uploaded and re-approved, it will be given the same lead time again. The final version of the document has to be approved by the final due date. [Link your Approval Due Date to a Date/ Time Attribute](#) on page 790

Link your Approval Due Date to a Date/ Time Attribute

WebCenter enables you to define Project (or Document) Statuses using **Attributes (Date-Time attribute)**. You can link your approval due dates to these Project or Document Milestones, if you have the milestones specified.

If your Project's Attribute Category contains **Date/Time Attributes**, you can choose your approval due dates based on them. You can use these Attributes in **Project/Folder/Document** approvals. The setting also allows you to specify an offset value along with the attribute value. For example. "Final Approval Date" – 2 days.

Date/ time Attributes can be used as the final approval date or as stage approval dates. If you change the attribute value, the linked approval due dates are updated including that of any ongoing approval cycles. A due date change will trigger a notification to the approvers, based on Notifications chosen.

1. In the **settings** section, choose the **Due Date** as either of the following options:
 - **No Due Date**

- **Fixed Due Date**
 - **Lead Times**
 - **Lead Time with Final Due Date**
2. If you select **Fixed Due Date**, you can specify the Due Date for each approval stage separately. You can specify:
- a **Specific Date**. In this option, you can select a date from the calendar.
 - or a **Date in Project**. This option lists the Date/Time Attributes, from which you can select. You can specify an offset period in days and/ or hours. The offset is added or subtracted from the Attribute value.

When you save, your approval due date is calculated using the date value given in the attribute and the specified offset. See the example below:

Due Date can also be calculated for all the stages at once if **Specific Due Date** is chosen. Read more [Due Date Calculation](#) on page 792

3. If you selected **Lead Time with Final Due Date**, you can select the Date /Time attribute +/- **Offset** in the **Final Due Date** drop down. The options are exactly the same as above.

Note:

- If you change your Approval Due Dates, the Milestones do not get updated.
- The Due Date calculations use only working days.
- if you change the attribute value after the completion of the stage, it has no impact on the Due Date of the completed stage.

Due Date Calculation

You can calculate the due dates for the different stages using **Due Date Calculation** option. Any calculation done on this page is applicable for all the stages.

Due Date Calculation

Calculate New Due Dates

Give Each Stage Days Hours

Shift Due Dates with Days Hours

Shift Due Dates to have Latest on

  

Shift Due Dates to have First on

Distribute Due Dates Evenly

From   

To   

- **Give Each Stage Days and Hours** You can specify the exact number of days and hours for each stage in the approval cycle
- **Shift Due Date with Days and Hours** You can shift the due dates specified as fixed or as a date/ time attribute to the given number of days and hours
- **Shift Due Dates to have latest on** You can shift the due dates specified as fixed or as a date/ time attribute to not exceed the number of days and hours
- **Shift Due Date to have First on** You can shift the due dates specified as fixed or as a date/ time attribute to have first on the number of days and hours
- **Distribute Due Dates Evenly** You can distribute the Due dates equally amongst all the stages

Define How to Handle a New Document Version

When a document's approval cycle is started, and someone uploads a new version of that document, the approval cycle may stop or restarted based on the option chosen in the workflow. You can define what happens to the new version of the document.

- In the **When a new version is uploaded** setting, choose either:
 - **Approval Restarts from Beginning** to restart the approval cycle from zero. People who already approved / rejected the document will have to evaluate it again.
 - **Approval Restarts from Current Stage** to keep the approval stages already completed (typically approved) and restart the current stage. Approvers who already approved / rejected the document in the current stage will have to evaluate it again.
 - **Approval Continues** to keep all the approval actions already done. Only approvers who rejected the document earlier will reevaluate to check whether the reason for their rejection was corrected.

Set the Approval Master

In the **Approval Setup > Settings** section:

- Choose the **Approval Master**. This can be:
 - **Me** (the person currently editing the approval setup),
 - the **Project Manager**,
 - the document **Uploader**,
 - any project member with **View** access to the document (users, groups and roles).

The approval master is the person who gets the approval follow-up under **Approvals to Follow Up** on his **My Work** page.

Set Up Approval Notifications

Notifications are electronic mail messages WebCenter sends to users involved in an approval cycle when certain approval events occur (for example **User Rejected Document**, or **Approval Cycle Finished**). You can define which users will receive notifications, and when in the **Approval Setup > Settings** section.

Note:

The system administrator must configure WebCenter to send e-mail for notifications to work.

Regardless of the e-mail configuration, the **My Approvals** section on the **My Work** page shows items waiting for approval.

1. Choose the type of **E-mail Notifications** to use:
 - **No Notifications** if you don't want to notify any user of the progress of the approval cycle,
 - **Default Notifications** if you want to use the project's or the folder's notifications (if the document is in a folder with notifications defined, they will be used, otherwise the project's notifications will be used),
 - **Custom Notifications** if you want to select who to notify (only for this document).
2. If you have chosen **Custom Notifications**, define who to notify for each approval event:
 - the Project **Manager**,
 - the **Involved People** (the people who are involved in a particular event, for example when an approval comment is posted, the **Involved People** are the document approvers).

Tip: Click on **Involved People** to see a list of involved people for each event.

- the Project **Members**.

Notification	Manager	Involved People	Members
	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Approval Stage started	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Approval, Rejection or Approval Comment posted	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Document rejected	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Ongoing Approval Due Date changed	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Approval Stage finished	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Approval Cycle finished	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Approval stopped	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Approval Setup changed	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Tip: You can use the top check boxes to notify the Project **Manager**, the **Involved People** or the Project **Members** of all approval events.

Approval Stage Configuration Details

You can access this by selecting the  icon on the approval stage header. This configuration is required when your

- Document(s) need(s) to be approved by several people or groups of people, in a sequential order, you can use staged approval
- The staged approval cycle works with approval **stages**, and each stage only starts when the previous stage is finished

Allow Conditional Approval or Not

Use conditional approval to allow your approvers to give their approval on a certain condition (for example, if a barcode in the document is corrected).

The conditions (like the comments and the reasons for rejection) will be shown in:

- the **Approval** tab of the Document Details page,
- the **Action History** tab of the Document Details page,
- the **Document History** in the Viewer.
- Decide to **allow conditional approval** or not.

Note: This option is hidden if the administrators have turned off the **Admin > Preferences > Security Allow Conditional Approval option in Approval setup** option.

Note:

When working with an Automation Engine workflow, documents you approve conditionally in WebCenter will go through the **Approved with a Condition** output of the **Publish on Web** task in your Automation Engine workflow.

Use a **Wait for Action (Checkpoint)** task for those documents, so the Automation Engine operator can fix them manually.

Inherit Previously Submitted Approvals

You can inherit the approvals done at a particular stage, if the same stage is restarted. The option is available in the traditional approval as well as in the workflow driven approval. When an Approval Stage is started, a check is made to know

- If there are any already submitted Approvals on this document and
- **Inherit Previously Submitted Approvals** option is enabled.

Inheritance of the Approvals are done only if the previous approval state is either **Approved** or **Approved with Comments**. Approvals in previous stages with status such as **Rejected, Forced Approved, Force Rejected** or **Force Approved with comments** are not inherited.

Inheritance of an approval is done, irrespective of whether the user is still an Approver. We consider all document versions except the deleted versions, when checking for approval statuses.

Note:

1. Notifications are not sent for inheritance of approvals but approvals are tracked in the Documents Action history.
2. Approvals with conditions are considered as regular approvals, when they are inherited.
3. Version number of the document from where the approval is inherited is also mentioned in the Approval set up.

Define How to Handle Document Rejection

- Define what to do **when one user rejects** the document:

- Choose **Stop approval cycle immediately** if you don't want to bother the rest of the approvers with a document that will have to be corrected and re-approved anyway.

Note:

That document version gets **rejected** as final approval status.

The approval request is removed from the to-do list of the approvers who haven't evaluated the document yet.

- Choose **Stop approval cycle after every Approver decided**, if you want to collect as many opinions as possible before creating a new version (to increase the chances that the next version will be approved).

Note: That document version only gets the **rejected** status after all approvers have decided. The approvers of the next stage(s) don't get an approval request for that version of the document.

- Choose **Continue approval cycle anyway** if you want to use the current stage as a review stage (the approvers are just expected to give their opinion on the document, but do not have a veto power) and to only start the real approval in a later stage.

Require Review State on all Annotations

In the approval Setup, you can set up a mandatory review on all annotations using the **Require review state on all annotations before approving or rejecting** option.

This forces all approvers to review annotations before submitting an approval status.

Note: This only applies to viewable documents.

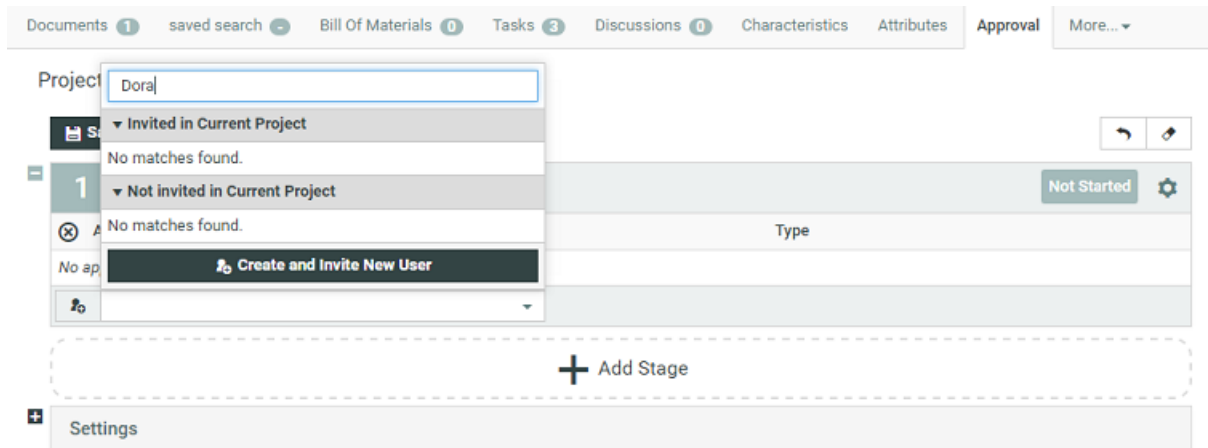

- Select **No** if you want all approvers to submit their Approval Status without the condition of reviewing the annotations. This is the default setting.
- Select **Any Viewer** when you want to enforce that all annotations should be reviewed by at least one person before submitting the Approval status. A warning message will appear when the Approver tries to submit the Approval status for the document containing unreviewed annotations.
- Select **Current Reviewer** when the Approver needs to review all annotations before submitting an Approval status. A warning message will appear when the Approver tries to submit the Approval status for the document containing annotations he did not review.

Note:

- The review status **None** will not be accepted as a valid review state.
- This setting is relevant while submitting an Approval Status from the Viewer and the other WebCenter pages.

Add Approvers

You can add any member of the project as an Approver. You can also add user groups or roles **Invited in the Current Project** as approvers.

- To add a project member as an approver, select him / her in the **Add Approver** drop-down. Repeat for every user you want to add as approver.
- To add a role as an approver, select it in the **Add Approver** drop-down. After adding the Role, edit the **Type**. Select from:
 - **One of Role** if you want only one of the role assignees to approve on behalf of the role. This is the default setting.

Tip:

It is possible to change Role assignments after starting the Approval cycle if you select **One of Role** option. Use **One of Role** if there is only one role assignee.

Note:

Make sure that the Role is assigned to at least one user/group before starting the approval cycle.

- **All of Role - One per Group** if you want all users and **one** (any) member per group assigned to the role to approve the document.
 - **All of Role** if you want **all** users and all members of groups assigned to the role to approve the document.
- All current assignees of a Role can see the approvals for their Role in their **My Work > My Approvals** section.
- To add a group as an approver, select it in the **Add Approver** drop-down. After adding the group, select either:
 - **One of Group** if you want **one** (any) member of the group to be able to approve it for the whole group. (The document will get the **approved** status once one group member approves it.)

A typical example would be a legal review, which is completed as soon as one member of the legal department has approved the document.

- **All of Group** if you want **all** members of the group to approve the document. (The document will get the **approved** status once all group members approve it.)

A typical example would be a management review, which is only completed after all members of the management team have approved the document.

All the users of a particular group are listed individually in this drop-down. It is possible to select one or members of the group by clicking on the listed members' name.

Note: When adding a group as **All of Group**, the users who are group members **when the approval cycle is started** become approvers. If you later add or remove users from the group, the list of approvers is not updated.

- To add a non-member as an approver, select him / her in the **Add Approver** drop-down. This will open the **Invite Project Member** dialog.
 - a) If there are Roles as members of the Project(with view rights to the folder or document where the approval is being set up), it is mandatory to assign the user to a role. Select the **Role** in the **Assign to a Role** field.
- To add a User who is not present in the system, click **Create and Invite New User** option from the **Add Approver** drop-down. It is possible to set up a default approval user template(in **preferences**) to apply to the newly created user.

Note:

- You need User Creation rights to be able to create and invite users.
- You can set up a default **Approval User Template** to automatically apply the **User Preferences** and **User Profile > Authentication** settings. Read more in: [User Creation](#) on page 99

Read step by step instructions in: [Create and Invite a User from the Approval Page](#) on page 269

To remove an approver or a group, use the x sign in front of it.

Create and Invite a User from the Approval Page

Project Managers can create and invite users in the context of an approval page. This allows you (as a Project Manager) to add an external reviewer to the **Approval cycle**. If the user is not in the system, you can add a new user and invite him or her from the approval page. It is possible to create and add users from any approval page(document's, project's or folder's).

Note: These users will be created as Regular Users. The only exception is when an Administrator user creates a user using an Admin User as the **Approval User Template**.

If you have used up all your Regular User licenses, you will not be able to **Create and Invite User** from the approval page. Read about Named User License model in [Licensing and Users](#) on page 256.

- Click **Add Approver > Create and Invite New User**.
 - User Info** in the **Create and Invite New User** wizard appears.
- Type the user's e-mail address. The fields (**Username**, **First Name** and **Last Name** will be filled in automatically from the e-mail address. You can change these fields, if necessary.

- Username is filled with the part before @ of the e-mail address.
- First Name is taken as the part before the last dot.
- Last name is filled with all characters after the last dot (or all the characters before @ if no dots are present).
- Optionally, assign to a **Company** and **Location**. Note that this can be very important to filter the content and users the new user will be able to see.
- If you want the user to log in with a link sent from the approval page, follow the process below:
 - a) Set up a *Token* based single sign-on instance and keep it active.
 - b) Specify a User as **Approval User Template**. Also remember to allow *link authentication* in the user profile.

To allow a User to authenticate via a link, configure *Token Authentication* on page 422 and allow this type of authentication in the User profile page.

Note: You need to disable all the other types of authentication to make the link authentication active.

Whenever the token-authenticated user receives a notification with a link, the link contains a token to authenticate without user credentials. This permits the users added to the approval cycle to log in using the approval links from the notification mails.

- If your **default approval user template** has no *Token Authentication setup* or you have not defined a user as the **template**, you need to specify and confirm a password in the **Create and Invite User** wizard.
- If there are Roles as members of the Project(with view rights to the folder or document where the approval is being set up), it is mandatory to assign the user to a role. Select the **Role** in the **Assign to a Role** field.
- Click **Create and Invite User**.

A new user is created and invited to the Project. You will be able to see this user in the Approvers list as well as in the Users list.

- If you enabled link authentication, the user will log on to the system using a link from the notification e-mail. The user will be able to see and approve the document/folder or project.
- If you specified a password, the user would need to know the password to be able to log in.

Add a Deactivated Approver

It is possible to invite deactivated users to the approvers list.

- To add a non-member as an approver, select him / her in the **Add Approver** drop-down. This will open the **Invite Project Member** dialog. The dialog will warn you that you are activating the user with this action.
- If there are Roles as members of the Project(with view rights to the folder or document where the approval is being set up), it is mandatory to assign the user to a role. Select the **Role** in the **Assign to a Role** field.
- Click **Invite** to confirm that the member should be activated and invited.

Notes

- You won't be able to invite a user who has been deactivated within the past 24 hours. The users automatically deactivated or created as deactivated users do not have this waiting period of 24 hours.
- To re-activate a Project member who is in the Project Members list, click on the name (in the Add Approvers dialog) and in the prompted dialog, click **Activate**.

Save the Approval Cycle

- When you are finished with the setup, click **Save**.

Note: If you were setting up an approval cycle for several documents and some of them already had a started approval cycle, the approval setup will fail for these documents. You will see a list of failed documents on the **Multiple Document Approval Setup - Info** page.

Tip:

From the same page, you can also:

- **Revert** the approval settings to the last saved version (when editing an existing approval cycle). See also [Editing Approval Settings](#) on page 800.
- **Clear** the approval settings (so the project, folder or document has no approval cycle). For a document, this also clears all settings inherited from the project or folder.
- **Start the Approval Cycle** (see also [Start or Stop the Approval Cycle](#) on page 800).

Start or Stop the Approval Cycle

Note:

You need the **Start / Stop Approval permission** to start or stop approval cycles. This is the same as the **Lock / Update permission**.

- You can **start** the approval cycle from:
 - the document list on the project page (in the **Approval** column),
 - the document details page's header,
 - the **Approval** tab of the document details page,
 - the upload page (click **Start Approval Cycle** right after uploading your document),
 - your workflow system (select the **Start Approval Cycle** option before sending your document to WebCenter).
- You can **stop** the approval cycle from:
 - the header of the document details page,
 - the **Approval** tab of the document details page.

Editing Approval Settings

Permissions Needed

You need the Change Approval permission to create or edit an approval setup.

Note: When editing a folder or a project's approval settings, the new settings will only affect the documents added to the project / folder after the settings are changed.

Started and Stopped Cycles

You **cannot** edit approval cycles while they are started.

If you want to edit an approval cycle that is already started, you must first **stop** it. You can do this from:

- the header of the document details page,
- the **Approval** tab of the document details page.

Editing a Simple Approval Cycle

After stopping a simple approval cycle that was already started, you can only edit the approvers (you can add or remove approvers, even if they have already approved or rejected the document).

You cannot change anything else (due date, conditional approval...).

Editing a Staged Approval Cycle

After stopping a staged approval cycle that was already started, what you can edit depends on the stages' status. If a stage is:

- **completed:** you cannot edit anything, and you cannot remove the stage;
- **pending:** you can only add or remove approvers (even if they have already approved or rejected the document!). You cannot change anything else (due date, conditional approval...), or remove the stage.
- **not started yet:** you can change anything you like. You can remove the stage, or add extra stages.

Note: You cannot change the Approval Master.

Editing the Approval Cycle for Next Version

You can also choose to leave the current approval cycle as it is, and only edit the approval setup for the next version of the document. To do this, click **Edit Approval Setup for Next Version** in the document details page's **Approval** tab.

Note: If an approval cycle is **finished**, you cannot edit it. In this case, you can only edit the approval setup for the next version of the document.

Role Selection while approving

In an approval cycle, a user is sometimes part of multiple roles, who are required to approve the document. While approving or rejecting the document, the Approver can choose the approval for each of the role he / she is part of.

For example, User A is part of Legal Asia, Legal Australia and also Legal South East Asia. When the user approves the document, the user can choose the role for which the approval is made.

Project History and action history pages tracks the approvals with the detail of user roles or groups specifically mentioned.

Note: User can still approve on behalf of all the roles by choosing the option **Default (All)**. This option is not available if reasons for rejections are enabled, as the reasons can depend on the roles of the Approver.

Following Up on Approvals

If you are an **Approval Master**, you will see the approval cycles you are responsible for under **Approvals to Follow Up** on your **My Work** page. This section shows a summary of each document's approval cycle, with all the necessary details (Approval **Status**, Document **Version**, **Due Date**...).

Note: If you cannot see the **Approvals to Follow Up** section, go to **My Work > Edit My Work Setup** to add it to your **My Work** page.

In this section, you can:

- Filter the documents:
 - by status (**Pending**, **Rejected**, **Approved** or **Approved with Comments**),
 - by date (**Finished within last 14 days**, **last 7 days** or **last day**).
- Sort the documents list (by **Approval Status**, **Document Name**, **Due Date**...).
- View the documents.
- Get to a document's details page.

When is an Approval Cycle Finished?

The approval cycle's status is changed to **Finished** when either:

- all approvers have approved or rejected it,
- the Project Manager or an admin has Forced Approved or Forced Rejected it (see [Forcibly Accept or Reject Documents](#) on page 802).

Note that in this case, the final status is **Forced Approved** or **Forced Rejected** instead of **Finished**.

A finished approval cycle may not be stopped or started without uploading a new version of the document.

4.9.6. Forcibly Accept or Reject Documents

Project Managers have two special approval status settings available: **Forced Approved** and **Forced Rejected** (unless this is disallowed by the Administrator).

Using either force approval or force reject finishes the approval cycle so that other approval users may not approve or reject the document.

4.9.7. Delegation

Delegations allows the users you nominate to view, edit, approve, comment, discuss and even reject documents on your behalf. Similar to having an assistant, another WebCenter user(s) chosen by you, can respond to all your pending tasks, approvals in your absence for a period of time specified by you. The delegation can be set up by any user based on permissions granted by the administrator.

Terminology used

- **Delegate:** A person to whom the work is delegated.
- **Delegator:** A person who is delegating his work to someone else.
- **Active Delegation:** Period during which the delegate can take up the work of the delegator.
- **Start Date:** Date on which the delegation becomes active.
- **End Date:** Date on which the delegation expires. When an end date is not specified, the delegation will be permanently active until it is removed.

My Delegated work

Any user in WebCenter can delegate his or her actions to be performed by other users.

When you have active delegations assigned, you can view them when you log in to WebCenter. Work delegated to you by other users are displayed as pop-up in the first screen. In case you have more than one delegator, you can view the work delegated by each of the active delegator along with their comments.

Note: To get this as the log in screen, enable the option **Show this information when logging in**

Log-in as a Delegate

You can either choose to continue your work or can log in as a delegate and complete the work assigned to your delegator. To perform the delegated work, choose **Act as (Delegator)**. Then you are logged in as the delegator in WebCenter and **My Work** page of the delegator is visible. You can now perform all actions as the delegator.

You can also note that the avatar in the navigation pane is that of the delegator and there is a banner indicating that **You are logged in as delegate of (User Name of the Delegator)**.

Return to your own account

Choose **Return to my account** link in the banner or from the drop down option in the avatar to return back to your WebCenter account.

Execute Work as a Delegate

Viewing as a Delegate

When you log in on behalf of the delegator, you can view and perform all the work assigned to the delegator, on top of that your menu will be updated to the menu of the delegator.

As a delegate, following actions can be performed

- [Approvals](#)
- [Task Actions as a Delegate](#) on page 804
- [Document actions as a Delegate](#) on page 804
- [HTML5 viewer actions as a Delegate](#) on page 804
- [Text Actions as a Delegate](#) on page 804
- [Discussion actions as a Delegate](#) on page 804

Approvals as a Delegate

Approving, rejecting or adding comments as a delegate is done similar to normal approvals. If the delegator has rights to change or start the approval cycle, then delegate will also have the same rights when logged in as delegator.

Note: When you are acting as a delegate, enter your own password to approve or reject any documents.

Task Actions as a Delegate

Whenever the delegate logs in as the delegator, he/she will have the same rights as the delegator. This means that if the delegator is allowed to create new tasks, the delegate will be able to perform that action.

Document actions as a Delegate

When you are logged in as the delegator, the same permissions as the delegator are given. The document actions performed by the delegate clearly indicate the owner/ uploader. Delegator is the owner of the document which is uploaded by the delegate, while logged in as the delegator. Similarly when a delegate locks the documents, the delegator can unlock the documents.

HTML5 viewer actions as a Delegate

While access the WebCenter to perform actions for your delegator, delegate can access the HTML viewer to view, annotate and approve the documents.

Text Actions as a Delegate

The delegate can log in as the delegator to approve, reject, comment or edit content of a Text Content language element and perform other Text Content operations based on the PCM permission model.

Discussion actions as a Delegate

In discussions too, delegate has all the access as the Delegator and can execute all actions the delegator can perform.

The actions done by the delegate are visible on the following places:

Action by Delegate	Displayed as
Creating a new Discussion	Delegator is set as the Owner
Post a New Message	author name of the message indicates that it is posted by the delegate who was logged in as the delegator.

Action by Delegate	Displayed as
Unread messages	<p>For the delegate: when logged for the first time, messages not yet read by the delegator are displayed. The unread messages reflect the messages that are not yet read by the delegate since the last login.</p> <p>For the delegator, the unread messages are shown as his previous log in.</p>
Watch/ Unwatch a Discussion	Any updates to Watchlist like adding a discussion to a watchlist or removal done by the delegate are applied to the delegator. When the Delegator logs in again will have the same Watchlist as updated by the delegate.
Online status	<ul style="list-style-type: none"> • Delegate: Shown as logged in (If part of the participant list) • Delegator: Shown as offline
Quotes in Discussion	When a user quotes a message posted by a delegate, the author of the quoted message indicates that it was originally posted by the delegate himself.
Mention	<p>When the delegator is mentioned in any discussion, the delegate will be notified, if the notification forwarding for the delegate is turned on.</p> <p>Note: You cannot mention a delegate if the user is not already a part of the discussion.</p>

Tracking of Delegate Actions

Actions	Tracked in
Approval	<ul style="list-style-type: none"> • Project History: "As Delegate of "column • Document Actions History: "As Delegate of" column • Approval Setup: In the "Last Submitted by" column in approval setup and the User column in the comments pop-up, contains a string with following format: "Delegate as Delegator"
Create New Tasks	Project History and Task Details pages
Complete a Task	Project History and Task Execution pages
Check an item in the checklist of a task	Task Execution and Task Details pages
All other events	Project History
Document Upload	Document Action History

Actions	Tracked in
	<ul style="list-style-type: none"> • Uploader is the Delegate (actual uploader) • Owner of the document is the Delegator
Document Lock	Document Action History <ul style="list-style-type: none"> • Delegate can lock the document which can later be unlocked by the delegator.
Document Annotations including creating new annotations, Removal of annotations, reply to annotations	Document action history <ul style="list-style-type: none"> • When a new annotation is added to the document, the author of the annotation is the delegate.

Add Delegate

You can delegate your work to a specific user or users. Follow the steps below to add delegates.

1. To add one or more delegates, go to **My WebCenter > My Delegates**.
2. Select a user from the drop-down and click **Add Delegate**.
To inform your colleague about the delegation, enable the **Notify new/modified delegates** option.
3. If this is a temporary delegation until your return to work, specify a **Start Date** and an **End Date**. There is also a comment field to leave your notes.
If you leave the **End Date** empty, the colleague can act as your permanent delegate.

My WebCenter > My Delegates page lists all your delegates and the respective time periods for which the delegations remain active.

Note: You can modify the delegation fields or delete a delegate from **My WebCenter > My Delegates** page.

Modify or Delete Delegate

You can delegate your work to a specific user or users and modify it at a later date. To modify the existing delegation, follow the steps below.

1. Navigate to **My WebCenter > My Delegates**
2. You can modify the existing delegates by changing the start date and end date. You can also change the notifications by checking the box to send.
3. Select **Save** to confirm the changes.

To delete a delegation, select the icon in the row for the respective user.

Delegation Notifications

Notifications for Delegator

During the delegation period, some notifications can be received by the delegator and the delegate based on the options chosen in the **My Delegates** page.

- To receive notification when you have delegated your work to another user, select **Receive email notifications during delegation period**. This will ensure you receive all email notifications during the delegation period.

Notifications for Delegate

- On Assignment of the Delegation, select the option **Notify new/modified delegates** to send notifications email to the delegate when added or modified.
- To receive notifications during the delegation Period, choose the option **Forward my notifications**.

4.9.8. Search on Project Duration

Duration Reporting for a project

You can search for projects based on the Start date, Due date, Completed date, Duration and Time Left of the project. You can save the searches and add it to the dashboard to have an instant view of the progress of all the current projects.

Field Name	What it means
Started	The start date of a project is the first time the project was set in an active status.
Completed	The last date the project was set in a completed status
Due	The due date is shown in the project details.
Duration	The time between the start date and the completed date. Only active statuses are considered to calculate the duration of the project. When the project is not completed, the duration is the time between the start date and the current date/time.
Time Left	This is the time between the actual completion date and the Due Date. When there is no due date, the time left is not shown as it is not relevant. When the project is in progress, the Time Left is the time between the due date and the current date. When the current date/time is still before the due date, the project is not overdue. In this case, the time left is a positive number, indicating that there is still time remaining before we reach the due date. When the current time is after the due date, the project is overdue. In this case, the time left is a negative number, indicating how much the project is overdue.

How to find Project Status Duration

You can also find the Duration metrics on the time spent in a given stage of the project. Projects statuses can reoccur multiple times and you can compute the duration of time in each of the given status.

Project Status Started Select Project Statuses that you want to search on

Prepress Creation Started

Prepress Approval Started

You can filter each selected Project Statuses based on the duration criteria

Project Status Duration

Prepress Creation Duration days

Prepress Approval Duration days

Field Name	What it means
Project Status Started	The start date of a project Status is the first time the project was set in the selected status.
Project Status Completed	The completed date of a project Status is the last time the project was in the chosen status before it was changed to a new status.
Project Status Duration	<p>The project status duration is the time that the project spent in the selected status. It is the sum total of all the time the project was in a particular status. When the project went into the selected status multiple times, the duration is the accumulated time the project spent in the selected status.</p> <p>In this field, you can filter on the duration in days of the selected status.</p>
Project Status Time left	<p>It is the time the project was in the Project Status. When there is no due date, the time left is not shown as it is not relevant.</p> <p>When the project is still ongoing, the Time Left is the time between the current date with the Project Status Due. When the current time is before the Project Status Due, the project is not overdue yet.</p> <p>When the current date is after the Project Status Due, the project is overdue. In this case, the time left is a negative number, indicating how many days the project status is overdue.</p>

For example: Let us assume that

Day 1: Jan 01 00:00 till Jan 02 00:00 => Project was in StatusA.

Day 2: Jan 02 00:00 till Jan 03 00:00 => Project was in StatusB.

Day 3: Jan 03 00:00 till Jan 04 00:00 => Project was in StatusA.

Project Status Started of StatusA is Jan 01 00:00 (first time project was in StatusA)

Project Status Completed of StatusA is Jan 04 00:00 (last time project was in StatusA)

Duration of StatusA is 2 days and Status B is 1 day

4.10. Project and Document Security

Project Managers secure projects by setting permissions for users and groups on a project as a whole, and on folders within the project. They can set and change permissions at any time.

Permission types

The permissions for folders and documents are:

- **View:** This permission allows viewing the project and the list of files and folders in the top level. All users and groups invited to a project get the **View** permission automatically at the project level. At the folder level, **View** allows a user to see that the folder exists. **View** permission is required for a project or document to be listed in the **Search** results. It takes precedence over all other permissions; if a user does not have **View** permission, nothing else is possible.
- **Add:** This permission allows adding a new document to a project or folder by using **Add**, **Copy**, **Copy as Link**, or **Move**.
- **Change Properties:** This permission allows changing database information about a document or project. Project Managers have implicit permission to change the database information about projects they manage.
- **Delete:** This permission allows the removal of a document from a project or folder. This permission is also needed to **Move** a document out of a project. Only Project Managers or members of the Admins group may delete a project.
- **Download:** This permission allows downloading a project or document from the database to a user's computer. This is also required to open documents other than an Esko ArtiosCAD 2D or 3D view, or those viewable in the WebCenter Viewer.
- **Lock/Update Start/Stop Approval:** This permission allows the locking of documents and the subsequent uploading of new versions. It also allows starting and stopping approval cycles.
- **Change Approval:** This permission allows the user to change the approval setup.
- **Change Task:** This permission is only available for WebCenter setups including task management. It allows users to create and change tasks. You can only set this permission at the project level, not at folder level.
- **Change BOM:** This permission allows the user to change the Bill of Materials (Administrators and the Project Manager can always change the Bill of Materials). You can only set this permission at the project level, not at folder level. See [Who Can Edit the Bill of Materials?](#) on page 433 in the Administration Guide for more information.

How permissions are inherited

Documents that are not in a sub-folder inherit project permissions. By default, folder permissions are inherited from the project, but they may be overridden by the Project Manager as desired.

If a user is invited to a project, and is also a member of an invited group, then group permissions for that user are ignored, and only the individual permissions for that user are considered.

If a user is not invited to a project, but is a member of a group that is invited to the project, the group permissions are used.

If the user belongs to more than one group that is invited to the project, the permissions are combined and the user gets the most permissive security setting available.

Permissions and groups: an example

For example, user USER1 is a member of GROUP1, GROUP2, and GROUP3. PROJECT1 has GROUP1 and GROUP2 as invited members, and GROUP3 is not invited. GROUP1 has Change Properties granted and GROUP2 has it denied, and it is not set for GROUP3 because GROUP3 is not an invited member. USER1 is able to modify database information about PROJECT1 because it is granted through GROUP1.

Project Managers and Admin group members

Members of the Admins group have full permission to access everything.

Project Managers have full permission within the projects they manage.

4.10.1. Set Security on a Project

1. Log in as a **Project Manager** or **Project Creator**.
2. Open the project.

Note: The project should have folders created and members invited already.

3. Click the **Security** tab.

	Full Permission	View	Add	Change Properties	Delete	Download	Lock/Update Start/Stop Approval	Change Approval	Change Task	Change BOM
Piro, Pieter-Jan (PJPR) as PRINTER	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
AGENCY GHENT as AGENCY	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
DESIGNER GHENT as DESIGNER	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Save

4. To set/edit the project permissions: choose **Project** from the menu and check or uncheck the desired permissions for specific users, user groups or roles.

When you first enter a project's security menu, this menu is selected by default. Project level security controls access to the project and whether the contents of the project documents folder are visible and searchable. A checked item indicates a granted permission; no check indicates a denied permission.

Note: View is automatically granted upon invitation to a project. View permission to the root of a project cannot be denied for an invited project member.

Tip: To grant or deny all permissions, check or clear the **Full Permission** checkbox. The changes are effective immediately.

5. Set folder level permissions:

- a) Click **Folders**.
- b) Select the folder to change from the **Permissions for folder** list.
- c) Check the checkbox in a column to grant it to the user, group or role in that row; clear the checkbox to deny it. To revert to default project permissions, click **Reset**.

Tip: To grant or deny all permissions, check or clear the **Full Permission** checkbox. The changes are effective immediately.

6. Set the user specific permissions:

- a) Choose **Users**.
- b) Select the user whose permissions are to be modified in the **Permissions for user** list.
- c) For Project and folder permissions, check the checkbox in a column to grant it to the user or group in that row; clear the checkbox to deny it. To revert to default Project permissions, click **Reset**.

Tip: To grant or deny all permissions, check or clear the **Full Permission** checkbox. The changes are effective immediately.

7. Set group level permissions:

- a) Choose **Groups**.
- b) Select the group whose permissions are to be modified in the **Permissions for group** list.
- c) For Project and folder permissions, check the checkbox in a column to grant it to the user or group in that row; clear the checkbox to deny it. To revert to default Project permissions, click **Reset**.

Tip: To grant or deny all permissions, check or clear the **Full Permission** checkbox. The changes are effective immediately.

8. Set role level permissions:

- a) Choose **Roles**.
- b) Select the role of which you want to modify the permissions in the **Permission for role** list.
- c) The changes you make in this section define what the default permissions to be used when you assign a user or group to this specific role. Any changes made here will not affect users and/or groups that have already been assigned to the role.

4.11. Reassign a Project to Another Project Manager

Projects may be reassigned to other Project Managers as long as the current Project Manager is not an Approver in ongoing Approval Cycles in that Project.

1. Log in as a **Project Manager** or **Project Creator**.
2. Open the project.
3. Click **General Information**.
4. Click **Manager**. WebCenter performs a dependencies check for the current Project Manager being an Approver on ongoing Approval Cycles. If it finds any, click **OK**, stop the Approval Cycle(s), and retry changing the Project Manager.

5. Assuming there are no dependencies, filter or click Go to generate a list of Project Managers.

This list can also include user groups.

6. Click the name of the new Project Manager or group and click **Finish**. The new Project Manager's name will appear on the General Project Information page.

To reassign more than one Project to another Project Manager, generate a list of projects either by searching or by using an item on the main Projects menu, and then click Change Manager in the **Actions** menu. Filter or click Go! to show the list of Project Managers, select the desired Project Manager, and click Finish.

Admins can change Project Managers for more than one project at a time using the **Projects** menu in **Project Management** on the **Admin** menu.

While they can select projects with different Project Managers, they may only assign all the projects to one Project Manager.

4.12. Create a User

Attention:

As a Project Manager, you can only create other users if the Admin granted you the **User Can Create User** privilege.

For more information about this privilege, see "[Create a User](#)" in the Administration Guide.

1. In the **Create** menu, click **Create User**.
Step 1: User Info in the **Create New User** wizard appears.
2. Type the basic user information into the appropriate fields (**Username, First Name, Last Name...**).

Note: Required fields are indicated with an asterisk *.

3. Provide the user's initial **Password** and confirm it.
 Enable the option **Require the user to change the password at first login** to force the user to choose a new password when they first log on to the system.
4. Do you want this user to see custom menus instead of the default WebCenter menus?
 Custom menus allow you for example to simplify the user interface, so the users only see the menus they need to use. For more information, see "Menus Preferences" in the Administration Guide.
 - If yes, choose the menu to assign to the user in **User Menu**.
 - If no, leave **Default** in **User Menu**.
5. Click **Continue**.
6. In **Step 2: Assign to a Company**, optionally select a company to which you want to assign the user. Note that this can be very important to filter the content and users the new user will be able to see.
7. Click **Finish**.

Your user is created.

4.13. Editing Users and their Preferences

4.13.1. Edit a User

1. In the **My WebCenter** menu, click **My Users**.

This shows all the users you have created.

2. On the **My Users** page, filter the list of users if desired, and click the username of the user to edit.

The **Profile** page appears.

3. Make the required changes:

To edit the user's...	You should...
user info	edit the fields on the Profile page.
menu	select a different User Menu . Note: Users linked to a company will always see the menu assigned to the company, even if they have a different menu assigned to them individually.
company or location	<ol style="list-style-type: none"> 1. Click the Company/Location link on the Profile page. 2. Select a new company and click Finish.

4. Click **Save** to confirm.

4.13.2. Change the Password for a User

1. In the **My WebCenter** menu, click **My Users**.

This shows all the users you have created.

2. On the **My Users** page, filter the list of users if desired, and click the username of the user to edit.

3. Click **Password** to show the **Password** page.

4. Type a new **Password** and confirm it.

5. Click **Change** to save the changes.

4.13.3. Set the Preferences for a User

1. In the **My WebCenter** menu, click **My Users**.
This shows all the users you have created.
2. On the **My Users** page, filter the list of users if desired, and click the username of the user to edit.
3. Click **Preferences** to show the **Preferences** page.
4. Configure the Preferences as needed. For more information on the settings and options, see General Preferences in the Administration Guide.
5. Click **Save** to confirm.

4.13.4. Copy Preferences to Users

Use this to quickly copy previously defined preferences to one or several users.

1. In the **My WebCenter** menu, click **My Users**.
This shows all the users you have created.
2. Select the user(s) whose preferences you want to change and select **Apply Preferences** in the **Actions** menu.
3. In the **Apply Preferences** popup, select the preferences to change, and deselect the preferences to keep.
Other Preferences are the user preferences not mentioned above (for example: show thumbnails or not, search results layout, etc.).
4. Select who you want to copy the preferences from: in **Take Preferences From**, select another of your users, or select **Default** to use the default settings for the preferences you selected.
5. Click **OK**.

4.14. Discussions in WebCenter

You can start a discussion in WebCenter, in a **Project**, **Task** or at a **Document** level. It facilitates members of the project to have conversations, which improves collaboration and faster decision making.

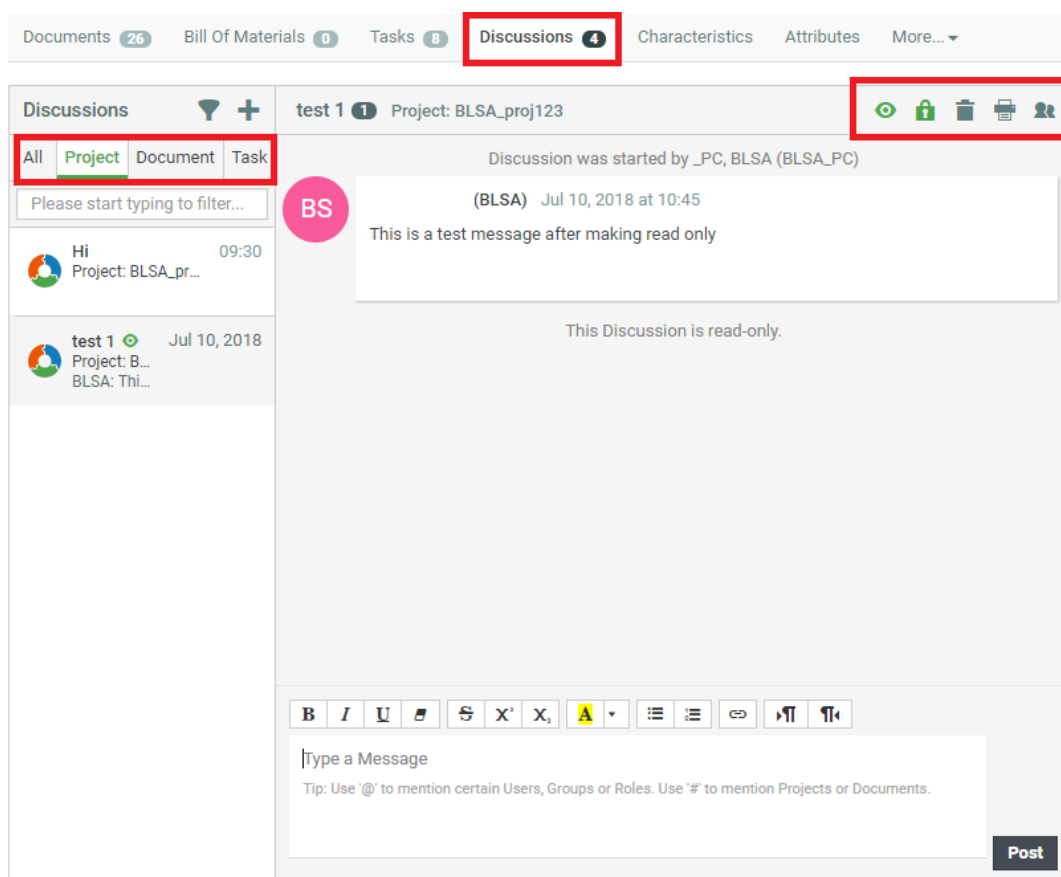

You can view the conversations in the **Project** or **Task** or at the **Document** level in the **Discussions** Tab. **Discussions** can be with all the members or private conversations with few or one member of the project.

You can view and respond to discussions on **My Work** and **Search Results** dashboard pages if enabled. You can also view and respond to discussion pertaining to the document in the HTML Viewer.

4.14.1. Start a New Discussion

New Discussions can be created in Projects, Documents or in Tasks that has discussions enabled. Any user can create new discussions.

- To **Start New Discussion** in a Project:
 - a) Navigate to **Project Details > Discussions Tab**. You can view the **Discussions** for **Project, Document** and **Task** in separate sub tabs.

- b) In the **Discussions** panel, click **+** to **Start New Discussion**. A message panel is opened in which you can enter a relevant subject.
 - c) Add the members to the **Discussion** by selecting from the drop down list in the **Visible To**. By default, the discussions are visible to all members in the project including the Project Manager. Refer to point 4 in the note below.
 - d) Write a relevant **Subject** line and type the message in the message panel and **Post** the message.
- To start a new discussion in a **Task**:
 - a) Ensure that the **Task Type** chosen for the task is enabled to have **Discussions**.

- b) Navigate to **Project Details > Task** .
- c) Click **Discussions > Start a new discussion**.
- d) Add the members required for the **Discussion** by selecting from the drop down list in the **Visible To**. Refer to point 4 in the note below.
- e) Type the message in the message box and **Post** the message. Now this message is visible in the **Discussions**.
- To start a new discussion on **Documents**:
 - a) Navigate to **Project Details > Documents**
 - b) Click **Discussions > Start a new discussion**.
 - c) Add the members required for the **Discussion** from the drop down list in the **Visible To**. By default, everyone allowed to view this document is part of the discussion on the document. Refer to point 4 in the note below.
 - d) Type the message in the message panel and **Post** the message. Now the discussion is visible in the document to all the users who have permission to view the document. Discussions on document can have members from other projects, if the document is part of other projects.

Note:

1. Discussions can be deleted only by the Admin User or the Project Manager or the Discussion Owner.
2. Project Manger can view all the private discussions in the Project or in the Documents or in tasks within the project.
3. Any discussion can be made read-only either while creation or any time during the discussion by the owner of the discussion or the Project Manager or the Admin user.
4. When a new Discussion is created, it is possible to have the default participant as the Discussion creator which can later be edited to add the required members. This feature is enabled based on the Admin User's choice in the **Preference** page. You can enable notifications when a new member is added or deleted in a discussion.

4.14.2. Post a Message in Discussion

Any user who is part of the discussion can post a message.

1. Go to the **Discussions** tab in Project.
2. Select the Discussion, where you want to add a message.
3. Enter the text in the Message box and click **Post**.

When hovering on any message, you can get an option to quote the post and to mark the message as unread. Discussion owners, Project Managers and Admin Users will get an option to delete the messages.

Tip: Depending on the setting for Notifications in the Project, notifications are sent when:

- Discussion Started
- Discussion Deleted
- Discussion Message added
- Discussion Message deleted

Discussion editor is equipped to handle texts from languages which are written from right to left. Enable the right to left or left to right buttons to change the direction of text.

4.14.3. Viewing Messages in Discussions tab

The **Discussions** tab label displays the numbers of Discussions and on hovering over the label you can view the number of discussions in **Project, Documents** and **Tasks**.

Note: When there are unread messages, the badge has a different color.

In the **Discussions** tab, you can view discussions filtered and displayed in four tabs on the left for **All, Project, Document** and **Task** respectively. The Discussion with the most recent message is displayed in the message box.

Menu Options in the Discussions Tab

Use	To
	<p>Filter the discussions based on what you are watching, or marked as unread or discussions started by you. You can choose one or more or none of the options to filter.</p> <p>Note: You can also filter out using Show Only options. You can filter out discussions based on what is being watched or unread or direct discussions or discussion started by the user or as a direct participant.</p> <div style="border: 1px solid #ccc; padding: 5px; width: fit-content;"> <p><input type="checkbox"/> Show Only Watched</p> <p><input type="checkbox"/> Show Only Unread</p> <p><input type="checkbox"/> Show Only Discussions I Started</p> <p><input checked="" type="checkbox"/> Show Only Direct Discussions</p> </div>
	Add a new Discussion
<p> Watch All</p> <p> Unwatch All</p>	Watch all Discussions or reverse it.
<p> Mark All as Read</p> <p> Mark All as Unread</p>	Mark all the Discussions as read or reverse it.
	Print the discussion which is currently visible.
	Watch the current discussion. The discussion subject also displays this icon to indicate the discussion is being watched.
	View Participants in the current discussion in a sub tab with their online status.

Note: You can filter to view only direct Discussions.

Special characters in the Discussions

Use	To
@	Mention a User, Group or Role in a message. The User, Group or Role will get a notification of the mention in the message.
#	Link to the Project or Document name mentioned

Discussions during Delegation

Users sometimes delegate their work to other users and in such circumstances the delegate can also be part of discussions for the delegator. Read more about delegation [here](#).

Discussions Read-only

Admin Users, Project Managers of the Project where the discussion is in and the owners of the Discussion can make the discussion read-only. In read-only mode, a normal user cannot add a new messages or quote any message. The owner of the discussion also cannot add or edit the users in the discussion nor delete the individual messages.

4.15. Task Management in WebCenter

Task management adds a complete time perspective to your Projects. WebCenter facilitates timeliness by adding extensive notifications on the tasks. The task searching and overview pages facilitate follow-up, finding critical and overdue tasks and creating reports.

Task Management allows adding tasks to WebCenter Projects and assigning these tasks to Project members.

Tasks have due dates, start dates and estimated dates. Tasks also have a specification and a checklist. In addition, you can link documents with tasks and organize a discussion forum around a task. Finally, tasks have statuses.

Note:

Task Management is an optional feature of WebCenter. If you did not purchase the Task Management license, you won't be able to create tasks or task types and these features won't appear in your user interface.

4.15.1. What You Can Do with Task Management

A task is work (or part of the work) that you assign to a project member with a specific due date. A task has a **name**, a **description**, a **status**, **due date**, **estimated date**, **starting date**, a **specification**, a **checklist** and a **discussion forum**. Use tasks to:

- **assign human tasks to project members, groups or roles:**

The assignees or group of assignees will get a notification by e-mail and via their To Do list. You can describe the task via the task description (free text), the task specification (structured data) or via the checklist.

You can restrict the task type to a dedicated **Main Assignee**.

- **create task sequences:**

You can connect the tasks in a way to launch the next task automatically on completion of the preceding task. Alternatively, you may set a delay to start the task automatically. This feature allows you to **build automated workflows that flow from one project member to another**.

You can also set the Project Status to be completed when the tasks are completed.

- **monitor critical tasks:**

Use the Gantt chart to view the tasks in their time line. You can monitor the status of the critical tasks according the project delivery time line.

- **project definition:**

Define what parts constitute a project. These parts can be human tasks but can often also be physical components to deliver, for example all the parts of a complex box. Each part can have a different due date. You can use the specification to define length, width, depth or any other parameter. You can upload the digital files representing this component to the task representing this physical delivery.

- **Create a project plan according to a project plan template.** This allows making a plan with multiple steps that are shifted in time. You can re-use timings from a previous project to create estimates from where you can start refining.
- **Keep track of quotes or projects in an initial state.**
- **Organize your own To Do list.**

4.15.2. Basic Concepts of Task Management

Task

A task is a piece of work you assign to a project member to be done before a certain due date. A task has a name, a description, a status, due date, estimated date, starting date, a specification, a checklist and a discussion forum.

Only the name and due date are needed, the rest can be omitted if they are not interesting or needed. Tasks have a task type.

A task lives in a project. A project can have multiple tasks but a task cannot be in more than one project at the same time.

Task Type

Task types are templates for tasks. Task types are global for the WebCenter system. Each task follows the task type from which it was created.

The task type contains:

- Estimated duration of the task.
- List of statuses for the task.
- Specifications. This is a set of parameters you want the task creator or assignee to enter into the system (they can be required, in which case the task will not be completed if they are not filled in).
- Checklist. This is a set of items you want to assignee to check off before completing the task. Optionally, the system can enforce this.
- Documents. This is a set of parameters that defines whether you can add or even have to add a document.
- Discussions. You can allow to start a discussion in your task.
- Workflow. In this section you can create a complete workflow using different task types and other nodes.

Specification

A parameter for a task. Specifications work much in the same way as attributes. The list of specifications is determined by the task type.

Due Date

The date and time by when a task must be completed. Due dates are visible in all task overviews. Due dates are mentioned clearly in the notifications sent to the person to whom the task is assigned.

If the task is not completed on the due date/time, the assignee will get a reminder. Tasks going overdue are flagged in red in the task overviews and search results.

Estimated Date

The estimated date is a date and time filled in by the task assignee. It gives the best current estimation of when the task will be finished.

Estimated dates are allowed to fall before or after the due date, but when they fall after the due date, they will appear in red in the task overviews. Changing the estimated date will normally send a notification to the Project Manager or task owner.

Started date

The date and time when the task changed status from Created to In Progress.

Assigned To

Tasks are assigned to project members. You can assign a task to one project member only (one user or one role or group). You can also assign any task to yourself, which provides a way of notifying the other project members that you will take responsibility for this task.

Tasks can change assignees during their life cycle, in this way handing over the task or responsibility from one person to another.

Allowed Assignee

You can restrict the tasks to have a pre-configured **Allowed Assignee**. This feature allows you to restrict the tasks to a group or a role specified in the Project / Template as the only allowed assignee.

- You can specify a **group** or **role** as the allowed assignee of a task type. This allows you to restrict the task assignment to a member of this particular group / role for all tasks derived from it.
- Alternatively, you can enable this feature in the task type and leave it unassigned (**default to task assignee**). This allows you or the user to specify a particular **group** or **role** in the task.

Note: This feature is restricted to administrator users.

Auto-delete

A task type can be configured with an option to automatically delete the task when it is completed successfully. This option comes in handy when you want to keep the task overview page clean.

This is especially useful in the case of tasks specified in [Rules](#). It is best to delete the Rule related tasks automatically once they are executed.

Note: The project history will keep a log of all the tasks that were created, started and completed successfully. History will capture the task details at the time of task creation.

4.15.3. Task Types

Use a Task Type to:

- Set up a template for a large number of tasks.
- Enforce structured specifications for tasks.
- Enforce a checklist for tasks.
- Add extra task statuses.

Note: Task types can only be created by Project Managers with the **User Can Create Task Type** permission, or by Admins.

The task types are also used in creating workflows in WebCenter. Read more in [Workflows](#) on page 871.

A **Task Type** can be either **Manual** or a Task Type with a **Workflow**. Both types can be added to a workflow from the canvas.

The **manual** tasks require human intervention and they can be used as either individual tasks or as workflow nodes.

Read also [Task Types](#) on page 933

Create a Task Type

Creating a task type demands some initial planning, certainly if you want to use specifications.

Attention: All specifications you want to put in a task type must first be defined by an Administrator.

To create a task type, do the following:

1. Click **Task Types** in the main menu bar. You will get an overview of the existing task types.

Note: If you cannot see **Task Types** in the main menu bar, you either do not have the **User Can Create Task Type** permission set on your user profile, or you do not have the task management license.

2. Click **Add Task Type**. This brings you to a wizard.
3. Enter a **Name**, an optional **Description**, **Estimated Duration** and **Due Date Link**. Click **Create**.

The Estimated Duration is used to calculate defaults for dates. We advise to only use the **Estimated Duration** for tasks that really have a typical duration (overnight shipping, die creation...).

Due Date Link is an option to select a **Date/Time Attribute**, which can be set as the task due date. You can also choose an offset value (plus or minus, in days and hours) to the attribute as due date. The due date will always be in weekdays. Changing the attribute value in the project will change the task due date.

Note: By default, Saturday and Sunday is considered as weekend. However, it is possible to switch the weekend days to Friday and Saturday. The due date calculation will ensure that the due date will always be on a weekday. To enable this in your WebCenter system, contact an Esko Representative.

Enable **Allow Changing Task Due Date Link** to allow users(with Change Task Permission only) to change the attribute link in the tasks derived from this task type or can provide a fixed date/time as task due date.

4. Optionally add **Specifications** and determine whether they are required.

Note: If a specification is required, tasks of this type cannot be put **In Progress** before all required specifications are filled out.

- If the Admin enabled **Attribute is also a task specification** when creating some attributes, they will be in the specifications list. If desired, those can be used both as an attribute in your projects, and as a specification for tasks.

You can then select **Automatically update project attributes from task specifications** so that when the task assignee updates the specifications' values and completes the task, the corresponding attributes' values are updated in the project.

- You can also select **Assign roles from task specifications**, if you want to use tasks created from this task type to allow non-project managers to select users or groups (for example to invite people, to assign tasks or approvals to users / groups).

See [Example: Assign a Role using a Task](#) on page 869 for more information.

Note:

You can also:

- [Add Statuses to a newly created Task Type](#),
- [Change settings related to task documents](#),
- [Change settings related to task discussions](#).
- [Add Custom Document Sources to the Tasks](#)

Now that you have created a new task type, it is a good idea to try to create a task based on your new task type.

Go inside a project, click **Tasks > Create New Task**, and follow the wizard.

Save As Task Type

New Task Types from existing Task Types

You can utilize the existing Task Type by the option **Save Copy As** in the Task Type details page. You can copy all the details of the existing task type and save it with a new name.

Note: Users with permission to create task type can use this option.

Edit a Task Type

1. Click **Task Types** on the main menu bar. You'll get an overview of the existing task types.

2. Click the name of the task type. You'll see an overview with the following tabs:
 - **General Info**
 - **Specifications**
 - **Checklist**
 - **Status**
 - **Documents**
 - **Document Creation**
 - **Discussions**
 - **Workflow**
3. Consult the following table to consider the impact of your changes to any existing tasks derived from the task type:

If you change the task type's...	Then...
Name	Existing tasks derived from the type will display the new task type name.
Icon	Each task type can have an icon. This icon is used in the Workflow canvas/gallery and is also used in the task list in Projects. Click the Select Icon button to select a required icon. You can also use filtering on the icon name. The files with extensions jpg/jpeg, png, gif, bmp.
Restrict Task to an Allowed Assignee option	<p>In the General Info tab, you can enable the setting to restrict task assignees to a particular role or group.</p> <p>After enabling this option, you can:</p> <ul style="list-style-type: none"> • select an Allowed Assignee role or group. • set Default to Task Assignee in the Allowed Assignee field. Read more in: Restricting a Task to Project Roles or Groups on page 840
Require Password to complete Task	<p>Enable this option in the task type, to get password confirmation for the task completion. Tasks completed with password re-entered, are specifically mentioned in the project history.</p> <div style="border: 1px solid black; background-color: #f0f0f0; padding: 5px; margin: 10px 0;"> <p>Note: Password requirement can be setup only for manual tasks.</p> </div> <p>When this option is enabled, you can further specify</p> <ul style="list-style-type: none"> • Prompt for Password where only password is to be provided

If you change the task type's...	Then...
	<ul style="list-style-type: none"> • Prompt for User name and Password where both User name and password ha to be provided • Prompt for username and password once, afterwards only prompt for passwordwhere user name to be given once and thereafter only the password to be provided
<p>Automatically delete Task when successfully completed</p>	<p>This option, if enabled, automatically deletes the tasks when they are completed successfully. This option comes in handy when you want to keep the task overview page clean.</p> <p>This is especially useful in the case of tasks specified in Rules where you do not want all the tasks in the Project's tasks page.</p> <div style="border: 1px solid gray; padding: 5px;"> <p>Note: The project history will keep a log of all the tasks that were started and completed successfully.</p> </div>
<p>Estimated Duration</p>	<p>Existing tasks will not be changed in any way.</p>
<p>Specification</p>	<p>Existing tasks derived from this type will be updated as follows:</p> <ul style="list-style-type: none"> • If you add a specification, all tasks of this type will get an extra specification. • If you make an extra specification required, all tasks not yet In Progress will enforce this specification. <p>Nothing will happen to tasks that are already In Progress, or Completed, or any other state beyond Created.</p> <ul style="list-style-type: none"> • If you delete a specification, it will be removed from tasks not yet in progress. Information in there will be lost. All other tasks will be kept intact. • Read more in: Synchronizing Specifications with Project Attributes on page 830
<p>checklist items</p>	<p>If you...</p> <ul style="list-style-type: none"> • Add checklist items: existing tasks derived from this type and not yet completed will also get the new checklist items. Completed tasks are not affected.

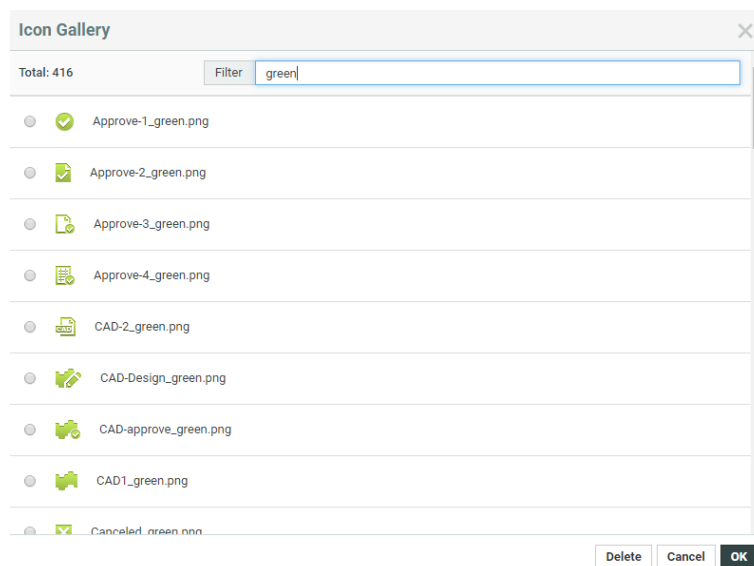

If you change the task type's...	Then...
	<ul style="list-style-type: none"> • Delete checklist items: they will be deleted from all non-completed tasks. Information in these tasks will be lost.
status	<p>If you...</p> <ul style="list-style-type: none"> • Add a status: it is added to all non-completed tasks. <div style="border: 1px solid gray; padding: 5px; margin: 10px 0;"> <p>Note: Tasks will not change status as a result of this.</p> </div> <ul style="list-style-type: none"> • If you delete a status: it will not be applied to any created tasks.
Document Creation	<p>Tasks created from this task type are presented with the customized document upload options. Read the details about this option in Document Creation Settings on page 160.</p>

Each Task Type can have an icon. The Icon gallery stores icons for Task Types, Project Statuses and WebCenter statuses.

You can add your own icons to this library as jpg/jpeg, png, gif or bmp images. The Project Statuses, Task Statuses and Task Types can load icons from the icon gallery.

Icons between 15 and 30 pixels high and between 15 and 130 pixels wide appears without scaling.

The gallery allows filtering of icons by its name.

Task Specifications

Specifications work like Attributes and together in a Task Specification page, they act like an Attribute Category. They are used for specifying tasks.

Note: Specifications can be made by an Administrator or Project Managers with **Create Task Type** permission.

Create a New Task Specification

1. Go to Task Types > Specifications.

A list of specifications opens (this list can be empty if this is the first time you use specifications).

2. If your specification will be a restricted set (a drop-down list of items to select from), you need to create this restricted set first. Click **Restricted sets to do this.**

Note: The restricted sets are shared with the Attributes' restricted sets.

3. Click **New Specification on the top right.**

4. Enter information in the fields as appropriate:

In the field ..	Fill In the ..
Name	name of the attribute (for example,Billable).
Description	description of the attribute contents (for example, Indicates whether work on this project should be billed by finance).
Type	<p>the type of the attribute. You can select from the drop down.</p> <p>Document References are attribute-links pointing to different document sources. When you select this option, you will have more options. Read more in Create a Document Reference Attribute on page 355.</p> <p>Floats are numbers containing a decimal point (e.g. 3.1415) and integers are whole numbers (e.g. 42).</p> <p>Rich Text attribute type allows you in entering long and/or rich text. You can:</p> <ul style="list-style-type: none"> • add set of least 16 different colors. • set the text bold and italic. • use bullet and numbered lists. • Heading up to four levels and also add tables. <p>In the Preview you will see the Rich Text editor. Click the Show Rich Text Controls link to view the broad pallet of text options. The Project Managers with change properties rights can add content from a document to the Rich text editor window. Here, the text (also Chinese,</p>

In the field ..	Fill In the ..
	special characters), font types, bullet types, color, tables and headings are preserved.
Values	<p>choose either:</p> <ul style="list-style-type: none"> • Prompted if you want to allow the user to enter any value. • Calculated if you want to use an ArtiosCAD formula to calculate the attribute value (enter the ArtiosCAD formula in the field). <p>Note: You should set Calculated attributes to <i>read-only</i> as their values are automatically updated from ArtiosCAD and should not be changed by WebCenter users. To set the value of the calculated attributes during upload, ensure that you have a default attribute category with the calculated attributes for the ArtiosCAD documents.</p> <ul style="list-style-type: none"> • Restricted Set to limit the possible values. <p>Note:</p> <ul style="list-style-type: none"> • To choose a Restricted Set, it must be created before defining the attribute (see Create a Restricted Set on page 292). • Make sure that the Type of the Restricted Set is the same as the attribute type. • For Document Reference attributes, you will have only Prompted as the value.

5. If you are creating a **document reference** specification:

Options	Description
Values	will be set to Prompted by default.
Versions and Revisions	<p>Use this field to point to the exact version of the document you need as the document reference link. This is especially useful when you want to point to an approved version. By default, it points to the latest version, but you can set this to:</p> <ul style="list-style-type: none"> • Latest Version: When you select this, the document reference link will be updated to the latest version of the document.

Options	Description
	<p>Note: When you update the referred document, the document link will point to the latest version regardless of the Change Properties permissions in the Project > Security tab.</p> <ul style="list-style-type: none"> • Selected Version: Use this setting if your document reference link should point to a certain version always. In this case, the document reference will not be updated to point to the latest version when a new version of the reference document is uploaded. • Selected Revision: When you choose this, the document reference will always point to the latest version of the selected revision. <p>Note: When you update the referred document, the link will source the latest version of the selected revision regardless of the Change Properties permissions in the Security tab.</p>
<p>Reference Category</p>	<p>To apply a reference category to the document reference, select from the drop down listing all the attribute categories.</p> <p>Note: Rich text attributes and document reference attributes cannot be used as reference attributes.</p> <p>You can use a reference category (which is an attribute category) to assign certain attributes to the document reference link. This is very useful when the property is not linked to the product or the component specifically. You can use reference categories to specify properties of the reference links.</p>

Edit or Delete Specifications

- To edit a specification, click **Task Types > Specifications**. Click the name of the specification and edit it as desired.

- To delete a specification, click **Task Types > Specifications**. Select the specifications you want to delete and click **Delete** in the **Actions** menu.

Synchronizing Specifications with Project Attributes

You can use **Task Specifications** to ask project members to supply values for Project's attributes or to assign Roles.

You can **Synchronize Project attributes with Task specifications** when the tasks are completed.

Note:

- While the task is running, **project attributes** and **task specifications** can be different. This is indicated by the **!** warning.

You can also [assign a role using task specifications](#).

1. Enable Synchronize Project Attributes and Task Specifications option to:

- automate the process of filling the Project Attributes if they are empty
- or to copy the values from Project Attributes to the Task specifications

Note:

- This function works without the user having the necessary **Change Properties** right at the Project level. This allows you to give a user temporary permission to change the Project Attributes.
- If the project attribute is blank, task specifications set in the previous sessions will be saved.

- The Specification values in the Task Execution Page will be filled with the Project Attribute values when the Specifications are empty and when the Task Specification is read-only.
- When the task is completed, the changed Specification Values will be copied to Project Attributes
- When a Task is saved without completing it, the new Specification value will be remembered, but not Project Attribute Value will not be updated.

Note: A warning sign will indicate that the Attribute values differ from the Specification value. You can choose to change the Attribute value to the new Specification value.

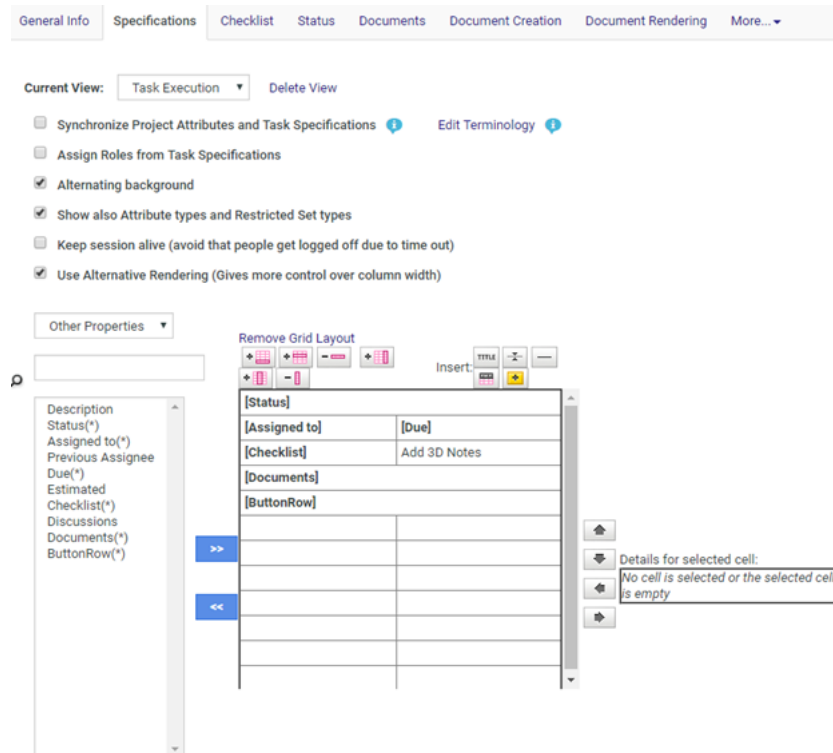

2. Optionally, enable Update empty values. This option is only available when the **Synchronize Project Attributes and Task Specifications** option is on.

This will result in clearing of the Project Attribute values if the corresponding Task Specifications were left empty when the Task is completed.

Task Forms (Task Execution View)

You can fully customize your Task Execution Form (just like [Project Creation Form](#) in WebCenter). This way you can have a uniform customized look for a Task Execution Page. To configure a custom form, you can combine **Specifications** with Task Properties in a dedicated **Task Execution View**.

1. Go to the Task Type's **Specifications** page and **Add Task Execution View**.

Your Specification page will load all the default Task Properties in the default order.

2. Use << to remove Properties (just like Specifications). It is also possible to remove these properties from the form, add them again or place them between the Task Specifications. You can customize these properties just like **Specifications**. See [Grid Layout](#).

Keep the following in mind when customizing Properties:

- You can show and hide fields or sections based on attribute values
- You cannot specify them as Read-Only or Required
- You can customize the label or image including their position (left or top).
- You can add Style to these Properties
- You can define the Column Span for them.

When the Task Execution view is defined in the Task Type's Specification, this view (with custom Task Properties) will be loaded on the Task Execution Page. When this view is loaded the whole page will look like one continuous form.

Note: Use caution when configuring a Task form:

- If you remove the ButtonRow from the view, you will not be able to save the Task.
- If certain sections are not enabled, but are configured in the Task Execution View, they will not be shown in the Task Execution View

Edit Terminology

It is possible to change the terminology used in Task Execution page so that it talks about "Designs" instead of "Documents", or "Attributes" instead of "Specifications", for example...

Attention: Your custom terms will not be automatically translated, and will show as **you enter them** for all languages in which you run WebCenter.

You can achieve this by customizing the terminology in the Specification page of the Task Type. To edit the terms:

1. Click **Edit Terminology** in the **Specifications** page

Edit Terminology
✕

Change terms in all Task Execution Page Forms for this Task Type

Default Term	New Term
Specifications	<input type="text" value="Attributes"/>
Task Discussion	<input type="text"/>
Task Documents	<input type="text" value="Designs"/>
Checklist	<input type="text" value="Items"/>

2. Specify the new terms next to the default terms.
3. Click **OK**.

Document Reference Task Specification

You can use a **Document Reference Attributes** as **Specifications** to refer to a document that is located within another project or a document library. You can add documents to tasks this way as references instead of copying them into tasks.

When you create such a **task specification**, select the **specification type** as **document reference**.

Note: You can use your **document reference attributes** as **task specifications** if you have checked **Attribute is also a task specification**.

Read more in:

- [Document References](#) on page 353
- [Create a Document Reference Attribute](#) on page 355

- [Edit a Document Reference Attribute](#) on page 359
- [Copy Document References](#) on page 393

Edit Checklist

Checklists can be added to a task type. Checklist items can be things you want the operator to check off before marking the task as completed. Another typical usage is to list subtasks.

Checklist items have no due dates but the system does track the day and user that checked off the checklist item, in this way enforcing responsibility.

1. Navigate to **Checklist** tab in **Edit Task Type**.
 - If you select **Finish task if all steps from checklist are completed**, it may not be possible to complete a task of this type without having checked off all the checklist items.
 - You can also decide that **Only a task assignee can check off checklist items**.
2. Choose **Add checklist items** to open Add Check Items text box. Enter items and **Finish** to save.

Note: You can create an empty checklist (with no checklist item) but in this case do not select **Finish task if all steps from checklist are completed**, as otherwise tasks of this type can never be completed!

Add Task Statuses

Tasks have three statuses by default: **Created**, **In Progress** and **Completed**.

Adding more statuses improves the accuracy of task progress. This comes in addition to the estimated date.

The task status is reported in all task overviews. Task statuses can have high-quality icons. This allows making these overviews much more visual.

Note: Only Administrators can create task statuses but the task type owner can select task statuses from the list.

Task statuses have a sequence and this sequence is automatically adopted by the task type.

- To create new task statuses, as an Administrator:
 - a) Click **Task Types > Statuses > Add Status**.
 - b) Type names of extra statuses and browse for an icon.

If you don't add an icon, the name of your status will be displayed in the status column (so avoid long names or use icons). Icons can be jpg/jpeg, png, gif, bmp file type. They are put without any scaling in the task column so you should be careful not to use large icons. Good sizes are between 15 and 30 pixels high and between 15 and 130 pixels wide.

Using wide icons allows showing progress very visually as in the example below:

- c) Click **Finish**.
- To add task statuses to a Task Type, as a user with the **User Can Create Task Type** privilege:

- a) On the **Task Types** page, click your Task Type.
- b) Go to the **Status** tab and click **Add Status**.
- c) Select the status you want to add and click **Finish**.

Document Sources in Task Type

Use the **Document Creation** tab to setup the document creation settings. You can configure custom document upload options (in Tasks) this way.

- **Default**

The default document creation options will be:

- **Browse**
- **Copy**
- **New** (when a template library is configured)

Note: **New** document creation is only possible if a **Document Template** library is linked in this template. Read more in: [Create Document Templates](#) on page 157.

- **Custom**

When you select this, you will see a list of customizable options:

Source	Where the document will be sourced from.
Label	The link description. You can create a custom label, such as Upload a graphic file. <ul style="list-style-type: none"> • Standard • Simple • Translated
Details	Additional information such as: <ul style="list-style-type: none"> • Allowed Extensions • Document Template Selector Here you can select the already specified document templates. Read also: Document Templates on page 157
Operation	The operation depends upon the Source button. For example, if you have chosen Project+Folder , the operations would be Copy, Move or Link the document
Sections	The configured upload source is made available in these sections. By default, all the options will be available and enabled. You can deselect the sections to disable some of the locations. <ul style="list-style-type: none"> • the Project Creation Documents • the Project Creation Bill of Materials

	<ul style="list-style-type: none"> • Bill of Materials • Upload (Copy or Create Multiple Documents)
Target Folder	The destination folder

When a task is created from this kind of a task type, you get custom upload options in the task execution page.

Note:

If the task type does not have a **document creation** setup, the setup defined by the task’s project is used as the upload options.

Define Task Documents Settings

Use the documents settings to define the relationship the tasks created from this task type will have with documents.

1. Select **Allow attached documents** if you want to be able to attach documents to the tasks of this task type.

Selecting this makes the other settings available. You can also customize document upload options in the **Document Creation** tab. Read more in [Create a Task Type](#) on page 822

2. If the goal of the task is to produce one or more document, you can choose to **Only allow task to complete if it has one or more attached documents**.

If the document(s) need(s) to be approved, you can also choose to:

- **Complete task automatically when all documents are approved,**
- **Only allow task to complete when all attached documents are approved.**

3. You can also select **Start approval cycle on attached documents** to start an approval cycle automatically when documents are uploaded to the task.

This uses the approval settings defined for the project the task is in (or the folder the document is uploaded into, if it has approval settings defined).

Note: If neither the folder nor the project has approval settings defined, the approval cycle will not be started automatically.

4. You can also choose to automatically **Assign Attribute Category to uploaded documents**. Select the attribute category to use in the drop-down menu.

Note: If the task has specifications that are also attributes, you can use this to assign those specifications / attributes to the task documents as well.

Attention: When linking documents that already have an attribute category to the task, the existing attribute category will not be replaced by the one you select here.

5. If you want the documents to be uploaded to a predefined folder, you can enter the name of that folder in the text field.

Note: This default folder will only be used if there is a folder in the project with that name.

6. If:

- the specifications used in the task are also attributes,
- those attributes are assigned to the document(s) attached to the task,

Select **Automatically update attached documents attributes from task specifications** to update the values of the document(s) attributes with the values that the task assignee fills in for the task specifications.

Note: The update happens once the task is completed.

7. Click **Save**.

Define Task Discussions Settings

To allow project members to start discussions on all task created from the particular task type

1. Select **Allow discussions**. By default, this option is not selected.
2. On selection , **Discussion Context** drop down list is displayed. You can choose one of the following options:
 - **Current Task** : This is the default option enabled. The discussions in the task are created and visible in the current task.
 - **Parent Workflow**: If the task is part of a workflow, the discussions in the task are created on the parent workflow. The discussions are visible in all tasks of the parent workflow with this setting. The discussions are visible in the parent workflow task if the task type of the workflow has the setting set to “current task” or if the workflow task has no parent.
 - **Root Workflow**: If the task is part of a workflow the discussions in the task are created on the top level workflow task of the task. The discussions are visible in all tasks in the workflow that have this setting, and all first level child tasks of the root workflow that have the Parent Workflow Discussion Context.
 - **Project**: The discussions created in the task are Project Discussions. All Project Discussion are shown in the task.
3. Choose the requisite option.
4. Select **Show Discussions of Documents linked to the Task** to view the discussion of documents linked to the task.
5. Click **Save**.

Delete a Task Type

1. Click **Task Types** on the main menu.
2. Select the task type(s) to delete.
3. Click **Delete** in the **Actions** menu.

Note: You can only delete task types that are not used in a task.

Copy a Task Type

You can copy an existing Task Type. To do that

1. Click on the Task Type. From the Task type's details page, click **Save as Copy**
2. Specify a unique name.

The following details are copied:

- Basic settings of the task type:
 - Description
 - Estimated duration (days + hours)
 - Restrict Assignees
 - Automatically delete option
- Document settings, including the name of the default document category
- Discussion settings
- Checklist items + settings
- Specifications including the layout and the order
- Restricted Sets used in Specifications.
- Workflow
- Task Status List, including the name of the icons.

Note: The icons are not copied.

- The Document upload configuration setup
- Document Rendering setup

4.15.4. Getting Started with Tasks

Create a Simple Task

The system comes with only one task type built in: Simple Task. This is a task with no document, no specification, no checklist, and no estimated duration.

Use the Simple Task type to experiment with creating tasks before figuring out how to make task types. Listed below is a procedure for getting started.

1. Open a project (or create one) and click **Tasks**.

Note: If you don't have a **Tasks** tab, you probably do not have the Task Management license.

If this is a fresh project, an empty list of tasks appears.

2. Click **Create New Task**.
3. On the **Create New Task** page, select the **Task Type**. Since this is the first time you are using tasks, select **Simple Task** from the **Task Type** list.
4. Assign the task to a project member or user group using the **Assigned to** list. For this first task, select yourself.

Note: If you assign a task to a user group in WebCenter, all members of this group will see the task show up in their My Work pages, and they will all receive notification e-mails (if set up by your site Administrator). Any member in the group can then take on the task and complete it.

5. Enter a **Name** and **Description** for the task. Fill in other fields as desired.
6. Click **Create**.

You have created a simple task.

Use the Task List, Task Search and My Work Page

- Click **Tasks** to get an overview of the tasks in your Project.
- Create some additional tasks with different due dates and assignees. You'll see a list of tasks building up and you can start experimenting with the **sorting options** in the overview.
- Try a task search: click **Search** in the top menu, click **Tasks** and enter your search criteria.
- Now go to your **My Work** page. You'll see all tasks assigned to you under **My Tasks**.

You'll see the status and the due date. Due dates in the next 3 days will appear in orange and due dates in the past will appear in red.

Completed tasks are shown under **My Recently Handled Tasks**.

Note: If you cannot see **My Tasks** or **My Recently Handled Tasks**, go to **My Work > Edit My Work Setup** to add them to your **My Work** page.

4.15.5. Working with Tasks

Create a Task

1. Click the **Tasks** tab in your project.

Note: If you don't have a **Tasks** tab, you probably do not have the Task Management license.

2. Click **Create New Task**.
3. On the **Create New Task** page, select the **Task Type**.
To know how to create custom task types, see [Task Types](#) on page 822.
4. Choose a **Status** among the statuses available for that task type.
5. Assign the task to a project member or user group using the **Assigned to** list.

Note: If you assign a task to a user group in WebCenter, all members of this group will see the task show up in their My Work pages, and they will all receive notification e-mails (if set up by your site Administrator). Any member in the group can then take on the task and complete it.

6. Enter a **Name** and **Description** for the task.

7. If this task needs to start after another (already created) task, you can **Add predecessor(s)**: hover over **Add predecessor(s)** and select another one of the project's tasks as predecessor.

Repeat to add other predecessors if necessary.

Note: See [Sequential Tasks](#) on page 849 for more information on tasks' links with their predecessors.

You can also choose to **Automatically link documents from predecessor tasks when task is started**.

8. Define when the task is due: you can use a **Lead Time** or a **Due Date**.

Use **Lead Time** if you know how long the task will take, but haven't calculated a precise due date for it (for example for a task in the middle of a project). This calculates the **Due Date** automatically by adding the **Lead Time** to the current date.

Note: The **Lead Time** only takes working days into account.

The **Estimated** field will be mostly used by the task assignee to indicate when he/she expect(s) to have finished the task.

Note: By default, Saturday and Sunday is considered as weekend. However, it is possible to switch the weekend days to Friday and Saturday. The due date calculation will ensure that the due date will always be on a weekday. To enable this in your WebCenter system, contact an Esko Representative.

9. Define when to **Start the task**:

- Choose **Manually** if you want the assignee to decide when to start the task him/herself.
- Choose **Automatically at ... (due date minus lead time)** to have the task start automatically a certain number of days (the **Lead Time**) before the due date. This makes sure that the task is automatically started when there is still enough time to finish it.
- Choose **Automatically after predecessors complete** if the task has predecessors, and you want it to be started as soon as they are finished.
- Choose **Automatically after predecessors complete and after ... (due date minus lead time)** to have the task start automatically a certain number of days (the **Lead Time**) before the due date, but only after the predecessors are finished.
- Choose **Automatically after project creation** if you want the task or workflow to be started right after project creation from a template containing this task.

Note: If you are making the task start automatically, you can still give the assignee the option to start it manually (select **Assignee can start task manually**).

10. If this task is crucial to the project, you can decide to have its completion change the project's status (for example mark it as **Completed**).

Select **Completion of this task changes project status to** and choose your desired project status.

11. Click **Create**. When the task is created, a log is created in the project history with the Assigned to, Lead time, Due Date, Estimated Date, Description.

Edit a Task

Note: You need the **Change Task** permission to be able to edit a project's tasks.

1. In the project's **Tasks** tab, click the **Edit** link next to a task to go to the **Task Information** page.
2. Edit the task as desired and click **Change**.

Note: You can also edit the tasks assigned to you from the task execution page (see [Working on Tasks Assigned to You](#) on page 843) by clicking the **Edit Task Details** link (if you have the **Change Task** permission).

Restricting a Task to Project Roles or Groups

1. [Create a Task Type](#).
2. In the [Edit Task Type page](#), enable the option **Restrict Task to an Allowed Assignee (Group or Role)** in the **General Information** tab.
 - After enabling this option, you can either select an [Allowed Assignee](#) role or group in the task type or leave it as **Default to Task Assignee**.
3. **Save** the **Task type**.
4. Click **Create New Task** in the **Tasks** tab in your project.
5. Select the **Task Type** you created.
6. Choose a **Status** among the statuses available for that task type.
7. Select an **Allowed Assignee** (a group or a role). This will restrict the task to that specific group or role.
8. In the **Assigned To** field, you can specify:
 - the **Allowed Assignee** role or group. This field will list all the project members.
 - the members of the **Allowed Assignee** role or group.

Warning: If you specify an **Allowed Assignee** in the task type and select a different role / group / project member in the **Assigned To** field, you will get an error while saving.

9. Click **Create** .
Your task is now restricted to the **Allowed Assignee**.

To change the **Allowed Assignee**, go to **Edit Task > Task Information** and select another role or group.

Note: You need to be an admin user to be able to change the **Allowed Assignee** of the task.

Note: If the **Allowed Assignee** role or group is specified in the **Task Type**, you cannot change it in the **Edit Task** page.

Reschedule a Set of Tasks

Often, an entire set of tasks must change its due date. Some possible reasons are:

- The project is delayed.
- The project needs to speed up.
- A set of tasks needs to happen earlier or later in the project.
- The entire set of tasks was copied from a template or another project and it needs to be shifted as a whole to be realistic for the current project.

Note: You cannot change the due date of completed tasks.

To reschedule your project's due dates:

1. Open the project and select **Tasks**.
2. Click the **Schedule Tasks** link.

You can see all due dates and lead times of the existing tasks but also their **Estimated Finish Date**.

Make estimated dates the new dates		Show	Task list (days only)									
#	Task Name	Assigned to	Depends on	Status	Old Lead Time	Old Due Date	(Estimated) Start Date	(Estimated) Finish Date	New Lead Time	New Start Date	New Due Date	
<input type="checkbox"/>	1 TL_Router Date sm_Task 1	ADMIN (ADMIN)		<input checked="" type="checkbox"/>	0 days	Jan 13, 2015	Jan 13, 2015	Jan 13, 2015

Project due date:

Fast operations on the selection

Shift due dates with days

Shift due dates to have the latest ending on

Shift due dates to have the first one starting on

Re-distribute due dates to start on

and end on

This can differ from the due date because certain tasks are already overdue, or because due dates were chosen without taking the predecessor tasks' due dates into account.

You can view the lead times in **days only** or in **days and hours**. When choosing **days and hours**, you will be able to refine the scheduling to the **hour** a task should start or finish.

3. To change the due dates, you can either:

- Manually change the **Lead Time** of certain tasks (enter the **New Lead Time** and press **Enter**). WebCenter then calculates a **New Start Date** (if the task isn't started yet) and a **New Due Date** (all the dependent tasks are moved accordingly).

For example if your project is late, you can shorten some tasks' lead times to make sure it still ends at the planned date.

Note:

- The **Lead Time** only takes working days into account.
- The fields in yellow show the tasks on the **critical path**. Those are the tasks that directly influence the project's end date (the last task and its predecessors).
To make the project end sooner, you can shorten the lead times of the tasks in the critical path (in yellow).

- Click **Make estimated dates the new dates**: this takes the **Estimated Start Date** and **Estimated Finish Date** as **New Start Date** and a **New Due Date**.

Use this for example if your project is late and you want to update your planning accordingly.

- **Shift due dates with** a certain number of **days** (select the tasks to change, enter a number of days and click **Try**).

Note: Selecting a task automatically selects its dependent tasks too.

You can use this if your project is late, or you can enter a negative number to speed the project up.

- **Shift due dates to have the latest ending on** a certain date (select the tasks to change, enter the due date of the last task and click **Try**). This will calculate how many days the latest task needs to shift (to later or to earlier) and apply the same shift to all others.
- **Shift due dates to have the first one starting on** a certain date (select the tasks to change, enter the start date of the first task and click **Try**). This will look how much the task with the first starting date shifts and apply the same shift to the due dates of all tasks.

This would be typical for a set of tasks of which just one is started. This starting date allows calculating the rest of the track.

Note: You cannot move tasks to before **Today**.

- **Re-distribute due dates to start on** a certain date **and end on** a certain date (select the tasks to change, enter the new start and end dates and click **Try**). This will compress the selected tasks' lead times to fit within the given dates.

By default, the starting date is today, and the end date is the project due date.

Tip: You can also use this to do **backward planning** by only giving an end date and disabling the start date checkbox, or **forward planning** by only giving a start date and disabling the end date checkbox.

4. If you are not satisfied with the changes, you can click **Reset** to go back to the original dates. You can then **Try** to change the dates using a different method.

When you are satisfied with the changes, click **Save**. This will send an e-mail notification to the task assignees (if this is configured).

You can also click **Cancel** to return to the task list without saving your changes.

You can also see your tasks in a **Gantt Chart**. You can display them by **Day, Week** or **Month**, and you can choose to view the **Original, Estimated** or **New** dates.

Note: You can also **shift due dates** from the project's **Tasks** page: select the desired tasks and click **Change Due Date** in the actions menu.

Task Discussions

You can start a discussion on a task by clicking **Edit Task Details** then **Discussions**.

Task discussions work in the same way as document discussions.

Read more on how to enable **Task Discussion** [Enabling Discussions in Task Type](#) on page 288

4.15.6. Working on Tasks Assigned to You

To work on a task assigned to you, you can either:

- click the link to the task in the notification email you received,
- click the task name in the **My Tasks** section of your **My Work** page,
- in the project details page, click the **Tasks** tab then the name of the task.

This opens the task execution page.

Task: Design New Chocolate Ice Cream Packaging Project: Chocofun Project Details Edit Task Details

Discussion [0] [Printer icon]

Start Task Return Complete Task

Start a Task

- On the task execution page, click the **Start Task** button.
This sets the task status to **In Progress**.

Upload Documents to the Task

On the task execution page:

1. In the **Task Documents** section, click one of the options in the **Task Documents** section. You can either:
 - Upload a document saved on your computer or network (use **Upload / Browse**),
 - Link a document already existing in the project to the task (use **Link**),
 - Create a document placeholder from a document template (use **New**).

Note: This is only available if the project has been created from a project/template containing document templates.

This is similar to the general upload document page. For more details, see [Uploading a Document via Upload](#) on page 587.

2. Choose the project **Folder** in which to upload the document.
3. Click **Change**.

You can also **Upload Multiple Documents** (see [Copy / Create Multiple Documents](#) on page 589 for more information).

Download a List of Documents from the Task

To download documents from the task execution page:

- Select the documents to download and click **Download** in the **Actions** menu.
 - If you selected a single document (that you have download rights for), it will be downloaded directly.
 - If you selected several documents, you will get a ZIP archive containing all the documents you selected and for which you have download rights.

Note:

- If you don't have download rights for any selected document, you will see an error message.
- If you selected CAD files as part of a multi-document download, they will be downloaded in the native perspective.

Change the Task Status

When you are working on a task, you may want to change its status to reflect the task progression (especially if the task was created from a task type with many precise statuses).

On the task execution page:

1. Choose the **Status** to give the task.
2. If the task contains a **Checklist**, mark some checklist items as done if necessary.
3. Click **Change**.

Complete a Task

Once you have completed a task, do the following to mark it as **Completed** in WebCenter.

On the task execution page:

1. If the task contains a **Checklist**, mark the checklist items as done.
2. If the task contains **Specifications**, fill them in as needed.
3. If the task type allows **Discussions**, you can add a comment if you wish.

Click **Start a New Discussion** if there is no discussion yet, or **Reply** if there is one, enter your **Message**.

4. Click the **Complete Task** button.

This sets the task status to **Completed**.

4.15.7. Overview of My Group's Tasks

My Group's Tasks lets the **Group Manager** quickly view the tasks assigned to their group or group members. It also allows to assign, re-assign, or distribute the tasks among the group members.

If a group member is ill or not available, the Group Manager can re-assign the task to an other group member. A Group Manager can also monitor the progress on a selected Group or Group Member. Using the filter options, the Group Manager can have a quick overview of the workload.

Group Task Manager

Every department has a Department Manager. In WebCenter Department Manager are referred to as **Group Manager**. A group can have any number of Group Managers including 0. Group Manager is always part of a group.

A Group Manager likes to view the tasks assigned to a selected group or group members, which will assist him in distributing the tasks and also get a quick view on the current status of a task.

The **My Group's Tasks** feature allows Group Managers to:

- View task assignments for a selected group and the workload overview.
- View tasks assigned to a group member and the workload overview.
- Re-assign any task assigned to a group member.
- Review the task overview filtering on status and due date.

Using My Group's Tasks

To access **My Group's Tasks** feature, log in as Group Manager. Click **My WebCenter > My Group's Tasks** to view the **Group Tasks for Group** page.

Viewing Task Assignments

You can view the tasks assigned to a selected group and also for a group member within the group.

1. The task list for assigned group appears.

Note: If a Group Manager manages or is assigned to multiple groups, WebCenter displays the list of managed groups. You can only view the tasks for one group at a time.

2. In the **Tasks assigned to** drop-down list box, select the group or group member for whom you want view the task assigned.
3. A task list assigned to the selected group or group member appears. Also in the list are:
 - Task Name
 - Project Name
 - Assigned to
 - Status
 - Lead Time
 - Due Date
 - Created Date
 - Started Date
 - Estimated Date
 - Task Documents

Viewing a Workload Overview

During editing/re-assigning, the Group Manager can have an overview of number of tasks assigned and how many are overdue. The Task Count is the number of assignments assigned to a group member. The Task Count displayed is based on the filtering criteria and tasks with past due-date always appears. The non-active projects do not appear and are not counted.

1. The task list for assigned group appears.

Note: If a Group Manager manages or is assigned to multiple groups, WebCenter displays the list of managed groups. You can only view the tasks for one group at a time.

2. The workload overview appears for the selected group.

Search Tasks		Sort by	Due Date	Status	All but Completed
Members	Task Count				
DEKE_DEPENDENCIES	Before: 1(1 overdue)	After: 1(1 overdue)			
ArtiosCAD, ArtiosCAD (ARTIOSCAD)	Before: 0(0 overdue)	After: 0(0 overdue)			
deke_user2 (DEKE_USER2)	Before: 0(0 overdue)	After: 0(0 overdue)			
il, pm (IL_PM)	Before: 61 (61 overdue)	After: 61 (61 overdue)			
Keizer, Debbie (DEKE)	Before: 138 (138 overdue)	After: 138 (138 overdue)			
prma (PRMA_USER2)	Before: 0(0 overdue)	After: 0(0 overdue)			

If the task is past the due date, it appears in red.

Reassigning a Task

A Group Manager can re-assign a task to a group or a group member. A task can be re-assigned only to a group member within the same Group. In addition to this when the task is reassigned, the WebCenter UI displays the previous assignee in **Previous** column.

- Note:** Ensure to log in as **Group Manager**.

- The task list for assigned group appears.

Note: If a Group Manager manages or is assigned to multiple groups, WebCenter displays the list of managed groups. You can only view the tasks for one group at a time.

- Select the new assignee in the **Assigned** to drop-down list box. This list contains group and group members name.
- WebCenter shows changed tasks with a yellow background indicating the change.

Note: Even if a task is not initially assigned to a group, the Group Manager has all the rights to re-assign the task to a group member.

- Click **Save** to commit the changes.

Filtering Based on Task Status and Due Date

A Group Manager manages multiple tasks at a time and this might lead to delay. Using the **Search Tasks Status**, one can see tasks in a more specific status.

For example, you can filter the tasks which are in Completed or In Progress status. By filtering the task, a Group Manager need not re-assign completed tasks or tasks which cannot start because a predecessor is not complete.

Similarly the tasks can also be filtered by **Due Date**. This gives a Group Manager a quick view of the task for the required time line. Using this information Group Manager can view what is due this week or this month to make the required planning.

- Note:** Ensure to log in as **Group Manager**.

- The task list for assigned group appears.

Note: If a Group Manager manages multiple groups, WebCenter displays the list of managed groups. You can only view the tasks for one group at a time.

2. In the **Search Tasks Status** drop-down list, select the desired task status.
3. In **Due Date**, select the required due date and then click **Go**.

Note: To set the Due Date filtering, setting a task status filter is not necessary. The Due Date changes to completion date, if the task status is filtered to completed.

The following are the default due dates settings available:

- All
- Today
- Next 3 days
- Next week
- Next 2 weeks
- Next month
- Next 3 months
- Overdue
- Week overdue, all the tasks which are overdue for less than five days.

Filtering Based on Column

By clicking a column header, the Group Manager can view tasks for a selected group in ascending or descending order.

For example, if **Due Date** is selected then the tasks for the selected group appears with the earliest due date. Similarly if **Due Date** is clicked again, then the tasks for the selected group appears with the latest due date.

1. Log in as **Group Manager**.
2. The task list for assigned group appears.

Note: If a Group Manager manages multiple groups, WebCenter displays the list of managed groups. You can only view the tasks for one group at a time.

3. Click a column header, for example **Due Date**, to sort on this column.

The sorting is indicated by an arrow. For example, if Due Date is selected then it would appear as:

4.15.8. Sequential Tasks

What is a sequential task?

Tasks can be made dependent on each other. You can define predecessors for a task, which automatically chains tasks to each other.

For example, if you create a "Review the final design proposal" task for a member, and then add a second task called "Implement design corrections" that has the "Review" task as a predecessor, you can make sure that the "Implement design corrections" task starts automatically when the "Review" task has been completed.

Starting tasks: options

Tasks can be set to start:

- Manually (the member changes the task status manually).
- Automatically, depending on the due date and lead time (in working days).
- Automatically, depending on the completion of the predecessor task(s).

Note:

If the **Due Date** is different from the **Due Date** of the predecessor plus the **Lead time** (i.e. the earliest the task can be finished), the **Reset Start Date** button will appear. Clicking this button will set the **Due Date** to the **Due Date** of the predecessor plus the **Lead Time**.

This option is only available if the task is in **Created** status, and if the **Start Task** is set to **Automatically after predecessors complete**.

- A combination of the above options.

Also, task completion can change the project status.

4.15.9. Linking Documents to Tasks

One of the strengths of Task management is the ability to link documents to tasks.

Documents always sit in a folder in a project. The link to Tasks is optional and comes on top of the positioning inside a folder.

Note: If a default folder was defined in the Task Type setup, new files will automatically be uploaded to that default folder. The user can still change the folder manually in the upload dialog.

You can also attach a document table to your Task Type. This gives you multiple referenced documents in the Tasks. You can use the [Document Rendering](#) on page 851 tab to attach multiple documents (for example, a copy sheet) to a Task Type's tasks.

Why Link Documents to Tasks?

Linking a document to a task gives purpose to the document. Without task management, the purpose of the documents in a project is implicit. You typically figure out what they represent through their name, through their Attributes, or through the name of the folder they are in.

Most documents linked to a task are one of the following:

- The result of the task. Creation type tasks end normally with a digital asset resulting from the creative work. Good examples are ArtiosCAD .ARD files, or PDF files etc.
- The “current state” of the task. When the task is not yet completed, you can already show what you have by linking the current version of the document to the task.
- A specification as a separate file. Although tasks can have structured specifications, it is possible that you want a complete document to specify the task. You can then upload that document and link it to the task.
- The input for a task. Creation of graphics for packaging demands a definition of the cutting shape. So you can link the .ARD file to the graphics creation task or upload it to the task.
- Collateral information.

Tip: Documents can be linked to multiple tasks. A typical example is where the same document is the result of a first task and the input for a second task.

Documents Tab

In this tab, you can configure how documents are handled in a **Task Type**. See the options below:

- **Allow Attached Documents**
- **Show link to Multiple Upload**

This option is to streamline handling of tasks that do not require any documents. It is common when a task is used to fill specified values (specifications) and/or fulfill defined checklist only.

Disable this to hide the **Upload Multiple Documents** button from the task execution page.

- **Only allow task to complete if it has one or more attached documents:** When this is checked, you have the extra options:
 - **Complete task automatically when all documents are approved**
 - **Only allow task to complete when all attached documents are approved**
- **Start approval cycle on attached documents**
- **Assign Attribute Category to uploaded documents**
- **Automatically update attributes for attached documents from task specifications**
- **Set default folder for uploaded documents**

Link a Document to a Task

There are multiple ways of linking a document to a task:

- From the documents overview, select the document(s) and click **Link to task(s)** in the **Actions** menu. This allows you to quickly associate multiple documents with multiple tasks

- Within the task details, click the **Documents** tab and then click **Link document(s)** in the grey bar. Select the document(s) to link.
- You can directly upload a new document to a task. In the task details, click **Documents** and then click **Upload Document**. This will give you the well-known upload dialog, but you will immediately create a link to this task.

Find Documents Linked to a Task

- In the task, click **Documents**. This shows what documents are linked to this task and it also shows their version, description and approval state.
- In the tasks overview, there is a **Task Documents** column showing the names of the documents linked to this task. Clicking a document name brings you to the document.
- In the documents overview, there is a **Tasks** column. Clicking a task name brings you to the task.

Document Rendering

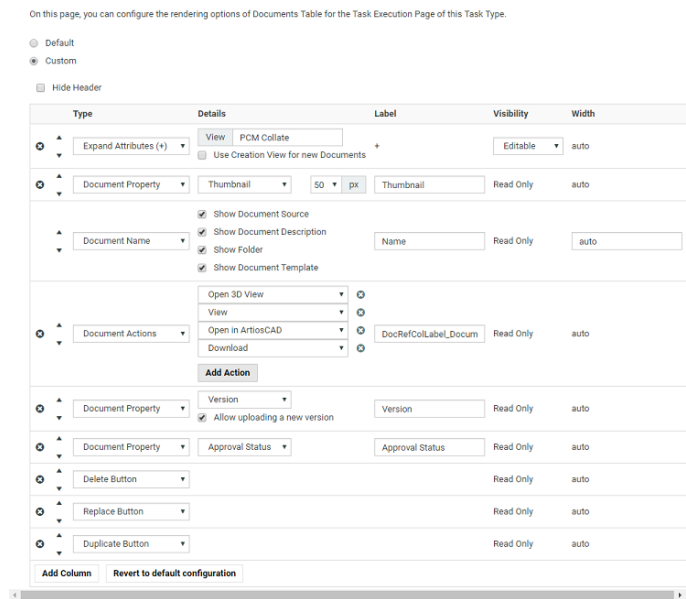

You can create **Custom** document rendering options in a Task Type's **Document Rendering** tab.

There are two options in this page.

- Default (this is selected by default). See the example of a **Default Rendering**:

Thumbnail	Name	Version	Approval Status
	01 Normal Permission.wcc	1	
	01 Requester.wcc	1	
	1Product-Feature.wcc	1	

- Custom

To create a customized document table in the Task Type:

- Enable **Allow Attached Documents** in the **Documents** tab. This option is disabled by default.
- Select **Custom** in the **Task Type > Document Rendering** tab to configure the document table.

The options available are exactly the same as Document Reference Rendering. Read details about the options in the [document references section](#).

- Configure your table options.

You can attach a [copy sheet](#) in a task type this way. This allows you to send a copy sheet to edit, translate or approve in a task (therefore automate it in workflows). If you are attaching a copy sheet, also configure options for [Text Documents](#).

Note:

You can configure Master Text and Translation Text widgets to appear in the Text document table.

Read more in: [Creating a Copy Sheet](#) on page 379

- Remember to **Save**. Only then it takes effect.

Documents section of all tasks created from this Task Type (old and new) are affected by the changes saved on this page. See an example of a Task Document Rendering (Artwork with its copy sheet) below.

Create an Advanced Table Rendering

Adding an advanced table of document references allows you to customize the way your document will be shown to users when they are applied (For example, in a template).

It also allows you to configure advanced features such as making an attribute of the document **required** or **read only**.

Note: The document reference attributes will inherit the **style** specified in the **attribute category**. This style is further expanded to the individual document's attributes as well.

- Click **Use Grid Layout** in the **Edit Category** page. Add your document reference attributes.

Reference Category:	No Reference Category selected
Version Mode:	Latest Version
Document Source(s):	Components_Default Edit Configuration
Rendering:	Table Components_Default Edit Render Configuration

- Select the **Rendering** as **Table** in the *grid layout*.

In the **Edit Render Configuration** dialog, you can set up the advanced rendering.

Note: You can create *custom tables* for your different views.

- Enable **Hide Header** if you do not want a header row in the document references table. The labels will be displayed in line for each document.
- Enable **Allow Bulk Operations** when any action performed on the document reference is also cascaded to all the references which are made to that particular document reference. Actions performed on the document reference could be to
 - Remove a Referenced document which removes all the document references in the tree structure
 - Replace and Undo
 - Getting document to Local and Undo action
 - Upload a new version and/or edit a text statement
 - Update to the latest version
- Enable **Limit Bulk Operations to Document References with matching Operations configured**, when you want to perform bulk operations on document rows which are filtered based on document sources and actions configured for them. Read more about [bulk operations](#).

User is informed about the number of rows the bulk operation will be really performed (after filtering) in the specific bulk operation modal dialog.

- Enable **Open Links in new Tab** , to open any link in the document reference in a new tab.
 - Click **Add Column** to add more columns to the table.
- The rows in the **Edit Render Configuration** pop-up correspond to your document reference columns.

Edit Render Configuration

Add Column Revert to default configuration

OK

- Select **Type** as **Document Name** which is a mandatory field. In the **Details** section, you can disable:
 - **Show Document Source**
 - **Show Document Description**
 - **Show Folder**
 - **Show Document Template**

Your rendering will have a hyperlink to the document depending on the user permissions. These options are additional details added to the document and can be viewed only when a new document is added.

[box_sprint2.ard](#)

- The name will not be a hyperlink for users without document view permissions.
- Depending on how your **document properties** should be rendered, configure the table columns. You can create custom **Labels** for your selections. The properties will be displayed as **read-only**.

Choose Document PropertyDetails as...	The result in the rendering table will be...												
<ul style="list-style-type: none"> • Description • VersionRevision • VersionAuthor • Project • ApprovalStatus • ApprovalStage • ModifiedDate • Thumbnail 	<p>The selected document properties will appear in the table header with the custom label. For example:</p> <ul style="list-style-type: none"> • the current Approval Stage of the document. The user can click to access the approval pop-up. • Clickable thumbnail of the document with the default (50x50) or specified pixels. <table border="1"> <thead> <tr> <th>Version</th> <th></th> <th>estado de aprobación</th> <th>etapa de aprobación</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>⊗</td> <td>🔄</td> <td>Stage2</td> </tr> <tr> <td>1</td> <td>⊗</td> <td>✔</td> <td>Etapa 3</td> </tr> </tbody> </table>	Version		estado de aprobación	etapa de aprobación	1	⊗	🔄	Stage2	1	⊗	✔	Etapa 3
Version		estado de aprobación	etapa de aprobación										
1	⊗	🔄	Stage2										
1	⊗	✔	Etapa 3										
<p>Tip:</p> <ul style="list-style-type: none"> • Create custom labels • Specify the pixels for your thumbnail. • Check the box Allow uploading a new Version button 	<ul style="list-style-type: none"> • Upload New Version 📄 if you have the rights to upload will be available in the Version column. 												

- You can configure **document actions** in the table rendering of the document references. The actions will appear next to the documents listed in the table only when it is relevant.

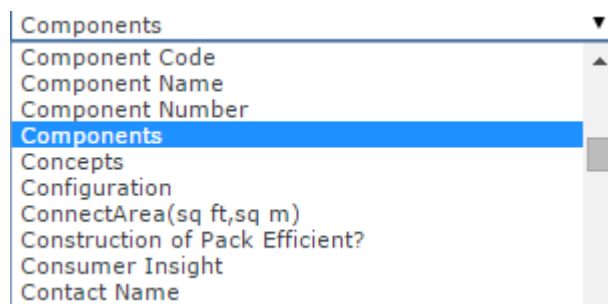

Choose Document Actions as...	The result in the rendering table will be...
<ul style="list-style-type: none"> • View • Open in 3D • Open in ArtiosCAD • Download • Upload New Version 	<ul style="list-style-type: none"> • A 3D 📄 button will be available only when there is an existing 3D perspective. • Open in ArtiosCAD option will be available for CAD files. Clicking on it will open the CAD document as set up in the preferences

Choose Document Actions as...	The result in the rendering table will be...
<ul style="list-style-type: none"> • Update to Latest Version 	<ul style="list-style-type: none"> • Download option will be available when the user has download permission. • Upload New Version: This is available when the user has the rights to upload new version. <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p>Note: The Upload New Version  button can also be placed in the Version column by checking the Allow uploading a new version check box.</p> </div> <ul style="list-style-type: none"> • Update to Latest Version: Allows user to update to the latest version

Note:

- If you change the **attribute** values during the upload of a new version, these are only applied on the new version of the document. The previous version will have the old attribute values.
- If a document version is linked in multiple projects, all linked projects will get the new document version.
- If the configured columns do not fit in the table, the table will assign each column its minimum width and show a horizontal scroll bar.

- Configure how your **Document attributes** should be displayed. Select the relevant **attribute** from the drop down as a specific column (with a custom **Label**) in your table.

Specify the Visibility of the attribute as...	The result in the rendering table will be...
<ul style="list-style-type: none"> • Editable if you want the users (with the right permissions) to be able to edit this attribute. 	<ul style="list-style-type: none"> • The selected document attributes will be displayed in the table header and its values in the respective columns.

Specify the Visibility of the attribute as...	The result in the rendering table will be...						
<ul style="list-style-type: none"> • Required if you want to make it mandatory for users (with the right permissions) to fill in this attribute. • Read Only if you don't want any user to be able to edit this attribute. 	<div style="border: 1px solid #ccc; padding: 5px; margin-bottom: 10px;"> <table border="1"> <tr> <td style="width: 50px;">Width *</td> <td style="width: 50px;">Length</td> </tr> </table> </div> <ul style="list-style-type: none"> • The users can type in the values for the editable attributes. <div style="border: 1px solid #ccc; padding: 5px; margin-bottom: 10px;"> <table border="1"> <tr> <th style="width: 50px;">Weight</th> <th style="width: 50px;">Date</th> </tr> <tr> <td style="border: 1px solid #add8e6;">1g</td> <td> <div style="display: flex; align-items: center;"> <div style="border: 1px solid #ccc; padding: 2px 5px;">May 26, 2015</div> <div style="margin: 0 5px;">📅</div> <div style="border: 1px solid #ccc; padding: 2px 5px;">13:30</div> <div style="margin-left: 5px;">▼</div> </div> </td> </tr> </table> </div> <div style="border: 1px solid #ccc; padding: 5px; background-color: #f0f0f0;"> <p>Note: You can configure the Visibility also at the attribute level. If your settings differ, the most restrictive setting will be applied.</p> </div>	Width *	Length	Weight	Date	1g	<div style="display: flex; align-items: center;"> <div style="border: 1px solid #ccc; padding: 2px 5px;">May 26, 2015</div> <div style="margin: 0 5px;">📅</div> <div style="border: 1px solid #ccc; padding: 2px 5px;">13:30</div> <div style="margin-left: 5px;">▼</div> </div>
Width *	Length						
Weight	Date						
1g	<div style="display: flex; align-items: center;"> <div style="border: 1px solid #ccc; padding: 2px 5px;">May 26, 2015</div> <div style="margin: 0 5px;">📅</div> <div style="border: 1px solid #ccc; padding: 2px 5px;">13:30</div> <div style="margin-left: 5px;">▼</div> </div>						

Tip: Click **add column** and select another attribute to have more attributes listed in your table.

Tip:
 You can configure a project's **document reference attributes** to be non-editable and still allow the user to edit the **attributes** of the **documents** referenced.
 Your user can do this from the project's **attribute category** tab.

Tip:
 Optionally, you can setup the **Project > Notifications > Project Attribute/Category change** to receive notifications about document references.
Reference category changes will be notified according to the **Project > Notifications > Document Attribute/Category change** settings.

- Configure **Expand Attributes**  / **Collapse Attributes**  button for your document references. This allows you to expand or collapse the **document attributes** of your **references**.

Tip: You can configure different **expand attributes** settings for different views. Specify the **view** name here.

Note:

The check box **Use Creation View for new Documents** is switched on by default. As a result, you will get the *creation view* whenever you use **Upload/ Browse, Copy** or **New** regardless of the view you are creating the rendering for. If this option is disabled, you will see the specific view or the default view.

When you save the view will change to the specified or default view depending on the configuration.

Edit the Visibility as...	The result in the rendering table will be...
<ul style="list-style-type: none"> read-only editable <div style="border: 1px solid gray; padding: 5px; margin-top: 10px;"> <p>Note: The user needs Change properties right to edit attribute values.</p> </div>	<p>Click  to expand the document attributes (which may also be document references):</p> <div style="border: 1px solid gray; padding: 5px; margin-top: 10px;"> <p>Tip: Keep this editable, if your users have to edit the document reference's attributes.</p> </div> <p>When the document attributes are expanded, you can use  to collapse them.</p>

Thumbnail	Name
 	BOXCO_00001.ard
Customer <input type="text" value="Box&Co."/>	Box Brands <input type="text" value="BoxingBox"/>
Description <input type="text" value="Blue box for Box&Co."/>	CAD Number <input type="text" value="1"/>
Display <input type="checkbox"/>	Style <input type="text" value="spark"/>
	Length <input type="text" value="300"/>

- Select the relevant **reference properties** and specify if you want it to be **Read-only / Editable / Required / Hidden**.

Reference properties are **attributes** (*reference category*) of the document reference link. You can select one of them from the attribute drop down in the **Details** cell.

Reference Property ▼	DEKE_Ingredient Quantity (float) ▼
Reference Property ▼	DEKE_Ingredient Unit ▼

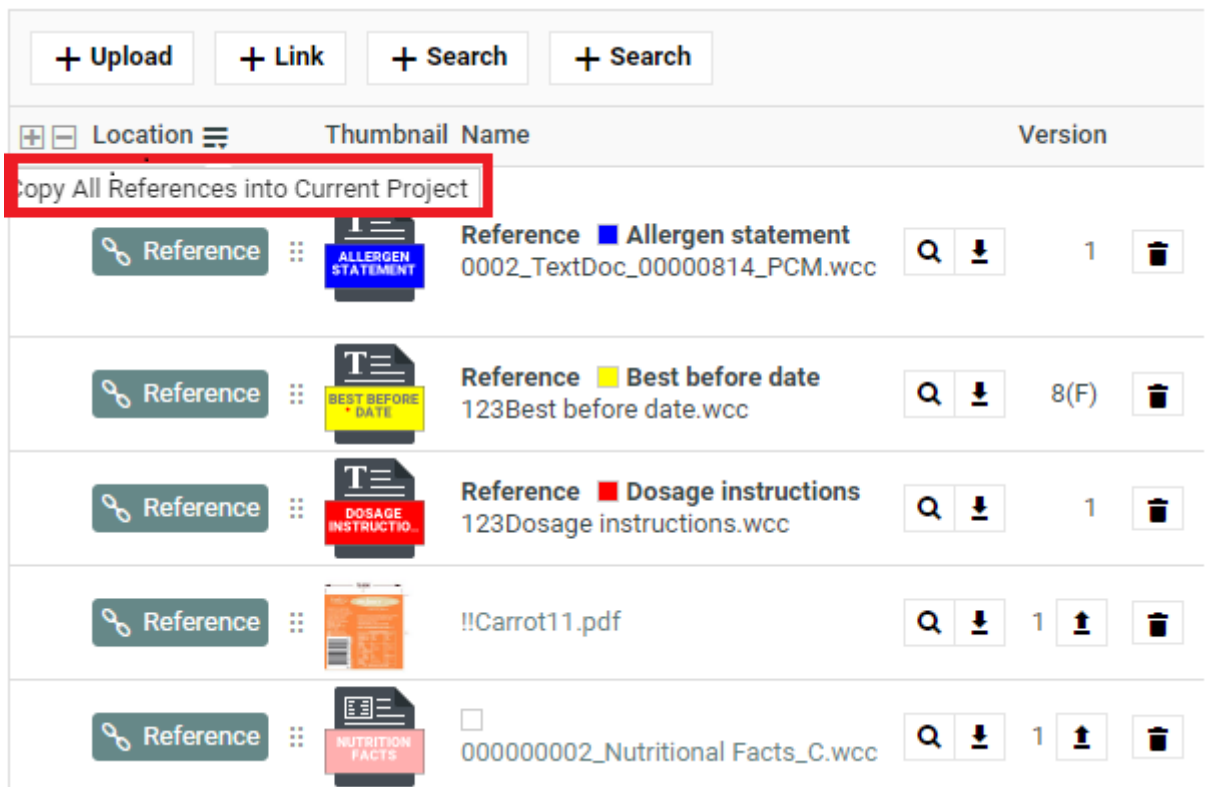

Note: **Reference Property** field is only available when a *reference category* is specified for the document reference.

Specify the Visibility of the reference category attribute as...	The result in the rendering table will be...
<ul style="list-style-type: none"> • Editable if you want the users (with the right permissions) to be able to edit this attribute. • Required if you want to make it mandatory for users (with the right permissions) to fill in this attribute. • Read Only if you don't want any user to be able to edit this attribute. <p>Hidden if you want to specify a Reference Property, but do not want to show it in the table.</p> <p>Note: This option is specific to Reference Properties.</p>	<ul style="list-style-type: none"> • The reference attributes will be displayed in the table header and its values in the respective columns. • The users can type in the values for the editable attributes. <ul style="list-style-type: none"> • No visible reference attributes in the table • The values (of the reference attributes) are retained when you <i>duplicate</i> or <i>replace</i> a document reference.

Note:
 Choose **Collapse** check box when you choose **Document Property, Reference Property, Reference Property Filter, Document Attribute, Project Property, Project Attribute, Master Text, Translation Text, Text Language Flags** fields for **Type**, to expand or collapse the column while rendering in the table.

- You can allow the users to move a referenced document into the current project. To set this up, create a column with **Local / Remote** setting. Specify the **visibility** as **editable** or **read-only**. You can move all the referenced documents into the local project by hovering on the **Location** in the header and selecting the option **Copy All References into Current Project**.

You can move any of the referenced document to the local by clicking on the Referenced field of the required document and selecting the option **Copy to Current Project**.

The users need to **Change Properties** and **Add** permissions to move a document to local folder. The document reference will point to the local copies.

The user will be able to specify:

- a new name and description
- document template
- target folder

If the setting is **Read-only**, the user will see indicating remote project.

- When you are creating a Copy Sheet using Text Document References, you can configure text related data to the table. Read more in: [Create a Table Rendering for Text Documents](#) on page 380

- To configure the rendering with Project related parameters, choose from
 - Project Property
 - Project Attribute
 Read more details in: [Project Properties in Advanced Table Rendering](#) on page 378
- Optionally, add:
 - a) a **Numbering** column.
 - b) **Up / Down** arrows to let the users change the sequence.
 - c) **Duplicate** button which allows the user to duplicate a reference along with its properties. Read more in: [Duplicate a Document Reference](#) on page 377.
 - d) **Replace** button which allows the user to replace a document reference. Read more: [Replace a Document Reference](#) on page 377.
 - e) a **Delete Button** to let the users delete the document references from the table.
 - f) **Row Selector** to let the users select single or multiple documents. Using this, user can select multiple documents from the document table and perform document actions on them.
- Save the configuration by clicking **OK**. To revert from this configuration, click **Revert to WebCenter Default Configuration**.
- **Save** the **Attribute Category**.

If the logged in user does not have permissions to view the document, the document table will have (based on the configuration):

1. **Document name** with !. The user will see a warning message.
2. Editable **reference properties** displayed in the specified columns
3. **Up /Down** arrows
4. **Delete** button
5. **Numbering** ("#")

Note: If the settings are not **editable**, the document table will have the document name and its sequence number.

Creating a Copy Sheet

Copy sheet is a term used to describe all the content together which will be attached to a particular artwork or printed item. A copy sheet containing aggregated content helps you to:

- validate the copy sheet templates for consistency, accuracy and compliance with the established content management process.
- review, proof-read and approve copy sheet in one place.

You can create a copy sheet using Text Content Document References in an **Attribute Category**. This gives the option to attach this copy sheet to your Projects or artwork documents.

The copy sheet categories allow you to:

- track the content on an artwork.
- easily reuse existing approved content
- configure separate permissions and approval system for each text document.

Tip:

By configuring [Document Rendering](#) for Text documents, you can attach copy sheets to Tasks. When you configure Workflows with manual tasks for editing or approving, the users can work on the copy sheet directly from their task.

An Attribute Category based copy sheet offers the following advantages:

- the languages. To view a particular translation corresponding to a master, just select that language in the filter drop down.
- the **Instance Sequence**. See more in: [Dynamic Content documentation](#)
- the option to [replace a text document with another](#)
- the button to [duplicate a document](#) with the same reference attributes
- [advanced document reference options](#)

You can [Edit](#), [Start Approval](#), [Approve and Reject](#) actions from the copy sheet depending on your content permission.

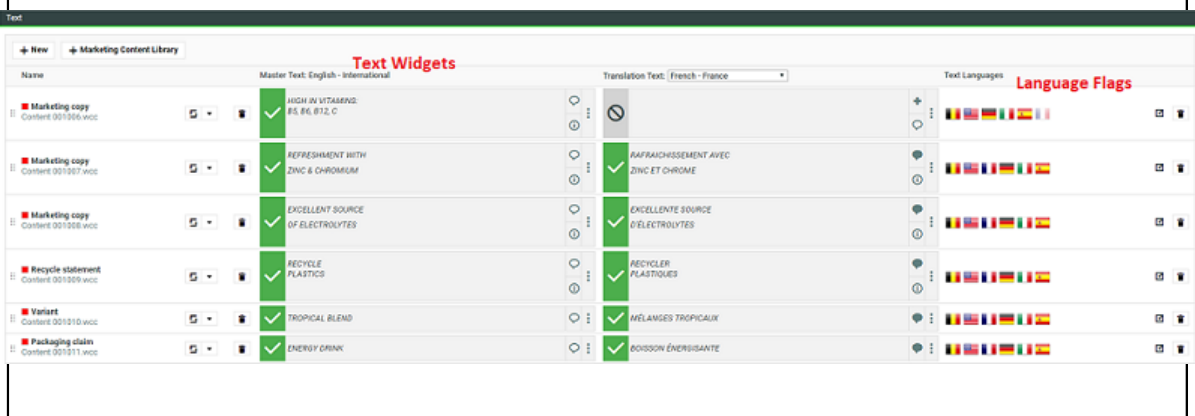

Note:

The text document references are used when you import Dynamic Content into WebCenter. Read about this in: [Import Dynamic Text](#) on page 903.

See the example screen shot below. The configuration explained here is only an example. You can configure your document references according to your needs.

Tip: You can configure the copy sheet with different **Attribute Views** to provide custom views to your users. For example, a content collator and Translation Language Editors can have different [custom views](#) of the same text document reference category.

Note: You can also add the languages by clicking on the **+** displayed in the text statement. On deletion of a language, the **+** icon is again displayed to enable adding back the language. You can configure the corresponding attribute category to display the languages one by one in a table.

Create a Table Rendering for Text Documents

You can configure Text or Table Documents as document references and add them to a Project or Document Attribute category. The configuration and rendering are similar for Task Specifications.

To create a Copy Sheet using Text Document References, you can configure text related data to an advanced table rendering.

1. [Create a Table Rendering](#).
2. In the **Edit Rendering Configuration** pop-up:

Specify...	The result in the rendering table will be...
Master Text	<p>Master Text Statement in a text widget along with its content in the edit field and all related text content actions.</p> <p>Note: The Visibility should be specified as Editable if you want your users to edit the text.</p>
Translation Text	<p>Translation Text Statement(s) in widgets. One or more columns can be configured for the translations of the Master Text. The Master and Translation languages will also appear in a drop down.</p>
Text Language Flags	<p>The language drop downs for Master and Translation Text columns.</p> <p>Note: The master and translation languages are populated from the project attributes MASTER_TEXT_LANGUAGE and TRANSLATION_TEXT_LANGUAGE respectively.</p>

Tip:
 You can specify a default language code for Text statements. The selected language will be the default in the document reference table. If default language is not specified, the first language from the language drop down will be selected as the default.
 WebCenter also supports right to left languages like Arabic and Hebrew for text content.

3. Specify the width for Master Text and Translation Text.

By default, the width of every column is set to **Auto**. However, you can configure the width for the following:

- Document Name
- Master Text
- Translation Text
- Translation Languages

Tip:

To change the width of the columns, specify pixels or a percentage (of the width of the table). If the label of the column is too big for the width specified, the column width will be bigger to accommodate this.

Edit Render Configuration

Name: Scope Other Doc Ref_Default

Hide Header
 Open Links in new Tab

Type	Details	Label	Visibility	Width	Collapse
Expand Attributes (+)	View: Default <input checked="" type="checkbox"/> Use Creation View for new Documents	+	Read Only	auto	<input checked="" type="checkbox"/>
Up/Down			Read Only	auto	<input checked="" type="checkbox"/>
Translation Text	<input type="checkbox"/> Show Side by Side	Translation Text	Editable	450px	<input checked="" type="checkbox"/>
Text Language flags	Show for: Master Language(s) Display: Show only flags Language Flag Indicators	Text Languages	Editable	100px	<input checked="" type="checkbox"/>
Document Actions	Open 3D View Open in ArtiosCAD Download Add Action		Read Only	auto	<input checked="" type="checkbox"/>
Local/Remote Project	<input checked="" type="checkbox"/> Retain text document status		Read Only	auto	<input checked="" type="checkbox"/>
Delete Button			Read Only	auto	<input checked="" type="checkbox"/>
Document Property	Description	Description	Read Only	auto	<input type="checkbox"/>
Text Language flags	Show for: Translation Language(s) Display: Show flags and languages	Text Languages	Editable	100px	<input type="checkbox"/>

Add Column Revert to default configuration

OK

4. Configure the display of Text Language Flags. You can configure the **Display** as **Show only Flags** or **Show Flags and Languages**.

These flags will be based on the Project Language Attributes.

- In the copy sheet view, all the newly created text documents will have the current Project's *Language attributes* as flags.
- All the sourced content (referenced from other Projects) will have the flags based on the source Project's language attributes.

To add the current project's languages, select them from the available flags.

- You can add or delete flags in this view. Read more in:

5. You can allow the users to move a referenced document into the current project. To set this up, create a column with **Local / Remote** setting. Specify the **visibility** as **editable** or **read-only**. You can move all the referenced documents into the local project by hovering on the **Location** in the header and selecting the option **Copy All References into Current Project**.

You can move any of the referenced document to the local by clicking on the Referenced field of the required document and selecting the option **Copy to Current Project**.

The users need to **Change Properties** and **Add** permissions to move a document to local folder. The document reference will point to the local copies.

The user will be able to specify:

- a new name and description
- document template
- target folder

If the setting is **Read-only**, the user will see indicating remote project.

6. If you are configuring **Local / Remote** button to allow copying of documents, ensure that you have enabled or disabled **Retain text document status**.

When this option is turned off, if you copy to **Local**, the approval status of the Text Document will be reset to **Draft**.

If **Retain text document status** option is turned on, when you copy the document, the document's approval status will be retained as it is.

7. Define adequate permissions to view and edit Text Statements:

Whether or not your user can edit or perform approval actions on a Text Element is determined by the following settings and permissions:

- **Visibility** should be specified as **Editable**.
- If your Text Document Reference is a child of another document (for example an artwork), the **Expand Attributes (+)** column of the Parent document should be configured as **Editable**.
- The user should have appropriate Content Permissions. Read more in: [Managing Text Permissions](#) on page 479.

Tip:

Check these Project level permissions (**Project Details > Security**) to troubleshoot editing problems:

- **Change Properties**
- **Lock/Update**
- **Start/Stop Approval**
- **Upload new version**
- **Change Task**
- **Download**
- **Add**

Note: The Text widgets, related languages and statuses are rendered only for Text Document References.

4.15.10. Setting Up Task Notifications

The biggest aim of Task Management is to make tasks happen at the right time. As with most production processes, packaging production is a complex process with both sequential and parallel operations.

The critical path is the set of dependent operations defining the total duration of the Project. At each moment, only one task is on the critical path and any delay on that task delays the entire Project. Often, people performing critical tasks are not even aware of the critical nature of their work.

Therefore, it is very **important that people get correctly notified** of what they are supposed to do and that they get **notified again if they cause delay** to the Project.

Currently, WebCenter does not calculate critical paths; it leaves it to the Project manager to set good due dates and it notifies people assigned to a task.

WebCenter also automatically sends **overdue notifications to Project managers and assigned Project members** whenever a task is overdue. Overdue means that the task passes its due date without being completed.

This information assumes that the e-mail environment is already set up. Please refer to the WebCenter Installation Guide for detailed instructions.

Set Up Notifications for Tasks

Task management notifications are set up on the same pages as all other notifications.

The Admin sets system-wide default notifications for all projects at once (see "Notifications Preferences" in the Administrator Guide), but you can change those defaults for the projects you manage.

- To set project-specific task notifications, click the **Notifications** tab in your project. Following Notifications can be set up for task related events.
 - Task created
 - Task Assignment changed
 - Task Due Date changed
 - Task Predecessor changed
 - Task Specification changed
 - Task Information changed
 - Task Document(s) changed
 - Task Checklist changed
 - Task Status changed
 - Task started
 - Task completed
 - Task deleted
 - Workflow canceled

For example, you can send notifications to the **Involved People**. For task management notifications, the involved people are typically the task creator and the task assignee.

Tip: On the notification setting page, click **Involved People** for more information about the involved people for each kind of notification.

4.15.11. Tasks, Templates and Copying Tasks

- When saving a project to a Template, you also save its tasks to this Template. When creating a new project from this Template, you'll automatically have these tasks in your new project.
- You can also create a project as a (partial) copy of an existing project. After clicking **Create New Project**, click **Copy setup from an Existing Project** (see [Create a Project Based on Another Project](#) on page 767). There you have the option to copy the tasks.

- A third way to quickly create a task from existing tasks is to create a task as a copy of another task.

Copy a Task from Another Task

Note: You can only copy from other tasks in the same project.

1. Go into the task details of the task you want to copy and click **Copy Task** on the right of the screen.
2. Choose if you want to:
 - **Copy Specifications,**
 - **Copy Documents.**
 ... into the new task.
3. Enter the new task's **Name** and an optional **Description**.
4. Change the due date as desired.
5. Assign it to the project member of your choice.
6. Click **Finish**.

4.15.12. Example: Assign a Role using a Task

Use this to allow non-Project Managers to invite people, assign tasks or approvals to users or groups via a task.

For example, use this if you want Marketing Managers or customers to invite an agency without getting to project management details.

You will need your Administrator's help for this (steps 1 to 3).

1. As an Administrator, create a **Restricted Set** containing the people or groups that will be used to assign the role in the task.
 - Use the **Text Type**.
 - For groups, use the exact group names.
 - For users, use this format: `Lastname, Firstname (username)`. Make sure this is spelled correctly, especially the `(username)`!

See the Administration Guide for details.

2. Create a **Specification** (from the **Task Types > Specifications** menu) with the same name as the role and add the **Restricted Set** you just created.
3. Create a **Task Type** that allows assigning roles with your restricted set values.

Note: You can do this part yourself if you have the **User Can Create Task Type** permission. It is possible to assign multiple users/groups to the same role in case you use the option **Allow Multiple Values** for your specification.

In the **Select available specifications** screen of the **Create New Task Type** wizard:

- a) Select **Assign roles from task specifications**.

- b) Add the **Specification** you just created.
- 4. As a Project Manager, create a task from the task type your Administrator created.
Assign it to the person who needs to take the decision (who to assign the role to).
For example, assign it to the Marketing Manager to have him / her choose a design agency for this project.
- 5. When you run the project, the assignee will get the task on his / her **My Work** page and will assign the role with the appropriate user or group.

4.15.13. Task Reporting

WebCenter has a number of areas where you can see progress of tasks and sets of tasks. The most obvious one is the tasks overview within the project. Here you can rapidly see how the project is doing and which tasks are in trouble.

You can also create reports that encompass multiple projects. The way to do this is through the **task searching combined with saved Global Searches**.

A typical task search for a follow-up report

Search for Tasks

Fill in one or more fields. Prefer less fields? Try [Keyword Search](#).

	Search Results Options				
	View(List)	Column Order	Sort	Order	
<input type="checkbox"/> Use Advanced Search Characters ?					Search
<input type="checkbox"/> Search Panel Design <input type="checkbox"/> Enable SmartNames ?					Clear this Form
Task Name <input type="text"/>	<input checked="" type="checkbox"/>	1	<input checked="" type="checkbox"/>	1 ▲	Save this Search
Task Description <input type="text"/>	<input type="checkbox"/>		<input type="checkbox"/>		Show Result Layout Options
Task Type Name <input type="text"/>	<input type="checkbox"/>		<input type="checkbox"/>		
Task Type Description <input type="text"/>	<input type="checkbox"/>		<input type="checkbox"/>		
Task Status <input type="text" value="Not Completed"/>	<input checked="" type="checkbox"/>	2	<input type="checkbox"/>		
Start Date <input type="text"/>	<input checked="" type="checkbox"/>	3	<input type="checkbox"/>		
Due Date <input type="text" value="this month"/>	<input checked="" type="checkbox"/>	4	<input type="checkbox"/>		
Completed <input type="text"/>	<input type="checkbox"/>		<input type="checkbox"/>		
Estimated Date <input type="text"/>	<input type="checkbox"/>		<input type="checkbox"/>		
Modified <input type="text"/>	<input type="checkbox"/>		<input type="checkbox"/>		
Created by <input type="text"/>	<input type="checkbox"/>		<input type="checkbox"/>		
Assigned to <input type="text" value="User"/>	<input checked="" type="checkbox"/>	5	<input type="checkbox"/>		
Assignee's Location <input type="text"/>	<input type="checkbox"/>		<input type="checkbox"/>		
Specifications... <input type="text"/>					
Task Documents <input type="text"/>	<input type="checkbox"/>		<input type="checkbox"/>		

The search pictured here shows all tasks in projects I have access to that need some follow-up. Completed tasks are excluded and also tasks in non-active projects are not interesting. Tasks with due dates far in the future or a long time ago are also excluded.

The result will show a set of tasks with their due dates. Those overdue will be shown in red and you can rapidly click-through to these tasks and take action.

Step into Workflow

View a Sub Workflow from the Workflow Node

Workflow nodes are sometimes linked to a sub workflow. Viewing a sub workflow from the workflow is simple. Right-click the node and the sub workflow opens up. With the browser backward or forward buttons, navigate in and out of the sub workflow.

4.15.14. Workflows

What is a Workflow

A Workflow associated with a task enables you to automate actions and events in WebCenter, reducing the number of human interventions during the project. Use these workflows to execute complex business processes in an automated way. You can create smart workflows by using SmartNames, subworkflows, routing and integration steps.

You can use Workflows in:

- task creation and assignment
- approvals
- communication to and from Automation Engine
- project creation
- setting the project status
- content management: translation
- ...

It uses attributes to decide what happens next (for example, who needs to approve a document, perform a task or manage a project). This reduces the number of templates required and also makes it possible to run many tasks in parallel.

Note:

To enable the workflow feature you need the following license module (depending on the License model):

- the **WebCenter Task Management Advanced** module in the **Named User License** model
- the **WebCenter Lifecycle Management** module in the **Concurrent User License** model

Workflow Basics

Workflow is attached to a Task Type

The workflows are attached to the Task types. Task types are templates for tasks which can be added into projects.

You can create:

- **Manual** Task types where human intervention is necessary. Read more in [Task Types](#) on page 822.
- **Workflow** Task types where you attach a workflow to perform the automated action sequence.

Workflow Editor

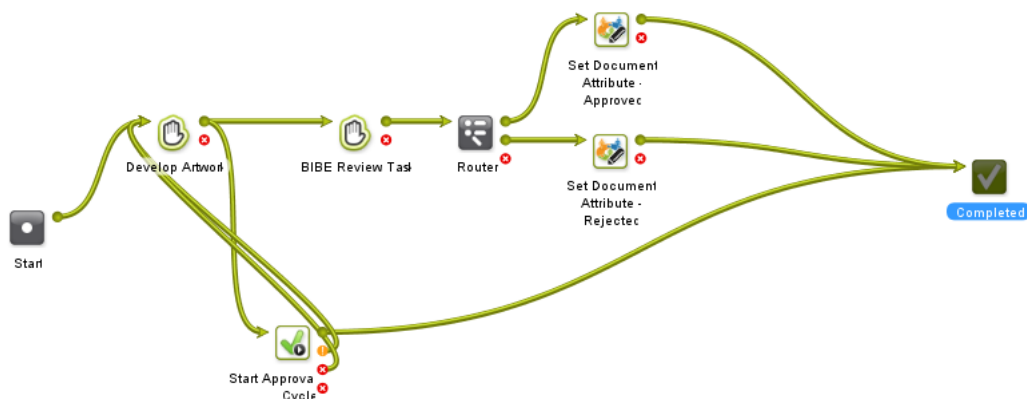

WebCenter has HTML 5 based Editor for workflow.

Workflow Step / Node

A step in a workflow is a **Task** which is configured to:

- perform an action on an input file to produce an output file.
- manage files such as selecting or copying a document using an **Auto Task**
- decide the flow (**Router**) of the workflow or decide about other administrative decisions in the workflow such as **wait for action** check points.

The actual workflow operations take place in these steps which are sequentially connected to each other via “tubes”.

- A **Transition** is the line that connects each step in the workflow. It is a graphical representation of communication of output file or data being sent as the input for the next step.

- By default, each node / step has an OK and an Error **Output Pins**. If the task ends in the OK state, the output file will be sent to the following step. If it fails, the step connected with the Error output pin will follow.

Note: You can have more output pins depending on the possible outcomes.

- Workflow constructs can do administrative actions on the workflow, such as in the case of **Router**.

Documents in the Workflow

There are a few ways to attach input documents to a workflow.

- You can upload them to the project where the Workflow task is added to. In this case, these are inputs for the **Start** node.
- You can use a [Select Document node](#) to pick up documents.
- You can have manual **Tasks** (conventional in the workflow. For example, when a designer creates and uploads an artwork.

Workflow Tokens

Documents and operations processed by the workflow are represented by tokens  traveling through it. The number indicates the number of tokens. The position of a token indicates what is currently happening (which node is being executed). A red token  indicates an error.

Using a Router node, you can split a token (and its documents) into multiple tokens based on certain parameters which will follow their own path through the workflow network. After certain workflow tasks, you can use a Data collector to aggregate these into a single token again. Read more in: [Data Splitter and Data Collector](#) on page 942.

- You can view the Token information while a workflow is in progress. The route that the Token has taken is highlighted.
- **Open in Viewer** is enabled when you right click some of these tokens
- You can **Retry** (in case of error) or **Relaunch** (in case the workflow is stopped or cancelled) a workflow when you right click on a token.

Workflow Feedback in Project Details

You can view a workflow's feedback from **Project > Tasks** page. To open the workflow feedback page either:

- hover over the task name and click the **Workflow**  icon.

Tip: You can use the **Edit** button to edit the Task Information.

- or click the **Show Active Nodes**  and **Expand** the mini Feedback view.

SmartNames

Certain parameters of the workflow nodes are SmartName enabled. This is a variable that will be resolved only when the node is executed. When the value is resolved (for example, an attribute value is found), this will be used as the value during the execution of the node. Click the SmartName + button in an input field to use this feature.

Building Workflows

Create a Workflow from a Task Type

Creating and Starting a Workflow

To create a Workflow, you need to:

1. [Create a new Task Type](#) or use an existing Task Type.

Note: Task types can only be created by Project Managers with the **User Can Create Task Type** permission, or by Admins.

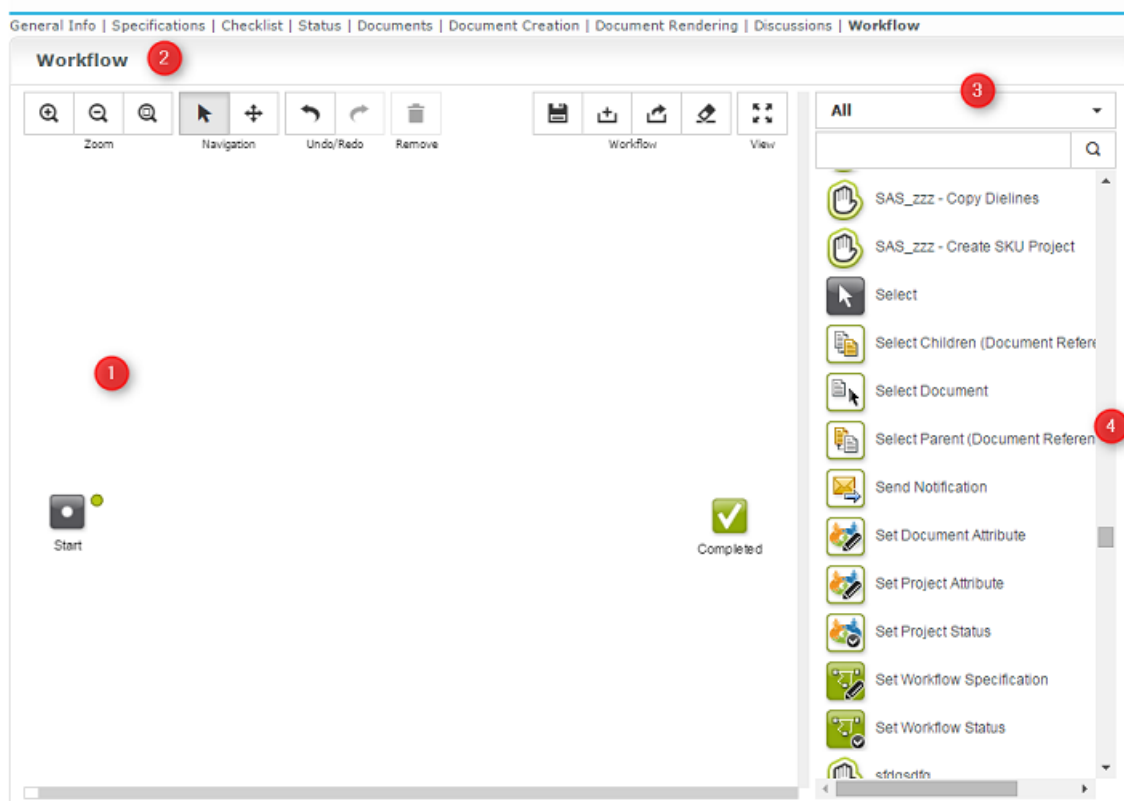

2. In that Task Type, [open the workflow tab](#) and [create a Workflow by combining workflow nodes](#). To start the workflow, make the task status active, such as **in progress**.

The Workflow Editor

To open the Workflow Editor, go to **Task Types** in the menu and:

- Hover over the Task Type Workflow  where you want to create a Workflow and click the Task Type icon. You can also create Workflows from the  Manual Tasks directly from the list.
- Or click the required Task Type. Go to the **Workflow** tab to access the editor.

The workflow editor appears as below. By default, it contains a **Start** node and a **Completed** node. A **node** or **step** represents an individual operation performed in the sequence of a workflow.

1	<p>The workflow canvas in the edit mode. By default, this only contains a Start node and a Completed node.</p> <p>After the workflow has processed its files, you will see this canvas in the feedback mode. In this mode, you can monitor your workflow or examine a finished workflow.</p>
2	<p>The Workflow editor <i>tool bar</i>. Use it to:</p> <ul style="list-style-type: none"> • Zoom in, Zoom out or Zoom to fit • Maximize the canvas in your browser window (and minimize it again), • Delete the selected items
3	<ul style="list-style-type: none"> • Use the filter to select certain workflow node types (see Workflow Node Types). Using this you can choose to display All or only: <ul style="list-style-type: none"> • Auto Tasks • Statuses • Task Types • Workflow Constructs

	<ul style="list-style-type: none"> Use the search field to search on node names. The search field accepts wildcards.
4	The Task pane shows all the Auto Tasks, Statuses and workflow constructs that you can use in a workflow. Drag and drop them onto the canvas. You can easily find tasks by using the filter and the search field.

Read more in: [The Workflow Tools](#) on page 876

The Workflow Tools

Table: Zoom Tools

Table: Other Tools

Use this Tool or Shortcut...	To...
 or CTRL + Z	Undo your actions on the <i>Canvas</i>
 or CTRL + Y or CTRL + Shift + Z	Redo your actions
 or Delete or Backspace	To remove a Node. Select the Node or Transition and click Remove . To remove a Transition, select the arrow-head and drag it away.

Use this Tool or Shortcut...	To...
	Note: You cannot delete the Start Node .
Context Menu	Right-Click to access the The Context Menu tools

Tip: Use **CTRL + click** or click and drag to select multiple steps.

Table: Workflow Tools and View Tool

Use this Tool or Shortcut...	To...
 or CTRL + S	Save all changes made to the Workflow
	Import Workflow from an XML file. The import will overwrite the current workflow.
	Export Workflow and save it as an XML file on your computer. It can be used later to Import the workflow to the same or another system
 Clear Workflow	Click Clear Workflow to clear an existing workflow from a Task Type. This will make it a Manual Task Type.
 or	To View the Workflow in Full Screen or Minimize the canvas in your browser window.
Tip: Use Esc to exit full screen.	

Node Gallery

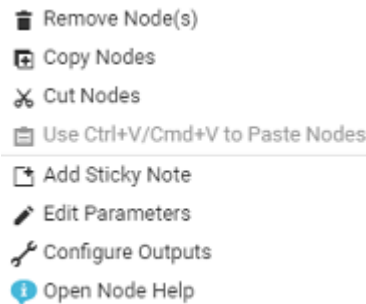

It contains all Task Types and Workflow Constructs required to build a workflow. Select using the below filter options:

The Filters...	and what they mean
All	Nodes from all categories
Auto Tasks	Tasks executed without human intervention
Statuses	Task status for the current workflow task type
Task Types	Manual, Auto Tasks and Workflow Task Types
Workflow Constructs	Building blocks for the workflow used for Routing and Token management. Read more in: Workflow Constructs on page 941

The Context Menu

Right-click anywhere on the Canvas or on a Node and access the context-sensitive menu.

Context Menu Actions on a Workflow Node/Canvas

See the details and keyboard shortcuts below:

To...	Select this from the Context Menu..	Or use these Shortcut Keys..
Remove Nodes	Remove Nodes(s)	Delete Backspace
Copy Nodes	Copy Nodes	CTRL + C (Windows) or CMD + C (Mac)
Cut Nodes	Cut Nodes	CTRL + X (Windows) or CMD + X (Mac)
Paste Nodes		CTRL + V (Windows) CMD + V (Mac). Paste Nodes can be done only by shortcut keys.
Add Sticky Notes on the Canvas	Add Sticky Note	Read more.
Edit Parameters of a Node	Select a node, right-click and select Edit Parameters	
Configure Outputs of a Node	Select a node, right-click and select Configure Outputs	
Open Help on Canvas and Tools	Click Open Editor Help to view workflow editor help page. Right-click on a Node and select Node Help to get help on a specific Node.	
Open a specific Help page about a Node	Click Open Node Help to view details of working with each Node type.	

To create a Sticky Note:

- Select **Add Sticky Note** from the Context Menu.

- Click the body or the **Edit Sticky Note** icon in the top-left corner to edit the sticky note
- Type your text and Save using the **Save Sticky Note** . To edit a Note, just click on it.
- To **Remove Sticky Note**, use .
- To resize the **Sticky Note**, drag the resize icon at the bottom-right of the **Sticky Note**
- To move the Note, click and drag to anywhere in the Canvas.

Create a Workflow

You can create a workflow from the [Workflow Editor](#) of any Task Type.

1. Click on the **Task Types** from the top menu items.
2. To open the editor:
 - Hover over the Task Type Workflow  where you want to create a Workflow and click the Task Type icon.
 - Or click the required Task Type. Go to the **Workflow** tab to access the editor.

You will get a blank canvas containing only the **Start** and **Completed** nodes.

3. Drag and drop your chosen nodes from the workflow nodes list onto the canvas.

You can add nodes to create a workflow. There are four types of nodes:

- [Auto Tasks](#) on page 884
- [Manual Task Types](#)
- [Workflow Constructs](#) on page 941
- [Statuses](#) on page 957

See [Workflow Auto Tasks and Constructs](#) on page 880 for more information about nodes.

Tip:

- To find a node quickly, you can either use the filter or the search field on top of the workflow nodes list.
- To delete a node, right-click and select **Delete**.

4. If desired, click your node names to rename them.
5. Connect your nodes with one another.

To do this, click a node's green **pin** and drag it onto the next node. This links the two nodes with a green **transition** or tube.

Note:

- You can connect a node's output to several other nodes.
- To remove a connecting tube, drag its arrow head to a blank area on the canvas.

Warning:

It is not possible to self-reference a node. Self-referencing happens when the error pin is connected again to the input pin of the same node. This will result in an error when you start the workflow.

The screenshot shows the 'Workflow Editor Tools' toolbar with icons for Zoom, Navigation, Undo/Redo, Remove, Workflow, and View. Below the toolbar, a workflow diagram is shown with nodes: 'Start', 'Transition tube connecting two Nodes', 'Create Project', 'Select Document', and 'Start Approval Cycle'. A red text overlay reads 'Transition tube connecting two Nodes'. On the right, a list of workflow tasks is visible, including 'Artwork Approval', 'Drupa Approve in Viewer', 'Drupa Draft and Approve in Viewer', 'JORE-Assign Approvers', 'LABO Approval Task', 'PCM Approve Master', 'PCM Draft and Approve Master', 'PCM Draft and Approve Master form', and 'PDL - Customer Review and Approve Quote'. A search filter 'appr' is applied to the list.

6. Double-click each node and fill in its parameters in the **Edit Parameters** pop-up.
7. When you are done, click the **Save** button to save your workflow.

Workflow Nodes

Workflow Auto Tasks and Constructs

Nodes	Description
Add to Bill of Materials	Adds the incoming document(s) to the current project's Bill of materials.

Nodes	Description
Assign Document Attribute Category	Allows you to assign an Attribute Category to your documents in a workflow step.
Completed	The workflow completes when all operations for a workflow have finished.
Copy/Move Document	Copies and moves the incoming document(s) to the given project/folder and optionally renames it.
Create Project	<p>This node allows you to create or update projects from your workflow. You can also iterate the project creation to create multiple projects at once. For example, using a multivalued attribute.</p> <p>Note: This node is only available if you have the WebCenter Advanced license.</p>
Copy Document Attributes Values	This node allows to copy all non-empty document attribute values including document references from a source document to one or many target documents.
Export to GS1 Format on page 899	This node exports your text content along with its Element Type tagging.
Export to XLIFF Format	This node exports your Text statements to be translated into a XLIFF file.
Import XLIFF Content	This node imports your translated Text statements in XLIFF format.
Import Dynamic Content	It extracts the Dynamic Content from your artwork(s) as Text Content Documents . You can configure this node to import these Text Documents with a link to specific document reference attributes and document templates .
Import Dynamic Table on page 515	This node extracts the Tables from your artwork(s) as Table Content Documents . You can configure this node to import these Documents with a link to specific document reference attributes and table document templates .
Import Dynamic Graphic on page 901	When this node is executed, images or symbols are extracted from an incoming artwork file and are added to the artwork file as document references.
Import Dynamic Barcode on page 902	When the node is executed, Dynamic Barcodes are extracted from an incoming artwork file. For each Dynamic Barcode, a new document is created and these Barcode documents are added as Document References in the Artwork.

Nodes	Description
Select Document	Selects a document based on the folder, project name and name of the document.
Select Children (Document Reference)	Selects the document references associated with an incoming document.
Select Parent (Document Reference)	Selects the master documents of the incoming document references .
Send Notification	<p>You can send automatic notifications to Project Manager, Sales Person, Workflow Master, Groups, Users, Roles. Here Workflow Master is the assignee of the workflow task.</p> <p>See Send Notification for more information.</p>
Set Document Attribute	Sets the value of one or more document attribute(s) automatically.
Set Project Attribute	Sets the value of one or more project attribute(s) automatically.
Set Project Status	Automatically changes the status of the current project.
Set Workflow Specification	Automatically sets the value of one or more specification(s) for the current workflow.
Set Workflow Status	Automatically sets the status of the current workflow to a new status.
Start Approval Cycle	Starts an approval cycle on a document and waits for its approval status.
Start Approval Stage on page 918	This node starts an approval stage in a workflow and build a staged approval.
Finish Approval Cycle on page 919	This node finishes the approval cycle of the incoming documents and send e-mail notifications.
Submit Workflow	Launches an Automation Engine workflow that is configured in WebCenter.
Sync Workflow	Synchronizes the project with the configured workflow are taken from the project/template setup.
Wait	The workflow waits/pauses for a specified amount of time.

Nodes	Description
<p>Data Splitter and Data Collector</p>	<p>If you have two or more documents with two different tasks assigned to each of them, then use the Data Splitter node. This node will put each document separately on this tube after which these follow their own path.</p> <p>Once the tasks are completed the Data Collector will wait until both tasks are completed and then proceed to next node.</p> <p>See Workflow Example on page 957 for more information.</p>
<p>Error Handler</p>	<p>Use this to collect failed tokens when other nodes go into failure (make sure the other nodes' error dots are not connected to anything).</p>
<p>Fork and Join on page 944</p>	<p>The Fork step automatically tags</p> <ul style="list-style-type: none"> • every file running through it • and all the files that those files are related to in the next steps <p>The Join step then groups all the files with the same tag and outputs it together.</p>
<p>Mark and Select</p>	<p>The Mark node marks the documents arriving to the node with a named tag. For example, main design, original data or admin data.</p> <p>Later, the Select node can pick up the same documents based on this named tag and then route it through the outgoing tube.</p>
<p>Router</p>	<p>Use the Router to build a rule list to meet a result, these rules are evaluated from top to down. The rules can be based on:</p> <ul style="list-style-type: none"> • Project Properties • Project Status • Project Attribute • Document Name • Document Attribute • Workflow Specification <p>See Workflow Example on page 957 for more information.</p>

Nodes	Description
<i>Stop</i>	Use the Stop node to stop the workflow before being completed. When a workflow token arrives at this step, it stops the workflow.

Auto Tasks

An Auto Task is a step in the node which does not demand human intervention. Auto tasks are automatically executed using predefined parameters (the attribute values or SmartNames).

Add to Bill of Materials

Use this node to add documents to the current Project's Bill of Materials automatically.

Parameters

Count: Set the documents' **Count** in the Bill of Materials.

Tip: You can use a SmartName (for example a document or project attribute) to set the count.

Copy/Move Document

Use this node to copy or move one or more document(s) to a new location.

Parameters

Double click a **Copy/Move Document** node to set up these parameters in its dialog box.

- **Copy:** select this if you want to copy a document to a new location, while keeping it in the original location. You can choose to:
 - **Link** the new document to the original document,
 - Create a **New version if the document already exists** in the new location.
 - **New revision if Document already exists:** enable this to raise the revision while copying or updating. This will raise the revision letter (and create a new version) if the document already exists.

Note:

The option is visible only if your **Admin > Preferences > General > Allow increment Document Revision when uploading a new Document Version** is on.

- **Copy Viewer Annotations:** use this option to copy annotations of a document to a new one.
- **Update Document References** to remove a current document and add a new document to the document reference. A new version/revision of a document is now created in the target project and added in the document reference attribute.

- **Keep Text Content Element Status** to retain each Text Content element approval status when the document is copied as new version. (by default each element approval status is moved to draft state).

Note: You can retain the language content approval status only when the Packaging Content Management Licence is enabled.

Note: You can choose to either copy the comments or can be cleared based on the option chosen by the Admin user in the preference settings for Packaging Content Management. You can read more on the option at [Copy comments from a text document](#) on page 99

- **Move:** select this if you want to move a document to a new location (removing it from the original location).

Project Name: Enter the name of the Project into which you want to copy/move the document.

Folder: Enter the name of the Project's folder into which you want to copy/move the document.

Name: Enter the name to give the document in the new location if desired.

Tip: You can use SmartNames for the **Project Name, Folder and Name** parameters.

These Copy/Move action have below results:

- When Moving, all document versions move along, including all the related features like approval, history, attributes...
- When Copying, only the latest version is copied along with its view data, attribute... and the Approvals reset.
- For each document, a line is added to the Project History stating that the document is deleted/moved from the source project and added to the target project.

Note: The node fails if the target project/folder does not exist.

Copy Document Attribute Values

You can use **Copy Document Attribute Values** node to copy all non-empty document attribute values including document references from a source document to one or many target documents.

Set up the Parameters as below:

- **General**

In the **Source Document tag** drop down, choose the source document. This tag is to identify the source document from where document attribute values need to be copied from.

Select **Only select tagged source Document from the incoming Documents** field to look up the source document from the incoming documents instead of selecting all documents with the given source document tag in the workflow. This allows bulk tagging of documents earlier in the workflow, but when a set of documents reaches this node, the only **Source Document** that is selected from the list of tagged documents is the one that is part of the documents of the incoming token.

- **Document Reference**

You can use this tab to copy all the document references and other attribute values to the matching attributes. When the same reference attributes are not available in the target document, then document references are copied in the reference attribute chosen in **Copy all unmatched Document Reference to**.

From 18.0.1 WebCenter, select **Only copy if Reference Properties match target Document Attributes** option to decide whether the document references are to be filtered based on reference properties or not.

When document references are copied from a source document, existing document references in the target documents are removed. Basic attribute's values are copied when matching attribute is found.

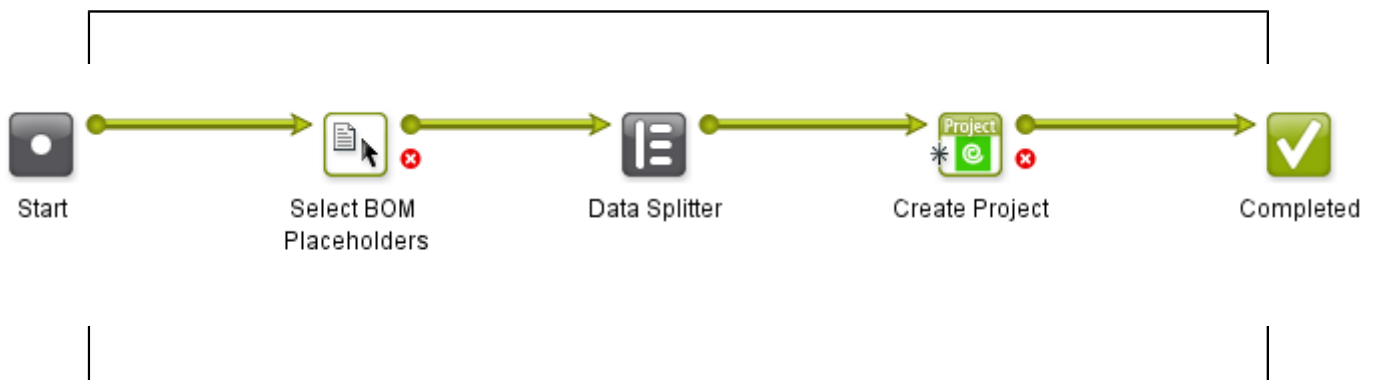

Create Project

This node allows you to create or update projects from your **workflow**. You can also iterate the project creation to create multiple projects at once. For example, using a multivalued attribute.

Note: This node is only available if you have the WebCenter Advanced license.

Using this node, you can:

- create or update projects either in the current WebCenter or another WebCenter.
- create *Child Projects* in a Program.
- copy the existing project documents to the new project.
- iterate over an attribute to create multiple projects.
- specify project attributes.

Project Tab

Parameters for creating the project (all smart name enabled):

- **Project Name** is the name of the new project. If not specified, auto-naming is checked in the template or in the **admin > general > preferences** settings.

Note:

If the field is left empty without auto-naming in the Project Template, you will receive an error message :

```
One or more mandatory parameters were not specified
```

- **Update Project if it already exists, otherwise create a new Project:** Check this option to update a **project** with the specified name if it already exists.

If it is not checked, a new project will be created. If a project with the specified name already exists, it will result in an error. For copying documents, there is an option to be copied as new versions.

Project Name Suffix is required when you are using auto-naming with a **Suffix** field as **Edit**.

- **Add as Child Project of the Current Project:** Check this box to create Child Projects in a Program. Use this to create Projects as part of a Program. This option is turned off by default.
- **Template:** The project template on which the new project should be based on. If left empty, a blank project will be created.
- **Project Description:** The description of the new project.
- **Project Status:** The initial status of the new project. This list follows the order of the project statuses as defined in WebCenter and by default, the **Active** status is selected automatically. You can also select **Blank** as an option.

When a new project is created, the first active status is assigned whereas while updating existing project, the project status is left unchanged. You can configure SmartNames to indicate this initial status to make it context relevant.

- **Customer/Company:** The legal name of the company/customer. By default, it will be the customer/company of the current project.
- **Location:** The customer/company location. By default, it will be the location of the current project.
- **Project Due Date:** The due date of the new project. By default, it will be the due date of the current project.
- **Project Manager:** The project manager of the new project. By default, the node takes the current project manager.
- Use **SmartNames** to choose a Group, Role, User as the Project Manager of the new Project and an attribute (document / project / task) to automate the setup of the node. You may also manually specify these parameters.

- When a SmartName for Project Manager is not resolved (for example, you choose an attribute (with Group or User as value) and it cannot be resolved because you forgot to add the attribute to the project's attribute category), an error

```
Project manager not found.
```

is shown.

- If you choose a role to assign the Project Manager, the current project is checked for the assignment of that role. A unique User or Group should be assigned to that role. If more than one group / user is assigned to then, you will receive a warning.

- If you assign a Group, at least one of the group members should be a Project Manager.
- If you assign a User, the user should be a Project Manager.
- If you choose an attribute to assign the Project Manager, the attribute should resolve to the user name of a user or the name of a group.

Documents Tab

In this tab, you can set options to copy the incoming documents to the project or projects being created.

The screenshot shows a 'Create Project' dialog box with the following elements:

- Title Bar:** 'Create Project' with a close button (X).
- Tabs:** 'Project', 'Documents' (selected), 'Iterate', 'Project Attributes', 'WebCenter'.
- Section Header:** 'Copy/Move/No Copy or Move'.
- Radio Buttons:**
 - Copy incoming Documents
 - Move incoming Documents
 - Do not copy or move incoming Documents
- Text Field:** 'Target Folder Name' with the value 'Products' and a green '[]' button.
- Footer:** An information icon (i) on the left, and 'Cancel' and 'OK' buttons on the right.

- **Copy Documents** (default): lets you copy the documents to the new project.
- **Folder Name:** specify the target folder in this field. If you leave it empty, it will take the root folder as the target folder.
- **Copy incoming documents as Link:** enable this to copy the documents as links in the new project.

Note: If you are creating projects in a remote WebCenter, you cannot copy the documents as links.

- **Copy incoming documents as new version if they already exist:** check this to copy the documents as new versions.

- **Raise revision if Document already exists:** enable this to raise the revision while copying or updating. This will raise the revision letter (and create a new version) if the document already exists.

Note:

The option is visible only if your **Admin > Preferences > General > Allow increment Document Revision when uploading a new Document Version** is on.

- **Copy Viewer Annotations:** use this option to copy viewer annotations of documents while copying.

Note: This will not work if you are copying to a remote WebCenter.

- **Move Documents:** choose this to move the documents to the newly created Project. You can specify a folder for this document.

Note: It does not work for remote WebCenter projects.

- **Do Not Copy Documents:** choose this option if you do not want to copy the documents to the new project.

Iterate Tab

You can create multiple projects at once using the options in this tab. The default option is **Do not Iterate**.

To create multiple projects over an attribute, choose **Iterate over Attribute**.

You can select this **attribute** via a SmartName or by manually typing in the attribute. Based on the resolved value of this **attribute**, this node will create multiple projects. For example,

- If the SmartNames resolves to a multi-value (text) attribute indicating languages, the created projects will be language variants. You will get the same result when you type in the attribute values.

For example, if you type in `Dutch | French | English`, the iterator value will be "Dutch", "French" and "English". As a result of running the task in a Project, you can expect three new Projects corresponding to each language.

Note: While iterating project creation, you can send only the related attributes to the created projects by specifying them `iterator value` as the attribute in the **Project Attributes** tab.

- When multiple documents with a multi-value document attribute (for example, `Dutch | Spanish | English` as the Iterator) arrive at this step:
 - In case there are two values for the attribute (e.g. `Dutch` and `English`), this document will be attached to both the `Dutch` and `English` projects.

- If the documents' attribute value is left empty, they will not be added to any of the projects created.
- The documents without the specified **attribute** will be attached to all the created projects.
- If the SmartName resolves to an integer or if you type an integer (for example, you type 3), the projects will be created based on these numbers.
For example, if the value resolves to 3, the iterator value will be 1, 2 and 3. You will get three new projects when the task is finished.

Note:

If the attribute is missing in the Project, you will get an error.

```
Attribute not found
```

Important:

- Do not aim to create more than a hundred projects using the **Create Project Node** . You will be warned if you do so.

```
Maximum number of projects that can be created at once exceeded.
```

Tip: You can use the **Iterator Value** SmartName from the **Iteration** category in the other node parameters such as the Project Name or description.

Project Attributes Tab

For setting project attributes of the new projects, click on the +. Add the

- **project attribute** and the corresponding **value**. Enter this value via a SmartName or by manually typing in.

Note: The attribute values are set regardless the Attribute Category of the new project.

Note: If the SmartNames are not resolved, it will not fail project creation. However, the attribute value will not be set in the new project.

- You may also assign **roles** via attributes.

WebCenter Tab

In this tab, define the WebCenter on which you want the new project :

- **Current WebCenter**(default): Use this to create the new projects on the WebCenter where the workflow is running.
- **Other WebCenter:** Use this to create the new projects on a remote WebCenter. For this to work, the parameters specified in the node (for example, the Project Manager) should be present on the remote WebCenter.
 - **WebCenter URL:** The URL of the remote WebCenter.
 - **WebCenter User Name:** The user name used to log in to the remote WebCenter

- **WebCenter Password:** The password used to log in to the remote WebCenter for the specified user name.

Note: If a user exports a task type containing a node with this option, this field will be blank in the generated XML.

Note: You may copy the documents remotely, but you cannot add them as links.

For every project created, you will find a log in the **Project History**.

Create Graphics Placeholders

You can use this node to create graphics placeholders to represent print area information available in the Collada document, referenced in the input document attribute called CAD_REFERENCE. Any user with Task Type creating rights can use this node to create graphics placeholders. Placeholders can be replaced with actual printable parts later.

These graphics placeholders are created to represent print areas available in the Collada document. Name of these graphic placeholders will be created with print area id and the side of the print area, like for example "printarea1_front".

Based on the node configuration, each print area is extracted once for the printable side front or twice for the printable side front and back.

Note: When the input document is a component document, then the Thumbnail is updated.

Parameters

- **Template Project:** This is a smart name input field to get project name(s) where document template is available.
- **Document Template:** This is to get document name available in the mentioned **Template project**. This document is copied for creating placeholders documents for each print area available in Collada document. Template document is having hard coded document type of an attribute called CAD_REFERENCE. This attribute will reference Collada document from where print area information is extracted. Two hard coded reference properties namely CAD_PRINTABLE_PART and CAD_PRINTABLE_PART_SIDE are expected to be in the CAD_REFERENCE attribute to hold the print area id and value of front/back.
- **Target Folder:** Name of the folder where new graphic placeholder documents are created.
- **Target Reference Attribute:** Select any one document reference attribute from the drop down to attach graphic placeholder documents as reference in the incoming document. Selected document reference attribute is expected to have one reference property called CAD_PRINTABLE_PART, to hold the name of the print area.
- **Extract printable part for front and back:** An option is provided to decide whether printable parts are expected for printable side front and back both or only for printable

side front. Placeholder for back side is only created if the print area information contains printable part for back and this option is enabled.

Execute JavaScript

Use **Execute JavaScript** step to write and execute JavaScript code in a workflow. To access the JavaScript editor, double-click the node.

You can use the WebCenter JavaScript API by using the API object. For example, `API.getProject()` returns a project object representing the current Project.

Use **CTRL+Space** to enable auto-completion in the node. You will get pop-up with all possible options related to the typed syntax.

If you type `API` and enter **CTRL+Space**, a popup will list all possible methods of API (in this case 'getProject').

If you type `API.getProject().` and enter **CTRL+Space**, you will see a list of all possible functions of a project.

Note:

- The auto completion does not list options if you nest multiple functions: for example, if you type in `API.getProject().getChildProjects()[0].setName(API.getProject().)`; and enter **CTRL+Space** you will not get a list of options.
- By default, a script can be of maximum 100.000 characters.

See also: [WebCenter JavaScript API](#) on page 893.

The screenshot displays a case where the workflow calculates if a Parent Project (Program) is at Risk. In this case, it updates the Parent Project's status to "At Risk" if more than 50 percent of the Child Projects are at risk.

```

1  var project = API.getProject();
2
3  var children = project.getChildProjects();
4
5  var count = 0;
6  for(var i = 0; i < children.length; i++) {
7      var child = children[i];
8      var status = child.getStatusName();
9      if (status == "At Risk") {
10         count++;
11     }
12 }
13
14 var percentage = (count/children.length)*100.0;
15 if (percentage > 50) {
16     project.setStatusByName("At Risk");
17 }
    
```

Line 17, Column 2 - 17 Lines, 373/100.000 Characters

Cancel OK

This workflow step executes JavaScript in a sandboxed environment which allows you to execute the java classes of WebCenter API exclusively.

Note: There is a limit of the stack depth (by default, 10,000) to avoid infinite recursions and there is also an instruction count limit (by default, 1,000,000) to avoid infinite loops. The maximum script size is also enforced during execution.

Any JavaScript error puts the token on the error pin with an appropriate error message.

WebCenter JavaScript API

Interface Summary

API This interface describes the JavaScript API.

Attribute This interface describes an attribute value.

Project This interface describes a project.

Specification This interface describes a task specification value.

Task This interface describes a task.

Interface API

This interface describes the JavaScript API.

Methods

getProject

public Project getProject()

Get the current project.

Returns:The object representing the current project.

getTask

public Task getTask()

Get the current project.

Returns:The object representing the current workflow task.

Throws: UnsupportedOperationException - If this method is called outside an Execute JavaScript workflow node

Interface Attribute

This interface describes an attribute value.

Methods

getName

public String getName()

Get the name of the attribute.

getValue

public String getValue()

Get the value of the attribute.

Returns:The value of the attribute as String. These are the name(s) of the referenced document(s) for document reference attributes.

setValue

public void setValue(String newValue)

Set a new value for the attribute.

Parameters:newValue - The new (String) value for the attribute.

Interface Project

This interface describes a project.

Methods

getAttribute

public Attribute getAttribute(String attributeName)

Get the project attribute (value) with the given name.

Parameters: attributeName - The name of the attribute.

Returns: An attribute object for the attribute value of the attribute with the given name or null if the attribute does not exist for this project.

Throws: IllegalArgumentException - If the provided attribute name is null.

getAttributeCategoryName

public String getAttributeCategoryName()

Get the name of the attribute category of this project.

Returns:

The name of the attribute category of this project or an empty String if there is no project attribute category.

getAttributes

```
public Attribute[] getAttributes()
```

Get an array of all attributes of the project.

Returns: An array with attribute objects representing the attributes of this project.

getChildProjects

```
public Project[] getChildProjects()
```

Get an array of all child projects.

Returns: An array with project objects which are child projects of this project.

getDescription

```
public String getDescription()
```

Get the description of the project.

Returns:The description of the project.

getDueDate

```
public long getDueDate()
```

Get the due date of the project.

Returns: The due date of the project as a long representing the number of milliseconds since January 1, 1970, 00:00:00 GMT.

getName

```
public String getName()
```

Get the name of the project.

Returns: The name of the project.

getParentProjects

```
public Project[] getParentProjects()
```

Get an array of all parent projects.

Returns:An array with project objects which are parent projects of this project.

getStatusName

```
public String getStatusName()
```

Get the project status name.

Returns:The name of the project status.

getTasks

```
public Task[] getTasks()
```

Get an array of all the tasks of this project.

Returns: An array with task objects representing the tasks of this project.

setDescription

```
public void setDescription(String newDescription)
```

Set the description of the project.

Parameters: newDescription - The new description of the project.

Throws: IllegalArgumentException - If the provided project description is null

setDueDate

public void setDueDate(long newDueDate)

Set the new due date of the project.

Parameters: newDueDate - The new due date for the project as a long representing the number of

milliseconds since January 1, 1970, 00:00:00 GMT.

Throws: UnsupportedOperationException - If the project due date is linked to an attribute.

setName

public void setName(String newName)

Set the name of the project.

Parameters: newName - The new name of the project.

Throws: IllegalArgumentException - If the provided project name is null

setStatusByName

public void setStatusByName(String newProjectStatusName)

Set a new project status by name.

Parameters: newProjectStatusName - The new project status name. This is case insensitive.

Throws: IllegalArgumentException - If the provided project status name is null or if the status cannot be found in the system

Interface Specification

This interface describes a task specification value.

Methods

getName

public String getName()

Get the name of the specification.

getValue

public String getValue()

Get the value of the specification.

Returns: The value of the specification as String. These are the name(s) of the referenced document(s) for document reference specifications.

setValue

public void setValue(String newValue)

Set a new value for the specification.

Parameters: newValue - The new (String) value for the specification.

Interface Task

This interface describes a task.

Methods

getDueDate

```
public long getDueDate()
```

Get the due date of the task.

Returns: The due date of the task as a long representing the number of milliseconds since January 1, 1970, 00:00:00 GMT.

getLeadTime

```
public long getLeadTime()
```

Get the lead time of the task.

Returns: The lead time of the task in milliseconds.

getCreatedDate

```
public long getCreatedDate()
```

Get the created date of the task.

Returns: The created date of the task as a long representing the number of milliseconds since January 1, 1970, 00:00:00 GMT.

getEstimatedDate

```
public long getEstimatedDate()
```

Get the estimated time of the task.

Returns: The estimated time of the task as a long representing the number of milliseconds since January 1, 1970, 00:00:00 GMT. If not filled in, 0 is returned.

milliseconds.

getCompletedDate

```
public long getCompletedDate()
```

The completed date of the task as a long representing the number of milliseconds since January 1, 1970, 00:00:00 GMT. If the task is not completed yet, 0 is returned.

Returns:

The completed date of the task as a long representing the number of milliseconds since January 1, 1970, 00:00:00 GMT. If the task is not completed yet, 0 is returned.

getStartedDate

```
public long getStartedDate()
```

Get the Started date of the task.

Returns: The started date of the task as a long representing the number of milliseconds since January 1, 1970, 00:00:00 GMT. If the task is not started yet, 0 is returned.

getName

```
public String getName()
```

Get the name of the task.

Returns: The name of this task.

getSpecification

public Specification getSpecification(String specificationName)

Get the task specification (value) with the given name.

Parameters: specificationName - The name of the specification

Returns: A specification object for the specification value of the specification with the given name or null if the specification does not exist for this task.

Throws: IllegalArgumentException - If the provided specification name is null.

getSpecifications

public Specification[] getSpecifications()

Get an array of all specifications of the task

Returns: An array with specification objects representing the specifications of this task.

getStatusName

public String getStatusName()

Get the name of the task status of the task.

Returns: The name of the task status of the task.

getTaskTypeName

public String getTaskTypeName()

Get the name of the task type.

Returns: The name of the task type of this task.

setDueDate

public void setDueDate(long newDueDate)

Set the new due date of the task.

Parameters: newDueDate - The new due date for the task as a long representing the number of milliseconds since January 1, 1970, 00:00:00 GMT.

Throws: UnsupportedOperationException - If the task due date is linked to an attribute.

Export to XLIFF Format

Use this node to export your Text statements to be translated in a translation software that uses XLIFF content (e.g. Trados or SDL). After translating, you can *import* them back.

Parameters

- **XLIFF File Name:** Specify the name for your target document.
- **Target Folder:** Specify the folder where the exported XLIFF file should be placed.

Note: By default, the document is exported to the root folder of the current project. If an XLIFF file (of the specific name) already exists, then exported document will be uploaded to the same folder as a new version. If there are no content to be added for export to XLIFF, then instead of generating an empty file, output is sent to **No Files** pin.

- **Source Language:** Specify the master language of the text content.

- **Target Language**

Note: You can use **SmartNames** to set these parameters.

- **Export statements only if Master Language is signed off:** Check this to specify that the exported XLIFF should only contain statements if their master is approved.
- **Export statements only if target language is already added to document:** Option to not add statements without the target language. This is unchecked by default.
- **Export Statements only if Target language is not signed off**

This step creates an XLIFF file from the incoming text document (.wcc) and uploads it to the current Project.

Notes

- If the source text is in rich text format, then the exported XLIFF file will have rich text identifiers.
- If a graphics file arrives at the node, it will search for Text Document References. If there are referenced text documents, an XLIFF file is generated.
- Comments added in the text content document will be exported to XLIFF file.

Export to GS1 Format

You can export all of the text content, symbols, images, Barcode attached to an artwork to XML in GS1 format in a workflow.

In a typical case, the designer creates a design in **Adobe Illustrator** with placeholders for text content. These are tagged with appropriate GS1 Element Types (Content Types). You (brand owner) can process and approve the corresponding text content (with Element Type tagging) in WebCenter.

You can use the **Export to GS1 Format** node to export the various content present within your artwork to AI including Images, Symbols and Bar codes. The node will add the output file to the current Project. You can send this GS1 XML file back to the designer to place the content on the artwork.

Specifications

- **GS1 File name:** Specify the name for your exported document. It is possible to use SmartNames to generate file names. If the file name is not specified, file name will be generated automatically.
- **Folder:** In this field, specify the folder where the exported GS1 file should be placed.

Note:

Default folder location is the [root] folder of the current project. If a GS1 document (of the specific name) already exists, then exported document will be uploaded to the same folder as a new version.

You can add a row for each language.

Language Index: Specify the sequence number referencing the locale of the text statement. **Language Index** represents the GS1 `localeSequence` tag. This mapping is defined in the header of the GS1 XML.

Language: Select the language corresponding to the **Language Index** from the drop-down. The drop-down will list all the master and translation languages listed in the system.

The node will create a GS1 XML document for the specified languages with Language index mapping.

Export Chili to PDF

From WebCenter 18.0.1 onwards, you can use this workflow node to export Chili documents to PDF format. By default, the exported PDF files are routed to the current project and the root folder with the incoming Chili file name. You can also specify the target location of the exported PDF document including the **Target Project**, **Target Folder** and the **Document Name**.

Specifications

- **Target Project:** Specify the location where the exported PDF documents are to be placed
- **Target Folder:** Specify the folder in the **Target Project** where exported document are to be placed.
- **Document Name:** Specify the new PDF document's name. If left blank, the document name will be same as the incoming document's name with the extension .pdf.
- **PDF Export Setting:** Specify the PDF Export Settings name as defined in the CHILI Server. The pdf document is created using the configuration defined in the XML of the export settings.

Note:

If there is an existing file in the target location with the same file name as the exported pdf, then the node will fail. Alternatively, you can choose the option **New Version if Document already exists**.

Generate Report

Use this node to generate a report for the incoming document(s)/ Current project/other reports according to the setup in the node.

Parameters

You can **Create Report for**

- **Incoming Documents:** Choose this option to generate a report for the incoming documents into this node. If there are no incoming documents, the node will fail.
 - **One Report for All Documents** option generates a single report for all the incoming documents.
- **Current Project:** Choose this option to generate report for the current project.
- **Other:** Choose this option to generate any other report.

Now choose the **Report Template, Report Name, Project** and the specific **folder** in which the report is directed.

Note: You can read more about the set up of report parameters [here](#).

Import Dynamic Graphic

When this node is executed, images or symbols are extracted from an incoming artwork file along with expected number of occurrences from either AI files (pdf) or Chili files and are added to the artwork as document references.

Parameters

Symbol Tab

- **Symbol Library:** Field for providing the Project name(s) where all the Symbols are located. You can either specify multiple project names with a "|" between them or provide SmartName which resolve to multiple project names. Read more on this is [How WebCenter finds previously used images](#) on page 902
- **Placeholder Document Template:** When matching symbols are not found in the Symbol Library, this graphic document is copied into the current project as a placeholder which can be replaced with actual symbol later.
- **Upload Folder:** Folder where the placeholder graphic documents are copied into.
- **Document Reference Attribute:** You can choose the Document Reference Attribute of the Artwork file that has to be used to link the Symbols.
- **Find Previously Used Symbols:** If this option is selected, the node will find if an existing symbol in WebCenter matches before creating a new document. In case the matching symbol was not found, the node will create a new document.

Note: This option is applicable only if the GS1 XML created in the system has been added to Artwork file through Dynamic Content.

Image Tab

- **Image Library:** Field for providing the Project name where all the Images are located. You can either specify multiple project names with a "|" between them or provide SmartName which resolve to multiple project names.
- **Placeholder Document Template:** When matching images are not found in the Image Library, this graphic document is copied into the current project as a placeholder which can be replaced with actual image later.
- **Upload Folder:** Folder where the placeholder image documents are copied into.
- **Document Reference Attribute:** You can choose the Document Reference Attribute of the Artwork file that has to be used to link the images.
- **Find Previously Used Images:** When this option is selected, the node will find if an existing image in WebCenter matches with the reference property specified from the artwork before creating a new document. In case the matching image was not found, the node will create a new document. Read more on this is [How WebCenter finds previously used images](#) on page 902

Note: This option is applicable only if the GS1 XML created in the system has been added to Artwork file through Dynamic Content.

Import of Chili Documents

When the incoming document is a Chili file, then only the Chili variables with the data type as image are imported and stored in the ARTWORK_VARIABLE.

Note: Symbols are also considered as images in the Chili File.

How WebCenter finds previously used images

When an artwork is imported into WebCenter, all its contents are also imported along with its meta data (XML)

Now when the images are imported and if the option **Find previously used Images** is enabled, before creating a new document, search is made on the value in the reference property EXTERNAL_IMAGE_PATH to find if any documents exist with the same name or matching image path.

If no matching document is found, then a placeholder document is copied into the project and its attribute values are set accordingly.

Similarly when symbols are imported and if the option **Find the previously used Symbol** is enabled, before creating a new document search is made on the value in the reference property SYMBOL_NAME to find if any documents exist with the same SYMBOL_NAME. If no matching document is found, then a placeholder document is copied into the project and its attribute values are set accordingly.

Import Dynamic Barcode

When the node is executed, Dynamic Barcodes along with the expected number of occurrences are extracted from an incoming artwork file. For each Dynamic Barcode, a new document is created and these Barcode documents are added as Document References in the Artwork.

Parameters:

- **Document Template Project:** Field for providing Project name(s) where the **Barcode Document Template** is present. You can either specify multiple project names with a "|" between them or provide SmartName which resolve to multiple project names.

- **Document Template:** Template used for creating a new document that stores the Barcode information.
- **Upload Folder:** Folder where the new Barcode documents are created.
- **Document Reference Attribute:** You can choose the Document Reference Attribute of Artwork file that has to be used to link the Barcode document.
- **Find previously used Barcode:** If this option is selected, the node will find if an existing Barcode in WebCenter matches before creating a new document. In case the matching Barcode was not found in the System, the node will create a new document.

Note: This option is applicable only if the GS1 XML created in the system has been added to Artwork file through Dynamic Content.

Import XLIFF Content

In a translation workflow involves third party solutions (e.g. Trados or SDL), you will get your translated content as XLIFF documents (.xlf or .xliff). You can use the **Import XLIFF** step in your workflow to import the translated statements into the WebCenter Text Document (.wcc).

If a particular language is missing in the Text Content document, this step will add that language.

This step will update the document only if the statement is in **Draft** or **Pending Sign off** or **Signed off rejected** state.

Parameters

- **Approve Translation:** If you enable this all imported content will be **Signed off**.
If this option is turned off, the imported text will be in the **Ready for approval** state.
- **Create Translation:** If you check this option, a new translation statement will be created even if the language does not exist in the document.
If this option is turned off, the languages should exist in the document before the XLIFF content is imported. Otherwise, the imported content will not be added to the document.

Note:

- If the statement is in **Signed off** state, it will not be updated with the XLIFF content.
- This step may update the Text Document partially, if there are reasons for the other statements (parts) to fail. For example, if there are three languages, it is possible that only one language statement is updated.
- Rich Text Support: If source and target languages contents are rich text format, then the same rich text identifiers are added into translation content in the imported text content file.
- When the import of the XLIFF document is failed, the error pin is updated with the reason for the failure.
- Any new comments given during translation is imported.

Warning: This step will update the language statement in WebCenter regardless of the User Permissions.

Import Dynamic Text

The **Import Dynamic Text** node extracts the **Dynamic Content** from your artwork(s) as **Text Content Documents** from either your AI files or Chili files. For AI files, the expected number

of occurrences of each text statement is also imported. You can configure this node to import the text documents with a link to specific **Document Reference Attributes** and **Document Templates**.

Note:

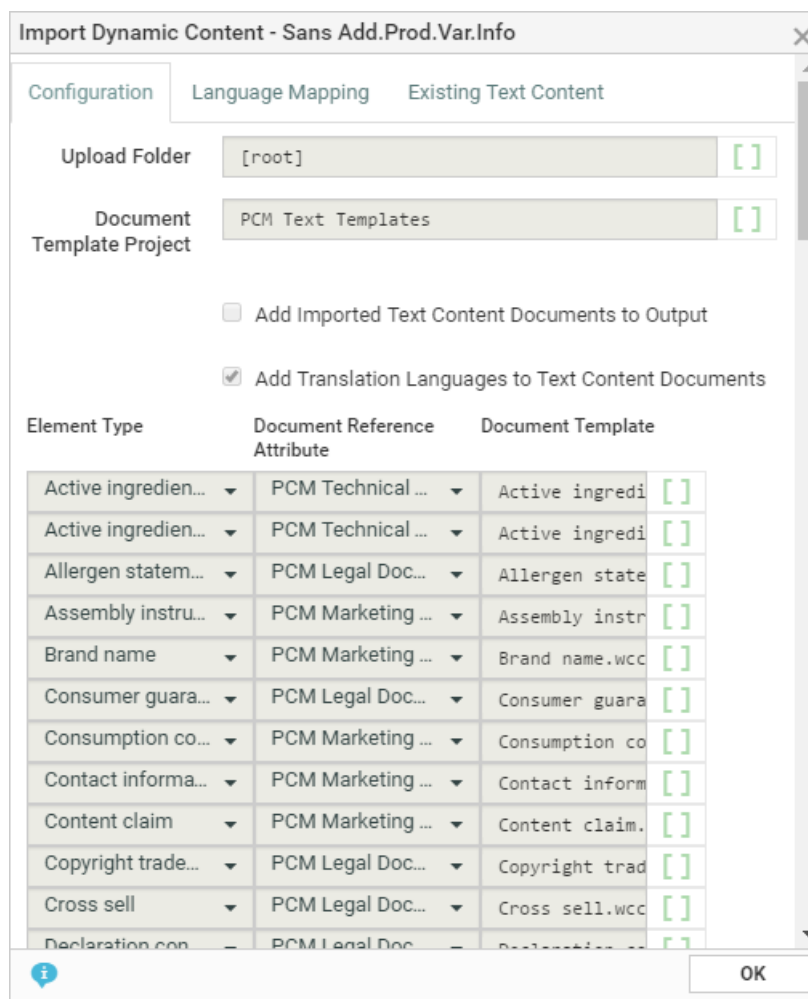

1. You need a **Copy Sheet Attribute Category** with Text document references as a pre-requisite to configure this node.
2. If the input is a Chili document, then read this for detailed explanation [Import Dynamic Content from Chili file using Import Dynamic Text node](#) on page 908

Parameters- Configuration tab

- Specify the **Upload Folder** to store the extracted documents.
- Select the **Document Template Project** at the top of this tab. Enter the name of the Project(s) where you have configured your Text content specific templates. It can either be SmartName that resolves to multiple project names or pipe separated values.
- Specify the **Element Type**. You can create a dedicated row per **Element Type / Content Type**. Click + to add a row. Read also: [Configure Element Types as a List](#) on page 473.

Tip: Select **All Element Types** to import content that has no specified **Element Type**.

- Select the **Document Reference Attribute** for each row (per **Element Type**). Select the appropriate **document reference** from the drop-down listing all document references. These document references keep the link between the artwork and its Text Content active while allowing you to process them separately.
- specify the corresponding **Document Template**. You can configure document templates for each of the Element Types in this SmartName enabled field.
Read also: [Creating a New Text Document](#) on page 485

Parameters- Language Mapping tab

You can map the **Locale ID** of the **Dynamic Content** to the corresponding language in WebCenter.

- **Language Index:** When you create the first row, this field will have the value 1 by default. When you create more rows, they will be numbered serially.
- **Language:** Select the language from a list of languages. Or use a SmartName to dynamically assign the languages.

Note:

1. By default, an imported statement is imported as Translated language if it does not exist as a Master Language in the Project's language attribute.
2. If you do not specify language mapping for the imported Dynamic Content, the node will try to find the language in the [Lists](#) (Master and Translation languages).

Parameters-Existing Text Content tab.

You can specify the reuse policy for matching Text Content Documents in this tab. Check **Reuse existing Text Content Documents** to match the incoming text with the existing documents.

Note:

- When you enable this option, the matched Text Documents will be copied to the current Project if it exists in another Project.
- If there is a 100 percent match with regard to the content and languages, the existing Text Documents will not be updated.
- If the incoming document is a Chili file, then the content of this tab is ignored while importing.

If left unchecked, the import will create new documents.

The following settings allow you to handle partial mismatches with regard to content or languages.

If there is a partial text match (with same list of languages), choose from:

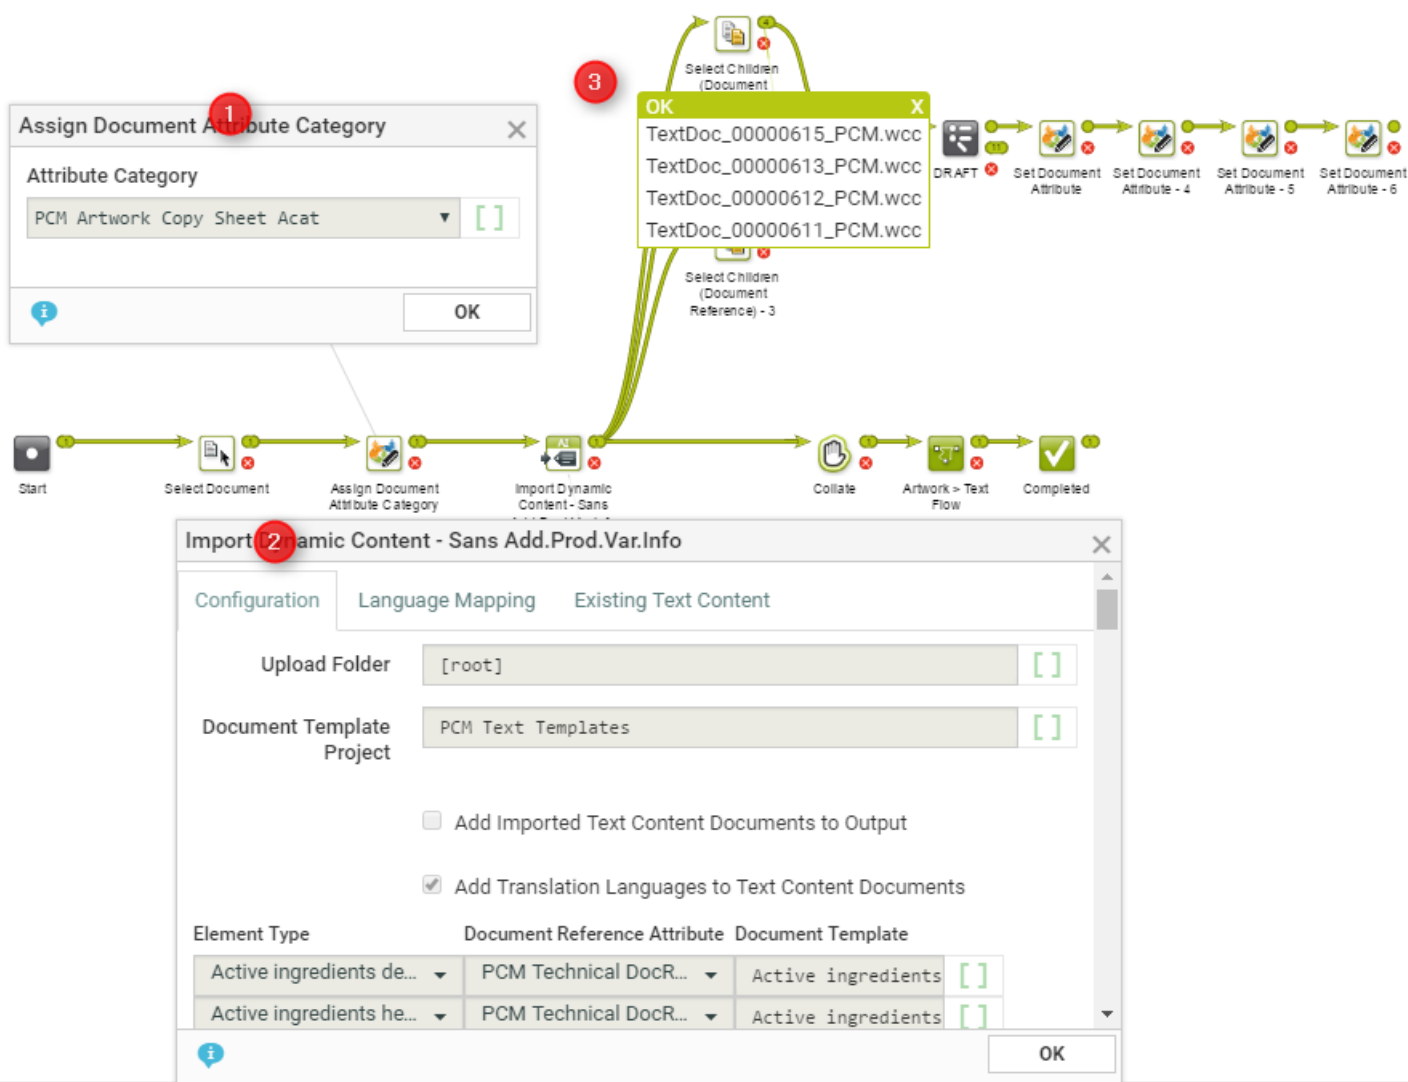

- **Replace text and Reset the Status to Draft:** The content will be updated and the document status will become **Draft**.
- **Replace text and Retain the Status:** The content will be updated retaining the current status.
- **Ignore Change:** In this scenario, the changes are ignored and the existing documents will not be updated in anyway.

If document is an Invariant, it will be reset to false.

If there is a language mismatch, then you have the option to:

- **Add language and Reset the Status to Draft** If document is available in different project, make a copy of document to current project, add language and content and reset the status of full document.
- **Add Language and Retain the Status** If document is available in the same project, then add new language and content, and reset the status of full document.
- **Ignore Change:** ignore the incoming language.

Example

In the example, when an artwork with Dynamic Content arrives at a Packaging Content Management workflow, the following steps happen:

1. The workflow assigns a **Document Attribute Category** to the artwork (parent). This 'copy sheet' category contains the **document reference attributes** to which the text content will be imported.

Note: If this step is not in the workflow, the **Import Dynamic Content** will use the Project's attribute as the default.

The category contains the **Document Reference Attributes** for:

- technical text statements,
- legal statements and
- marketing statements

to serve as the copy sheet template.

2. The **Import Dynamic Content** step maps the various Element Types to appropriate **document reference attributes** as configured.

- The *Select Children* nodes select the text documents (technical, legal and marketing) separately. These documents can be processed as separate text documents while keeping the link between them and the artwork alive.

Import Dynamic Content from Chili file using Import Dynamic Text node

Import Dynamic Text node handles incoming Chili document in the same way as other artwork files except it ignores any configuration in the **Existing Text Contents** tab.

WebCenter supports the following Chili data types for text content documents

- String, short text, long text, formatted text, unformatted, number for text content documents.

When imported, the imported Chili file is considered as GS1 complaint, if the **Instance Sequence** and **Locale** are already defined in the Chili Variable name.

You can see examples of how Chili variables are handled by the workflow node in the table below.

Before Import		After Import to WebCenter						
Chili Variable Name	GS1 Complaint Var	Derived ElemType	DocTemplate ElemType	Final ElementType	ARTWORK_VARIABLE	Instance	Locale	DocName (if autonaming is not enabled)
MARKETING_COPY	No	MARKETING_COPY	BRAND_NAME	MARKETING_COPY		1	1	MARKETING_COPY.wcc
MARKETING_COPY_I1	No	MARKETING_COPY	VARIANT	MARKETING_COPY		1	1	MARKETING_COPY.wcc
MARKETING_COPY_I4_L5	Yes	MARKETING_COPY	RECIPE	MARKETING_COPY		4	5	MARKETING_COPY.wcc
UNKNOWN_VAR	No	UNKNOWN_VAR	BRAND_NAME	BRAND_NAME	UNKNOWN_VAR	1	1	UNKNOWN_VAR.wcc
UNKNOWN_VAR_I1	No	UNKNOWN_VAR	VARIANT	VARIANT	UNKNOWN_VAR_I1	1	1	UNKNOWN_VAR.wcc
UNKNOWN_VAR_I2_L3	No	UNKNOWN_VAR	RECIPE	RECIPE	UNKNOWN_VAR_I2	2	3	UNKNOWN_VAR.wcc
UNKNOWN_VAR	No	UNKNOWN_VAR	Not Configured		UNKNOWN_VAR	1	1	UNKNOWN_VAR.wcc

Tip: Chili variables should be GS1 compliant so that node can process the data correctly.

Import Dynamic Table

The **Import Dynamic Table** node extracts the **Tables** from your artwork(s) as **Table Content Documents**. You can configure this node to import these Documents with a link to specific **document reference attributes** and **table document templates**.

Note: You need an Attribute Category with Table document references as a pre-requisite to configure this node.

If there are multiple artworks coming into the documents, the node will iterate and extract tables from all of them.

Parameters- Configuration tab

- Specify the **Upload Folder** to store the extracted documents.

- Select the **Document Reference Attribute** for the table. Select the appropriate **document reference** from the drop-down listing all document references.
- **Add Imported Table Documents to Output** . Check this if you want the document sent to the output pin.
- **Reuse existing Table Documents**. The document version specified in the document reference will be reused to store the data instead of creating a new Table Document. If there are no matching tables in the system,new document will be created.

Document Template Tab

- Specify the corresponding **Document Template**. Select the Table Template (either simple or Smart) that corresponds to the incoming Table.

Select the **Document Template Project** at the top of this tab. Enter the name of the Project(s) where you have configured your table templates. You can either specify multiple project names with a "|" between them or provide SmartName which resolve to multiple project names. Read more in: [Creating a Simple Table](#) on page 512

- **Add all Document Template elements** Check this to import all statements present in the document template.
- **Set values from Document Template**. Check this to take values from the Document Template for all matching statements. If there are no matching statements, the incoming values will be used in the table document.

Parameters- Language Mapping tab

You can map the **Locale ID** of the **Dynamic Table** to the corresponding language in WebCenter.

Language Index: When you create the first row, this field will have the value 1 by default. When you create more rows, they will be numbered serially.

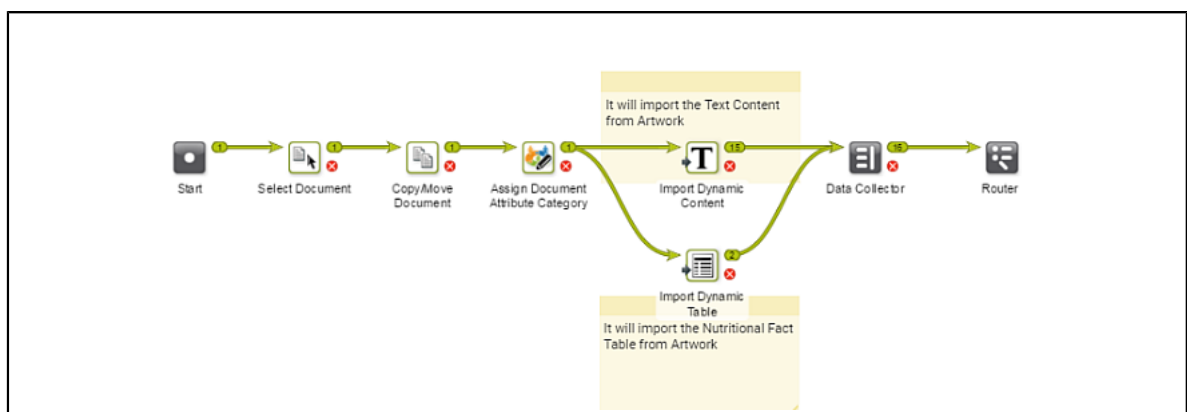

- **Language:** Select the language from a list of languages. Or use a SmartName to dynamically assign the languages.

Note: By default, an imported table is imported as Translated language if it does not exist as a Master Language in the Project's language attribute.

For new Table documents created from this node, the master language table will be added in the **Draft** state, even if that language is not available on the artwork.

Note: If you do not specify language mapping for the imported Dynamic Content, the node will try to find the language in the [Lists](#) (Master and Translation languages).

-Read also: [Import Dynamic Text](#) on page 903.

In the example, when an artwork with Dynamic Content arrives at a Packaging Content Management workflow, the following steps happen:

1. The workflow assigns a **Document attribute category** to the artwork (parent). This 'copy sheet' category contains the **Document reference attributes** to which the text and table content will be imported.

Note: If this step is not in the workflow, the **Import** node will use the Project's attribute as the default.

The category contains the **Document reference attributes** for:

- text statements,
- and nutrition facts table

to serve as the copy sheet template.

2. The *Import Dynamic Text* on page 903 step maps the various Element Types to appropriate **document reference attributes** as configured.
3. The **Import Dynamic Table** extracts the table matching it to the document reference and the table document template.

After the extraction of the content, the workflow processes the content based on the requirements. You can, as in the example, update the incoming table and text using the workflow.

Select Document

Use the **Select Document** node to choose a document to be processed by the rest of the workflow. When a workflow is started with a human task requiring documents, the **Select Document** node can be used to provide documents.

Parameters

Project Name: The name of the Project containing the document to select (by default, this is the project in which the workflow is launched).

You can select either:

- **Documents in the project:** then define the following:
 - **Name:** The name of the document to select.
 - **Folder:** The project folder containing the document to select. By default, this is the root folder.

Tip: You can use SmartNames for the **Project Name**, **Folder** and **Name** parameters.

- **From Project Document Reference**

In 18.0.1 WebCenter release onwards, the documents that are referenced by the selected **Project Document Reference** in the specified project are put on the output pin. You can scroll the drop down list to select the document references.

- **From Task Document Reference**

The documents that are referenced by the selected **Task Document Reference** in the currently executed workflow task are selected. You can either select the Task Document Reference from the drop down or select **Any Document Reference**. When **Any Document Reference** option is selected, all documents that are referenced in the task's specification are selected in the node.

- **Documents in the Bill of Materials.** When this option is selected, all the document(s) (versions) that are in the Bill of Materials of the project specified in the Project Name field, are selected and put on the green output pin as one token.

There is also an option to **Fail if no document found**. This option stops the workflow with a failed state, if there are no documents in the defined Project location/Bill of Materials.

Merge Text Content

This node is used to merge incoming text content documents with matching text content documents into the library project configured. For every incoming text content document, library document should match the content for each of the languages in both the documents.

This workflow node has the following configurable fields:

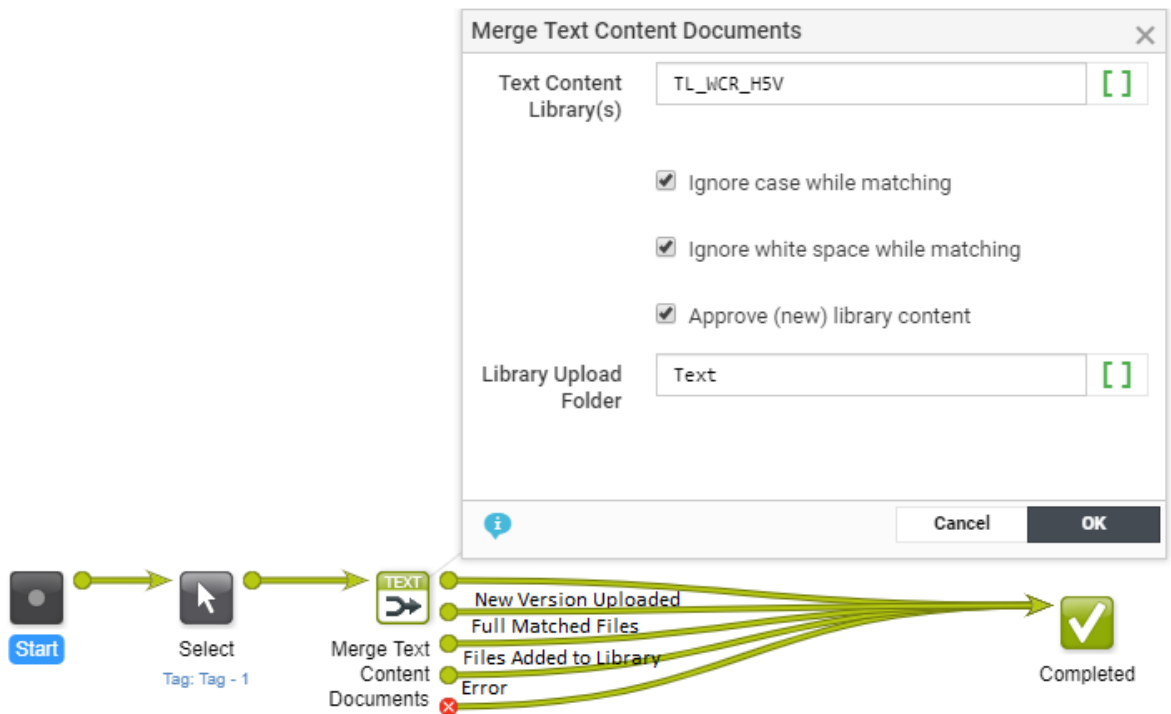

Text Content Library(s) – Enter project names or smart name that resolves into multiple projects.

Ignore Case while matching–Select this field to match only the content, ignoring the case.

Ignore white space while matching– Select this field to ensure that the leading and trailing spaces are ignored.

Approve Content Enable this field to approve the content merged. When the master language of the merged content is not approved already, then the newly added language will not be approved.

Library Upload Folder – Specify the folder, where the copied document should be placed in library project.

Select Children (Document Reference)

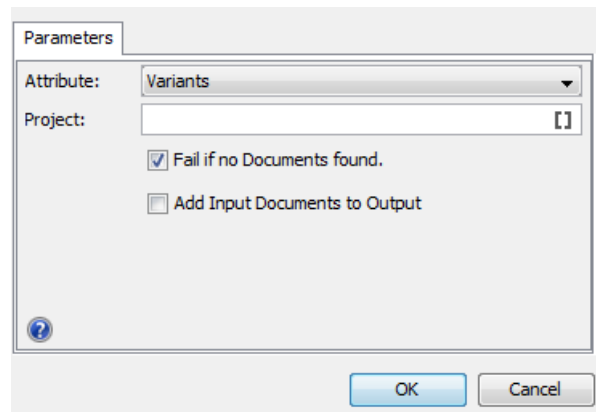

Using this node, you can select the documents that are referenced in the input document as a document reference attribute value. Read more in: [Document References](#) on page 353.

This node collects the documents referenced in each of the input documents and sends them as the output documents. Based on the settings, this task may output the incoming parent documents as well.

In the following example, the node selects the `artwork` document referenced in a design file.

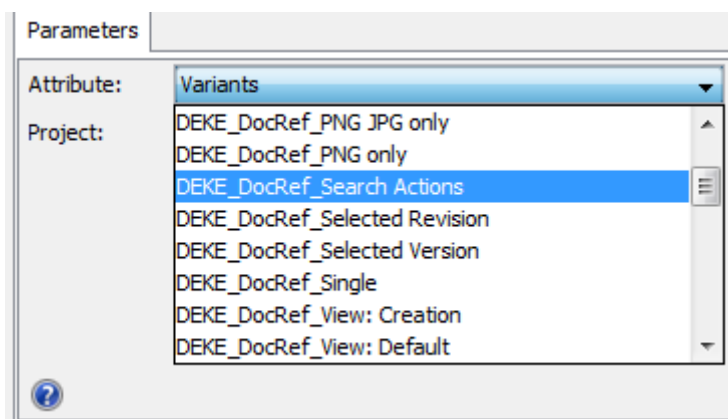

Double-click the node in the canvas to fill in the following options:

- **Attribute:** drop down listing all the **document reference attributes** defined in the system.

Note: When you select the option **Any Document Reference** from the drop down, all document reference children of the incoming documents are selected and added to the set of output documents.

- **Project name:** use SmartNames or type in the name of the project where the referred document is located. This is handy when you want to filter the multi-valued document references located in several projects.
This field is optional and by default empty.
- **Fail if no Documents found:** check this when you want the workflow to stop if there are no document references for the attribute you selected.
This option is turned on by default.
- **Add Input Documents to Output:** check this to send the incoming documents (the documents containing the document references) also to the output pin in addition to the selected document references.
This option is turned off by default.

Select Parent (Document Reference)

Using this node, you can select the parent documents where the input documents are being referenced as the attribute value. Read more in: [Document References](#) on page 353.

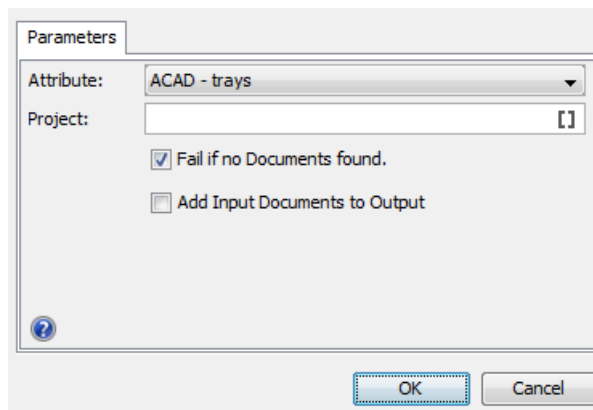

This node collects the master documents of the input documents (document reference values) and sends them as the output documents.

In the example below, the document `Christmas Bottle.zae` has an ARD file as a document reference value for the attribute `Die Line`.

To select the parent when your input document is the `CAD008.ard`, specify the attribute (`Die Line`) in the node. The node will select `Christmas Bottle.zae`.

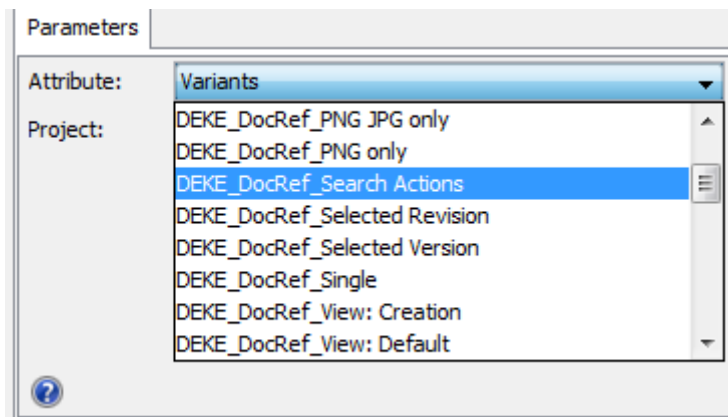

Double-click the node in the canvas to fill in the following options:

- **Attribute:** drop down listing all the **document reference attributes** defined in the system. Select the attribute name where the input document is the referenced document.

Note: When you select the option **Any Document Reference** from the drop down, all parent document referencing the incoming documents are selected and added to the unique set of output documents.

- **Project name:** use SmartNames or type in the name of the project where the parent or master document is located. When the project name is specified, only the parent documents that are in this project are selected.

This field is optional and by default empty.

- **Fail if no Documents found:** check this when you want the workflow to stop if the parent documents are not found.

This option is turned on by default.

- **Add Input Documents to Output:** check this to send the incoming document references also to the output pin.

This option is turned off by default.

Send Notification

You can send automatic workflow notifications using the **Send Notifications** node. These notifications are sent as an e-mail with a configurable subject and body. You can customize this according to your needs.

Parameters

In the **To** field, type the e-mail addresses of the receivers or select them using SmartName . The following SmartNames are supported:

- Project Manager
- Sales Person
- Workflow Master (the project member who is assigned the whole workflow as a task in the project)
- Groups
- Users
- Roles (the e-mail will be sent to the current holders of this role in the project)

Tip: Use ; as a separator between the receivers.

In the **Subject** field, type the subject of the e-mail. The subject can be configured using SmartNames.

In the **Message** field, type the body of the e-mail. You can use the buttons and options at the top of the field to format your message. The e-mail body will automatically contain a link to the first document coming into the node even if the node gets multiple documents.

Tip:

- Click the  icon to use SmartNames (for example to add Attributes, a link to a Document, the Project name or a User name).
- In the Links section, You can find a SmartName to generate a Temporary Document Preview or a Temporary Document Download link in the e-mail. The preview link SmartName is only available if the admin has enabled **Allow large Document preview (approval e-mail notifications)** and for download link **Allow Project Members with Download permission to e-mail a link for non-authenticated download of a Document**.
- Select some text and click  to create a hyperlink.

Set Document Attribute

Use this node to automatically add document attributes and their values to the documents processed by the node.

Attention: Your documents should have the attribute category (containing the attributes you add) already assigned, otherwise the workflow will fail.

Parameters

Click + to add one of the attributes of the document's attribute category. If this is not the attribute you wanted, click it and select another attribute.

Then double click in the **Value** column to enter the corresponding attribute value. You can use SmartNames.

To remove an attribute, select it and click -.

Set Project Attribute

Use this node to automatically add project attributes and their values to the current project.

Attention: Your project should have the attribute category (containing the attributes you add) already assigned, otherwise the workflow will fail.

Parameters

Click + to add one of the attributes of the project's attribute category. If this is not the attribute you wanted, click it and select another attribute.

Then double click in the **Value** column to enter the corresponding attribute value. You can use SmartNames.

To remove an attribute, select it and click -.

Set Project Status

Use this node to automatically set the status of the current project.

Parameters

Choose the project status in the **Status** list (it contains all project statuses configured in your WebCenter system). You can also use SmartNames to configure a status parameter.

Set Workflow Specification

Use this node to automatically set the value of one or more specifications of the workflow you are running.

Attention: The specifications you want to use should already be added to the workflow task, before starting the workflow.

Parameters

Click + to add one of the workflow specifications to the list. If this is not the specification you wanted, click it and select another of the workflow's specifications.

Then double click in the **Value** column to enter the corresponding specification value. You can use SmartNames.

To remove a specification, select it and click -.

Set Workflow Status

Use this node to automatically set the status of your workflow (this must be an active status).

Parameters

Choose the workflow status in the **Status** list (it contains all active workflow statuses configured in your WebCenter system). You can also configure SmartNames to set the status parameter.

Start Approval Cycle

Use this node to start an approval cycle on any incoming document, and wait until the approval cycle is finished.

Parameters

Choose to either:

- **Use the default approval setup:** This is the default approval setup of the incoming document. If no approval setup exists for it, the default approval setup of the folder containing the document, or failing that, of the project containing the document, is used.
- **Use the approval setup of another document.** In this case, enter the **Project Name** of the project containing that document, and the **Document Name**.

You can use SmartName for both the **Project Name** and **Document Name**.

Note:

- If there is no active approval setup in your project or you chose to use a document that has no approval setup, this node will fail.
- If the approval was already started, it won't change. The node will wait until the document got approved or rejected.
- If the document was already approved or rejected this node will fail.

Start Approval Stage

Use this node to start an approval stage in a workflow and build a staged approval. You can set up an approval stage in the workflow similar to a stage in the Approval Setup page in **Projects**.

You may have multiple stages of approval required within the same approval cycle. In such cases, you can set up stages within the approval cycle to approve a document from different stakeholders.

Parameters

Stage Setup

The stage starts when the incoming document is received for the stage. The document is sent to the appropriate output pin based on the outcomes defined for the stage.

Note: If a document version is deleted while the node is waiting, the document is sent to the error pin with the message.

Document version is deleted.

Approval stage has to be defined with the required information like:

- **Stage Name**
Provide a name to the approval stage. This is a mandatory field.
- **Approver**
Roles for a particular approval stage have to be assigned before the stage begins or else the workflow will fail.
- **Allow Conditional Approval** Tick the check box if conditional approval has to be allowed. Read more about it [here](#)
- **Inherit Previously Submitted Approvals** Tick this check box to inherit the approvals. To know more, read about it [here](#)
- **When one User Rejects** Specify how document rejection should be handled. To know more on this option read [here](#)
- **Require review state on all annotations** Specify how the review on annotations has to be handled by approvers. To know more, read [here](#)

Due Date

Specify the due date for the approval stage. To know how to set up, read [here](#)

Approval Settings

Specify the setting for approval in this tab

- **When a new version is uploaded** You can read how to set up [here](#)
- **Approval Master** You can read on how to set up [here](#)
- **Email Notifications** You can read on how to set up Email Notifications [here](#)

When a New Version is uploaded

When a document's approval cycle is started, and a new version of the document is uploaded, then the approval cycle is automatically stopped. You can define what happens when the approval cycle restarts.

In the **When a new version is uploaded** setting, choose either:

When a new version is uploaded

Approval Restarts from Current Stage	▼
Approval Restarts from Current Stage	
Approval Continues	
Go to New Version Pin	

- **Approval Restarts from Current Stage** to keep the approval stages already completed (typically approved) and restart the current stage. People who already approved / rejected the document in the current stage will have to evaluate it again.
- **Approval Continues** to keep all the approval actions already done. Only people who have rejected the document will see it again (to check whether the reason for their rejection was corrected).
- **Go to New Version Pin** redirects the uploaded new version of the document to the **New Version Uploaded** output pin if the approval has already started. When no rule is specified, then the approval of the document is in Waiting for workflow status.

The approval rule will be initialized, when the workflow starts an approval stage. Depending on the stage that is started next, the inheritance of Stages/ Approvals is determined as follows:

- **A new stage that was never executed before:** All stages are inherited, except for the stage that triggered the **Go to New Version Pin**.
- **A previous stage:** All stages are inherited up to the one that needs to be started.
- **Same Stage:** All previous stages are inherited.

Note:

- It is not possible for a document to go through two **New Version Uploaded** output pins in a row. This is to prevent endless loops in the workflow. **Go to New Version Pin** setting in the second stage will be overruled. In such a case, the stage is restarted.
- The new version can also be uploaded, when the approval is in a **waiting for workflow** state where approval is required, but the workflow is pending completion of a manual task.
- When the document was already in a **waiting for workflow** status and a new version is uploaded, the new version of the document will also be in **waiting for workflow** status and when entering an approval stage node, the **new version uploaded** setting gets executed in this node.

Finish Approval Cycle

Use this node to finish the approval cycle of the incoming documents and send e-mail notifications. Since there could be many stages in an Approval cycle, a workflow step is designed to determine the completion of the approval cycle. The output pin of this node denotes the final approval status of the document.

E-mail notifications:

- **No Notifications:** No e-mail notifications will be sent when the Approval Cycle is completed.

- **Default Notifications:**

E-mail notifications are sent according to the notifications setup defined in the Document Approval Setup, Folder Approval Setup, Project Notification Setup and System Notifications setup, each time falling back to the next level if that level is set to default.

- **Custom Notifications:** Choice to send an e-mail notifications to the **Project Manager**, **Involved People** and/or **Project Members** when the approval cycle is completed.

Documents with similar approval statuses are directed to the same output pin.

For example, two documents arriving in one token with final approval status as **Approved** would be shown in the Approved output pin. The error output pin is split per document to view the error for each document.

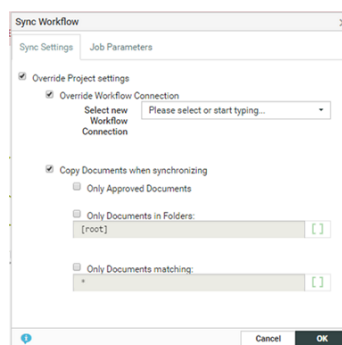

The final approval status of the document shown in the output pin is

- **Approved:** If the final status of the incoming document is approved
- **Approved with conditions:** If the final status of the incoming document is approved with condition
- **Rejected:** If the final status of the incoming document is rejected.
- **New Version Uploaded:** When a new version of the document is uploaded after all the approval stages are completed then the document is directed to this pin.
- **Error:** For example, when there is no incoming document.

Sync Workflow

Use this node to sync the current WebCenter project with the Automation Engine **job** configured in your [Workflow Connection](#). This syncs the WebCenter project data with the Automation Engine job parameters.

This node uses the synchronization settings from the project/template setup by default. However, you can setup alternative synchronization settings in the **Sync Settings** tab.

To change the project settings:

- Enable **Override Project Settings** and configure the following settings:
 - To associate the workflow with a different **workflow connection**, select **Override Workflow Connection** and **Select new Workflow Connection** from the drop-down.

Note: This drop-down lists all the connections listed on the **Project > Configure > Workflow Connection** page.

- For overriding the copy document settings, enable **Copy Documents when Synchronizing** and select the specific setting:
 - **Only Documents in Folders:** Select this to specify one or more folders in this editable field. Use ; as the separator. Only the documents in the specified folders will be synchronized.

Note:

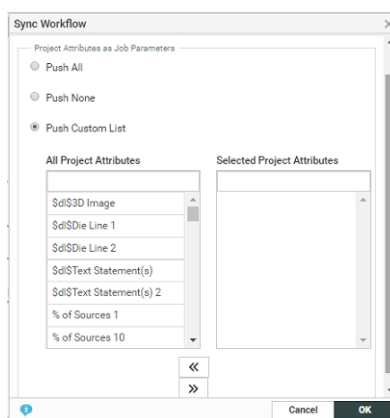

- If one of the specified folders does not exist in the project, the node will skip the workflow synchronization.
- To specify the root, leave the field empty or as “[root]”.
- You may also specify the folders using wildcards. For example, A* will match the folders A, ABC, and Amadeus.

- **Only Approved Documents:** Use this setting to synchronise only the approved documents.
- **Only Documents matching:** Type in the names of the specific documents that you want to synchronise. This field accepts wild cards.

Note: If **Copy Documents when Synchronizing** option is not checked, no documents are synchronized.

Specify the WebCenter **Project Attributes** that should be synchronized as Job Parameters in Automation Engine. Configure the settings in the **Job Parameters** tab:

- **Push All (default):** All the **Project Attributes** from the project attribute category are pushed as **Job Parameters**.
- **Push None** for not pushing any **Project Attributes** to Automation Engine
- **Push Custom List:** When you select this, you see two columns and two buttons:
 - Select from **All Project Attributes** to add one or more attributes listed in the column. The **>>Add All (Filtered) Attributes** adds all attributes listed in the column.
 - Select from **Selected Project Attributes** to remove one or more attributes listed in the column. The **<< Remove All (Filtered) Attributes** removes all attributes listed in the column.

Note: The **Sync Workflow** node will push only the attributes that are assigned to the WebCenter project in which the workflow is executed. If the attributes specified in this node are not assigned to the **Project**, these will not be pushed.

Executing the node results in the project being synchronized with Automation Engine as per the settings from the node and the Project in which the workflow runs. The workflow will wait until the synchronization is finished and show an error in case this fails.

Warning: When you push a custom list of attributes to Automation Engine as job parameters, you may lose some of the existing job parameters. This happens if you are using the old JDF policy on Automation Engine. Read about the JDF policy in: http://help.esko.com/docs/en-us/suite-general/14/otherdocs/AE_Job_Parameter_Policy.pdf

Manually force the node to an output pin

Any user with **Change Task** rights can force a node to an output pin. To force the node to the output pin, right click on the token of a running workflow node and choose either

1. **Force to Completed pin:** This will put the token on the green completed pin.
2. **Force to Error pin:** This will put the token on the red error pin.

When one of the option is chosen, a confirmation window appears and the action is logged in the project history.

This feature is useful, when the feedback from Automation Engine is not received, and you want to let the WebCenter workflow continue after some manual correcting actions are done.

Sync Chili Variables

You can use this node to sync the attributes with the chili document.

When the node is executed for incoming CHILI documents, only those CHILI variables with data type **Text** and **Image** are processed.

Ensure that the referenced text content documents in the incoming chili document contains the attribute **ARTWORK_VARIABLE** or the chili variables in the incoming document is in the format

```
<element type>_L<x>_I<y>
```

where x and y are integers.

Basic Attributes are also synced if CHILI Variable name matches exactly with the Attribute Name. For Images, the variable name of CHILI image file should match with **ARTWORK_VARIABLE** present in the attribute category.

A new document version and a new thumbnail of the chili file is created after the workflow is successfully completed.

Submit Workflow

Use this node to launch a workflow in Automation Engine from WebCenter.

During execution this node will:

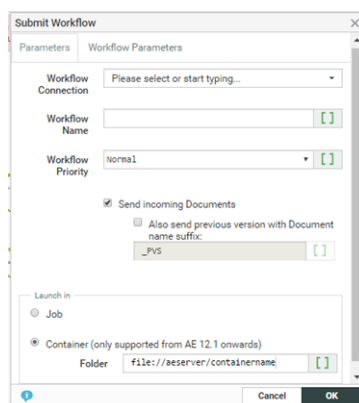

- connect to Automation Engine using the specified **Workflow Connection**.
- launch the workflow in the specified Automation Engine **Job / Container**

The incoming documents will be processed according to the **Send incoming Documents** option setting. If there are documents to be sent, they will be copied to the specified Job or container and will be added to the start node of the workflow in Automation Engine.

When the workflow is finished in Automation Engine, the WebCenter node will continue over the green output pin. During execution, the workflow feedback shows that it is running on Automation Engine.

Note: Your Administrator must have configured a **Workflow Connection** of the type **Project/Workflow (JDF)** for this to work. See [Configure Workflow Connections](#) on page 400 in the Administration Guide.

Parameters Tab

Workflow Connection:

Select the JMF type workflow connection (configured by your Administrator) from the drop down. Read in: [Configure Workflow Connections](#) on page 400

Workflow Name:

Enter the name of the Automation Engine workflow to launch. You can use SmartNames.

Attention: The **Workflow Name** is case sensitive.

Workflow Priority:

This parameter allows you to launch a workflow with a Normal, Low and High Priority. The default option is Normal. The value is represented as sw.priority.low, sw.priority.normal or sw.priority.high if you are using SmartNames.

Send incoming Documents (by default):

Check this to send the **incoming documents** to Automation Engine (e.g. because of an earlier submit or a sync operation).

Select the check box **Also send previous version with Document name suffix** to send the previous version of the file as well.

Note: Specify the mandatory suffix when enabling this option. The previous version is submitted only when a suffix is specified. For example, if the name of the file name is file.pdf and the suffix is _PVS, the previous version will be submitted as file_PVS.pdf.

Choose if you want to launch the Automation Engine workflow on the files in:

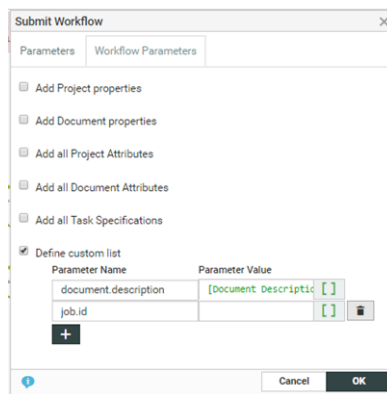

- an Automation Engine **Job**; in this case, enter the **Orderid** and the **Sub-orderid** of that job.
- an Automation Engine **Container** (only if you use Automation Engine 12.1 or newer); in this case, enter the path to the container in the **Folder** field, in the format `file://aeserver/containername`.

You can use SmartNames in all of these fields.

Workflow Parameters Tab

To map your WebCenter **Project Attributes** to the Workflow parameters in Automation Engine, specify them in this tab.

Note: This is only supported if you use Automation Engine 12.1 or newer. Read also [Add Documents from Automation Engine](#) on page 438

You have the following options that you can enable:

- **Add Project Properties** to add the WebCenter **project properties** as Automation Engine **workflow parameters**.
- **Add Document Properties** to add the project properties as parameters.
- **Add All Project Attributes** to add all the project attributes. They will be available as **project.attributename** in Automation Engine.
- **Add All Document Attributes** to add all the document attributes. They will be available as **document.attributename** in Automation Engine.
- **Add All Task Specifications** to add specifications.
- **Define Custom List** to type in the specific Parameter Name and specify their values manually in the resulting columns below.

- In the left column, specify the workflow parameter name. It will show up as that workflow parameter name in Automation Engine.

Note: This list will overwrite the previously added values (For example, **add all project attributes** as "project.attributename").

- You can type in a text value or use SmartNames to specify the workflow parameter in the right column.

Note:

The default behavior is to send no parameters unless specified. However, if you had enabled the **Map attributes to Workflow Parameters** in a previous version, all the above options except the **Define Custom List** are sent by default.

Manually force the node to an output pin

Any user with **Change Task** rights can force a node to an output pin. To force the node to the output pin, right click on the token of a running workflow node and choose either

1. **Force to Completed pin:** This will put the token on the green completed pin.
2. **Force to Error pin:** This will put the token on the red error pin.

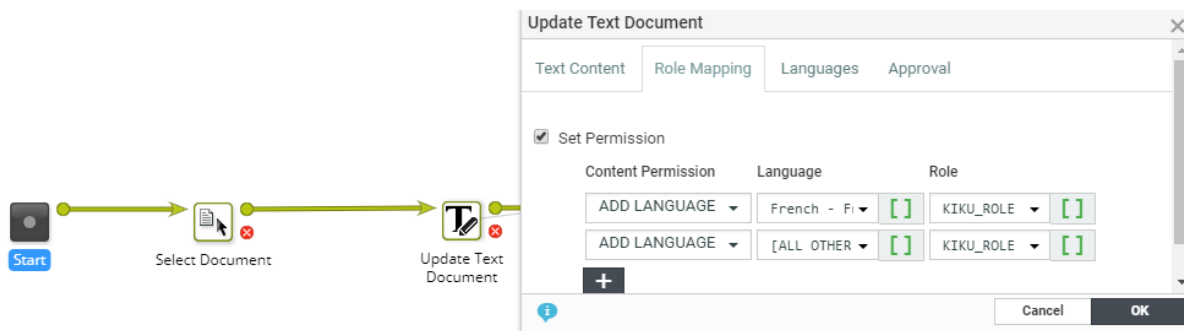

When one of the option is chosen, a confirmation window appears and the action is logged in the project history.

This feature is useful, when the feedback from Automation Engine is not received, and you want to let the WebCenter workflow continue after some manual correcting actions are done.

Update Text Document

This workflow step allows you to specify or update Text Document properties such as:

- Text Content
- Role Mapping
- Languages
- Approval

Text Content

In this tab, specify the properties in the **Text Content Field** and the corresponding values in the SmartName supported **Value** field.

You can specify or update the following properties and their values in this tab:

Field	Value
Approval Setup	One of Role
Inherit Content ...	English - United States
Invariant	False

- the **Element Type** of the Text Document. You can select from the list of text content element types supported in the system.

Note: The **Element Type** drop down is configured as a *List*. Read more in: [Text Content Element Types](#) on page 466

- **Invariant** : Specify this as `True` if translations are not required for a particular Text Document.

Note: If the Invariant is set as `True`, then all translation languages will be removed from the incoming document.

- the **Approval Setup**:
 - **Default:** Only one member has to approve. For example, if the Approver permission is assigned to two Roles, only one member (from any Role) has to approve.
 - **One of role:** One member of each Approver Roles (assignees) has to approve to complete the signing off. In case a Role is assigned to several members (groups or users), any Group member or user from that Role can approve.
 - **All of Role - One per Group** : At least one member from each Role-Group has to approve. If there is an individual User, then he or she has to approve as well.
- **Type** of Text: Simple or Rich Text. If the Type changes from the existing type, the document status will become **Draft**.
- **Inherit Content From** :

You can choose to inherit content one of the options below

- **Default:** Will inherit the content from the language that is configured to follow in the Language List.
- **None:** Will not inherit content from any language in the workflow node. However the user can manually change the language at the element level in the document.
- **Master Languages:** Can choose any of the languages from the master language list.

By default **Disable** is chosen which will not allow Inherit content.

Role Mapping

This tab allows you to map Content Permissions to Roles. To specify the new set of permissions or to specify permissions in a workflow:

1. Enable **Set Permission**. This will show the Permission Settings.
2. Select the **Content Permission** (Add Language, Editor, Approver or Content Manager).
3. Set the corresponding **Language** from a list of all the text content languages supported in the system.

Select [All Other Languages] to specify permissions and role mapping to all languages without permission assignment in one go.

Note: The Content Manager has permissions to all languages by default and cannot be specified per language.

4. Specify the **Roles** corresponding to the selected Content Permissions. The drop-down lists all Roles configured in the system.

Languages

This tab lets you:

- add and remove languages to the document or Inherit content from the language configured in document
- update or create actual text content

To do an **Action**:

1. Select **Language** – You can either select from the drop-down (listing all the languages present in the system) or use a SmartName in this field.

Note: If your SmartName points to a multi-value attribute, it will resolve to multiple values.

2. Specify the **Action**: Choose from **Add/Remove/Update/Inherit**.
3. You can add a condition where the workflow node can inherit/add/update/remove elements. There may be a combinations of different conditions that may be given.

Condition	Action Possible
Always	Add, Remove, Update, Inherit
New Value is not empty	Add, Update, Inherit
Current value is empty/not available	Add, Update, Inherit
Current value is empty	Remove, Inherit
Current value is not available	Inherit
Current value is empty and new value is not empty	Add, Update

4. Define the corresponding **Value**. This is the field where you can type in the actual text content.

Warning: If a language is specified in more than one row, only the settings specified in the last row will be valid.

Approval Tab

This tab allows you to set **Approval Status** (per language) via workflow.

Note: You can use SmartNames in this step and if your SmartName points to a multi-value attribute, it will resolve to multiple values.

1. Select **Language** – You can either select from the drop-down (listing all the languages present in the system) or use a SmartName in this field.
2. Specify the **Status**. You can choose from **Draft**, **Pending SignOff**, **SignOff Rejected** and **Signed Off**.

Update Table Content

This workflow node allows you to specify or update Table properties and Table values. You can add:

- Role Mapping
- Languages
- Approval
- Add / Remove / update/ inherit elements and set values for nutritional facts elements

Settings

In this tab, specify the properties in the **Field** and the corresponding values in the SmartName supported **Value** field.

You can specify or update the following properties and their values in this tab:

- **Invariant** : Specify this as `True` if translations are not required for a particular Document.
- **Approval Setup:**
 - **Default:** Only one member has to approve. For example, if the Approver permission is assigned to two Roles, only one member (from any Role) has to approve.
 - **One of role:** One member of each Approver Roles (assignees) has to approve to complete the signing off. In case a Role is assigned to several members (groups or users), any Group member or user from that Role can approve.
 - **All of Role – One per Group** : At least one member from each Role-Group has to approve. If there is an individual User, then he or she has to approve as well.

- **Inherit Content From** :

You can choose to inherit content one of the options below

- **Default:** Will inherit the content from the language that is configured to follow in the Language List.
- **None:** Will not inherit content from any language in the workflow node. However the user can manually change the language at the element level in the document.
- **Master Languages:** Can choose any of the languages from the master language list.

By default **Disable** is chosen which will not allow Inherit content.

- **Type:** Simple or Rich Text. If the Type changes from the existing type, the document status will become **Draft**.

Role Mapping

This tab allows you to map Content Permissions to Roles. To specify the new set of permissions or to specify permissions in a workflow:

1. Enable **Set Permission**. This will show the Permission Settings.
2. Select the **Content Permission** (Add Language, Editor, Approver or Content Manager).
3. Set the corresponding **Language** from a list of all the text content languages supported in the system.

Select [All Other Languages] to specify permissions and role mapping to all languages without permission assignment in one go.

Note: The Content Manager has permissions to all languages by default and cannot be specified per language.

4. Specify the **Roles** corresponding to the selected Content Permissions. The drop-down lists all Roles configured in the system.

Values

This tab lets you add / remove /update table statements and their values. Use a single row per **element** or statement.

Update Table Document

Settings Role Mapping **Values** Approval

Element	Instance Sequence	Language	Action	Condition	Value
Serving Pe	1	English -	Add	Always	[List]
Serving Si	1	French - F	Inherit	Current va	
Calories	1	English -	Update	Always	[List]
Total Fat	1	English -	Update	Always	[List]
Total Fat	1	French - F	Inherit	Always	
Cholesterc	1	English -	Update	Always	[List]
Cholesterc	1	French - F	Inherit	Always	
Sodium Mez	1	English -	Update	Current va	[List]
Sodium PDV	1	English -	Update	Always	[List]
Total Cart	1	English -	Update	Always	[List]
Total Cart	1	French - F	Inherit	Always	
Dietary Fi	1	English -	Update	Always	[List]
Dietary Fi	1	French - F	Inherit	Current va	
Sugars	1	English -	Update	Always	[List]
Sugars PDV	1	English -	Update	Always	[List]
Added Sugz	1	English -	Add	Always	[List]
Added Sugz	1	French - F	Inherit	Always	
Protein Me	1	English -	Update	Always	[List]
Protein PL	1	French - F	Inherit	Always	

Cancel OK

- **Element** – The table *Element Type* to be added or removed. This field is a smartname dropdown populated with the list of table element types supported in the WebCenter.
- **Instance Sequence** – Specify the instance sequence number. This number indicates how many occurrences of an Element is present in a Table. The default value is 1.
- **Language** – You can either select from the drop-down (listing all the languages present in the system) or use a SmartName in this field.

If the specified SmartName resolves to multiple languages, then the specified configuration(from that row) will be applied to all of them.

- **Action:** Choose from **Add / Remove /Update/ Inherit** .
- **Condition** You can add a condition where the workflow node can inherit/add/update/remove elements. There may be a combinations of different conditions that may be given.

Condition	Action Possible
Always	Add, Remove, Update, Inherit
New Value is not empty	Add, Update, Inherit
Current value is empty/not available	Add, Update, Inherit
Current value is empty	Remove, Inherit
Current value is not available	Inherit
Current value is empty and new value is not empty	Add, Update

- **Value** – Field where you can specify the actual content. You can enter the data or use SmartNames.

Tip: Use List SmartNames(pointing to an Excel sheet based List) to provide content in a smart way.

Note: If you specified the action as **Add** for an existing value, the value is updated. If the element does not exist in the document, the element and the value will get added. However, if the action is **Update** and the element does not exist, the row is ignored.

Note: If you are updating a SmartName table using this node, the value from this node will replace the SmartName in the table.

Approval Tab

This tab allows you to set **Approval Status** (per element, per instance and per language) via workflow. This allows you an automated way of approving the nutrition fact statements.

Note: You can use SmartNames in this step and if your SmartName points to a multi-value attribute, it will resolve to multiple values.

1. Select the **Element** or the statement.
2. Specify the **Instance Sequence** of the element.
3. Select **Language** – You can either select from the drop-down (listing all the languages present in the system) or use a SmartName in this field.
4. Specify the **Status**. You can choose from **Draft, Pending SignOff, SignOff Rejected** and **Signed Off**.

Upload to Asset Management System

The [Asset Management](#) configurations allow you to push a document to the asset management system. The **Upload to Asset Management System** node allows you to specify the Asset Management connection and metadata mapping.

Specify the Parameters

1. Choose the **Asset Management System** from the searchable drop-down. You can choose from any of the Connections set up in the system (by the [admin](#)).

Note: If you leave this field blank, the workflow will look from an Asset Management system that acted as the source for the incoming document. This step will fail if it cannot find any DAM configuration.

2. Define DAM specific parameters.
 - Specify if it is a **New Asset** or a **New Version** of an existing asset.
 - Specify the **MediaBeacon** Namespace and any parameters with its value.
 - Specify if the zip files should be expanded on the MediaBeacon server on upload.

If you did not specify an Asset Management Connection, the workflow will use the document's source Asset Management connection. If there is no such system, the workflow will fail.

Wait for View Files

With this node, you can

- have view files available before starting an approval cycle or starting a task
- detect warnings in the view file generation.
- re-generate view files after they are flushed

For example, before starting an Approval Cycle.

During execution, the node waits for the view file generation of the incoming documents and proceeds to one of the output pins according to the view files status:

- If the view files are available or if the document is not viewable, the document is sent to the **Succeeded** output pin
- If the view files are available but if it contains a warning, the document is sent to the **Warning** output pin

Note: The Task Details of the view file generation has the text "Task(s) generated warnings"

- If the view file generation failed, the document is sent to the **Failed** output pin.
- If there are no incoming documents, the node fails and the token is sent to the **Error** pin.

If there are multiple documents in the incoming token, the node will wait until the status of all the document(s) is known, and then proceed to the appropriate pins.

Note: If the view files were deleted, the node will re-start the view file generation first before waiting for its status.

Manually force the node to an output pin

Any user with **Change Task** rights can force a node to an output pin. To force the node to the output pin, right click on the token of a running workflow node and choose either

1. **Force to Completed pin:** This will put the token on the green completed pin.
2. **Force to Error pin:** This will put the token on the red error pin.

When one of the option is chosen, a confirmation window appears and the action is logged in the project history.

Wait

Use this node to pause the workflow for a certain amount of time (for example to wait for a user action). The next node will start processing after the wait time is over.

Parameters

Release date:

By default, this is set to the current date (using the SmartName `[Current Date]`). You can change it using any SmartName that resolves to a date (not only the SmartNames from the **Date** category but also for example an **Attributes** or **Specifications** category SmartName resolving to a date).

Note: When using an attribute or specification SmartName, the attribute category must be set on the project in which you run the workflow, or the specification must be set on the workflow task. See [Project and Document Attributes](#) on page 292 in the Administration Guide for more details about attributes, restricted sets and attributes categories.

In **Days offset**, **Hours offset**, **Minutes offset** and **Seconds offset**, you can add a number of days, hours, minutes and seconds to wait after the **Release date**. For example, if you set the **Release date** to `[Current Date]` with an **Hours offset** of 2, the node will pause the workflow until two hours after the workflow was started.

You can use SmartNames in all these parameters.

Select **Count only working days** if you are setting the node to wait a number of days and you only want to count business days. For example, if you set it to wait two days and start it on a Thursday, it will start again on the Monday after that. This is selected by default.

Manually force the node to an output pin

Any user with **Change Task** rights can force a node to an output pin. To force the node to the output pin, right click on the token of a running workflow node and choose either

1. **Force to Completed pin:** This will put the token on the green completed pin.
2. **Force to Error pin:** This will put the token on the red error pin.

When one of the option is chosen, a confirmation window appears and the action is logged in the project history.

Task Types

A **Task Type** can be either **Manual** or a Task Type with a **Workflow**. Both types can be added to a workflow from the canvas.

The **manual** tasks require human intervention and they can be used as either individual tasks or as workflow nodes.

Editing a Task Type

You can edit a Task Type in a workflow by double-clicking on a node and specifying details in the **Edit Parameters** dialog. This dialog is task specific and has SmartNames-enabled tabs:

- [Parameters](#)
- [Specifications](#)
- [Due Date](#)
- [Iterate](#)
- [Notifications](#)
- [Output](#)

Note: Click the  icon to use SmartNames in this node.

Parameters Tab

The screenshot shows the 'Edit Parameters' dialog box with the 'Parameters' tab selected. The dialog contains the following fields and options:

- Task Type:** 2,1 Document Brief
- Name:** 2,1 Document Brief
- Description:** (empty)
- Status:** In Progress
- Update the Task if existing (otherwise add incremental number)
- Assignee:**
 - Select Role
 - Role:** Project Manager
 - Assign To:** One of Role
 - Select Group
 - Select User

Buttons for 'OK' and 'Cancel' are located at the bottom right of the dialog.

Fields	Description
Name	The name of the task.

Fields	Description
	<p>By default, the name will be derived from the Task Type.</p> <p>When a task is executed multiple times, the task name will automatically get the suffix _1, _2, and so forth.</p>
Description	Type in a fixed description for the task assignee.
Status	<p>The initial status of the node. By default, the drop down will have the following statuses:</p> <ul style="list-style-type: none"> • Created • In Progress • Completed <p>Note: It will list all the statuses configured in the task type. Read in: Add Task Statuses on page 833</p>
Update the task if existing	<p>By default, this is off. The task will create a new a task.</p> <p>Enable this to update the task if it already exists. If this happens, the task will get back from a completed status to an in-progress status.</p>
Assignee	<p>Specify the task assignee:</p> <ul style="list-style-type: none"> • Select Role (Default): • Select Group • Select User <p>Read more below:</p>

Task Type Assignments

- **Select Role** (default): You can select the assignee from a SmartName enabled drop down with all the roles in the system (visible to the current user):
 - **Project Manager** (default): The project manager of the project containing the workflow.
 - **Project Creator** : The user who created the project.

Note: In case the project was created earlier than 18.1 or when the project creator does not have access to the project, and the creation of task fails.
- **Sales Person:** The sales person of the project in which the workflow runs.

Note: The **Sales Person** should be invited to the project.

- **Workflow Master:** User/group/role to which the workflow is assigned (task assignee of the workflow task).
- All other configured roles visible to the current user.

Use the **Assign To** field to specify the iteration settings for the task:

- **One of Role** setting for creating and assigning one task for the role.
- **All of Role – One per Group** setting for creating and assigning individual tasks for each group / user in that role. Only one task is created and assigned per **group**.
- **All of Role** setting to create and assign individual tasks for each unique user in the role (including users in groups assigned to the role).
- **Select Group:** You can select the assignee from the drop down listing all the visible groups. Specify the **Assign To** field as:
 - **One of Group** to create one task assigned to the group.
 - **All of Group** to create and assign tasks for each user in the group.
- **Select User** from the drop down of all the users visible to the current user. The user should be invited to the project.

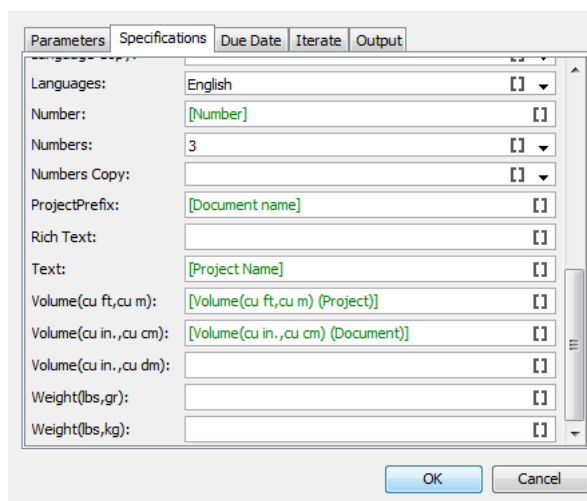

Note: The role / group /user should be invited to the project. If you are using a SmartName or free text, the resolved role / group name should be invited in the project.

Note: If the Project Manager or the Workflow Master is role / group, it follows the **Assign To** settings.

If your **Assign To** field settings create multiple tasks, the workflow will wait until all of these tasks are finished to progress to the next step.

Specifications Tab

Use this tab to set the values for the task specifications. These values can be either fixed values or selected using the SmartNames.

Note:

If you want to see the **specifications** in the **specifications tab** you should add them in the **task type**.

Output Tab

Specify the output documents in this tab. The fields on the Output tab are:

Fields	Description
Add as output	<ul style="list-style-type: none"> All task documents: Output all the documents that are attached. Only new task documents: This excludes all the task documents and the documents that were previously available. This results in the new task documents. <p>Note: If there are new versions, these are also considered as new documents.</p> <ul style="list-style-type: none"> No documents: Set no documents as output of the task.
Name	Filter the output document by name or document extension. For example, *_1.pdf files.

Iterate Tab

You can iterate task creation from a **Task Type** node. The **Task Type** node will create tasks depending on the **Iterator** value.

The default option is **Do not Iterate**.

To create multiple tasks over a **Project /Document attribute** or a **Task Specification**, select it in the **Iterate over Attribute** field.

You can select this **attribute** via a SmartName or by manually typing in the attribute. Based on the resolved value of this **attribute**, this node will create the tasks. For example,

- If the SmartNames resolves to a multi-value (text) attribute indicating languages, the node will create tasks based on the language variants. You will get the same result when you type in the attribute values.

For example, if you type in Dutch | Spanish | English, the iterator value will be "Dutch", "Spanish" and "English". As a result, there will be three new Tasks corresponding to each language attribute value.

For each **iterator value**, the node will create a task with the value of 'iterator value' filled in as the value for the corresponding parameters.

- If the attribute/task specification is **Integer** type or if the SmartName resolves to an integer or if you type an integer (for example, you type 3), the projects will be created based on these numbers.

For example, if the value resolves to 3, the iterator value will be 1, 2 and 3. As a result, this task type will create three new tasks.

Note:

- If the attribute is missing in the Project, you will get an error:

Attribute not found

- If the resolved attribute is empty, your error message will be:

Resolved iterate attribute value is empty

If you iterate over a project attribute or task specification, all incoming documents are added to the tasks.

When you iterate over a multi-value document attribute (for example, Dutch | Spanish | English):

- if the incoming document has two values for the Languages (the **Iterator**) attribute, Dutch and English, this document will be attached to the Dutch and English Tasks.
- if you have documents where this attribute is empty, they will not be added to the iterated tasks.
- if you have documents without this **attribute**, they are attached to all the created tasks. However, these documents will be transferred to the output pin (of the task type node) only once to avoid duplication.

Note: The output of this task type node will depend also on the [Output Tab](#) settings.

Tip: You can use the **Iterator Value** in combination with other node parameters such as **Role**.

If you select multiple assignees (for example, by selecting **All of Role**) for a task, the node will execute the **Iterate over an attribute** function first. Based on the Iterator value and **Assignee**, it will then create tasks for the multiple task assignees (**all of role** in this example).

This allows using the iterator SmartName in the assignee fields for roles and groups. Read in: [Parameters Tab](#) on page 933.

Notifications Tab

This tab allows you to create and send **Notifications** without adding a [Send Notification](#) node.

The configuration is almost the same as the [Send Notification](#) on page 915 node. However, there are extra SmartNames available in this tab to refer to the just created/updated task.

In the **To** field, type the e-mail addresses of the receivers or select them using SmartName . The following SmartNames are supported:

- Project Manager
- Sales Person
- Workflow Master (the project member who is assigned the whole workflow as a task in the project)
- Groups
- Users
- Roles (the e-mail will be sent to the current holders of this role in the project)
- Current Task Owner (E-mail). Filled in by default.

Note: This is not available in the **Send Notification** node.

In the **Subject** field, type the subject of the e-mail. The subject can be configured using SmartNames.

In the **Message** field, type the body of the e-mail. You can use the buttons and options at the top of the field to format your message.

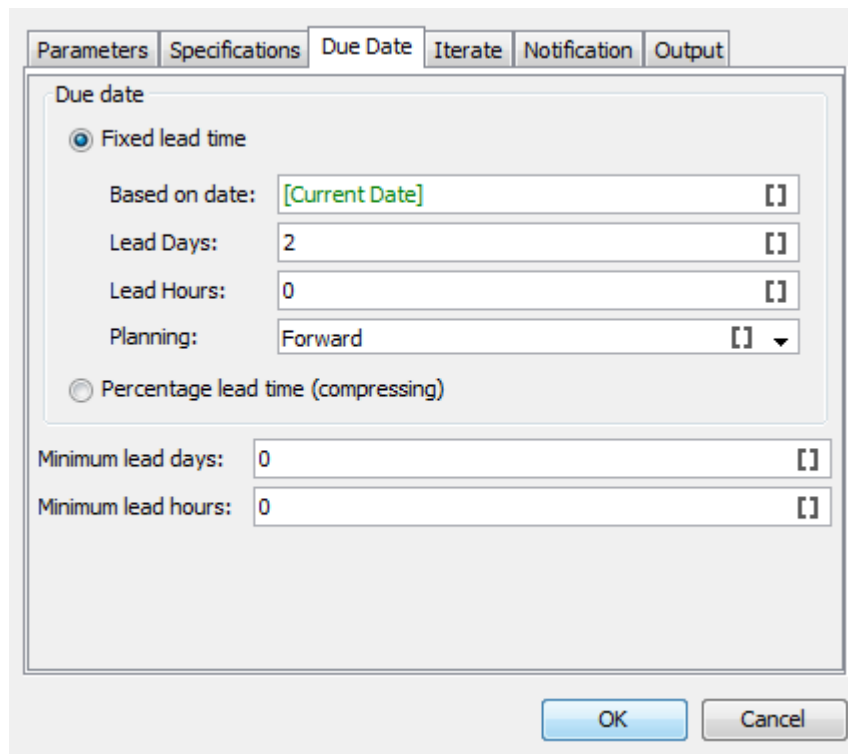

Tip:

- Click the  icon to use SmartNames (for example to add Attributes, a link to a Document, the Project name or a User name).
- Select some text and click  to create a hyperlink.
- Select the icons   to change the text direction from right to left or back when working with languages like Arabic or Hebrew. Use SmartNames **Link to Current Task** from the category **Links** and **Current Task Due Date** from the category **Date**.

Note: This is not available in the **Send Notification** node.

Due Date Tab

Due Date Tab

In this tab you can setup the due date by configuring the following fields according to your needs.

Fixed Lead Time

Specify the **Based on date** as the reference. This field is SmartName enabled and you can use values such as [Current Date], [Workflow Duedate], [Workflow start date] and any date-attribute as the reference.

Also specify the **Planning** as either **Forward** or **Backward**.

The **lead** time is added or subtracted to your reference date depending on this setting:

- If your **Planning** is set to **Forward**, the **Lead** days and hours are **added**.
- If your **Planning** is set to **Backward**, the **Lead** days and hours are **subtracted**.

Percentage Lead Time (Compressing)

Another way to specify the due date is by specifying the lead time in percentage. A percentage of the difference between the current date and the reference date.

The **Based on date** is the SmartName enabled reference date. Use [Current Date], [Workflow Duedate], [Workflow start date] and any date-attribute as the reference.

If your workflow due date is on 27th Thursday and the current date is the 13th,

- The number of days is calculated as 10 working days.
- If your percentage set as 20, the task will add two working days to the current date to calculate the **task due date**.

August 2015						
						1
2	3	4	5	6	7	8
9	10	11	12	13 Task / Sub-Task Execution date ¹	14	15
16	17 Task or Sub-Task due date ¹ based on Percentage Lead Time Compressing	18	19	20 Task / Sub-Task Execution date ²	21 Task or Sub-Task due date ² based on Percentage Lead Time Compressing	22
23	24	25	26	27 Project Due Date (Based on Date)	28	29
30	31	<ul style="list-style-type: none"> • The lead time is calculated based on the percentage=20 • 10 working days between the start date (13th) and the Project Due date. So 2 working days are added to the task execution date. • When the task is started on 20th, there are 5 workign days before the due date and task due date is the 21st. 				

Workflow Constructs

Workflow constructs are "tools", nodes that help you build the workflow. They help control the flow of data and/or documents through the workflow.

Data Splitter and Data Collector

Data Splitter

Use the **Data Splitter** if you want the next step in the workflow to process each file individually.

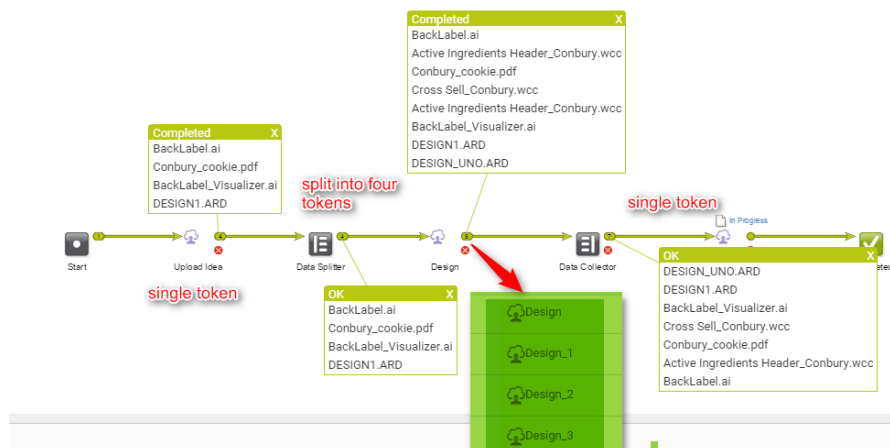

You cannot specify parameters for this node. When a *token* arrives with multiple documents, **Data Splitter** will be split them up as separate tokens with a single document.

Data Collector

Use the **Data Collector** workflow control

- to collect all files that travel separately as individual tokens in the workflow and then merge them before sending the group the next step.
- to wait for all files before continuing the workflow.

In the example below, four files arrive at the **Data Splitter** node and are outputted as four tokens with a document each. The **Design** steps (a task per token) collect the design documents and sends it to the **Data Collector**. This step outputs the processed files as a single token to the next step.

You can set the **Error Policy**:

- to **Fail when errors occur**
- or to **Ignore Errors**

Error Handler

The Error Handler node is a **workflow construct** with a single output pin. You can attach this to any other node.

Note: This node will not accept input connections.

When a workflow node has a failure, the system will check the error dot of the node. If this dot is NOT connected to anything, and there is an error handler node on the canvas, the system will put the token on the output dot of the error handler.

In the example below, if **Start Approval Cycle** fails because there is no approval setup:

- the **Error Handler** will check if the error pin of the node is connected to any other node. When the error pin is not connected to any workflow path, **Error Handler** will receive the error.
- the **Send Error Mail** node will send an e-mail to the person specified in this node.
- after the notification email, the token will be placed on the original node.

The person receiving the e-mail can then take action and retry the approval node.

Note:

- Do not connect the **Error Handler** node and its following nodes to the main Workflow to avoid unexpected results.
- You only can add one Error Handler node in your canvas.

Feedback from the Error Handler node

To know the source of the error, click on the output token of the node connected to the **Error Handler**. In the example below, the green output pin of the **Send Error Email** will show the error.

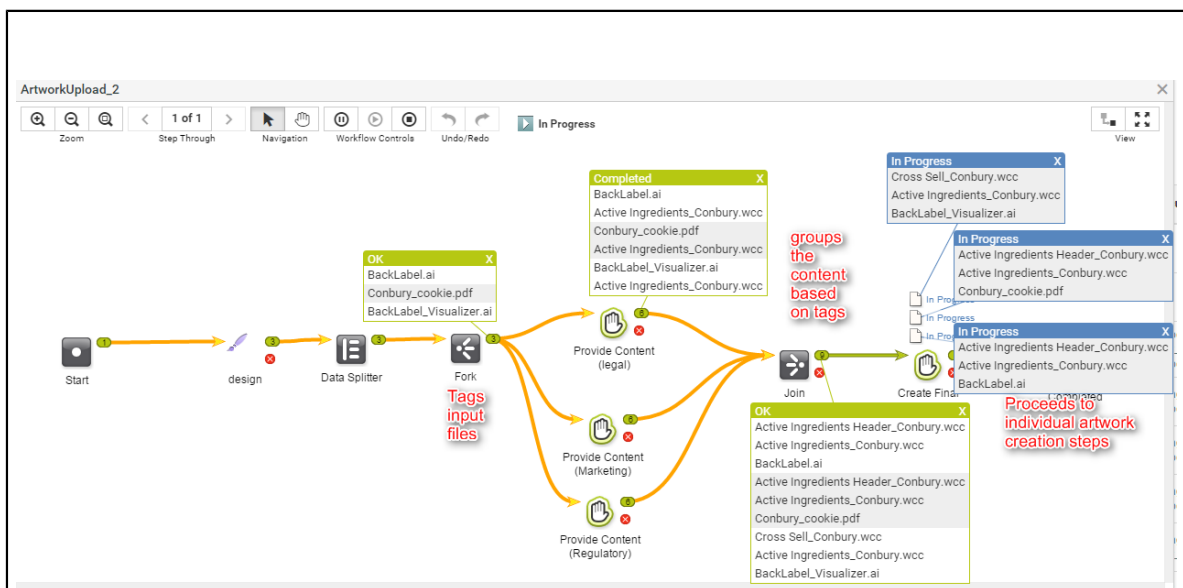

Fork and Join

The **Fork** step automatically tags

- every file running through it
- and all the files that those files are related to in the next steps

This creates a tag for the group.

The **Join** step then groups all the files with the same tag and outputs it together.

In the example workflow:

- the designer uploads packaging designs (three files). This task will send a single token of three files to the next steps.
- the **Data Splitter** separates them into three tokens
- the **Fork** node **tags** these three files separately
- each design file gets tasks for collecting its own legal, marketing and regulatory content. This results in 9 tasks to gather content.

- the **Join** node groups individual design files with related content using the **tags**. This step will result in three groups of files and three `create final artwork` steps.

Mark and Select

The **Mark** and **Select** nodes are used as a pair. You can use **Mark** to tag files in the workflow and use **Select** to select those files later in your workflow.

You can have several pairs of **Mark** and **Select** in your workflow. By default, the tags will be set as **tag-1**, **tag-2**, etc.

Mark

To specify your own **tag**, double-click the node and enter the tag in **Mark all incoming items with tag** field.

Select

You can use the drop-down in the **Select all items with tag** field to specify the **tag** for this node. The drop-down list will contain tags specified during the **Mark** step.

Router

The **Router** workflow control serves to automatically decide the route that your workflow (tokens) should follow.

When a workflow arrives at this node, the workflow will continue over one of the configured output pins based on the specified rules. You can also create SmartName powered rules for routing.

The screen shot above shows how to route a document through different paths depending on its **project attribute**. The router decides which department should approve the document based on this project attribute.

- These are the settings in the Router:

Route based on: Project Attribute	
Attribute: KRJA RES DW Routing Options	
<input type="checkbox"/> Case sensitive	
Project Attribute	Route to
is Marketing > NPD >Regulatory	Marketing > NPD >Regulatory
is Marketing > Regulatory	Marketing > Regulatory
is Regulatory (Only)	Regulatory (Only)
is No Approval Needed	No Approval Needed
no match	Error

The rules were defined based on the attribute values. The **Route to** names correspond to these values.

Note: The rules are executed from top to bottom. Their order can be changed with **Move Up / Move Down**. The last rule, **no match** will be applied when the other options are not applicable. This will result in **Error** or a custom label.

Routing can be based on many different criteria (see the list below).

You can make all of them except the **Project Status Case sensitive**. Enable this option to match the exact case.

Note: The leading and trailing spaces are always ignored.

Adding and deleting rules

You can **Add** or **Remove** rules. Use the options on the right hand side.

To **Add** a rule:

1. Click the **Add** button. For each additional rule another output dot is added to the node.
2. A new line appears under the current selected row (**no match** always stays at the bottom of the list). Select the operator and value for your rule.

Note: The name of the output will be the same as the matching value by default. However, you can edit the name.

3. You can choose **Move Up** or **Move Down** to change the order of your rules, except for the **no match** rule. The **no match** rule stays at the bottom.

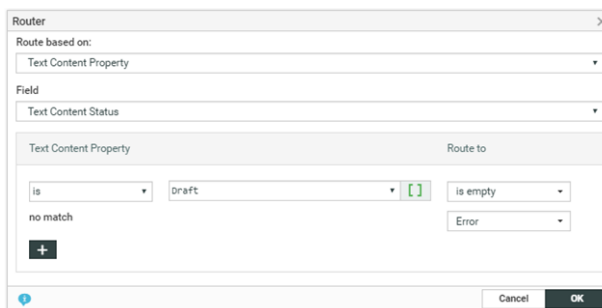

Tip: You can also set the same output token for multiple rules. To do this, select the same from the drop down The node will then have less output dots than there are rules.

To **Remove** a rule:

1. Select the rule you wish to remove.
2. Click the **Remove** button.

It is not possible to delete the **no match** rule.

Routing on Text Content Properties

Routing on Text Content Properties can be setup during execution, when setting main routing dropdown on Text Content property, the Field selector allows following values:

Depending on the Text Content property, different options appear in the rule.

The **Text Content Fields** become available only if PCM license is enabled:

- **Text Content Status** : this is the overall status of a Text Content document. Options available are Draft and Signed Off
- **Text Content Element Status**: This is a status of a particular language that needs to be selected from language drop down. Options are Draft, Pending Sign off, Signoff Rejected and Signed off.
- **Element type**: All the Text Content element types supported in the system
- **Approval Type**: Default, All of role, one per group and One of role.
- **Invariant**: True or False

- Note:**
 Two rules apply to text Content Properties:
 - Is valid if the Text Content Property value equals the value in the drop down field of the rule
 - Is not valid if the Text Content Property does not equal the value in the drop down field of the rule.

- When a workflow comes in router having Text Content Property rules, the incoming documents will be checked and put on the corresponding output pin as per the routing rules. If you have multiple documents coming in, each of them is routed and put on the right pin.

Anomaly Handling: If there are no input documents, a **No Input Documents** error is put on the error pin. If the Text Content Property cannot be found (for other type of documents), a **Text Content Property not found** error is put on the error pin.

Routing on Project Field

Route based on Project Field

Route based on: Project Field

Field: Project Name

Case sensitive

Project Field	Route to
contains Designl	Match
no match	Error

Buttons: Add, Remove, Move Up, Move Down

Field list	As an example, use this to...
<ul style="list-style-type: none"> Project Name Project Description Project Manager Sales Person Customer Name Customer Location 	Decide which part of the workflow to follow based on naming conventions of the project name. Note: Use SmartNames to make the rules dynamic.

Routing on Project Status

Route based on Project Status

Project Status

is 1.1 PCOLLECT approve release complete

no match

Route to

1.1 PCOLLECT approve release complete

Error

Buttons: Add, Remove, Move Up, Move Down

When a workflow comes in a router checking on project status, the status of the project in which the workflow runs is checked at that moment and matched against the values in the rule list.

Field list	As an example, use this to...
<p>Project Status</p> <p>Choose from:</p> <ul style="list-style-type: none"> All project statuses (Select from the drop down containing all the statuses including the custom ones.) 	<p>assign a different path depending on the status. For example, 'Design' versus 'Correction'.</p>

Routing on Project Attribute

Field list	As an example, use this to...
All attributes in the system	Decide where to go based on the value of an attribute 'Project Type'.

Routing on attribute values

When you configure the routing based on the attribute values, the behavior depends on the **attribute type**.

For **Text** attributes:

- Is empty:** applies when the attribute is not filled out.
- Is Equal To:** valid if the **attribute value** equals the value in the input field of the **rule**.
- Is Not Equal To:** applies if the **attribute value** equals the value in the input field of the **rule**.
- Contains:** applies if the **attribute value** contains the specified **rule** value.
- Does not contain:** applies if the **attribute value** does not contain the specified **rule** value.
- Matches:** applies if the **attribute value** matches the specified **rule** value. This value can contain wildcards and regular expressions.
- Begins With:** valid if the attribute value begins with the **rule** input.

Note: Leading spaces are ignored.

- Example: Attribute value = Sales Belgium and the rule says [Begins with] "Sales".
- Ends with:** Similar to the **Begins with** option. The rule applies if the attribute value begins with the **rule** input.

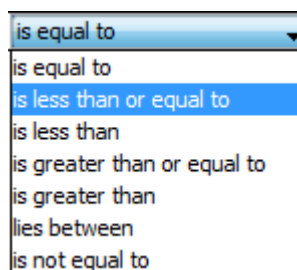

Note: Trailing spaces are ignored.

For **Restricted Sets** and **Cascading Attributes**:

- If the selected attribute is a restricted set, the rule options will be limited to **is** and **is not**. The input field will have a drop down list with the restricted set values.
If your restricted set is a check box, the unchecked value resolves to **no match** instead of no.
- The **cascading** drop-downs defined by a list will be treated as text attributes, not as restricted set attributes.

For **Numeric Attributes** (integer, float, weight, dimensions...):

The rule drop-down now has the following options:

You can specify one or two floating point values in the input field.

Note: When you specify **lies between**, the lower and upper limits will be taken in. For example, 4 lies between 4 and 6. To exclude 4, type in 4.00001 (or 5 for an integer attribute).

When a project does not have the selected attribute (not part of the attribute category), the router will always take the **no match** route.

For **Multi-value Attributes**:

If you are routing based on a **multi-value attribute**, the values are compared individually to the specified rules.

For example, if your "Packaging Type" attribute has values:

- Label | Folding Carton

and the **rules**:

- 'is equal to Label'
- 'is equal to Folding Carton'

the **router** will have two outgoing pins with tokens.

Using SmartNames:

If your rule value is a SmartName that resolves to a multi-value attribute, the rule is evaluated as "OR".

If your packaging project has a language attribute with multiple values, you may want to use this to filter the documents (language variants with a Language attribute) to direct them through different paths. To do this:

- Configure your **Router to route based on Project Attribute** Languages.
- Configure your rule to specify Languages (Document)

If your **project attribute** "Languages" has the the value "English", the router will select documents with the attribute (a multi value attribute with values as different languages) that resolves to the value "English".

If the **document attribute** values are English and Dutch, the rule will be evaluated as:

- Project "English" is Document "English" OR
- Project "English" is Document "Dutch"

In this example, the router will direct all the documents with "English" to the first output pin and the others with "Dutch" to the **no match**.

Routing on Document Reference Attributes: If you are routing on **document reference attributes**, the router will treat it like text attributes. If you have a multi-valued document references, it is possible to route based on the referred documents. It will route based on the **document name** of the references.

Routing on Reason(s) for Rejection

You can use the router to redirect the workflow based on the reasons selected for rejection. The router only routes on the reasons for rejection of the latest approval stage.

Router

Route based on:
Reason(s) for Rejection

Handle Reasons Separately

All rules operate on the string 'reason @ category'

Reason(s) for Rejection		Route to
is equal to	Base Artwork reference incorrect @ Briefing []	Base Artwork referer
contains	Text does not fit container []	Text does not fit con
matches	Incorrect Languages @ Legal Text []	Incorrect Languages
begins with	Missing []	Missing
ends with	Specifications []	Specifications
no match		Error

You can choose **Handle Reasons Separately** to ensure each rule is checked against the rules separately.

Reasons chosen for rejection may be in different categories and you can route the documents specifically on a particular category of the reason. To do so, specify the rule as 'reason @ category'.

Routing on Document Name

Route based on: Document Name

Case sensitive Include the file extension

Document Name	Route to
contains .ard []	Design
no match	Error

Field list	As an example, use this to...
<p>Note: Select Include the File Extension if the entire document name has to be checked for.</p> <p>Otherwise, the extension is parsed off before doing any comparison.</p>	<p>Decide where to go based on naming conventions of the incoming document.</p> <p>Your incoming documents will be routed and put on the right pin based on the name.</p> <p>Example: If you have three documents "A.jpg", "B.jpg" and "C.png" with two rules "contains jpg" and "contains png",</p> <ul style="list-style-type: none"> the two .jpg documents will be in the output pin .jpg. These two will follow the workflow together and the .png document will be in the .png pin. <p>If you are including the file extension, you can check for types of files using ends with rule.</p>

Routing on Document Attribute

Field list	As an example, use this to...
<p>All attributes in the system</p>	<p>Decide where to go based on a document attribute such as "Packaging Type" which can have values like Label, Folding Carton, Corrugated Box, etc..</p> <p>The incoming documents will be checked for the specified attribute and will be moved to the right pin based on the first matched rule.</p> <p>If you route on a multi value attribute of the document, that document can occur on multiple output pins (each value is evaluated separately, which is in line with routing</p>

Field list	As an example, use this to...
	on a multi value project attribute or task specification.

Read about using different types of attributes and **SmartNames** in [Routing on attribute values](#) on page 949

Routing on Workflow Specifications

Field list	As an example, use this to...
All specifications of the workflow task (so not all specifications in the system).	Decide where to go based on decisions taken earlier in the workflow and saved in the workflow's task specifications.
Note: If you want to see the specifications , you should add them in the task type .	For example, you can use Set Workflow Specification node first to set the specification values and use them in the Router later on in the workflow.

Routing on Text Content Properties

You can route your Text Content statements according to their **Text Content Property**.

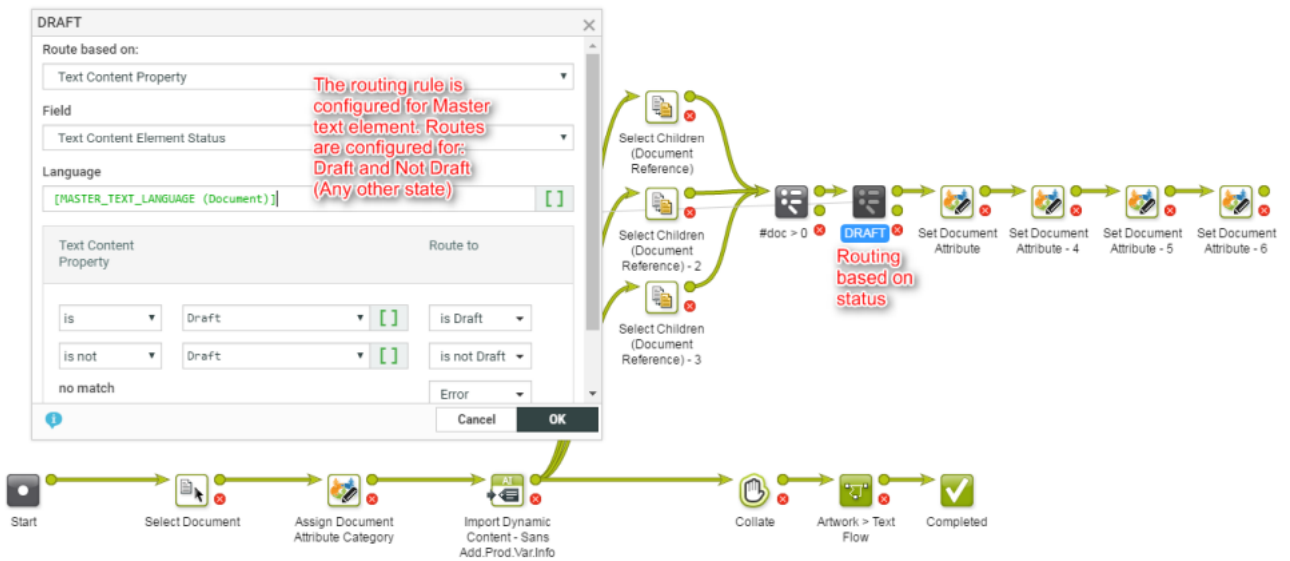

When a workflow arrives at this node, this step will filter the statements and documents based on the Text Content Property and route them based on the rules.

When you select **Route based on Text Content Property**, you have the following options:

Text Content Status

This is the status of the overall document including the individual language statements. You can route based on whether the document is in **Draft** state or is **Signed Off**.

You can add one **Language** parameter in the node. In this example, the `Master Language` SmartName is used.

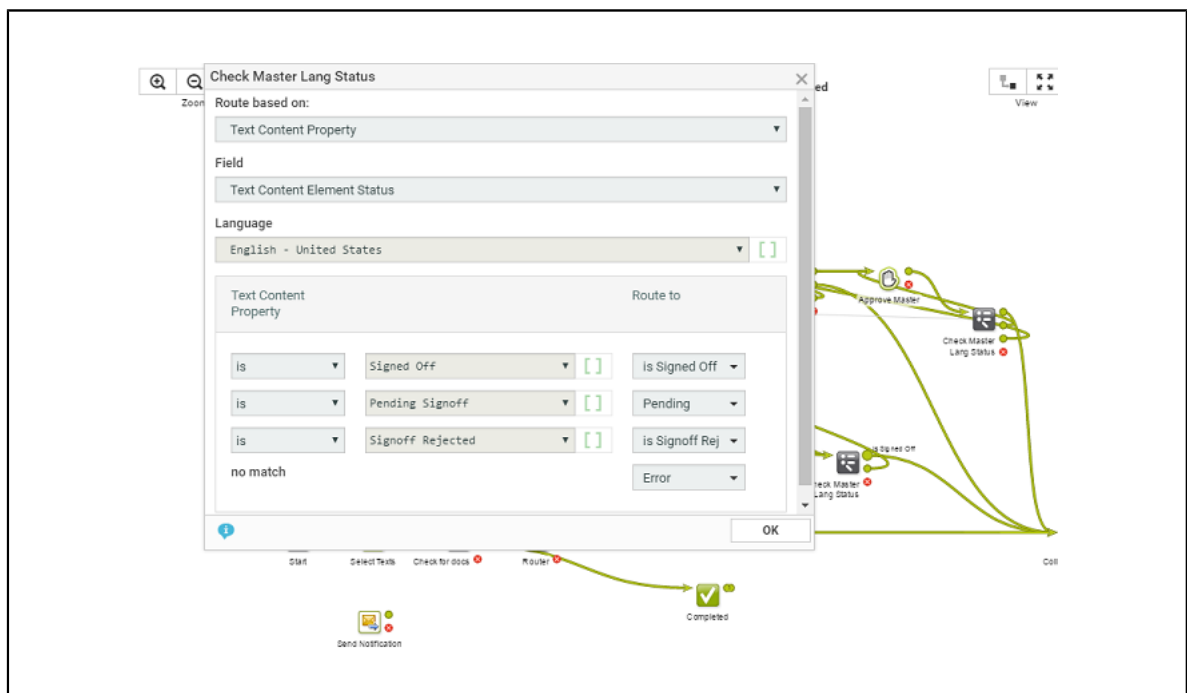

In the example above, the routing step:

- redirects **Draft** documents to Set Document Attribute step.

Text Content Element Status

This is status of a particular language Statement that needs to be selected from language drop down. You can route based on:

- **Draft**
- **Pending Sign-off**
- **Sign-off Rejected**
- **Signed Off**

In this example, the **Router** routes the Signed off elements to the next step, whereas the other elements are sent back to the editors.

Element Type

All configured Element Types are available and you can create routing rules based on a type. For example, you can route all `Warning` statements to Legal Approver.

See the example screen shot below.

You can route documents based on it's **Approval Type**. Configure the routing rules based on the fields below.

- **Default**
- **All of Role – One per Group**
- **One of Role**

Invariant

To route documents based on whether translation is needed or not, you can use the **Invariant** parameter.

In the example screen shot,

- the documents marked as **Invariant** =True are routed to Completed.
- the documents marked as **Invariant** =False are routed to the Translation flow.

Stop

Use the **Stop** node to stop the workflow before being completed. When a workflow token arrives at this step, it stops the workflow.

Note: The task status will be set as **Completed** if at least one route of the workflow gets completed. If none of the workflow routes are completed, the workflow will end in error state.

Statuses

Use statuses node to give the workflow task in the project the desired status. The workflow task can have any of the statuses defined in the Task Type it was created from.

This means that you need to:

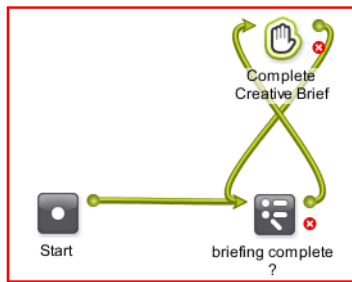

1. think about which statuses you need before creating the workflow,
2. ask your Administrator to create them if they don't exist in the system yet,
3. add them to the Task Type you want to create the workflow from (see [Add Task Statuses](#) on page 833),

and then create the required workflow.

If you didn't add any particular status to the Task Type, the workflow will only have the **Completed** status node.

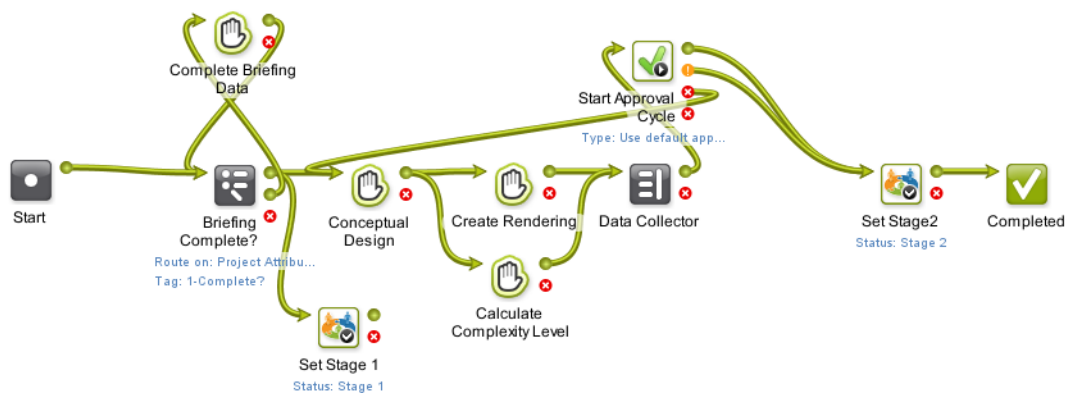

Workflow Example

The example below describes a workflow from the **Start** node to the **Completed** state.

The *Router* (in the example renamed as `Briefing Complete?`) in the workflow will verify if the briefing is completed.

- It checks if all specified Project Attributes are filled out. If it is all completed, the workflow will continue to the **Conceptual Design** node.
- If the Project Attributes are not all filled out, a manual task **Complete Briefing Data** is created and will be assigned to its assignees.
- In the **Conceptual Design** phase, the workflow takes parallel paths. When one of the tasks is completed its token moves to the **Data Collector** node. The Data Collector will wait for the two tasks to complete and send the tokens to the **Start Approval Cycle** step.
- Depending on the outcome of the **Start Approval Cycle** step, the workflow moves forward or sends the token back to Design phase.

When the workflow is **Completed**, it will show up as completed in the **Project > Tasks** list. All tasks that were created during the workflow will show up as subtasks of the workflow task.

Working with Workflows

Note: A workflow can be started by Administrators, Project Managers and people with the **Change Task** right in the Project.

The workflow starts when its task in the Project (created from the workflow task type) is put in an active status (typically **In Progress**).

Workflow Feedback and Actions

Viewing the Workflow Feedback

You can view a workflow's feedback from **Project > Tasks** page. To open the workflow feedback page either:

- hover over the task name and click the **Workflow**  icon.

Tip: You can use the **Edit** button to access the [Workflow Editor](#) and edit it.

- or click the **Show Active Nodes**  and **Expand** the mini Feedback view.

Tip:

Show Active Nodes View zooms to the currently active node(s). If there are more nodes use the **Step Through**. Read below in [Troubleshooting tools](#) on page 960.

Undo/Redo

▶ In Progress
PCM Create Artwork

Note: When the workflow is not running, all controls are disabled.

In the toolbar of the workflow editor, you will see:

- [some of the workflow tools](#),
- controls,
- the status of the workflow,
- the name of the Task Type,
- and view tools.

Read more below:

The following workflow statuses are self-explanatory.

Workflow Controls

- Use to **Hold Workflow**
- Use to **Resume Workflow**
- Use to **Cancel Workflow**

Note: These actions can be performed only on Active Workflows.

Read more about [Pausing and Resuming a Workflow](#) on page 961.

Troubleshooting tools

- Use to **Highlight** the Active Nodes and Error Nodes. The workflow fades out everything else.
- Use to **Step Through** all active or nodes in error state by zooming into them one by one.

Stepping into Sub-workflows

When you have embedded workflows, you can step into a sub-workflow from a master workflow's canvas. To do this:

-
- Right-click on the **In Progress**

Right-click on the token above the sub-workflow node or on the sub-workflow node itself. Select the **Step into Workflow** option from the context menu.

CTRL+Double-click on the token above the sub-workflow's task node or on the node itself.

To access the master, click on the link from the top right corner of your subworkflow.

Note:

- This is only possible when your master workflow is in progress.
- You can use your browser's Back and Forward buttons after you step into the sub-workflow.

Pausing and Resuming a Workflow

The administrators, project managers and users who can edit tasks can pause the workflow by clicking the **Hold** . The tokens (in a node) that are in progress will be paused after they finish.

Note: The workflow status will change to **in Hold**.

To resume the workflow, click the **Resume**  button. This control becomes active only when a workflow is paused. This will move the tokens to the next step in the workflow.

Tip:

You can try holding and resuming to get out of workflow "hangs".

After resuming, the workflow status becomes the current status.

Cancel a Workflow

A user with task edit rights (Admin, Project Manager and members with task edit rights) can

Cancel  a workflow in progress.

The ongoing workflow tokens will be cancelled and these will be moved to the error pin.

Note:

- Stopping a workflow will delete all the subtasks that are not completed yet.
- The **status** will change to **Workflow cancelled**. This is logged in the Project History. A canceled workflow will always show the task status as canceled regardless what is already completed. You have to enable **Include in Project History > Workflow Canceled** to include the cancellation events in the Project History.

Solving a Workflow Failure

When a node goes into failure, you can either:

- **retry** the failed node after correcting the cause of failure,
- stop the **workflow**,
- **relaunch**(first, correct the cause of the failure) the workflow.

Note:

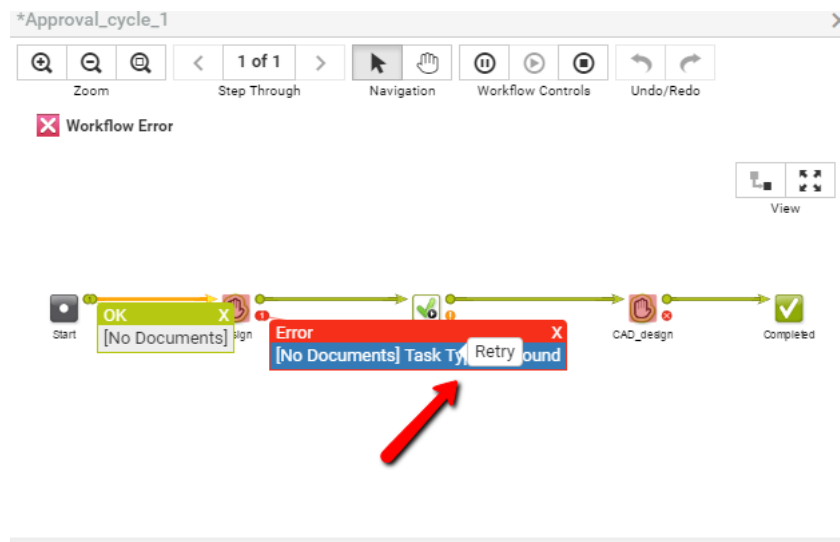

- We recommend you use the *Error Handler node* for troubleshooting your workflow.
- When a workflow has more than 5000 tokens (for example documents traveling through it), it will be canceled and reported in the Project History. This typically happens when the workflow is stuck in an endless loop.

Retry a Workflow Node

If your workflow failed due to an issue (for example a missing approval setup) and you have corrected the problem, you can **retry** the workflow.

Right-click on the failure icon (the red ellipse) and right-click again to **Retry**. Do this after you have fixed the issue that caused the workflow failure.

Note: The **Retry** is accessible when the user has Task edit rights

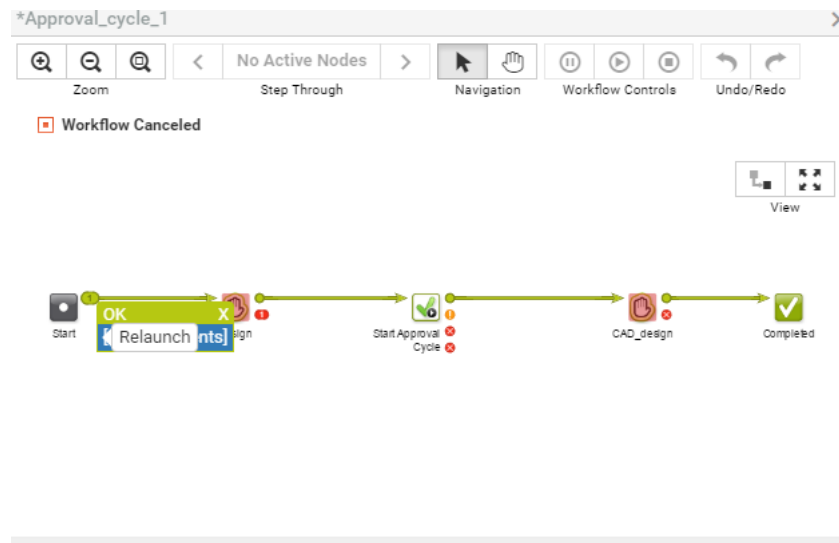

The remains to indicate the workflow's history.

Relaunch a Workflow at a Certain Point

A user with task edit rights (Admin, Project Manager and members with task edit rights) can right-click on any output token with a number and **relaunch**.

This will re-create a new workflow task that is similar to the task that gets relaunched.

Note:

1. The workflow needs to be stopped first (see [Cancel a Workflow](#) on page 961).
2. This only works for first-level workflows, not for workflows which are already started from another workflow.

Note: When a workflow is re-launched, WebCenter automatically makes sure that any dependent tasks will depend on the new workflow task, rather than on the cancelled one.

4.16. Packaging Content Mangement in WebCenter

4.16.1. Introduction to Packaging Content Management in WebCenter

WebCenter Packaging Content Management offers a simplified platform for creating, translating, approving and managing text / copy assets.

The Packaging Content Management module offers:

- a repository / library for your text content with GS1 tagging
- re-use of your content across multiple projects
- support for a translation based or single language workflow.
- export to and import from industry standard formats
- ability to view and edit your text in the context of your artwork in the WebCenter Viewer.
- a complete approval workflow

- established content rights facilitating the ownership at different stages

4.16.2. Working with Text Content

With the right *permissions*, you can edit, start approval or approve in all the following pages:

- *Text Information* tab. Here you can only view and perform actions on the single text document and its elements.
- In Copy Sheet (Text Document References) attached to an Artwork or a Project. You will have a view of multiple text documents. You can perform actions on their Master or Translation Elements. Read more in: *Creating a Copy Sheet* on page 379.
- In a Task Document Rendering. Here also, you can view and perform actions on Master or Translation Elements of multiple text elements.
- In the Viewer Text Content Widget. You can perform the same actions, but you can use viewer filters to filter text content. Read in: *Viewing Text Content*

Text Document Details

When you click on a Text Content Document Type icon, the **Document Details** will have the **Text Information** tab with the following sub-tabs:

- *Text Content*
- *Role Mapping*
- *Compare*

The screenshot displays the 'Text Information' tab within a 'Document Details' view. The top navigation bar includes tabs for 'Text Information', 'Document Information', 'Approval', 'Action History', 'Annotations', 'Projects', 'Attributes', 'References', 'Characteristics', 'Discussions', and 'Test doc view'. Below this, sub-tabs for 'Content', 'Role Mapping', and 'Compare' are visible. The main content area is divided into sections: 'Preparation instructions' with fields for 'M' (Master) and 'T' (Translation) and their respective language flags; 'Master Text' which lists 'English - International' and 'English - United States' with associated text content and editing icons; and 'Translations' which lists 'Dutch - Belgium' and 'French - France' with editing icons. A link at the bottom indicates 'Show languages which are not part of the Project.'

Text Content Tab

The **Text Document > Text Information > Content** tab displays all the content of the document along with its classification and languages. To **Configure Content**, click on the  (gear) icon to expand and view the following info:

- **Element Type**
- **Approval Setup**
- **Type** of Text
- **Character Limit**
- **SmartText Search**
- **Auto Suggestion**
- **Allow Inherit content**
- **Inherit Content from**
- **Invariant** or not

Note: When you (as the Content Manager) change the text type, the Text Statements affected by this change will be put into **Draft** status.

- **Languages:** The Master and Translation languages will be listed here. You can see the language flags and the respective names.

Note: If the language selected is typed from right to left like Hebrew or Arabic, the text is displayed or edited right to left.

	Packaging claim	M:  	T:  			
Element Type	<input type="text" value="Packaging claim"/>	Master Language	 English - International			
Approval Setup	<input type="text" value="Default"/>	Master Language	 English - United States			
Text Type	<input type="text" value="SmartName"/>	Translation Language	 Dutch - Belgium			
SmartText Search	<input type="text" value="pcm_ss"/>	Translation Language	 Dutch - Netherlands			
	<input checked="" type="checkbox"/> Enable Auto Suggestion	Translation Language	 French - France			
	<input type="checkbox"/> Make this an Invariant Document					
	<input checked="" type="checkbox"/> Allow Inherit Content					
Inherit Content from	<input type="text" value="English - United States"/>					
Character Limit	<input type="text" value="100"/>					

Read more about the concepts in: [Basic Concepts](#) on page 463.

Working in the Content Tab

You can perform Text Content related actions in this tab if you are a Content Manager / Editor / Approver or Add Language permission. You can perform the actions for which you have permissions enabled.

If you are a **Content Manager**, you can do the following:

- Select the **Element Type** of the Text Document.

Note: The **Element Type** drop down is configured as a [List](#) and is only editable by Content Managers. The regular users will see only the specific **Element Type** of the document as a label.

- Select the **Type of text:** Text can be Simple, Rich text, or Smart Name. When you choose the text type as a Smart Name, you can view the **SmartText Search** field.

- **SmartText Search** drop down displays all the saved searches for the text content document type. This field is optional and can be left blank. Read more in [Create Smart Text in Text Content](#) on page 967.

You can resolve the Smart Content (containing both SmartName and SmartText) by clicking  or saving the document.

- **Enable Auto Suggestion:** Suggests when you type the text content. This option is enabled only if SmartName is chosen in the Type.
- **Character Limit:** You can set the number of characters that are visible in the widget. Warning message will be displayed if the limit set is exceeded.
- **Make this an Invariant Text Document:** Enable this, if translations are not required for a particular Text Document. For example, Brand Names.

Text documents can have only one master language, when the document is marked as invariant.

Note: Invariant content which existed prior to 18.1 and has more than one master language, will become non-invariant.

- Define the **Approval Setup:**
 - **Default:** Only one member has to approve. For example, if the Approver permission is assigned to two Roles, only one member (from any Role) has to approve.
 - **One of role:** One member of each Approver Roles (assignees) has to approve to complete the signing off. In case a Role is assigned to several members (groups or users), any Group member or user from that Role can approve.
 - **All of Role – One per Group :** At least one member from each Role-Group has to approve. If there is an individual User, then he or she has to approve as well.
- [Add or Delete](#) Master and Translation Languages

This list will contain the document's selected languages. You may have more languages to add from if they are present in the Project's Attribute Category.

If you are an **Editor** or a **Content Manager** with Editor permissions, you can

- Modify text and save changes
- Edit content and start Approval in the text widgets if you are an Editor. Read in: [Editing Text Statements and Starting Approval](#) on page 976.
- Start Approval or change the status back to Draft.

An **Approver** can:

- [Approve or Reject Text Content](#)
- [Add new Comments as an Approver/Editor](#)

A user with **Add Language** permission can add specific languages for which permission has been assigned.

Note:

- It is important to click **Save** after every action to save changes to the status element. A new document version is created after each **Save** action. You can view these changes in the Document's **Action History** page.
- The older versions of the Text Content Document are displayed as read-only (even when you have the right permissions). To **Reload latest version**, click .
- **Tip:** There is no direct way (even as the Content Manager) to change the status of the **Signed Off** Text Documents. Only an Admin user can make this change.

Create Smart Text in Text Content

Smart Text can be created for text contents which are reused frequently. The referenced Smart text content may be within the same project or could be in multiple projects.

Changes made to the referenced text content in any one of the project, creates warning message wherever the document is referenced in other projects. Although the text content is updated, the approval of the text content has to be done in each project. This allows flexibility to retain the old version of the text content or to update to the latest version.

Getting Started with Smart Text

Ensure you have a:

- Saved Search configured with text content which is chosen as a Reference Source.
- Document reference attribute named SMART_TEXT_REFERENCE added to the text content document.

Add Smart Text by Clicking

Smart Text can be created by any user with Content Manger or Editor Permissions.

When user clicks on  icon, configured Saved Search results chosen in **SmartText Search** Field is shown to the user in a pop-up.

User can select one or multiple Text Content documents to add. Selected documents are shown as Smart Text in the Text Content editor. If saved search is not configured, or Reference Source is not chosen, then Smart Text cannot be added.

Add Smart Text by typing text in Text Content editor

Select **Enable Auto Suggestion** to get prompts automatically when you type in the text content box. Minimum of four characters should be typed for the search to be performed. You can choose any one of the text content from the list of suggestions shown. Selected Text Content is shown as **Smart Text** in the editor. Auto suggestions are not shown, if no matches are found for the text keyed in. You may add any number of Smart Text in the text content editor.

Note: If saved search is not configured, then auto suggestions are not shown even if the **Enable Auto Suggestion** is selected.

Resolve Smart Content

The Language statement's smart text will be resolved automatically on save of the document.

Alternatively you can also click  to resolve the Smart Content that are added to the text content editor.

Note: When Smart Content gets resolved in any language, other statements following that language are resolved automatically.

For Example, if **French** and **Dutch** languages are following **English** language text, while resolving **English** both **French** and **Dutch** language contents are also resolved.

Warning messages will be displayed when the Smart Text:

- added are resolved and it contains no text
- is empty or is broken
- character limit set is reached
- is not resolved although the user has permissions
- are not of the latest version and reference is made to an older version of the text document. You can click on the Smart Text, where the user can optionally update to the latest version.

Copy Smart Content

SmartText Language

When a SmartText is added, by default current language is selected for the SmartText. You can change from current language to any of the Master or Translation language by clicking on the SmartText pop up window.

A language inherits content from another language:

- If the source language in the SmartText language is configured to current language, then the inheriting language will get content for its own language
- If the source language SmartText language is configured to a specific language, then the inheriting language will get the same content of the source language

Approve Smart Content

Smart content has to be resolved before the element is approved.

Delete Smart Text

You can delete Smart Text in the text content editor. On save, the text content is removed from Document Reference attribute also.

Smart Text pop-over

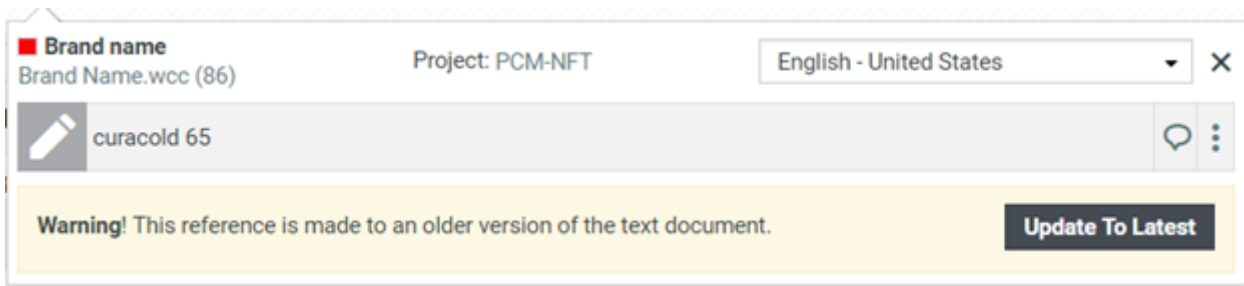

You can click on the Smart text to view the referenced content in a pop-over.

Pop-over contains the following:

- View of the referenced content
- Document Name along with the Version
- Project Name where the referenced content is present
- Language selection drop down, which allows you to change the smart text language to any of the available language in the current project.

When you copy smart content from one language to another, all available translations are also copied.

- Warning message if the referenced text is not the latest version and an option to **Update to Latest**.

Note: You cannot revert back to the previous version if you update the referenced text.

Role Mapping Tab

Role Mapping

This tab displays all the permissions enabled in the Text document.

Manage Permissions

Content Permission	Language	Role	Assignee(s)
CONTENT MANAGER		MARKETING	Varghese, Shalet (SKVA)
EDITOR	English - United States	LANGUAGE EDITOR EN-US	
EDITOR	Dutch - Belgium	LANGUAGE EDITOR NL-BE	
EDITOR	English - Ireland	LANGUAGE EDITOR EN-IE	
EDITOR	French - Canada	LANGUAGE EDITOR FR-CA	
EDITOR	French - France	LANGUAGE EDITOR FR-FR	
EDITOR	Greek	LANGUAGE EDITOR EL	
EDITOR	Italian - Italy	LANGUAGE EDITOR IT-IT	
EDITOR	Portuguese - Portugal	LANGUAGE EDITOR PT-PT	

In this tab, you can see:

- the **Content Permission**

Note: **Content Manager** is not associated with any language.

- the **Language** relevant for each permission. For the **Editor** and **Approver** permissions, the language is listed.
- the **Role** assigned to each permission. The **roles** will be links if you are a **Project Manager** or an **Administrator**.

Note:

- The **Roles** list will have links only if these roles are invited to the project and exists in WebCenter.
- If you do not see **Roles** as links, check if you are looking at the latest version of the document. In older versions, this data will be read-only.

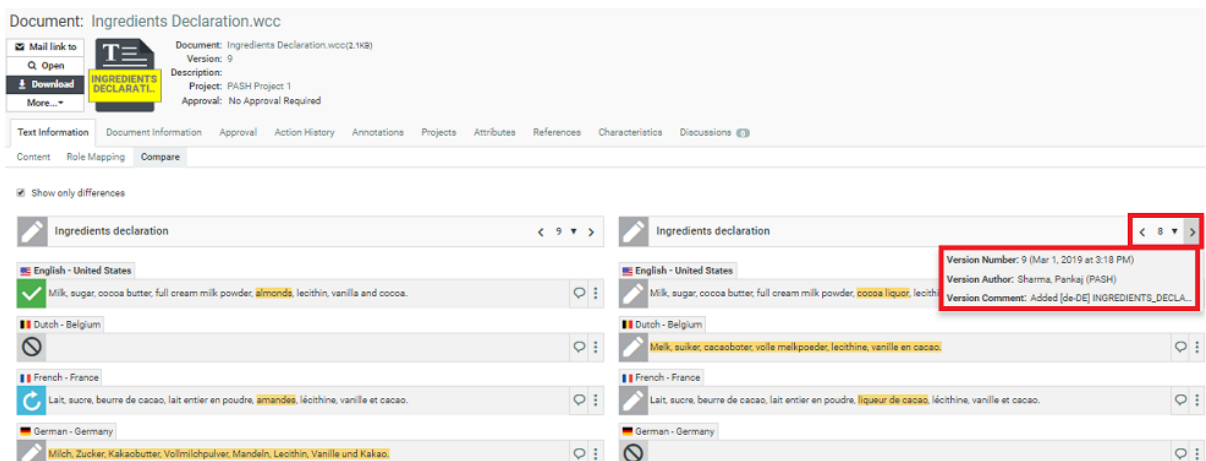

- the **Assignees** (Groups or Users) assigned to a particular **role** with a certain permission.

Compare Tab

You can now compare different versions of the same document in the Compare tab in read only mode. This allows you to view the differences between two selected versions of the same text content document.

You can navigate from **Document > Text Information > Compare** . This tab is divided into two parts where, two versions of the text content document is shown side by side. By default, left side block is loaded with the current version of the document and the right side block is loaded with previous version with clear indication of differences.

Note: If the document has only one version available, then the right side block is empty.

A drop-down is provided on the header of the both blocks to change the version of the document to compare. Navigation arrows are provided to go to the next or previous versions of the document. Hovering on the drop-down option or on the navigation arrows displays the Version Number along with the modification date, Version Author, and Version Comment in a pop up window.

You can expand to view the content properties by clicking on the header and both versions are shown simultaneously.

Selecting **Show only differences** option shows only the languages which have some difference in the text content and languages not having any differences are hidden.

When a language is not added in one of the compared version and is available in the other version, then the language widget is shown as not added.

Note: Compare is done only on the content of the two versions of the document and not on the settings.

Managing Text Permissions

Ensure that:

- you have invited the right **Roles** in your **Project** or **Template** with the Text document.
- you have added the Master and Translation Languages to the Project's Attribute Category to configure Language specific Editor and Approver permissions. It is important to do role mapping in a *smart way*.
- you have enabled the right *Preferences*.

If you are a **Project Manager / Admin**, you can manage and assign content permissions.

Note:

A user without any of these permissions can only view (depending on the view permissions) the text content documents.

1. To manage Permissions, go to the **Document details > Text Information > Role Mapping**.
When you click on a Text Content Document Type icon, the **Document Details** will have the **Text Information** tab with the following sub-tabs:
 - **Text Content**
 - **Role Mapping**
 - **Compare**
2. Click on **Manage Permissions**. This will open up the **Role Mapping** page.
3. Click **Add Permission**. Repeat this for as many permissions as you want.

Content has changed since last Save.

Save Cancel

For each Content Permission, select the Language. If the '[ALL OTHER LANGUAGES]' option is selected under Language, SmartName is applied automatically to derive the Roles (if Role is not selected).
[Click here to Manage Roles](#)

Content Permission	Language	Role
CONTENT MANAGER		PCM_CONTENT MANAGER
EDITOR	[ALL OTHER LANGUAGES]	PCM_CONTENT MANAGER
APPROVER	[ALL OTHER LANGUAGES]	PCM_CONTENT MANAGER
ADD LANGUAGE	English - International	PCM_LEGAL
ADD LANGUAGE	Dutch - Belgium	PCM_TECHNICAL
ADD LANGUAGE	French - France	PCM_CONTENT MANAGER

4. Choose the **Content Permission** from the drop-down listing:

- **Content Manager**
- **Editor**
- **Approver**
- **Add Language**

5. For the Content Managers permission, define the appropriate **Role**.

Read about the permissions below:

1. CONTENT MANAGER:

The WebCenter Role with this permission facilitates the entire content management process to ensure accuracy and compliance. For example, the role Marketing could have this permission where the Marketing has the responsibility of the packaging content. The Content Manager will manage the Master and Translated statements.

Note: The Content Manager Role is not associated with any specific language.

This role will manage all the permissions and the settings for the current document.

Note: Content Manager Role cannot act as an Editor or Approver unless this permission is granted to the same role.

2. EDITOR

The Content Manager typically assigns this right to the dedicated roles who will create, edit, revise or translate the text. This can be assigned per language.

An Editor Role (for example, a Translator) can edit when a document is in the **Draft** state, not in **Signed-Off** or **Pending Sign-off** state. After editing, the role can mark it as **Pending Sign-off**.

Note:

- The **Content Manager Role** has to configure the list of translation languages to make use of multiple language based **Editor** permissions.
- You can configure **Roles** for all languages to which the content should be translated and grant them the **Editor** permission.

3. APPROVER: A **Role** with this permission can approve the text content. This permission can also be configured per language. The approver puts the Text Statement to **Signed-Off** or **Rejected** state.

4. ADD LANGUAGE:

Any user with **Add Language** permission can add language to a text or table content document. The users can be assigned with permission to add only specific languages.

Manage Permissions

Content Permission 	Language	Role	Assignee(s)
CONTENT MANAGER		 PCM_CONTENT MANAGER	 MRJN
EDITOR	 English - International	 PCM_CONTENT MANAGER	 MRJN
EDITOR	 English - United States	 PCM_CONTENT MANAGER	 MRJN
EDITOR	 Dutch - Belgium	 PCM_CONTENT MANAGER	 MRJN
EDITOR	 French - France	 PCM_CONTENT MANAGER	 MRJN
APPROVER	 English - International	 PCM_CONTENT MANAGER	 MRJN
APPROVER	 English - United States	 PCM_CONTENT MANAGER	 MRJN
APPROVER	 Dutch - Belgium	 PCM_CONTENT MANAGER	 MRJN
APPROVER	 French - France	 PCM_CONTENT MANAGER	 MRJN
ADD LANGUAGE	 English - International	 PCM_LEGAL	 MRJN  MRJN_USR2
ADD LANGUAGE	 Dutch - Belgium	 PCM_TECHNICAL	 MRJN  MRJN_USR3
ADD LANGUAGE	 French - France	 PCM_CONTENT MANAGER	 MRJN

Note: You may choose to give more than one permission to a Role. For example, the Content Manager can have Editor and Add Language permissions as well.

- Define the **Editor** permission and assign it to a role. Select the corresponding **Language** from the drop-down.

You can automatically create **Editor** and **Approver** Roles for all languages in one go. Read about [Smart Role Naming](#) on page 483. To do this for the editor permission:

- Make sure that the **Admin** preference section has the right Prefixes. Read [here](#).
- Next to the **Editor** permission, select **All Other Languages**.

Manage Permissions

Content Permission	Language	Role	Assignee(s)
CONTENT MANAGER		MARKETING	Varghese, Shalet (SKVA)
EDITOR	English - United States	LANGUAGE EDITOR EN-US	
EDITOR	Dutch - Belgium	LANGUAGE EDITOR NL-BE	
EDITOR	English - Ireland	LANGUAGE EDITOR EN-IE	
EDITOR	French - Canada	LANGUAGE EDITOR FR-CA <i>Prefix + Language code</i>	
EDITOR	French - France	LANGUAGE EDITOR FR-FR	
EDITOR	Greek	LANGUAGE EDITOR EL	
EDITOR	Italian - Italy	LANGUAGE EDITOR IT-IT	
EDITOR	Portuguese - Portugal	LANGUAGE EDITOR PT-PT	

- Define the **Approver** permission and assign it to a role.

Select **All Other languages** to create Approver roles with default names in one go.

Note: You can configure Editors and Approvers individually for some languages and choose the Smart Role Naming for the rest of the languages by selecting **All Other languages**.

- To edit Content Permissions, click **Manage Permissions** and edit or change the assignment of a permission.

- The **Role Mapping** page will list all the Content Permissions, respective languages, Roles and their assignees (individual or Group).

The Roles will be clickable if they exist in the system and are invited to the Project.

- The Master Language of the Project will be highlighted in bold.

If you would like to give content editing and approving permission during Project Creation, assign Editor and Approver permission to the `_REQUESTOR` role.

For example, if you assign Editor permission to the `_REQUESTOR` role, the Editor can draft the text during project creation.

EDITOR

English - United States

`_REQUESTOR`

BO, Manager (BO_MANAGER)
 Keizer, Debbie (DEKE)

Warning: During a Project's creation, you can assign another user as the Requester. If this happens, the permissions defined for the `_REQUESTOR` role does not get transferred. In this scenario, some updates done during the Project creation may be lost.

Smart Role Naming

When your content workflow contains translations into different languages, you can have **Editor** and **Approver** permissions assigned to **Roles** (text authors/editors and approvers such as legal or marketing) associated with these languages. To automate the naming of such Roles, you can specify prefixes for these placeholder **Roles**.

Manage Permissions

Content Permission	Language	Role	Assignee(s)
CONTENT MANAGER		MARKETING	Varghese, Shalet (SKVA)
EDITOR	English - United States	LANGUAGE EDITOR EN-US	
EDITOR	Dutch - Belgium	LANGUAGE EDITOR NL-BE	
EDITOR	English - Ireland	LANGUAGE EDITOR EN-IE	
EDITOR	French - Canada	LANGUAGE EDITOR FR-CA <i>Prefix + Language code</i>	
EDITOR	French - France	LANGUAGE EDITOR FR-FR	
EDITOR	Greek	LANGUAGE EDITOR EL	
EDITOR	Italian - Italy	LANGUAGE EDITOR IT-IT	
EDITOR	Portuguese - Portugal	LANGUAGE EDITOR PT-PT	

The names of the Roles will have the specified **prefix** (In the example screenshot, Language Editor) and the respective language code.

Adding and Deleting Languages in a Text Content Document

Go to **Projects > Attributes** page and assign the Master and Translation Language Attributes. This will make them available in your Project's text documents.

In the **Text Content Document Details > Text Content** tab, you can view and add / delete the Master Text Language and Translation Language(s).

It is also possible to view, add and delete these Languages in the *Copy sheet* view. Read also: [Creating a Copy Sheet](#) on page 379

Note: You can add or delete this only if you have **Content Manager** or **Add Language** Permissions.

- To add a language, hover over the blurred flag indicators and click + on the flag image to add a language. The languages that are added in the list have clear flags. Only four of the selected Translation Languages (Flags) are displayed. Click ... (ellipsis) to view the expanded list of the other selected languages and ▲ to collapse the list. Languages are displayed in the order

of the Language Index specified in the language list irrespective of the sequence it has been added.

- Hover over and click **x** on the flag image to delete a language. You can add or delete multiple languages in one go by clicking multiple language flags.
- In the basic view, to delete a language of the text content from either the master languages or the translation languages, click on ellipsis

After deleting a language, you get  icon to add the language again in basic view. Similarly in attributes, if the translation languages is not added to the text content, then  is displayed.

- To delete a language that is not present in the Project Attributes, and is available in a text document, click .

The language is now marked for deletion in the element status. Click  to revert the action.

Ensure that you save the modifications.

The following conditions apply when you delete Master Text Languages:

Note:

- If only one Master Text Language is present, it cannot be deleted.
- If two or more Signed Off Master Text Languages are present, then any one of them can be deleted. But if there is only one Signed Off, that language cannot be deleted.
- If none of the Master Text Languages is Signed Off, then any of them can be deleted.
- A language can be deleted even if the Text Content document is linked with multiple projects.

Editing Text Statements and Starting Approval

Editing Content

With the Editor permission:

- You can edit a document in Draft state.

- Auto-Approve. If you are assigned the role of an Editor and an Approver, you can approve the content you created immediately.

Approving after Editing (Auto- Approval)

For example, Marketing can create and approve Master Text of certain statements. Essentially, you can skip **Start Approval** and **Approve** actions. To do auto-approve:

- Hover over **Draft** state next to the Text widget. You see options to **Approve** or **Start Approval**.
- Approve and **Save**. The document status is now **Signed Off**.

Note:

If saving fails, check if:

- your Editor permission is revoked.
- there is any conflict from another user regarding content update.

You can **Start Approval** by clicking  (even after you auto-approve).

Note:

- You cannot **Reject**, when a document is set for Auto approval.
- You can auto-approve from all the pages where you have the Text widget (Text Document Details, Task Execution Page, Document Attribute Category, Project Attribute Category, Project Creation Page and Viewer).

Starting Approval or Reverting to Draft

Hover over **Draft** status to view and click **Start Approval** to kick start the approval process.

To put the status back to **Draft**, hover and click the **Revert** button.

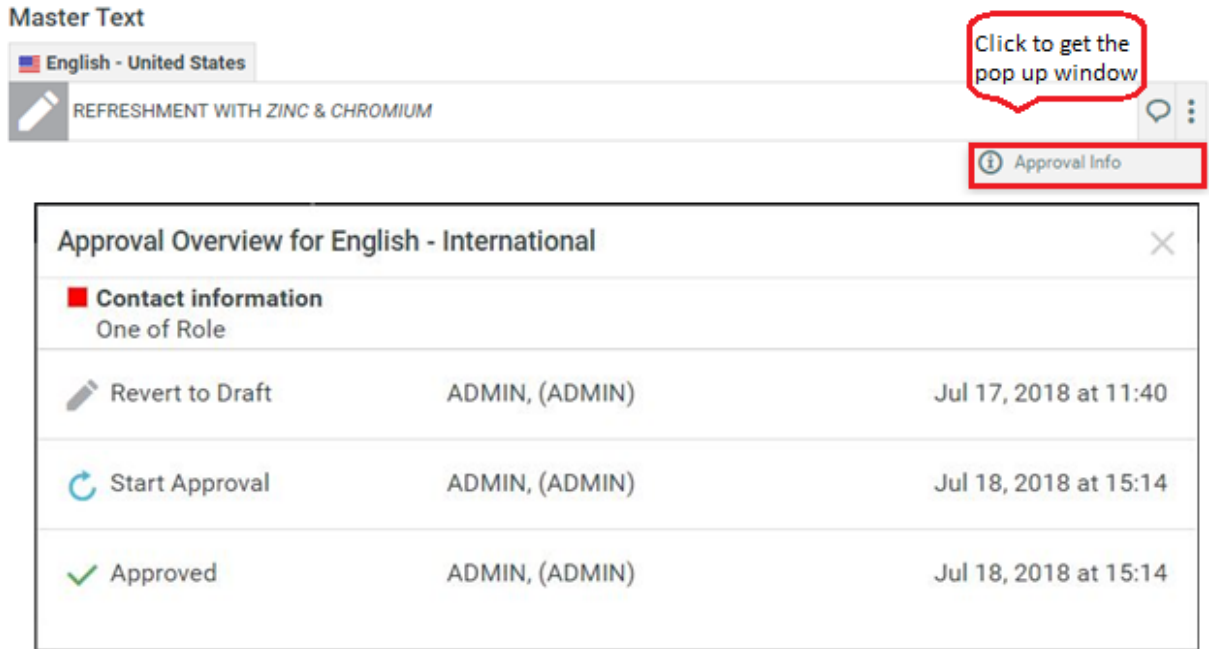

When you save, the status changes to **Draft**.

Note: After starting the approval process, users with Editor permission can revert the status back to **Draft**.

On clicking on the Reject button, the element will be marked for reject and the Approve/Reject/ Revert to Draft button will disappear and replaced with a Revert button. Content won't be editable, even if user has editor permission for this statement.

Approval Information

You can click on the **Approval Info** icon for a Text Content element, and it opens a pop-up which displays approval cycle information.

This pop-up window provides information on

- Language on the header
- Element type
- Approval type
- Approval Information along with user details and date of the action.

Approving or Rejecting Text Statements

Approving Text Content Statements

To **Sign-off** text statements (as an Approver), hover over the **Pending SignOff** icon next to the Text statement and **Approve**. When you save, the status changes to **Signed Off** or **Pending SignOff (You Approved)** when there are more approvers.

You can revert your action (before you **Save**) by clicking **Revert**

Note: Once **Signed Off**, you cannot makes changes to the text content or the text status. Translation languages can be edited even if the master language is not yet signed off.

Rejecting Text Content Statements

To **Reject**, hover and click . When you save, the status changes to **SignOff Rejected**.

If there are more approvers, status remains **Pending SignOff (You Rejected)** until all Approvers approve or reject.

Note:

If the Admin user has enabled **Required password for Approvals/ Rejections** in **Preferences**, your **Approve/Reject** actions requires a password.

4.16.3. Text Document Actions

You have additional Project Documents Actions for Text Documents. These actions allow you to

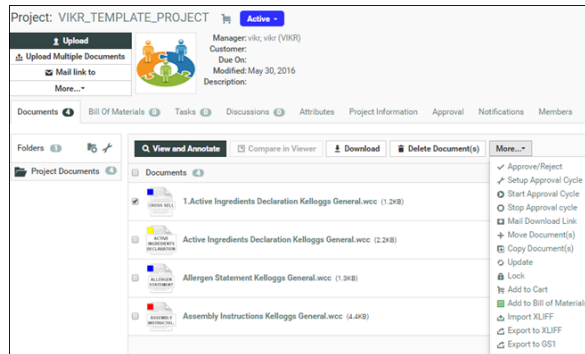

- Export text documents
- Import XLIFF files

- Copy documents with their Approval State

Importing and Exporting Text Documents

Export and Import XLIFF

You can export your text documents to be translated into XLIFF files. Once translated, import the XLIFF files back to WebCenter.

How to **Export to XLIFF** from a Project:

- Select the Documents and click **Export to XLIFF** in the **Actions** menu or bar.

Note: You may have these actions in the **More** drop down menu depending on your menu configuration.

- In the resulting **Export to XLIFF** pop-up, select **Source Language** and **Target Language** and click **Download**.
- There are other options which can be selected.

Export to XLIFF
✕

Source Language *

English - United States ▾

Target Language *

--select language-- ▾

Export Statement(s) only if the Master is signed off

Export Statement(s) only if Target language is specified in the Document

Export Statement(s) only if Target language is not signed off

Cancel

Download

- **Export Statement(s) only if the Master is signed off** By default this option is checked. When checked all the text statements which are signed off are exported and other statements are ignored.
- **Export Statement(s) only if Target language is specified in the Document** By default this option is unchecked. When checked only the text statements that has translations are added and rest of the text statements are not exported.
- **Export Statement(s) only if Target language is not signed off** By default this option is unchecked. When checked, only that statement for which translation language is not signed off is added to xliiff file.

Note: If there are no text content documents to export to XLIFF, then a warning message is displayed that **No text content document(s) available to Export to XLIFF**

The downloaded file contains the approved source language text and an empty statement of the target language. Comments added in the text content document will be exported to XLIFF file.

To **Import XLIFF** files after translation:

- Click **Import XLIFF** in the **Actions** menu or bar. Click **Browse** to select the file for importing. The translated XLIFF file are added to the corresponding Text Content Document(s).
- When you import the XLIFF file, you can directly **Approve Translation** by enabling the option.
- You can view the **XLIFF Import Report** which gives the status of the import. If the import of the document(s) fails for any reason, then the reason is updated in the **Warnings** column.
- Any new comments given during translation can be viewed in the XLIFF Import Report.

Note: When you configure translation Workflows, you can use the *Export* and *Import* XLIFF content nodes.

Exporting to GS1 XML

You can download a GS1 XML file containing all the **content documents (Dynamic Content)** including text, table and Artwork files. In the Artwork creation process, this GS1 XML file can be sent to the designer to place the content on the artwork in Adobe Illustrator with **Dynamic Content**. The **Dynamic Content** plug-in will match the placeholders in the artwork with the GS1 XML content.

Note: Any **User** with download permissions will be able to generate and download GS1 XML content.

Generate GS1 Export function supports below Text or Table Content and Artwork file types.

To generate a GS1 XML:

- Go to the **Project** where the artwork or **text content document(s)** or **table document** is stored.
- Select the artwork document with text/table content or **text/table content documents**.
- Select **Actions > Export to GS1**.
- If the selected artwork document contains reference property filter values either at the Document Attribute level or at the Project Attribute level, then the **Export to GS1** pop up window display the filters, from which you can select the **Reference Property** filters and **Languages** along with Locale. Reference property filters are used to filter the content to be downloaded to the XML format.
- The locale mapping values are pre-populated from the Document or Project attribute in the pop-up window, which holds unique values and these values are editable. When the locale mapping is not available in both the Project or in the Document attributes, then you can manually provide locale mapping and locale value will start with zero. Order of priority to pick locale value is Document attributes followed by the Project attributes.
- Specify the **Target Language** (one or more) in the **Export to GS1** pop-up window. The **Target Language** drop-down lists the master and translation languages specified in a project.

Note: If the project does not have specified language attributes, this drop-down will list the system wide language lists (master and translation).

- Click **Download**.

The GS1 XML will contain the dynamic content of the specified **Target Language(s)** including:

- the approval **status**
- the **Instance Sequence** value

Note: If the instance sequence number is not available, then unique instance sequence is auto generated and exported. When a GS1 document, if the referenced documents have EXPECTED_NUMBER_OF_OCCURRENCES (hard-coded) reference property, then the GS1 file will export this data for every dynamic element (Text Content, Table, Bar Code, Graphics). If this reference property is not available, then GS1 will have "1" as value for this field.

- The generated GS1 XML will include only content for which the user has read permission.

How to get Attribute Category Report for Text Content

You can get a report of all the attributes present in a Project or in a Document Attribute Category. Attribute Categories report can be downloaded and accessed by any users who has the permission and the Admin user has configured the report and uploaded it. Read more about it [here](#).

Users who have access to the report, will have the report icon in the Attributes page of the Document or the Project. Labels defined to the attributes while creating are shown in this report for all attributes except the document reference type.

Note: If the attribute name is derived from SmartName or if internationalization is done for the attribute, then the label name is not considered and only the attribute name is shown.

While generating the report you can further filter the report based on the languages and the reference properties.

Copying a Document with Status

You can copy a Text Content Document to another project along with their status.

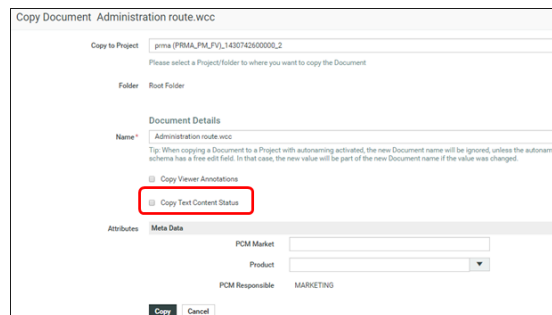

When you select one or more documents in a Project (Signed Off, Pending Sign off..) and choose **Copy Document(s) Action**

- You have the option to **Copy Text Content Status**. If you do not select this, the copied document will be in **Draft** state.

If you are copying from the Document Details Page, you can:

- Enable or disable the **Copy Text Content Status** option. If this is disabled, the copied document will be in **Draft** state.

5.2. Why Customize WebCenter?

You can customize the look and feel of WebCenter. This information describes what can, and what cannot be modified, and includes instructions on how to make those changes.

Whenever you let your customers or partners work with your WebCenter-enabled website, you spread a message to them. Therefore, most WebCenter customers want to brand their site and take the best advantage of the time the WebCenter user spends using the site.

WebCenter allows changing color schemes, logos and images, and virtually every piece of text. You can even change the logo based on who logs in. This way, you can make the user feel treated personally. WebCenter gives you a high amount of flexibility in changing the look and feel. You can combine this with custom menus to change the navigation within the site.

Esko cannot guarantee robust functionality and consistent behavior when upgrading when you start changing the way WebCenter reacts to customer actions.

Some changes to the navigation are built into the product. Good examples are customizable menus, the choice of what document types are allowed, whether documents are shown in a list view or a grid view, or what CAD outputs are available. In future versions, we'll further increase the flexibility. If you have suggestions, please contact Esko via your local Customer Services representative.

5.3. Where to Start the Customization?

Customizing the Look and Feel of WebCenter

The user interface to customize WebCenter's look and feel is the `customizationConfig.xml` file. All you need to do to apply your customizations is to modify this file accordingly and save it. The changes will be visible after a little while (this can take up to a few minutes).

The `customizationConfig.xml` file should be placed into the customization directory on your Web server instance, which is `<WebCenter_Instance>\custom` directory (such as `c:\Artios\WebCenter\WebServer\tomcat\webapps\WebCenter_instance\custom`).

See [Customizing the Look and Feel of WebCenter Using the customizationConfig.xml file](#) on page 994 for details.

Since WebCenter 12.1, it is also possible to customize several of these elements from the Customization page in the Admin section without editing the `customizationConfig.xml` file manually anymore. See [Customizing the Look and Feel of WebCenter Using the Customizations Page](#) on page 990 for details.

Customizing the WebCenter Menus

You can customize the WebCenter menus to tailor what users see to what they need to do in WebCenter.

You can manage custom menus through the WebCenter user interface. Log in as an Admin, and go to **Admin > Preferences > Menus**.

See [Customizing the WebCenter Menus](#) on page 1006 for details.

Since WebCenter 12.1, it is also possible to customize menus using the Menu Builder in the WebCenter Admin section.

Customizing the E-Mail Notifications

All the e-mail notifications' related files are stored on the Application Server in the following path: `C:/Artios/WebCenter/ApplicationServer/EmailNotifications`.

Inside the root directory you can find two subdirectories - Default and Custom. Actually you will notice that there is also a third one - example - with an example customization.

To customize the e-mail notifications, modify the files in the Custom subdirectory.

See [Customizing the E-Mail Notifications](#) on page 1032 for details.

5.4. Applying your WebCenter 12.X or 14.X customization to WebCenter 16.X or 18.X

It is possible to re-use your WebCenter 12.X or 14.X customization in your WebCenter 16.X or 18.X installation. This section explains the changes that need to be made to make the customization work properly in WebCenter 16.X or later, along with new customization features that come in WebCenter 16.X or 18.X.

Moving your customization from WebCenter 12.X or 14.X to 16.X or 18.X

Before upgrading your WebCenter installation, please make sure your custom folder is backed up in a different location. You can find the custom folder on your WebCenter Web Server:

<WebCenter_Instance>\custom. You may have used different custom folders for different WebCenter instances.

After you have created your new WebCenter instance, copy the contents of the custom folder into the new, empty custom folder. The contents of the custom folder typically includes folders such as "images", "text" and "languages".

Attention:

When copying folders from a different operating system into your custom folder (especially from Mac OS to Windows), make sure the contents aren't encrypted.

1. Right-click the old folder you are copying into the custom folder, and select **Properties**.
2. In the **General** tab, click **Advanced...**
3. Make sure **Encrypt contents to secure data** is not selected and click **OK**.

Encrypted folders and files have green names, and can cause problems in your customization.

If you would like to make a totally new customization at this point, you can copy the contents of the custom_example folder into the custom folder and start making changes to this file.

In case you have copied your old customization into the new custom folder, please have a look at the new customizationConfig.xml file. You can find this file in the <WebCenter_Instance>\custom_example folder. Compare this new file to your old

`customizationConfig.xml` file. The recommended way of proceeding is to copy the customized settings from your old file into the new one and use this new file in your custom folder. This way, you can use the new features that have been added.

Note: There may be sections in the `customizationConfig.xml` that are not actually used, these sections are typically greyed out in XML editors and can also be recognized because they are between: `<!--` and `-->`

Changes to the customizationConfig.xml file

The new `customizationConfig.xml` file contains some additional features, as well as some features that have been removed. For example, the **MenuBackground** image is no longer used in 16.X. Instead, the Menu background and font colors are calculated automatically based on a single Menu Color, allowing for much easier customization.

A new feature in WebCenter 16.X is the "full screen Background Image" for the Login page. Also, it is now possible to change the default background colors for the buttons.

Changes required to make your customization work

The old customizations you have created will largely work in WebCenter 16.X. After you have copied your old customizations into the new `customizationConfig.xml` file and possibly made some additional changes, it is a good idea to go over the **Colors** section. Since various colors have changed and colors may have been added or removed, the color settings may have to be adapted.

Attention: After applying your customization, you may need to restart the Tomcat service.

Moving your customization from WebCenter 18.X Backup phase (during uninstallation)

When uninstalling WebCenter 18.0 or later, Web server the installer inspects the list of Tomcat web instances and records the names of all the custom WebCenter instances while backing up 'custom' folder including the default one - *WebCenter_Inst*.

Common App Data root folder is used to store the customization files backup on the target Web server host. The default path on most Windows server is `C:\ProgramData\Esko\WebCenter\WebInstanceCustomData`. This folder is the root and each of the WebCenter web instance custom folder files is stored under a subfolder that takes the name of the appropriate instance.

The list of web instances that were found and later re-deployed is stored in the registry among the other WebCenter "upgrade values".

Re-deploy phase (during upgrade installation)

When performing an upgrade installation of a WebCenter Web server on the same host the installer gives the User the following options:

- **Redeploy web instances with customizations:** This is the default option. Re-deploys the custom instances marked during the previous uninstallation as well as the custom folders backup.
- **Redeploy web instances without customizations:** Re-deploys the custom instances marked during the previous uninstallation and does not retain the backed-up custom folders
- **Do not redeploy automatically:** Does not re-deploy any of the custom instances and their custom folder backups.

5.5. Customizing the Look and Feel of WebCenter Using the Customizations Page

In the **Admin > Preferences > Customizations** page, you can customize a number of WebCenter user interface elements visually.

The current customization for your instance is always visible when you first load the Customizations page. You can alter this customization, reset the customization to default (the standard WebCenter look) or load a theme, which will give you a starting point for your new customization.

You can customize the following items on this page:

- Images
- Colors

- Fonts
- Static Text

You can also enable the **Forgot Password** option, that displays a **Forgot Password?** link on the WebCenter **Log In** page, and allows users to reset their password.

You can also customize WebCenter *using the customizationConfig.xml file*.

5.5.1. Viewing and Editing a Customization

Admin users are able to view and edit an existing customization on the Customizations page.

On the Customizations page the following items can be customized:

- **Images:** Application logo, Company logo, Product Line logo and Login page Background image. New in Webcenter 16.X is the "full-screen" Background image.
- **Colors:** Different colors can be set for various elements using a color picker.
- **Fonts:** The current font type can be changed and a base size for the font can be entered. Other sizes will be calculated proportionally to allow for easier customization.
- **Static Text:** Customize messages on the login page, welcome page and contact page by uploading a valid XHTML file.

The following steps describe how to view and change the current WebCenter instance's customization:

1. Go to the WebCenter instance you would like to customize and open the Customization admin page.
2. In case any customization was done before, those files and values are displayed, if not, the page will show the standard WebCenter values.
3. It is now possible to change images, colors, the font that is used and upload a static text file.
4. After making your changes, click the Save button to save your customization.

Note: After saving your customization, there is no need to restart the TomCat server, as the changes are applied upon saving or after loading a theme. Since WebCenter 16.X, the customization will need to be re-applied by the system and the effect is not shown immediately. Reloading the customization may take as long as 2 to 5 minutes.

Load a Theme

On the Customizations page, there is an option to load a theme. The first theme (Default) is the WebCenter default look.

1. Click **Load Theme** for a particular theme to load it.
2. After confirmation the theme will be installed.

Note: Loading the theme, as applying a customization, may take up to a few minutes.

Reset to Default Look and Feel

From the Customization page, it is always possible to revert back to the standard WebCenter look and feel.

1. Either click the button **Reset to Default** at the bottom of the page, or pick **Default** from the **Themes** section.
2. After confirmation, the default WebCenter look and feel will be used again.

Note: You may need to do a deep refresh of your browser to see the changes.

Note: The option to reset to default is also available for several individual items, like colors and images. In this case, only that particular item will revert to the default look. Note that sometimes the 'default look' is to not show the element, for example the Product Line image is not there by default.

Customize Logos and Hyperlinks

It is possible to change several images on the Customizations page. An image can be changed by uploading a new file, it is also possible to reset an image to the default WebCenter value. Any changes to the images are saved after clicking the page's main **Save** button.

There are four images (and their hyperlinks) on you can change:

- **Application Logo:** This is the top left logo. This logo appears on every page. It can be replaced by uploading a new image with approximately the same height (50 pixels). In case you use an AppLogo image higher than 50px, you will stretch the top header along with this image. The recommended file type for this image is: GIF or PNG. It is common practice to give the top logo a hyperlink to a more general web page (typically your company's home page). In WebCenter 16.X you can choose between showing the Application Logo in the Menu bar (default, more compact), or displaying it above the Menu bar for wider images, by applying the setting **Show the application logo above the menu bar**.
 - **Company Logo:** To the bottom right of the login page is the Esko logo (and its hyperlink to www.esko.com). It can be replaced by uploading a new image with approximately the same height (28 pixels). We appreciate it when customers keep our logo visible.
 - **Product Line Logo:** To the bottom left, there is a placeholder for another image (ProductLineLogo). The standard installation does not put anything there. It is possible to upload a new image with a height of approximately 28 pixels.
 - **Background Image:** The default background image can be replaced with any image or with no image at all. This watermark **ONLY** appears on the login page. It has no hyperlink. The recommended file type for this image is JPG or PNG. Since WebCenter 16.X, it is possible to use a "full-screen" Background image (default). By disabling the setting **Use full screen background image**, the image is displayed as a smaller rectangle on the page as in older versions of WebCenter.
1. To upload a new image click the **Upload** button and select an image from your system. Make sure you select an image with roughly the correct dimensions and resolution (72 ppi).
 2. To reset an image to the default value, click the **Reset** button. Note that sometimes there is no default value, like for the Product Line Logo.
 3. To add or modify an image link, enter a URL (starting with <http://>) in the **URL** field.

Customize Colors

It is possible to change various colors on the Customizations page. Any changes to the colors are saved after clicking the page's main **Save** button.

There are several colors listed in the Colors section. Each with a title reflecting its purpose. For example, you can change the footer color on the login page by changing the value for **Login Footer Color**.

Note: Since WebCenter 16.X, the Menu colors are all determined by the value set as **Menu Color**. The system automatically calculates shaded of your chosen color and determines the font color (black or white) based on the optimal contrast with the calculated colors, to allow for easy and fast customization of the Menu bar.

1. In the **Colors** section you can see an overview of the currently selected colors.
2. To change a color, you can either paste a hexadecimal color code in the color field, or you can use the color picker by clicking the color patch.
3. After opening the color picker you can move the little circle selecting the color around to change the saturation and brightness within the same hue. It is also possible to edit the hexadecimal color code manually, or to enter a new value for the RGB and HSB values.
4. After selecting a color, you can exit the color picker by simply clicking outside the color picker pop up, or by clicking the little **color circle icon**.
5. By using the **Reset** button you can revert a specific color to the original WebCenter value.

Customize Fonts

In the Fonts section you can change the currently used font to a different font type. It is also possible to change the font base size.

Any changes to the fonts are saved after clicking the page's main **Save** button.

1. To change the font type, enter a new value in the **Font** field. Make sure you use a commonly used font, which is installed on your user's systems.
2. To the font sizes, simply enter a new value in the **Base Font Size** field. All other font sizes (larger/smaller) are calculated based on this base font size, to allow for easier customization.

Customize Static Text

There are a number of places in WebCenter where static text such as a marketing message is displayed. You can replace these sections with your own valid HTML pages. Any changes to the static text section are saved after clicking the page's main **Save** button.

Currently it is possible to replace the following sections:

- Welcome message on the login page (band above the main login section)
- Marketing message on the login page
- Marketing message on the welcome page
- Contact page (linked on top of each page)

The Static Text section shows an overview of the static text customizations that are currently applied. The static text section can be filled in with HTML pages containing text, images and inline CSS. In case no customization has been done, you will see "Default" next to the static text name. In case there is a customization you will see a **Preview** and a **Reset** button.

1. To upload a new static text file, click the **Upload** button and select a valid HTML file from your system.

Note: Ensure that your HTML page does not contain !DOCTYPE else it could affect the functioning of WebCenter.

2. To preview a static text file, click the **Preview** button.
3. To reset a static text item and remove the customization, click the **Reset** button.

Forgot Password

To add a **Forgot Password?** link to the WebCenter **Log In** page, do the following:

1. Go to **Admin > Preferences > Customizations**.
2. At the bottom of the **Customization** page, select **Show Forgot Password link** in the **Other** section.
3. Click **Save**.

Alternatively, you can add this link when *customizing the user interface*.

When a user can't remember his/her password and clicks the **Forgot Password?** link, they will be asked to supply their user name or email address. They will then receive an email with a temporary password and a link to the **Log In** page.

After logging in, they will be asked to change their password.

Fixed Navigation Bar

To fix the Navigation / Menu bar in the WebCenter application, do the following:

1. Go to **Admin > Preferences > Customizations**.
2. At the bottom of the Customization page, select **Use Fixed Navigation Bar** in the **Other** section.
3. **Save** the changes.

When a user scrolls down any page, the navigation bar is fixed on the top of the page.

5.6. Customizing the Look and Feel of WebCenter Using the customizationConfig.xml file

You can customize WebCenter's look and feel using the `customizationConfig.xml` file. All you need to do to apply your customizations is to modify this file accordingly and save it. Reload your pages to see your changes reflected.

Any settings from the `customizationConfig.xml` file overrule default WebCenter application settings.

The `customizationConfig.xml` file should be placed into the customization directory on your Web server instance, which is `<WebCenter_Instance>\custom` directory (such as `c:\Artios\WebCenter\WebServer\tomcat\webapps\WebCenter_instance\custom`).

In the following section we will list what is possible to customize and how to achieve that.

For your convenience there is a `<WebCenter_instance>\custom_example` directory in the web server instance including a customization example. This directory contains a commented

customizationConfig.xml file and necessary additional files which will help you easily try most of the customizations described in this documentation.

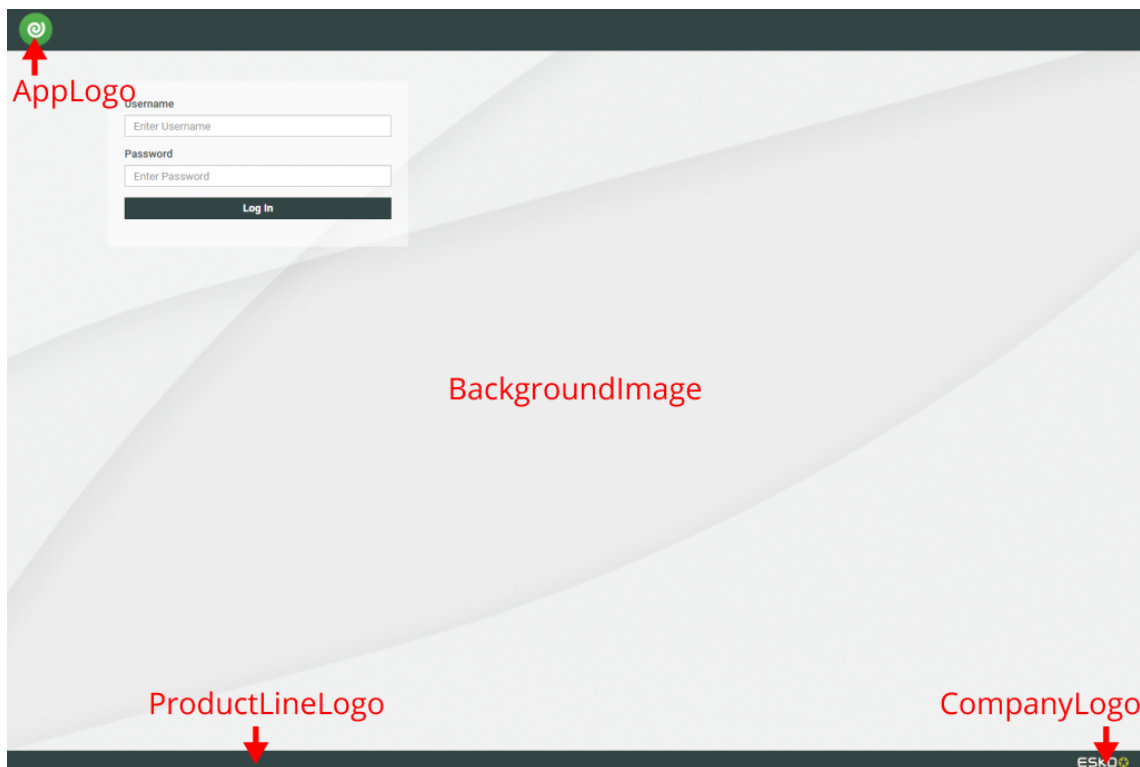

To use the example files, simply copy content from this directory into the <WebCenter_Instance>\custom directory.

5.6.1. Customizing Logos and their Hyperlinks

A number of logos are displayed in WebCenter, many of them with a clickable hyperlink. You can change the logo image and the hyperlink target.

Customize Logos and Hyperlinks

In a standard WebCenter installation, the login window will look more or less like in the picture below (the actual appearance depends on your screen settings, the browser used and the version of WebCenter you have installed).

There are four images (and their hyperlinks) on this page you can change:

- The top logo **WebCenter icon**. This logo appears on every page. It can be adapted by replacing it with any image of approximately the same height (50 pixels). In case you use an AppLogo image higher than 50px, you will stretch the top header along with this image. Once the user is logged in (and not before that), this image can be further changed to reflect your relationship. It is common practice to give the top logo a hyperlink to a more general web page (typically your company's home page).

- The Background image (BackgroundImage) can be replaced with any image or with no image at all. This image ONLY appears on the login page. It has no hyperlink. Since WebCenter 16.X, it can be set as a full-screen image as well.
- To the bottom left, there is a placeholder for another image (ProductLineLogo). The standard installation does not put anything there.
- To the bottom right (CompanyLogo) is the Esko logo (and its hyperlink to www.esko.com). It can be replaced just like any other logo. We appreciate it when customers keep our logo visible. Esko stands for quality, innovation and communication. Your site will be more appreciated if you reinforce it by showing what technology you are using for servicing your customers and partners.

1. To customize the logos on the log on page, add the following tags to customizationConfig.xml:

```
<AppLogo
  RelPath="images/DEFAULT_WebCenter-banner.png"
  href="homepage.jsp" />
<CompanyLogo
  RelPath="images/DEFAULT_logo_esko.png"
  href="http://www.esko.com" />
<BackgroundImage
  RelPath="images/BackgroundImage.png" />
<FloatAppLogo
  value='false' />
<FullScreenBackground
  value='true' />
```

The settings **FloatAppLogo** and **FullScreenBackground** can be used to move the Application Logo above the Menu bar and set the Background Image to full-screen respectively.

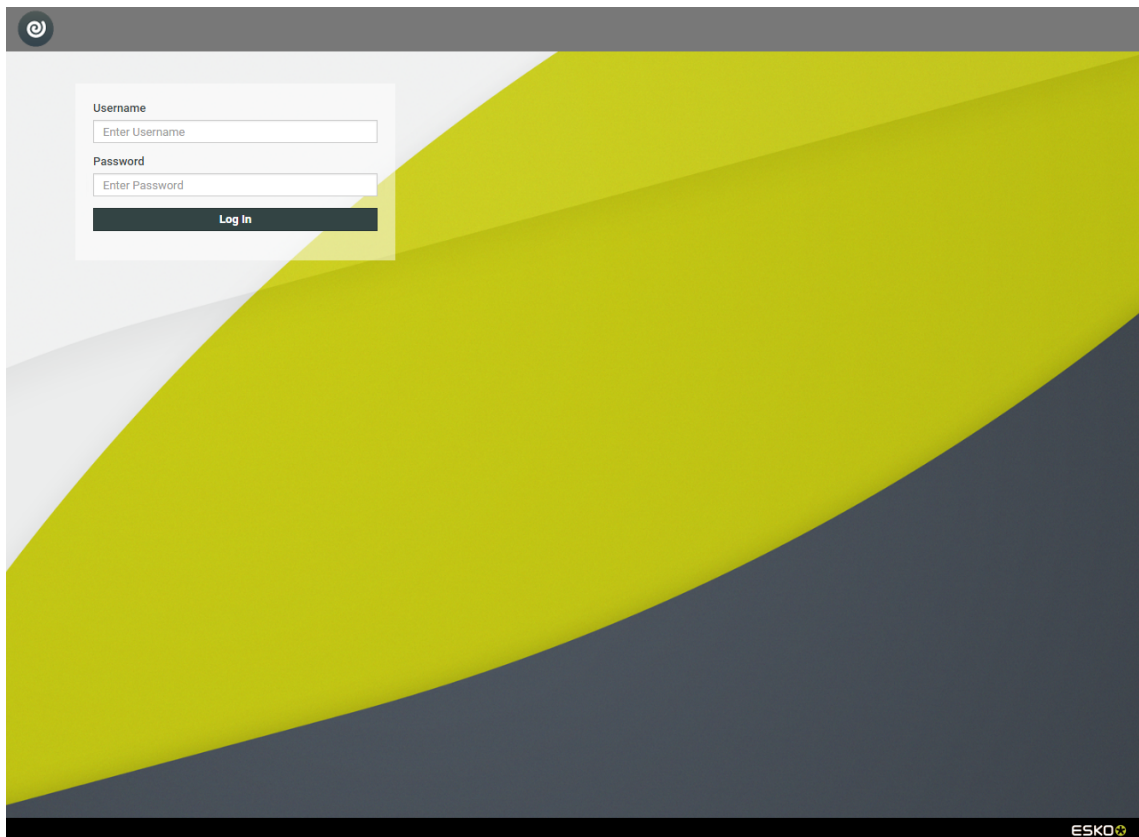

The following attributes can be used to provide the required image and optionally set the hyperlink:

- RelPath – defines the path of the logo image relatively to the custom directory.
- href – if the logo is also a hyperlink, you can specify its target.

2. To customize the logo for the normal pages, you can also use the following tag:

```
<AppLogo
  RelPath="images/AppLogo.png"
  href="http://www.esko.com"/>
```

The following is an example of a Login page with customized Application Logo and Background Image. Note that in this case the header and footer colors have also been customized.

Customize Logo for a User or Company

Besides from customizing different WebCenter instances, it is also possible to create different customizations inside the same instance. Using this type of customization you are able to customize the **AppLogo** image, in the top left corner, for specific users or companies.

1. Inside your WebCenter instance's `custom` folder, you can create individual folders. Each of these folders should contain their own `customizationConfig.xml` file and a folder called `images` in which the logo image is placed. These folders should be named according to the following conventions:

- **USER** to apply for a user with a specific user name,
- **Company_** to apply for a specific company,
- **Company_Location** to apply for a specific company and location.

For example, for a user called "John Doe" (with the user name "JOHNDOE") at the company "Esko", that has two locations: "Ghent" and "Singapore", you should name the folders:

- JOHNDOE (the user name) when applying the customization to that user specifically,
- Esko when applying the customization to all users at the "Esko" company,
- Esko_Ghent when applying the customization to users at the "Esko" company and "Ghent" location.

Note: Please make sure you use the exact user, company and location names, keeping the correct case and any spaces or special characters they may contain. For example, user names should be in capital letters.

2. The `customizationConfig.xml` file should only contain one tag:

```
<AppLogo
  RelPath="images/AppLogo.png"
  href="http://www.esko.com"/>
```

The following attributes can be used to provide the required image and optionally set the hyperlink:

- `RelPath` – defines the path of the logo image relatively to the custom directory.
- `href` – if the logo is also a hyperlink, you can specify its target.

In the example a special "JOHNDOE" folder has been created. This folder contains a `customizationConfig.xml` file and an `images` folder with a different logo image. When the user with the user name "JOHNDOE" now logs in, he will see his customized **AppLogo** image. All the other users will still see the image used in the top level customization.

5.6.2. Change the Color Scheme

The WebCenter color scheme has been chosen to be business-oriented and to reflect Esko's corporate identity.

Many companies want to use their company colors in WebCenter. This is perfectly possible: the application uses several colors consistently throughout the application and each one of them can be replaced with another color. Use standard HTML-formatted color definition (e.g. #334444).

Tip:

The color definitions consist of 6 hexadecimal numbers, 2 for Red, 2 for Green, and 2 for Blue. The easiest method for determining the hexadecimal RGB values of a color is to create it in the Color Picker in Photoshop. You can copy and paste the hexadecimal values from the # field.

- Add the following tag to the `customizationConfig.xml` file:

```
<Colors>
  <Color id="1" hexVal="FF0000"/>
</Colors>
```

Color Scheme Reference

ID	Default Value	Used in
8	fafafa	Project Selected Folder
13	334444	Main Header and Menu

ID	Default Value	Used in
15	fbfbfb	Footer Background Color
16	334444	Footer Login Page
18	334444	Primary Button
19	ffffff	Default Button
20	5f7e7e	Link Color
21	3e5353	Link Hover Color

5.6.3. Change the Fonts

Fonts in WebCenter are based on a similar concept as the color scheme. One font in varying sizes is consistently used through the application.

The default font sizes were chosen to optimally fit into the various WebCenter pages, so you probably wouldn't need to change them unless you use different font that might look too small or too big.

Note: Since WebCenter 16.X, you only need to adapt the base font size, all other font sizes will adapt proportionally.

Add the following tag into the `customizationConfig.xml` file to change the font family to Open Sans and increase the base font size.

```
<Font name="Opens Sans">
  <Size id="3" pxVal="14"/>
</Font>
```

5.6.4. Customize Static Text

There are a number of places in WebCenter where static text such as a marketing message is displayed. The software provides a straightforward mechanism for you to replace the text with your own HTML pages.

What Static Text Items Can You Customize?

Currently it is possible to replace the following (see screen shots below):

- Welcome message on the Login page.
- Marketing message on the Login page.
- Marketing message on the Welcome page.
- Contact page (linked in the footer, at the bottom of each page)

The screenshot shows the ESKO WebCenter login interface. At the top left, there is a dark header bar with a circular icon. Below it, a message box contains the text "We are proud to use Esko software to help your business grow." with a red arrow pointing to it labeled "LoginWelcomeMsg". To the left of the main content area is a login form with fields for "Username" (containing "Enter Username") and "Password" (containing "Enter Password"), and a "Log In" button. To the right of the form is a large white box containing the text "Welcome to WebCenter 16" and the ESKO Software Platform logo, which consists of a colorful circular graphic and the text "ESKO SOFTWARE PLATFORM". A red arrow points to the bottom of this box labeled "LoginMarketingMsg". At the bottom right of the page, there is a dark footer bar with the ESKO logo.

Customize a Static Text Item

There are some limitations you need to take into account when preparing your HTML page. You need to make sure that your HTML page body is also valid XHTML. Therefore, the rules for HTML tags are a bit stricter. There are many tools and online Web pages where you can validate your HTML, such as <http://validator.w3.org/>. If the document body is not valid XHTML you may encounter runtime errors when accessing your customized page.

Note that the default WebCenter stylesheet is applied to the whole page, as well as to your custom HTML static text. That might be confusing because your text could look different than expected when inserted as static text on the page. For example, links might look bigger. To avoid such effects, can either use inline styling in your HTML, or set styles in your CSS to !important. For example:

```
a {font-size:15px !important; color:#f00 !important;}
```

- To replace the pieces of static text, add the following tags into the customizationConfig.xml file:

```
<StaticText>
  <LoginWelcomeMsg RelPath="text/loginWelcomeMsg.html"/>
  <LoginMarketingMsg RelPath="text/loginMarketingMsg.html"/>
  <HomeMarketingMsg RelPath="text/homeMarketingMsg.html"/>
  <ContactPage RelPath="text/contactPage.html"/>
</StaticText>
```

Each of the StaticText sub-tags replaces the corresponding static text with your custom HTML document. Using the RelPath attribute, specify the path to your HTML document relative to the custom directory.

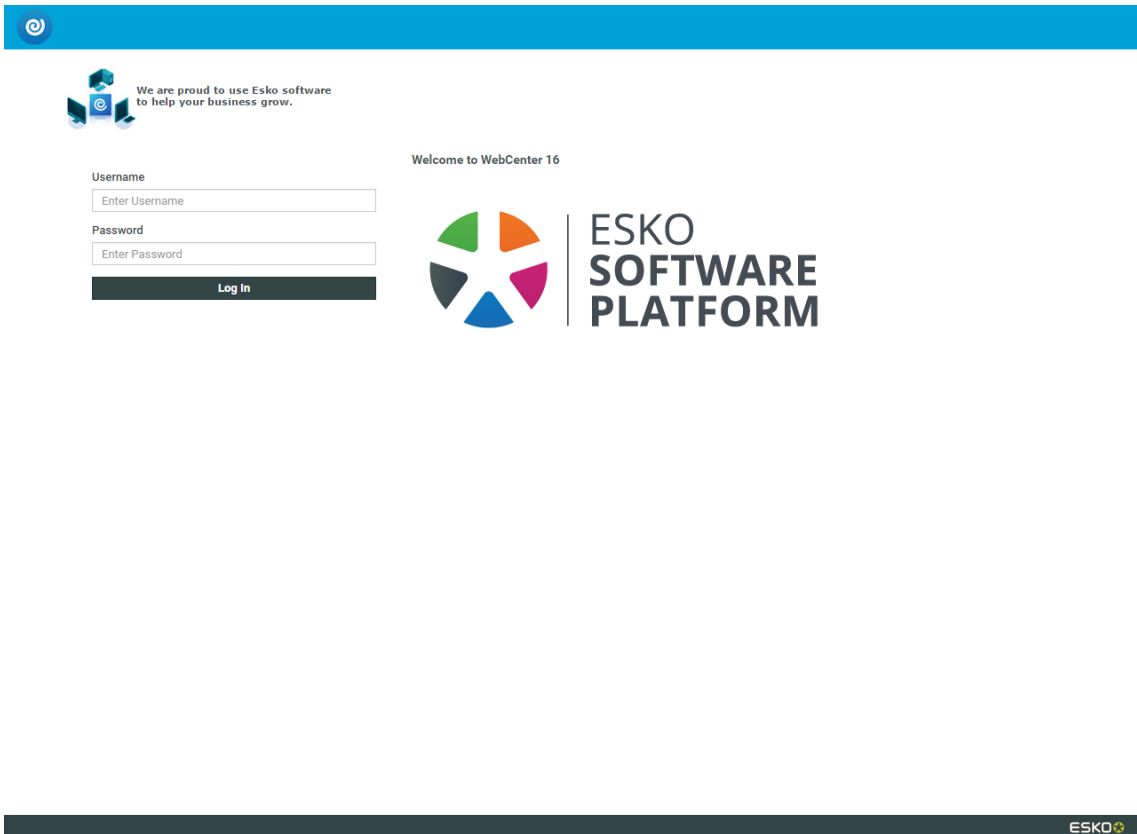

Example: Customizing Static Text

Let's look at the following HTML with which we want to replace the Login page Welcome message. If you put the content of our HTML into the XHTML document as shown below and it passes the validation test, WebCenter should display your HTML correctly.

```
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Strict//EN" "http://www.w3.org/TR/xhtml1/
DTD/xhtml1-strict.dtd">
<html xmlns="http://www.w3.org/1999/xhtml" lang="en" xml:lang="en-us">
  <head>
    <title>Login Page Marketing Message</title>
    <style type="text/css">
      #welcome p {color:#4a5656;font-family:Verdana,Arial,Helvetica,sans-serif;font-
size:11px;font-weight:bold;}
      #welcomeimage {align:left;}
    </style>
  </head>
  <body>
    <table>
      <tr>
        <td id="welcomeimage">
          <a href="http://www.esko.com/webcenter">

          </a>
        </td>
        <td id="welcome" width="220px">
          <p>We are proud to use Esko software to help your business grow.</p>
        </td>
      </tr>
    </table>
  </body>
</html>
```

Note that all relative references that you use in HTML should be relative to the Web server root directory which is the WebCenter instance directory, such as WebCenter_Inst. Like in the example above, the path for images needs to be relative.

5.6.5. Customize the Language Files

You can customize your own language files or add completely new language translations.

The example below shows how to modify the customization configuration file to modify the default English language translation:

1. In the `customizationConfig.xml` file, add the following language tag:

```
<Languages RelPath="languages">
  <Language key="en" zipencoding="Cp437"/>
</Languages>
```

The `RelPath` attribute specifies the directory where the system looks for customized language files. `RelPath` should be specified relative to the custom directory. In this case, you are referring to the `languages` subdirectory in the `custom` directory.

The `Language` sub-tag has the same attributes as the corresponding tags in the default `config.xml` file. Also, the naming convention and structure of the language files are the same as for the standard language files.

2. Edit the `wcstrings_en.xml` file in the `languages` subdirectory to reflect your new language strings.

If you are not familiar with the default language files structure and usage, the easiest method is to copy the language file (from the default location `<WebCenter_Instance>`

\languages) you want to modify to a subdirectory of the custom directory, such as `wcstrings_en.xml` in `custom\languages`. Edit the file and remove all tags except the ones you want to change.

The edited result could look like the example below, it can contain one or a multitude of strings (you only need to add the ones you wish to modify):

```
<?xml version="1.0" encoding="UTF-8"?>
<language xml:lang="en-us">
  <application name="JSP_Strings">
    <lang_string key="WCAUTHOR" value="WebCenter is another awesome product created by"/>
  </application>
</language>
```

As you can see, we have changed the text in the footer lower left corner. The picture below shows the result of our customization.

5.6.6. Forgot Password

To add a **Forgot Password?** link to the WebCenter **Log In** page through the `customizationConfig.xml` file, do the following:

1. Open the `customizationConfig.xml` file in an XML editor.
See [Customizing the Look and Feel of WebCenter Using the customizationConfig.xml file](#) on page 994 to know where to find this file.
2. Add the following XML code between the `WebCenterCustomizationConfig` XML tags:

```
<ForgotPassword show="1"/>
```

3. Save your file and place it into the customization directory on your Web server instance.

When a user can't remember his/her password and clicks the **Forgot Password?** link, they will be asked to supply their user name or email address. They will then receive an email with a temporary password and a link to the **Log In** page.

After logging in, they will be asked to change their password.

Note:

The e-mail uses the e-mail customization framework to customize/translate the messages sent to the user.

You can find an example of the data that can be used in the e-mail in `C:/Esko/Artios/WebCenter/ApplicationServer/EmailNotifications/Example/user`. This folder contains:

- `reset_password_example_body.xml`
- `reset_password_example_source.xml`
- `reset_password_example_subject.xml`

You should copy these files to `C:/Esko/Artios/WebCenter/ApplicationServer/EmailNotifications/Custom/user` before editing them.

For more information about customizing e-mails, see [Customizing the E-Mail Notifications](#) on page 1032.

5.6.7. Fixed Navigation Bar

To fix the Navigation / Menu bar in the WebCenter application, do the following:

1. Go to **Admin > Preferences > Customizations**.
2. At the bottom of the Customization page, select **Use Fixed Navigation Bar** in the **Other** section.
3. **Save** the changes.

When a user scrolls down any page, the navigation bar is fixed on the top of the page.

5.7. Customizing the WebCenter Menus

You can customize the WebCenter menus to tailor what users see to what they need to do in WebCenter.

This way, you can make sure their user experience is as smooth as possible.

You can:

- remove unused menu items to simplify the user interface,
- add menu items that link to frequently used WebCenter pages not already part of a menu,
- change which page a menu item links to,
- remove unwanted action buttons from tables,
- add custom action buttons.

You can assign custom menus to users and / or companies (see "Edit a User" and "Edit a Company" in the Administration Guide).

Tip: To see what a menu looks like, hover on it in the WebCenter user interface. This shows the sub menu.

You can manage custom menus through the WebCenter user interface. Log in as an Admin, and go to **Admin > Preferences > Menus**.

See [Menus](#) on page 106 in the Administration Guide for details.

5.7.1. Create a Custom Menu

You can create a custom menu for each category of users, to make it more convenient for them.

Note:

Menus are XML files, so you will need an XML editor (you can find various freeware XML editors on the internet, for example XML Marker or Notepad++).

However, if you are not comfortable using XML, you can also create a custom menu through the WebCenter user interface (see [Create a Custom Menu through the WebCenter User Interface](#) on page 106 in the Administration Guide).

You will need to:

1. Determine which menus a particular group of users needs, and which menus they don't need.
2. [Download the default menu](#) to use as a starting point.
3. In an XML editor, [remove the menu items](#) that are not necessary for those users.
This allows you to simplify the WebCenter interface, especially for occasional users. For example, you can create a menu that only contains **My Work** for approval users.
4. [Add custom menu items](#), to link to the WebCenter pages of your choice.
This allows you to make the pages most used by your users more accessible. For example, you can add menu items linking to saved searches, or to project creation from a specific project template.
5. When you are done editing the menu file, save it under a meaningful name.
6. Upload your custom menu:
 - a) click the **Menu Upload** button on the **Menus** page,
 - b) on the **Menu Upload** page, browse to your XML file,
 - c) give your custom menu a **Name** and a **Description**,
 - d) click **Upload**.
7. Assign the menu to the users (or company) you created it for.
8. Log out and log in to WebCenter as one of the users to which you gave the custom menu, and check whether the menu works.

Download the Default Menu

You will use the default menu as a basis for creating custom menus.

1. Download the default menu:
 - a) On the **Admin > Preferences > Menus** page, click the **Download Menu** link corresponding to the **Default** menu.
 - b) The (XML) menu file will typically open in your browser. You need to save it to a file. Use for example:
 - **File > Save As** in Internet Explorer,

- **File > Save Page As** or **Ctrl+S / Command+S** in Firefox,
- **File > Save As** or **Command+S** in Safari (make sure you select **Page Source** as **Format**),
- **Ctrl+S / Command+S** in Google Chrome.

Note: Do not copy and paste the XML from your browser as this can give corrupted XML.

2. Open the menu file you downloaded in your XML editor.

See [Structure of the XML Menu File](#) on page 1008 to familiarize yourself with the file.

Structure of the XML Menu File

Each menu and menu entry is enclosed in a **menuitem** tag.

```

- <menu>
  <!-- The Four Main Menus -->
  - <menuitem>
    <name>NON_ADMIN</name>
    <labeltag>HOME_TAG</labeltag>
    <url>homepage.jsp</url>
    <!-- My work menu -->
    - <menuitem>
      <name>MY_WORK</name>
      <labeltag>MY_WORK_TAG</labeltag>
      <url>mytodolist.jsp</url>
      - <menuitem>
        <name>MYTODOLIST</name>
        <labeltag>MY_WORK_TAG</labeltag>
        <url>mytodolist.jsp</url>
      </menuitem>
      - <menuitem>
        <name>MY_CHECKOUTS</name>
        <labeltag>MY_CHECKOUTS_TAG</labeltag>
        <url>mycheckouts.jsp</url>
      </menuitem>
    </menuitem>
    <!-- Projects menu -->
    - <menuitem>
      <name>PROJMGMENT</name>
      <labeltag>PROJMGMENTPROJS_TAG</labeltag>
      <url>myfavoriteproj.jsp</url>
    - <menuitem>
      <name>MY_FAVORITEPROJS</name>
      <labeltag>MY_FAVORITEPROJS_TAG</labeltag>
      <url>myfavoriteproj.jsp</url>
    </menuitem>
    - <menuitem>
      <name>MY_PROJECTS</name>
      <labeltag>MY_PROJECTS_TAG</labeltag>
      <url>myprojects.jsp</url>
      - <scope>
        <project_managers/>
      </scope>
    </menuitem>
    - <menuitem>
      <name>MY_PROJECTS_IN</name>
      <labeltag>MY_PROJECTS_IN_TAG</labeltag>
      <url>iamprojectmember.jsp</url>
    </menuitem>
  </menuitem>
</menu>

```

You can expand and collapse menus and menu entries (use + to expand and - to collapse).

```

- <menuitem>
  <name>NON_ADMIN</name>
  <labeltag>HOME_TAG</labeltag>
  <url>homepage.jsp</url>
  <!-- My work menu -->
+ <menuitem></menuitem>
  <!-- Projects menu -->
+ <menuitem></menuitem>
  <!-- Tasks menu -->
+ <menuitem></menuitem>
  <!-- Search menu -->
+ <menuitem></menuitem>
  <!-- My webcenter menu -->
+ <menuitem></menuitem>
  <!-- Creation Menu -->
+ <menuitem></menuitem>
  <!-- Add Document Menu -->
+ <menuitem></menuitem>
</menuitem>

```

Tip: The comments between <!-- and --> indicate what the tags below correspond to.

Main Row Menus

The first <menuitem>, "NON_ADMIN", contains the menu items corresponding to the top menu bar (when not in Admin mode).

```

- <menuitem>
  <name>NON_ADMIN</name>
  <labeltag>HOME_TAG</labeltag>
  <url>homepage.jsp</url>
  <!-- My work menu -->
+ <menuitem></menuitem>
  <!-- Projects menu -->
+ <menuitem></menuitem>
  <!-- Tasks menu -->
+ <menuitem></menuitem>
  <!-- Search menu -->
+ <menuitem></menuitem>
  <!-- My webcenter menu -->
+ <menuitem></menuitem>
  <!-- Creation Menu -->
+ <menuitem></menuitem>
  <!-- Add Document Menu -->
+ <menuitem></menuitem>
</menuitem>

```

Note: It is not possible to edit the Admin menus.

Task Type Details

The menu items inside the "TASKTYPEDETAILS" <menuitem> (under <!-- Task type details menu -->) correspond to the tabbed menu you get when editing a task type (only for users who can create a task type).

You will probably not need to change this.

Project Details

The menu items inside the "PROJDETAILS" <menuitem> correspond to the tabbed menu you get on the Project Details page.

Template Details

The menu items inside the "TEMPLATEDetails" <menuitem> correspond to the tabbed menu you get on the Template Details page (only for Admin users).

You will probably not need to change this.

Document Details

The menu items inside the "DOCDETAILS" <menuitem> correspond to the tabbed menu you get on the Document Details page.

Task Type Details (Read Only Mode)

The menu items inside the "TASKTYPEDETAILSRO" <menuitem> correspond to the tabbed menu you get when looking at task types in read only mode.

You will probably not need to change this.

My Users

The menu items inside the "MYUSERS" <menuitem> correspond to the tabbed menu you get when going to **My WebCenter > My Users** and editing a user (for Project Managers with the **User Can Create User** right).

Remove Unused Menu Items

Remove the menus and / or menu entries that are not necessary for your target users.

- For each item to remove, delete everything between `<menuitem>` and `</menuitem>`, including the `<menuitem>` and `</menuitem>` tags.

```

- <menuitem>
  <name>PROJMGMENT</name>
  <labeltag>PROJMGMENTPROJS_TAG</labeltag>
  <url>myfavoriteproj.jsp</url>
- <menuitem>
  <name>MY_FAVORITEPROJS</name>
  <labeltag>MY_FAVORITEPROJS_TAG</labeltag>
  <url>myfavoriteproj.jsp</url>
</menuitem>
- <menuitem>
  <name>MY_ALLPROJECTS</name>
  <labeltag>MY_ALLPROJECTS_TAG</labeltag>
  <url>myallprojects.jsp</url>
  - <scope>
    <project_managers/>
  </scope>
</menuitem>

```

Attention: Make sure you are very precise and delete only corresponding `<menuitem>` and `</menuitem>` tags, so as not to break the XML structure!

Add Custom Menu Items

- To add a top level menu, add a `<menuitem>` element, with the following elements in it:

<code><name></code>	<p>Choose a unique name for your menu. This name is only used to identify the menu in the XML file.</p>
<code><labeltag></code>	<p>Enter the language file tag corresponding to your new menu. You can use a tag already existing in the language files, or a new tag.</p> <p>This makes displaying your new menu in multiple languages possible: you enter the tag here, and in each language file you associate that tag with the text string that will be shown for that menu in that language.</p> <p>If for example you are adding a menu linking to a(n existing) saved search showing rejected documents:</p>

	<ol style="list-style-type: none"> 1. Enter "REJECTED_DOCUMENTS_TAG" as <labeltag>. 2. Associate that tag with the "Rejected Documents" string in your English language file, with "Documents Rejetés" in your French language file, etc. <div style="border: 1px solid black; padding: 5px; margin-top: 10px;"> <p>Note: If you are using a new tag, you need to add it to the custom language files, otherwise you will lose it with every upgrade.</p> </div> <p>See Customize the Language Files on page 1004 for more information about customizing the language files.</p>
<p><url></p>	<p>Enter the page which will be shown when clicking the new menu.</p> <p>Typically this will be a standard WebCenter page which you otherwise would get by more complex navigation.</p>
<p><scope></p>	<p>Define which type of users will see the new menu.</p> <ul style="list-style-type: none"> • Enter <project_managers/> if you only want Project Managers to see it. • Enter <admin_users/> if you only want Administrators to see it. • Enter <normal_users/> if you only want normal users to see it. • Enter <project_creators/> if you only want Project Creators to see it. <p>If you want three types of users to see the menu, enter them here. For example:</p> <div style="border: 1px solid black; padding: 5px; margin-top: 10px;"> <pre><scope> <admin_users/> <project_managers/> <project_creators/> </scope></pre> </div> <p>If you want all user types to see it, don't enter a scope at all.</p>

Note: Do not use spaces in the XML values.

For example, to create a menu showing the rejected documents saved search to all users, use this:

```
<menuitem>
  <name>REJECTED_DOCUMENTS</name>
  <labeltag>REJECTED_DOCUMENTS_TAG</labeltag>
  <url>dosavedsearch.jsp?searchName=RejectedDocuments</url>
</menuitem>
```

- To add a menu entry under a top level menu, place that bit of XML between the <menuitem> tags of the top level menu, as in the example below.

```
<menuitem>
  <name>SEARCH</name>
  <labeltag>SEARCH_TAG</labeltag>
  <url>projsearch.jsp</url>
  <menuitem>
    <name>REJECTED_DOCUMENTS</name>
    <labeltag>REJECTED_DOCUMENTS_TAG</labeltag>
    <url>dosavedsearch.jsp?searchName=RejectedDocuments</url>
  </menuitem>
</menuitem>
```

5.7.2. Examples

Going to Projects I Am invited to in One Click

By default, the **Projects** menu of a normal (non Project Manager) user contains **Favorite Projects** and **Projects I am invited to**. However, many users don't use favorites.

To make it quicker for them, you can remove the **Favorite Projects** and **Projects I am invited to** entries, and make clicking on the **Projects** menu go directly to **Projects I am invited to** (instead of going to **Favorite Projects**).

This makes going to **Projects I am invited to** a one-click operation.

1. Add a **Projects** menu (with no entries) going directly to **Projects I am invited to** for normal users:

Just before...

```
<menuitem>
  <name>PROJMGMENT</name>
  ...
```

add:

```
<menuitem>
  <name>PROJECTS_NONPROJMGMENT</name>
  <labeltag>PROJMGMENTPROJS_TAG</labeltag>
  <url>iamprojectmember.jsp</url>
  <scope>
    <normal_users/>
  </scope>
</menuitem>
```

Note: The "PROJMGMENTPROJS_TAG" <labeltag> already exists in the language files with the value "Projects" (in the English file), so you don't need to add it.

2. Change the scope of the old **Projects** menu (so normal users can't see it) by adding a <scope> element:

```
<menuitem>
  <name>PROJMGMENT</name>
  <labeltag>PROJMGMENTPROJS_TAG</labeltag>
  <url>myfavoriteproj.jsp</url>
  <scope>
    <admin_users/>
    <project_managers/>
  </scope>
  ...
</menuitem>
```

3. Save and upload your custom XML file.

Customizing the Interface for Project Requests

Often you might want to allocate a separate menu item for creating a project (or requesting a project) based on a fixed template.

You don't need to call this button "Create Project"... Depending on your business process, you can use for example:

- New Sales Request
- Order Samples
- Create New Book
- Add Product
- New Campaign

If you only ever have one type of project request, you can [Create a Project from a Fixed Template](#) on page 1014.

If you have different project request types, [Create a Project from Different Templates](#) on page 1015.

You can also [Show Projects Created from the Request Template\(s\)](#) on page 1019 and [Add Your Requests to Your My Work Page](#) on page 1020.

Create a Project from a Fixed Template

If your users only need to create one type of project (request), you can add a button that will bring them directly to the project creation page, with the template they need already selected.

1. In your XML menu file, remove all menu items the requesters won't need.
2. Add a menu item (called for example "New Request"), that links to creating a project based on an existing template (called for example "New Box").

```
<menuitem>
  <name>NEW_REQUEST</name>
  <labeltag>NEW_REQUEST_TAG</labeltag>
  <url>projmgmntnewproject.jsp?template=New%20Box</url>
  <scope>
    <project_managers/>
  </scope>
</menuitem>
```

Note: Make sure you enter your template name precisely (the <url> is case sensitive and needs %20 to represent a space).

3. Save and upload your custom XML file.
4. Assign the menu to the users (or company) you created it for.
5. Add a language string to the language files (see [Add Custom Menu Items](#) on page 1011 and [Customize the Language Files](#) on page 1004).
6. Restart TomCat.
7. Log in to WebCenter as one of the users to which you gave the "New Request" menu, and check whether:
 - you see the "New Request" menu,
 - clicking the menu opens the project creation page, with the "New Box" template selected.

Note:

If this does not work, check all previous steps for spelling mistakes.

- If you don't get the new menu item, you have added the information incorrectly to the XML file.
- If you get an empty menu item (no text), your XML file is correct but your language file is not.
- If all is scrambled, you have broken the XML. Go back to a previous version.

Create a Project from Different Templates

If your users need to create several types of projects (requests), you can add a button that will bring them to the project creation page, with a selection of templates to choose from.

1. Mark the templates they will need to choose from using a characteristic:
 - a) Log in to WebCenter as an Admin and go to **Admin > Characteristics**.
 - b) On the **Characteristics** page, make sure **ROOT** is selected and click **New Characteristic**. Create a characteristic called "Request".
 - c) Go to one of the template the requesters will use (for example "New Box") and add the "Request" characteristic to it.
 - d) Repeat for all templates the requesters will use.
2. In your XML menu file, remove all menu items the requesters won't need.
3. Add a "New Request" menu item, that links to the project creation page, and calls the "Request" template characteristic.

```
<menuitem>
  <name>NEW_REQUEST</name>
  <labeltag>NEW_REQUEST_TAG</labeltag>
  <url>projmgmntnewproject.jsp?templatecharacteristicpath=\\Request</url>
  <scope>
    <project_managers/>
  </scope>
</menuitem>
```

Note: Make sure you enter your template name precisely (the <url> is case sensitive).

4. Save and upload your custom XML file.
5. Assign the menu to the users (or company) you created it for.
6. Add a language string to the language files (see [Add Custom Menu Items](#) on page 1011 and [Customize the Language Files](#) on page 1004).
7. Restart TomCat.
8. Log in to WebCenter as one of the users to which you gave the "New Request" menu, and check whether:
 - you see the "New Request" menu,
 - clicking the menu opens the project creation page, with all the templates that have the "Request" characteristic available.

Note:

If this does not work, check all previous steps for spelling mistakes.

- If you don't get the new menu item, you have added the information incorrectly to the XML file.
- If you get an empty menu item (no text), your XML file is correct but your language file is not.
- If all is scrambled, you have broken the XML. Go back to a previous version.

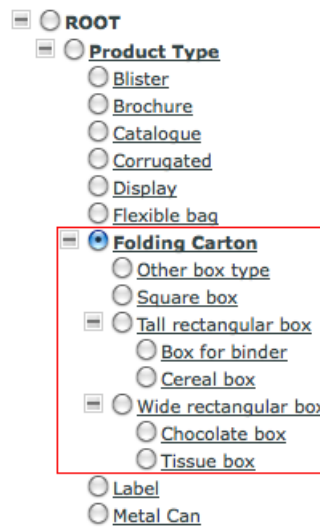

Create a Project and Run a CAD Standard

If you are an ArtiosCAD user, you can run a CAD standard at project creation (see [Run a CAD Standard from WebCenter](#) on page 145 in the Administration Guide).

You can create a custom menu item that allows users to create a project, based on a specific project template (or a selection of templates), using specific ARD document templates to run a CAD standard.

1. Mark the ARD document templates the users will need to run a CAD standard using a characteristic:
 - a) Log in to WebCenter as an Admin and go to **Admin > Characteristics**.
 - b) On the **Characteristics** page, create the characteristic to assign to your ARD document templates, and sub-characteristics if desired.

For example, create "Folding Carton" as a main characteristic and types of boxes as sub-characteristics.

Note: The main characteristic can be as deep as you want in the characteristics tree, but it cannot contain more than two levels of sub-characteristics.

See [Create a Characteristic](#) on page 291 in the Administration Guide for details.

- c) Add the characteristic or one of the sub-characteristics you just created to all ARD document templates you want to make available to the users at project creation.
For example, you can have an ARD document template with the "Tall rectangular box" and "Cereal box" characteristics, another one with the "Square box" characteristic, etc.
2. In your XML menu file, remove all menu items the requesters won't need.
3. Add a menu item (for example "New Request") that links to creating a project based on an existing template (for example "New Box"), using ARD document templates with your chosen main characteristic (for example "Folding Carton") for running a CAD standard.

```

<menuitem>
  <name>NEW_REQUEST</name>
  <labeltag>NEW_REQUEST_TAG</labeltag>
  <url>projmgmntnewproject.jsp?template=New%20Box&documentcharacteristicpath=\
\Product%20Type\Folding%20Carton</url>
  <scope>
    <project_managers/>
  </scope>
</menuitem>
  
```

Note:

Make sure you enter your template and characteristic names precisely:

- the <url> is case sensitive,
- use %20 to represent a space,
- use & between the reference to the project template and the reference to the document characteristic,
- use \\ before each level of the characteristic tree under ROOT (so **ROOT > Product Type > Folding Carton** is \\Product%20Type\\Folding%20Carton).

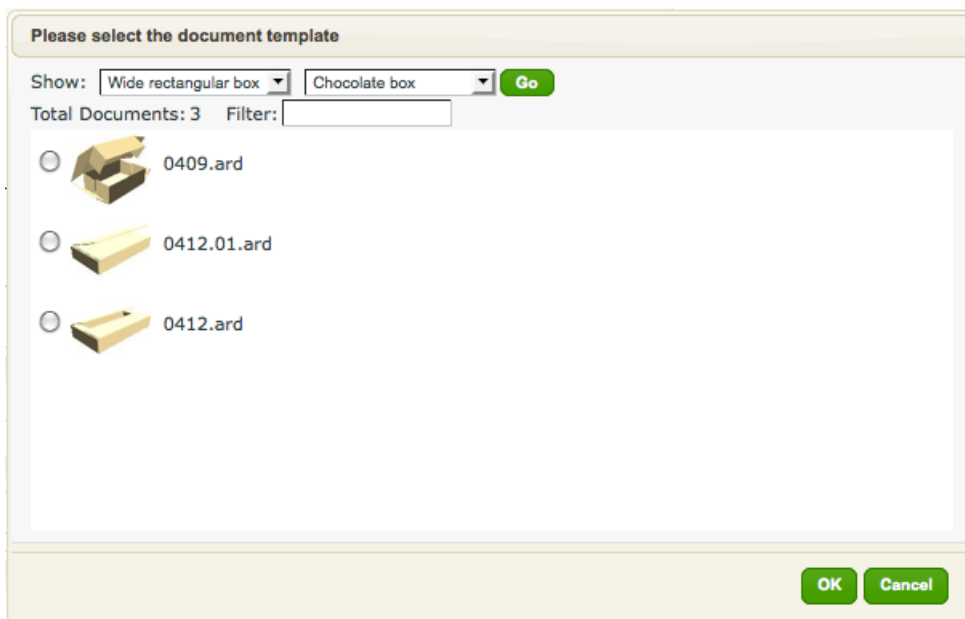

Tip:

If you want the requesters to select from a list of relevant project templates instead of using a fixed one, mark these project templates with a characteristic as explained in [Create a Project from Different Templates](#) on page 1015.

Then specify the project template and document template characteristics to use in the XML:

```
<menuitem>
  <name>NEW_REQUEST</name>
  <labeltag>NEW_REQUEST_TAG</labeltag>
  <url>projmgmntnewproject.jsp?templatecharacteristicpath=\\
Request&amp;documentcharacteristicpath=\\Product%20Type\\Folding%20Carton</url>
  <scope>
    <project_managers/>
  </scope>
</menuitem>
```

4. Save and upload your custom XML file.
5. Assign the menu to the users (or company) you created it for.
6. Add a language string to the language files (see [Add Custom Menu Items](#) on page 1011 and [Customize the Language Files](#) on page 1004).
7. Restart TomCat.
8. Log in to WebCenter as one of the users to which you gave the "New Request" menu, and check whether:
 - you see the "New Request" menu,
 - clicking the menu opens the project creation page, with the "New Box" template selected (or with a list of all templates that have the "Request" characteristic available, depending on what you specified in the XML).
 - when clicking **New** in the **Documents** section, you can see the ARD templates that have the "Folding Carton" characteristic or one of its sub-characteristics, and you can filter on sub-characteristics (select up to two levels of sub-characteristics in **Show** and click **Go**).

Note:

If this does not work, check all previous steps for spelling mistakes.

- If you don't get the new menu item, you have added the information incorrectly to the XML file.
- If you get an empty menu item (no text), your XML file is correct but your language file is not.
- If all is scrambled, you have broken the XML. Go back to a previous version.

Show Projects Created from the Request Template(s)

Once you allow people to create requests, you will probably also want a "Requests" menu item, which shows all projects created from templates with the "Request" characteristic.

1. Add a "Request" menu item (under "NON_ADMIN" if you want it to be a top level menu, or under a top level menu item if you want a menu entry):

```
<menuitem>
  <name>REQUESTS</name>
  <labeltag>REQUESTS_TAG</labeltag>
  <url>myallprojects.jsp?characteristicpath=\\Request</url>
</menuitem>
```

2. Save and upload (update) your custom XML file.
3. Add a language string to the language files.
4. Restart TomCat.
5. Log in to WebCenter as one of the users who has this menu, and check whether the menu works.

Add Your Requests to Your My Work Page

To complete the user experience of requests, you can add a **My Work** section that displays the list of requests the user created him/herself on their **My Work** page.

1. Log in to WebCenter as an Admin and do a project search looking for the "Request" characteristic.

Search for Projects

Fill in one or more fields. Prefer less fields? Try [Keyword Search](#).

	View(List)	Column Order	Editable	Sort	Order
Project Name <input type="text"/>	<input checked="" type="checkbox"/>	1	<input type="checkbox"/>	<input checked="" type="checkbox"/>	1
Description <input type="text"/>	<input checked="" type="checkbox"/>	2	<input type="checkbox"/>	<input type="checkbox"/>	
Project Status Show All ▼ <input type="button" value="I"/>	<input type="checkbox"/>		<input type="checkbox"/>	<input type="checkbox"/>	
Created <input type="text"/>	<input type="checkbox"/>		<input type="checkbox"/>	<input type="checkbox"/>	
Modified <input type="text"/>	<input checked="" type="checkbox"/>	3	<input type="checkbox"/>	<input type="checkbox"/>	
Due <input type="text"/>	<input checked="" type="checkbox"/>	4	<input type="checkbox"/>	<input type="checkbox"/>	
Customer/Location <input type="text"/>	<input type="checkbox"/>		<input type="checkbox"/>	<input type="checkbox"/>	
Salesperson <input type="text"/>	<input type="checkbox"/>		<input type="checkbox"/>	<input type="checkbox"/>	
Project Manager <input type="text"/>	<input checked="" type="checkbox"/>	5	<input type="checkbox"/>	<input type="checkbox"/>	
Manager's Location <input type="text"/>	<input type="checkbox"/>		<input type="checkbox"/>	<input type="checkbox"/>	
Add Role					
Attributes...					
Characteristics... <input type="checkbox"/>					
Bill of Materials Show All ▼	<input type="checkbox"/>		<input type="checkbox"/>	<input type="checkbox"/>	

2. Save this search as a **Global** search with the name "Requests".
3. Create a **My Work** section displaying this search:
 - a) Go to **Admin > Preferences > My Work** and click **Create New My Work Section**.
 - b) Fill the fields on the **Create New My Work Section** page as shown below and click **Create**.

Create New My Work Section

Name *

Type

Saved Search

URL *

Scope

Role Groups All Users Specific Groups

Tip: Select one or more Role Groups to limit the Visibility of this section to the selected Groups

Note: You can choose another scope than **All Users**, for example only a group of requesters.

Now people in the scope can add the "My Requests" section to their **My Work** page (via **MyWork > Edit My Work setup**).

My Work

▼ My Requests

<input type="checkbox"/>	Name ↑	Description	Status
<input type="checkbox"/>	Request0001		<input type="button" value="Active"/>
<input type="checkbox"/>	Request0002		<input type="button" value="On Hold"/>
<input type="checkbox"/>	Request0003		<input type="button" value="Active"/>
<input type="checkbox"/>	Request0004		<input type="button" value="Completed"/>

Found: 4 items.

Removing the Keyword Search

To remove the ability to search using a keyword, add the following under the "NON_ADMIN" <menuitem>:

```
<keyword_search><enabled>>false</enabled></keyword_search>
```

This will remove the search box at the top right corner of the WebCenter window, and the **Keyword Search** option from the **Search For Projects**, **Search For Documents** and **Search For Tasks** pages.

5.7.3. Will My Customizations Survive New Updates?

The XML files you create are uploaded to the database and as such, they will survive WebCenter updates/upgrades. This means that the menus will remain as you have defined them.

However, new features added by a new version may mean extra menu items added in the default menu.

If you created your custom menu(s) from a **full** copy of the default menu, users having those menus **will not see the menus added by the new version**.

To prevent this, **we recommend you work with an XML file containing only the "differences" between the default menu and your custom menu**.

This means that you only put the part which you actually changed in the new XML file.

Examples

- If you only changed the top menu, your XML should only contain the "NON_ADMIN" menu item. This way, the other menus will stay the same.
- If you only want to remove a part of the project details tabbed menu, create an XML file with only the "PROJDETAILS" section (and change it to your needs).
- If you only want to add an item to the existing top level menu, just include that menu item in the XML file (nothing else). It will be added to the right of the top level menu.

5.8. Integrating an External Web Connection into the User Interface

An external web connection is a connection to some data in an external system (usually a MIS system). The MIS system calculates the data (for example a bill's details) and WebCenter retrieves this data through the external web connection and displays it on a WebCenter page.

After configuring the external web connection (see [Configure External Web Connections](#) on page 396 in the Administration Guide), you can choose to add a link to it in a WebCenter top-level menu, project menu or a My Work section.

5.8.1. Integrating an External Web Connection into a Top-Level Menu

To integrate an external web connection into a WebCenter top-level menu, you need to edit the `menu.xml` file (see [the Customizing the WebCenter Menus chapter](#) for some background information about menus and how to edit them).

Note: You can only have one link to an external web connection in the top level menu per menu file.

If the external system you are connecting to outputs XML, you will also need an XSL (eXtensible Stylesheet Language) file to transform this to HTML and display it in WebCenter. Your WebCenter installation comes with an example XSL file, that you can customize.

1. If the external system you are connecting to outputs XML, edit the example XSL file as necessary:

- a) Copy the example XSL file called `externalwebtransform.xml`, located in your `custom_example\externalwebconnection` folder, and paste it into `custom\externalwebconnection`.

Tip: Both the `custom_example\externalwebconnection` and the `custom\externalwebconnection` folders are located on your Web server instance, for example `C:\Artios\WebCenter\WebServer\tomcat\webapps\WebCenter_instance\custom_example\externalwebconnection`.

- b) Edit the `custom\externalwebconnection\externalwebtransform.xml` file as necessary. You can also rename it if desired.

Tip: See [the Customizing the E-Mail Notifications chapter](#) for principles and tips about editing an XSL file.

2. [Download the default menu](#) to use as a starting point.
3. In the `menu.xml` file, locate the part starting with `<!-- External Web Connection (1-level Menu)`.
4. Uncomment the following section:

```
<!-- <menuitem>
    <name>MYEXTERNALWEB_INFO</name>
    <labeltag>MYEXTERNALWEB_INFO_TAG</labeltag>
    <url>myexternalwebinfo.jsp?ExternalWebConfigName=<Name of your external
web configuration>&amp;XSLTransform=<Name of your xsl transformation in custom/
externalwebconnection directory>&amp;CallFromWebserver=<0/1 depending on whether the
call to the external system needs to be made on the tomcat server (1), or the jboss
server (0)></url>
</menuitem> -->
```

Tip: To uncomment, remove the `<!--` and `-->` signs that surround the section.

5. Edit this section as necessary:
 - a) Replace `<Name of your external web configuration>` by the name of your external web connection.
 - b) If the external system you are connecting to outputs XML, replace `<Name of your xsl transformation in custom/externalwebconnection directory>` by the name of the XSL file in your `custom\externalwebconnection` folder.
You can skip this step if you didn't rename the `externalwebtransform.xml` file.
 - c) In the `CallFromWebserver` parameter, replace `<0/1 depending on whether the call to the external system needs to be made on the tomcat server (1), or the jboss server (0)>` by either:
 - `<0>` if you want to connect to the external system from the WebCenter Application Server,
 - `<1>` if you want to connect to the external system from the WebCenter Web Server.

If you don't specify anything, WebCenter will try to connect to the external system from the Application Server.

For example, if:

- your external web connection is called "ExternalWebConfig1",
- you haven't renamed the `externalwebtransform.xsl` file,
- you want to connect from the Application Server,

then you should include the following section `menu.xml` file:

```
<menuitem>
  <name>MYEXTERNALWEB_INFO</name>
  <labeltag>MYEXTERNALWEB_INFO_TAG</labeltag>
  <url>myexternalwebinfo.jsp?ExternalWebConfigName=ExternalWebConfig1</url>
</menuitem>
```

6. When you are done editing the menu file, save it under a meaningful name.
7. Upload your custom menu:
 - a) click the **Menu Upload** button on the **Menus** page,
 - b) on the **Menu Upload** page, browse to your XML file,
 - c) give your custom menu a **Name** and a **Description**,
 - d) click **Upload**.
8. If desired, assign the menu to specific users (or companies).
9. Log out and log in to WebCenter as one of the users to which you gave the custom menu, and check whether the menu works.

When clicking the menu item, the system will send a request to the configured service, and show the result in a page containing the normal WebCenter navigation and:

- for a HTML connection: the returned HTML.

Note: The external system must make sure this HTML is sufficiently self-contained.

- for an XML connection: the HTML resulting from converting the returned XML with the XSL file you configured.

5.8.2. Integrating an External Web Connection into a Project Menu

To integrate an external web connection into a WebCenter project menu, you need to edit the `menu.xml` file (see [the Customizing the WebCenter Menus](#) for some background information about menus and how to edit them).

Note: You can only have one external web connection menu item per project.

If the external system you are connecting to outputs XML, you will also need an XSL (eXtensible Stylesheet Language) file to transform this to HTML and display it in WebCenter. Your WebCenter installation comes with an example XSL file, that you can customize.

1. If the external system you are connecting to outputs XML, edit the example XSL file as necessary:

- a) Copy the example XSL file called `externalwebtransform.xml`, located in your `custom_example\externalwebconnection` folder, and paste it into `custom\externalwebconnection`.

Tip: Both the `custom_example\externalwebconnection` and the `custom\externalwebconnection` folders are located on your Web server instance, for example `C:\Artios\WebCenter\WebServer\tomcat\webapps\WebCenter_instance\custom_example\externalwebconnection`.

- b) Edit the `custom\externalwebconnection\externalwebtransform.xml` file as necessary. You can also rename it if desired.

Tip: See [the Customizing the E-Mail Notifications](#) for principles and tips about editing an XSL file.

2. [Download the default menu](#) to use as a starting point.
3. In the `menu.xml` file, locate the part starting with `<!-- External Web Connection (Project-level Menu)`.
4. Uncomment the following section:

```
<!-- <menuitem>
    <name>PROJDETAILSEXTERNALWEBINFO</name>
    <labeltag>PROJDETAILSEXTERNALWEBINFO_TAG</labeltag>
    <url>projdetailsexternalwebinfo.jsp?ExternalWebConfigName=<Name of your
External Web configuration>&XSLTransform=<Name of your xsl transformation in
custom/externalwebconnection directory>&CallFromWebserver=<0/1 depending on
whether the call to the External Web system needs to be made on the tomcat server
(1), or the jboss server (0)></url>
</menuitem> -->
```

Tip: To uncomment, remove the `<!--` and `-->` signs that surround the section.

5. Edit this section as necessary:
 - a) Replace `<Name of your external web configuration>` by the name of your external web connection.
 - b) If the external system you are connecting to outputs XML, replace `<Name of your xsl transformation in custom/externalwebconnection directory>` by the name of the XSL file in your `custom\externalwebconnection` folder.
You can skip this step if you didn't rename the `externalwebtransform.xml` file.
 - c) In the `CallFromWebserver` parameter, replace `<0/1 depending on whether the call to the external system needs to be made on the tomcat server (1), or the jboss server (0)>` by either:
 - `<0>` if you want to connect to the external system from the WebCenter Application Server,
 - `<1>` if you want to connect to the external system from the WebCenter Web Server.
 If you don't specify anything, WebCenter will try to connect to the external system from the Application Server.

For example, if:

- your external web connection is called "ExternalWebConfig2",

- you have renamed the `externalwebtransform.xml` file to `ExternalWebProjecttransform.xml`,
- you want to connect from the Web Server,

then you should include the following section `menu.xml` file:

```
<menuitem>
  <name>PROJDETAILSEXTERNALWEBINFO</name>
  <labeltag>PROJDETAILSEXTERNALWEBINFO_TAG</labeltag>
  <url>projdetailsexternalwebinfo.jsp?
  ExternalWebConfigName=ExternalWebConfig2&amp;XSLTransform=ExternalWebProjecttransform.xml&amp;CallE
url>
</menuitem>
```

6. When you are done editing the menu file, save it under a meaningful name.

7. Upload your custom menu:

- a) click the **Menu Upload** button on the **Menus** page,
- b) on the **Menu Upload** page, browse to your XML file,
- c) give your custom menu a **Name** and a **Description**,
- d) click **Upload**.

8. Go to a WebCenter project, and check whether the menu works.

When clicking the menu item, the system will send a request to the configured service, and show the result in a page containing the normal WebCenter navigation and:

- for a HTML connection: the returned HTML.

Note: The external system must make sure this HTML is sufficiently self-contained.

- for an XML connection: the HTML resulting from converting the returned XML with the XSL file you configured.

5.8.3. Integrating an External Web Connection into a My Work Section

To integrate an external web connection into a **My Work** section, you need to create a new homepage section in the **Admin > Preferences > My Work** page.

If the external system you are connecting to outputs XML, you will also need an XSL (eXtensible Stylesheet Language) file to transform this to HTML and display it in WebCenter. Your WebCenter installation comes with an example XSL file, that you can customize.

1. If the external system you are connecting to outputs XML, edit the example XSL file as necessary:

- a) Copy the example XSL file called `externalwebtransform.xml`, located in your `custom_example\externalwebconnection` folder, and paste it into `custom\externalwebconnection`.

Tip: Both the `custom_example\externalwebconnection` and the `custom\externalwebconnection` folders are located on your Web server instance, for example `C:\Artios\WebCenter\WebServer\tomcat\webapps\WebCenter_instance\custom_example\externalwebconnection`.

- b) Edit the `custom\externalwebconnection\externalwebtransform.xml` file as necessary. You can also rename it if desired.

Tip: See [the Customizing the E-Mail Notifications chapter](#) for principles and tips about editing an XSL file.

2. Click **Admin > Preferences > My Work**. The **My Work Sections** page appears.
3. Click **Create New My Work Section**.
4. Give your new section a **Name**.
5. In the **Type** option, select **Generic**.
6. In the **URL** field:
 - a) Paste the following:

```
http://<webserver_name>/<Instance name>/myexternalwebinfo.jsp?
ExternalWebConfigName=<Name of your External Web
configuration>&XSLTransform=<Name of your xsl transformation in custom/
externalwebconnection directory>&CallFromWebserver=<0/1>&homepageSection=1
```

- b) Replace `http://<webserver_name>/<Instance name>` by the address of your WebCenter server.
- c) Replace `<Name of your external web configuration>` by the name of your external web connection.
- d) If the external system you are connecting to outputs XML, replace `<Name of your xsl transformation in custom/externalwebconnection directory>` by the name of the XSL file in your `custom\externalwebconnection` folder.
- e) In the `CallFromWebserver` parameter, replace `<0/1` depending on whether the call to the external system needs to be made on the tomcat server (1), or the jboss server (0) by either:

- `<0>` if you want to connect to the external system from the WebCenter Application Server,
- `<1>` if you want to connect to the external system from the WebCenter Web Server.

If you don't specify anything, WebCenter will try to connect to the external system from the Application Server.

Note: Make sure you keep the `homepageSection=1` parameter at the end!

For example, if:

- the address of your WebCenter server is `http://webcenter2.esko.com/WebCenter_Inst/`,
- your external web connection is called "ExternalWebConfig3",
- you have renamed the `externalwebtransform.xml` file to `ExternalWebHomepage.xml`,
- you want to connect from the Application Server,

then you should use the following as URL:

```
http://webcenter2.esko.com/WebCenter_Inst/myexternalwebinfo.jsp?
ExternalWebConfigName=ExternalWebConfig3&XSLTransform=ExternalWebHomepage.xsl
&homepageSection=1
```

7. In **Scope**, choose which type of users will be able to use this section in their **My Work** page:

- **All Users**,
- **Administrators**,
- **Project Managers**.

8. You can use groups to further filter the users that will be able to see the section. In **Role Groups**, choose either:

- **All Users** if you want all users of the type specified in **Scope** to be able to use the section,
- **Specific Groups** if you want to restrict the section's visibility to specific groups (within that user type).

In this case, select the groups which will be able to use this section.

9. Click **Create**.

10. Log out and log in to WebCenter as one of the users to which you assigned the new My Work section, and check whether the link to the external web connection works.

When clicking the link, the system will send a request to the configured service, and show the result in a page containing the normal WebCenter navigation and:

- for a HTML connection: the returned HTML.

Note: The external system must make sure this HTML is sufficiently self-contained.

- for an XML connection: the HTML resulting from converting the returned XML with the XSL file you configured.

5.9. Customizing the Attributes

From WebCenter 12, it is possible to customize the attributes. You can now change the attribute's label to an image, add an HTML help page, allow multiple values and more.

For more information about the **Graphic Asset Browser** and **Cascading attributes**, please consult the WebCenter Admin Guide.

5.9.1. Create Image Label for an Attribute

You can create Project request forms or Order forms with graphical labels by setting image labels for specific **Attributes** in an **Attribute Category**. You can use this feature to make the form visually attractive and user friendly. In addition, you can add graphical (packaging) symbols and warnings to aid the user while filling in the forms.

1. Add the label images to the following folder on the WebServer: WebCenter\WebServer\tomcat\webapps\WebCenter_Inst\custom\AttributeLabelImages.
Create a new folder `custom` if it does not exist yet and create a folder named **AttributeLabelImages** under this folder.

Note:

- For the best user experience, use .jpg images. It does recognize .gif,.jpeg and .png.

2. Open your **Attribute Category** and select the **Attribute** for which you want to give an image label.
3. In the cell details, enter the correct image name including the extension in the **Label Image** field and save your attribute category.

The screenshot shows two parts of the WebCenter interface. On the left is a table with columns for attribute names and their types. On the right is a configuration panel for the attribute NAPR_TASK_ATT1.

Attribute	NAPR_TASK_ATT1
Attribute Type:	Text
Label:	Label Text: NAPR_TASK_ATT1 Label Image: Danger.jpg Position: Left Custom Unit Label:
Span Columns:	1
Span Rows:	1
Style:	WebCenter Attribute Add Style
Style Rule:	No Rule Add Style Rule
Visibility:	Editable Add Rule
Restrict Values:	Restricted Set: NAPR_RES1 Rendering: Dropdown
Allow Multiple Values:	<input type="checkbox"/>
Info Page:	Info HTML page (name+extension) <WebInstanceRoot>/custom/AttributesHelp/

Note: The image name is case sensitive.

You can see image labels appearing instead of attribute names in the forms.

Regulatory Input / Briefing

Packaging Symbols

Packaging Code	Barcode type	Barcode	Approved for Use?
* <input type="text"/>	* <input type="text" value="---Please Select---"/>	* <input type="text"/>	* <input type="text" value="---Please Select---"/>

Required Legal Disclaimers / Warnings

[Show Rich Text Controls](#)

Tip: In case you wish to display a check box for the **attribute**, make sure you use an **attribute** with a **restricted set** containing only the values Yes and No.

Note: You can either have a text label or an image label, but not both.

5.9.2. Create HTML Information for an Attribute

When you design Project request forms or new Order forms, you might want to provide additional information to the user who is filling in the information.

From WebCenter 12 onwards you can provide additional information as HTML help or information. This is especially useful when technical fields need to be supported with extended HTML help.

There will be an information  icon that is added next to the attribute name or attribute image label. When the user clicks on this icon, a pop-up HTML page with the information will appear.

1. Create an HTML file with the additional information you want to provide along with the attribute. You can create textual information as well as images to explain the attribute.
2. Place this HTML file in the AttributeHelp folder (WebCenter\WebServer\tomcat\webapps\WebCenter_Inst\custom\AttributesHelp).
3. Open the **Attribute category** and select the **attribute** for which you want to provide HTML help or information.
4. In the cell details, enter the correct file name (of the HTML file) in the **Info Page** field and save your **Attribute Category**.

Details for selected cell:

Attribute	w2p-Finishing
Attribute Type:	Text
Label:	Finishing
Label Image:	
Span Columns:	1
Style:	WebCenter Attribute Add Style
Visibility:	VisibilityRule Add Rule Edit Rule Delete Rule
Allow Multiple Values:	<input type="checkbox"/>
Info Page:	Info HTML page (name+extension) <WebInstanceRoot>/custom/AttributesHelp/ sheet-and-roll.html

If you have an HTML information page linked to an **attribute**, you can see an information icon next to the attribute in the form that you created. When you click on the information , you can see a pop-up window with the information to help the User.

5.10. Customizing the E-Mail Notifications

WebCenter users can determine the look and content of the e-mail notification messages themselves, thus allowing for customizable e-mail notification messages.

5.10.1. E-Mail Notification Templates In Detail

Each of the notification message types consists of two XSLT template files

1. one for the message's body and
2. one for the message's subject.

For example the default Approval Cycle Finished notification message templates are following:

```
C:/Esko/Artios/WebCenter/ApplicationServer/EmailNotifications/Default/Approval/cycle_finished_body.xsl
```

```
C:/Esko/Artios/WebCenter/ApplicationServer/EmailNotifications/Default/Approval/cycle_finished_subject.xsl
```

All XSLT templates used for creating e-mail notification messages consume a single XML document as a source for the actual transformation that leads to a plain-text-formatted output for message body and subject. This XML source is supplied by the system when an appropriate action is triggered (i.e. a project manager has changed a project status; an approval cycle has been started on a document; a task was reassigned to a different user; etc.).

There are two basic parts of this XML source document:

- All supported String labels in XML format. These labels are inserted into the XML source document by E-mail Language Manager. They are localized based on the language preference of the message's recipient passed to the E-mail Language Manager.
- The actual data that makes up the "information part" of the message (i.e. project name/due date/project manager name etc.)

These two parts of a XML source are enough for the XSLT template to create an appropriate output.

5.10.2. Start from the example

The easiest way to customize the **WebCenter** e-mail notifications, is to start from the example files. In the **EmailNotifications** folder, you can find an **Default** folder which contains an elaborate e-mail customization.

Note: This example has been tested for compatibility with the following e-mail clients: Outlook, iOS Mail and GMail.

1. First of all, you may need to navigate to your `../EmailNotifications/Custom` folder and create a back-up of your current customized e-mail notifications.
2. Place the contents of the `../EmailNotifications/Example` folder inside the **Custom** folder.
3. Restart the WebCenter services in order to update all language labels.

Basic customization

At the root of the **Example** folder, you can find 3 important XSL templates for basic customization of the WebCenter e-mail notifications:

- header.xsl
- footer.xsl
- customize.xsl

These three template files contain the formatting of the header, the footer, style and content that is used in all the e-mail notifications sent by **WebCenter**. If you make changes to these files, the changes are reflected in all notification mails.

Another important file is: `URL.xsl`.

Header.xsl

The `Header.xsl` file contains the logo of your company. The same header is included at the top of every e-mail notification sent by WebCenter.

Logo image

In the example, the logo image is the same as the WebCenter **AppLogo**; the logo that is displayed in the top left part of the header. This image is located on the Web Server. You can replace the WebCenter logo by modifying the **logoSource** variable. You can use the **host URL** of WebCenter to build the URL, by first adding:

```
<xsl:value-of select="host_url" />
```

After that, you add the path to the image, for example: `/myimages/logo.gif`, like in the example. You could also use a web URL.

Note: You can only specify an image source a server location (for instance, a web server on the internet). A relative path to the e-mail customization folder will not work.

Logo link

By replacing the contents of the **logoLink** variable with the link to your company website, you change the link attached to the company logo. When a user clicks on the logo in the e-mail notification, they will be redirected to this specific **URL**.

Example:

Replace the existing variables:

```
<xsl:variable name="logoLink">
  <xsl:value-of select="host_url"/>
</xsl:variable>
<xsl:variable name="logoSource">
<xsl:value-of select="host_url"/>
  /images/WebCenter-banner.png
</xsl:variable>
```

By:

```
<xsl:variable name="logoLink">
  http://www.mycompany.com
</xsl:variable>
<xsl:variable name="logoSource">
  http://www.mycompany.com/image.jpg
</xsl:variable>
```

Footer.xsl

The `Footer.xsl` file is similar to the header file. It is included at the bottom of every e-mail notification sent from WebCenter. You can modify the company name and address by changing the **company** and **address** variables at the beginning of the file.

Example:

Replace the existing variables:

```
<xsl:variable name="company" select="'WebCenter © Esko' " />
<xsl:variable name="address" select="'Kortrijksesteenweg 1095, B-9051 Gent, België' " />
```

By:

```
<xsl:variable name="company" select="'My company name' " />
<xsl:variable name="address" select="'My address' " />
```

Note: Pay special attention to the single quotes that are used in addition to the double quotes.

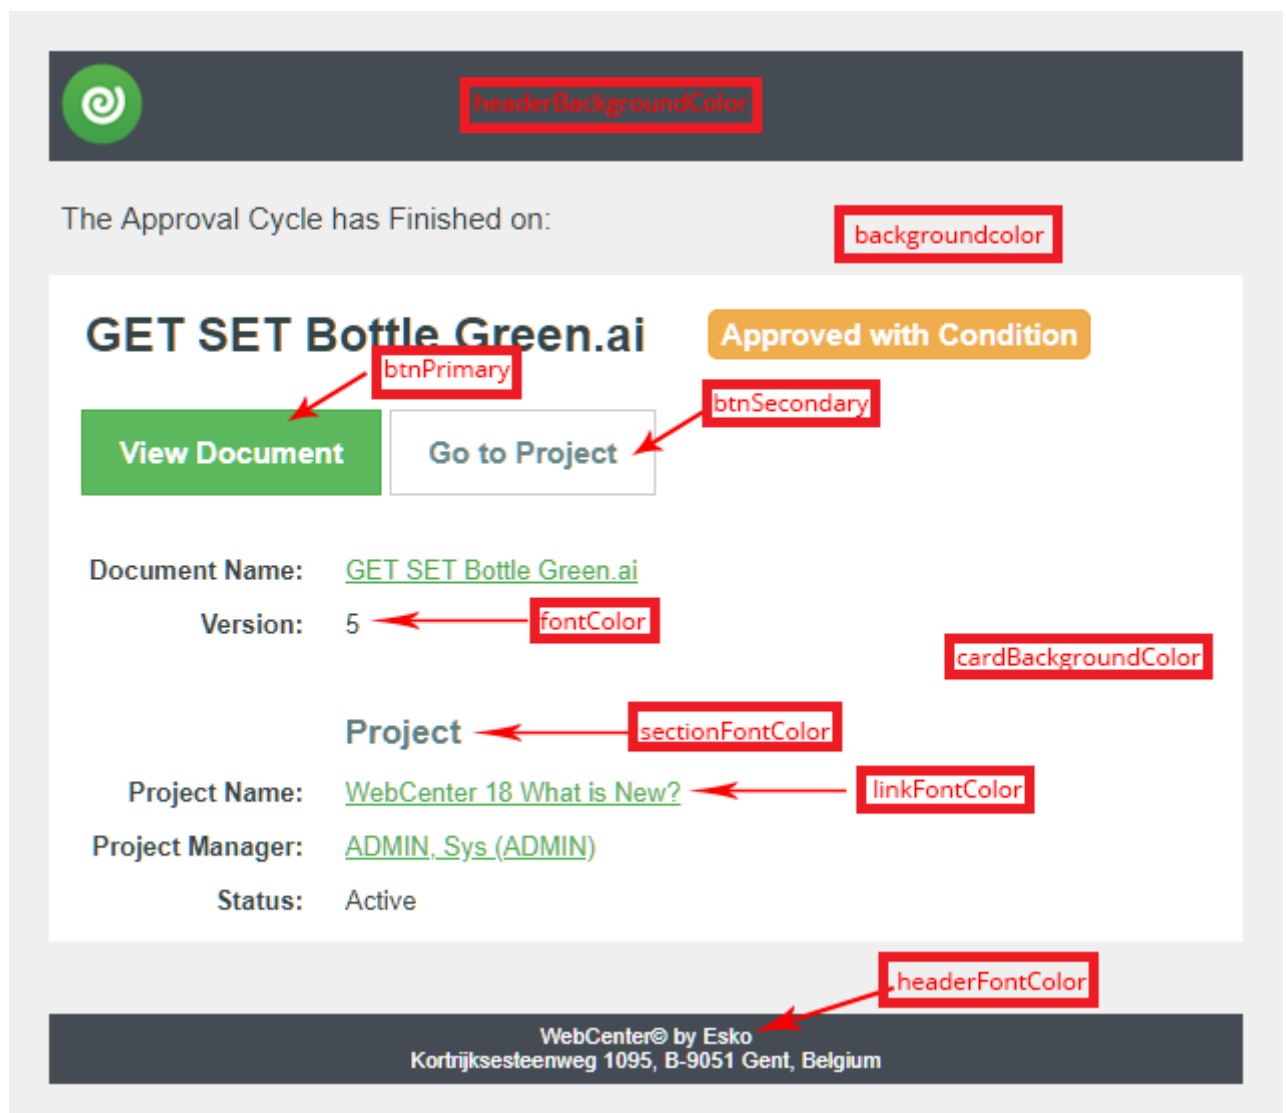

Customize.xsl

The `Customize.xsl` file contains three parts: **Styling**, **Content** and **Styles**.

You can customize fonts and colors of the notifications in this file.

Styling

The **styles** section contains all the elements that make up the fonts and the colors of the e-mail notifications. For example, you can set a background color, font, font-size, font color, etc..

Example for styling in a customize.xsl file is given below:

```
<xsl:variablename="fontFamily">Roboto, Arial, Helvetica, sans-serif</xsl:variable>
<xsl:variablename="fontSize">13px</xsl:variable>
<xsl:variablename="buttonFontSize">15px</xsl:variable>
<!-- colors -->
<xsl:variablename="fontColor">#334444</xsl:variable>
<xsl:variablename="backgroundColor">#efefef</xsl:variable>
<xsl:variablename="cardBackgroundColor">#ffffff</xsl:variable>
```

```
<xsl:variablename="headerBackgroundColor">"#babe13</xsl:variable>
<xsl:variablename="headerFontColor">#ffffff</xsl:variable>
<xsl:variablename="linkFontColor">#4cae4c</xsl:variable>
<xsl:variablename="sectionFontColor">#5f7e7e</xsl:variable>
<!-- Primary Button -->
<xsl:variablename="btnPrimaryBackgroundColor">#5cb85c</xsl:variable>
<xsl:variablename="btnPrimaryBorderColor">#4cae4c</xsl:variable>
<xsl:variablename="btnPrimaryFontColor">#ffffff</xsl:variable>
<!-- Secondary Button -->
<xsl:variablename="btnSecondaryBackgroundColor">#ffffff</xsl:variable>
<xsl:variablename="btnSecondaryBorderColor">#cccccc</xsl:variable>
<xsl:variablename="btnSecondaryFontColor">#668888</xsl:variable>
```

Content

The second part, **content**, allows you to control the presence of certain sections in the notifications. You can display or hide the document, task and project sections. The section will be displayed when you set it to **true** and hidden if you set it to **false**.

Example:

If you want to show the document and task sections, but hide the project section, your variables will look like this:

```
<xsl:variable name="document" select="true()"></xsl:variable>
<xsl:variable name="project" select="false()"></xsl:variable>
<xsl:variable name="task" select="true()"></xsl:variable>
```

Note: Pay attention to the brackets used behind the true and false values, these are necessary.

Styles

The **styles** section contains all the elements that make up the layout of the e-mail notifications. You can modify the CSS of a specific part in order to change the look and feel of the notifications.

Layout

Every e-mail notification follows the same layout pattern. The body of the e-mail notification contains the **main** table that consists of three parts: **header**, **information table** and **footer**.

1. main
2. header
3. information card
4. message
5. section header
6. label
7. value
8. section header
9. footer

Header and footer

The **header** and **footer** information is imported from the `Header.xml` and `Footer.xml` files. The styling of these sections can be modified in `Customize.xml`.

Information card

The **information card** consists of multiple parts. First of all, there is a **message** that describes the action. Next you find multiple sections describing the project, document and task changed information. Every section has a **sectionHeader**.

A section typically contains two columns: **label** and **value**.

Note: Not all sections are relevant for, and therefore present in, every notification, it depends on the action what is displayed. The same goes for label-value pairs, they are displayed depending on the action and information in WebCenter.

Example:

If you want to change the background color of the **sectionHeader** in all e-mail notifications to green, you only need to change the following value in the specific template:

```
'background-color: #EEEEEE;'
```

The **sectionHeader** template in the `Style.xsl` file will now look something like this:

```
<!-- Section Header Style -->
<xsl:variable name="sectionHeaderStyle">
  font: 24px <xsl:value-of select="$fontFamily"/>;
  font-weight: bold;
  color: <xsl:value-of select="$sectionFontColor"/>;
  padding: 30px 0 5px 12px;
</xsl:variable>
```

URL.xsl

The `URL.xsl` file contains a template that is called for every URL in the e-mail notifications. This way, you can map the internal WebCenter URL to an URL that is accessible from the outside. This is sometimes needed because you want to access the links to tasks, documents and projects in the notification e-mails from the outside. The internal URL is specified in the **internalURL** variable and the corrected accessible URL is specified in the **correctURL** variable. Change both variables to your URLs to activate this feature for your WebCenter e-mail notifications

Example:

Replace the existing variables:

```
<xsl:variable name="internalURL" select="'http://intranet.esko.com'"/>
<xsl:variable name="correctURL" select="'http://accessible.esko.com'"/>
```

By:

```
<xsl:variable name="internalURL" select="'http://my.intranet.esko.com'"/>
<xsl:variable name="correctURL" select="'https://correct.esko.com'"/>
```

Note: Pay attention to the usage of both double and single quotes.

Advanced customization

For a basic customization, you can change the layout of the e-mail notifications by modifying the header, footer and/or style files. For a more advanced customization, you could alter every XSL of an e-mail individually.

For example, you could:

- Include or exclude certain label-value pairs in sections.
- Change or override the layout of an e-mail individually from the style file.
- Change the links attached to certain fields (for instance, the document name).

In order to execute such a more advanced customization, you should have knowledge of both XSL and HTML.

5.10.3. Technology Used: XSLT

Staying true to the technology already used and the web anchored environment of WebCenter the framework of e-mail notification templates is based on a XML/XSLT solution.

XSLT is an industry standard for transforming an XML source to any preferred output. It uses an XML-based structure to process a passed source XML document in order to transform it into a desired output (plain text format for e-mail notification messages' purposes). Although working with XSLT requires some technical skills, it is a powerful and reliable tool.

In order to work with the XSLT template framework a user has to know:

- Structure of the XML document that is being processed by the XSLT template.
- Basic syntax and terminology of the XSLT technology.

Using XSLT also means that the templates are actually present in the form of physical files on the Application Server. They are modified on the file system directly using any text editor. There is currently no support for modifying the templates by using any part of the WebCenter user interface.

Note: You can find various freeware XSLT editors on the internet.

5.10.4. The E-Mail Template File Structure

All the e-mail notifications' related files are stored on the Application Server in the following path: `C:/Esko/Artios/WebCenter/ApplicationServer/EmailNotifications`.

This is a root directory of the repository. All the subdirectories contain the required templates and language files. The structure of the repository is following:

Inside the root directory you can find three subdirectories - Default, Custom and Example. In the Example folder, you can find a customization example. Copy the contents of the Example folder into the Custom folder to it try out.

Default directory is a container for all the default files related to e-mail notifications. Contents of this directory come with the WebCenter installation and are overwritten whenever any of these files/directories are updated (or new files/directories are added).

Note:

It is forbidden to modify the contents of Default directory, since doing so may lead to incorrect behavior in the process of creating the e-mail notification messages!

Custom directory is intended as a repository of the customized elements of the e-mail notification framework. In a clean WebCenter installation it comes empty and is populated only when a user decides to customize any part of the framework. In order to have the e-mail notifications customization framework to acknowledge and use the customized XSLT templates and/or language files it is necessary to mimic the file system structure of the default directory.

For example: a default XSLT template located on the following path:

```
C:/Esko/Artios/WebCenter/ApplicationServer/EmailNotifications/Default/Approval/cycle_finished_body.xsl
```

This default template will only be overridden by a customized template on a following path:

```
C:/Esko/Artios/WebCenter/ApplicationServer/EmailNotifications/Custom/Approval/cycle_finished_body.xsl
```

It is not necessary to mimic the entire directory/file structure of the Default directory inside the Custom directory for the customized elements to be used by the system, but the user rather needs to supply the file system structure ONLY for the individual customized elements (this means, that if the user wants to customize just Approval Started notification message, he has to create an appropriate file system structure for this notification type only).

5.10.5. Customizing E-Mail Language Files

WebCenter in general uses XML based file as a source for all labels in the system with each of the labels set stored in a single file for each of the supported languages.

The same applies to the e-mail notifications framework. This allows for supporting localized labels inside the e-mail notification messages, based on the user profile preference of the notification message's recipient.

In order to be independent on the rest of the application, the e-mail service utilizes its own E-Mail Language Manager and a separate set of XML language files.

These language files are stored on the following path: `C:/Esko/Artios/WebCenter/ApplicationServer/EmailNotifications/Default/Languages`.

If you wish to customize the labels, you need to copy an appropriate XML language file (based on the language for which you want to customize the label for) to a corresponding path in the `Custom` directory. After doing so, you need to restart the JBoss service.

5.10.6. Customizing the Notification Templates Step by Step

The most important aspect of smooth and successful e-mail notification customization process lies in basic knowledge of XSLT technology. The templates are rather simple and the XSLT constructs utilized are few. This makes any modification of the templates confusing at first sight, but is understood soon enough.

What You Need to Know Before You Begin

Structure of the Source XML

Even more important than knowledge of XSLT is knowledge of the source XML, since that is the cornerstone of X-Path usage.

To be able to work with the XSLT templates, the user has to know the structure of the XML document that is consumed by the appropriate XSLT file. Since the XML source that is used in e-mail notification message creation process is never stored anywhere on the disk and is held only in the server's memory at runtime, there is no easy way to investigate its contents and their XML structure. Since each of the individual notification templates share their "parent notification type" XML structure, it is required to learn only one XML document structure to be able to work with a whole set of the parent's "subtype" (by parent notification type one should think about Approval Notification Type, while its subtypes are Approval Cycle Started Notification, Approval Cycle Finished Notification and Approval Status Submitted Notification).

This is why each of the "parent notification type" directories contains an example XML file that represents a model XML source document that is expected by each of the "subtype" XSLT templates. The actual values of the elements in such an example XML document are of no importance. It's their XML structure that matters for anyone who wishes to customize the templates.

XPath

XPath is something like XSLT's own proxy SQL query framework. While SQL queries are used to stalk through a database, XPath is used to navigate through a XML document. The XML structure of XML source used by notification templates is really simple so the XPath queries are also simple. To tell the truth all the user doing the template modifications needs to know about XPath is parent-child relation between XML elements.

XPath basic syntax is actually done through namespace navigation. This means that it is the same as navigating through a Windows file system or internet URLs.

Here are some examples:

Windows file system - `C:/Artios/WebCenter/.`

Internet URL - `http://myserver/WebCenter_Inst/login.jsp`

In the first example:

- C: part stands for volume name (you can consider this to be the root definition of the namespace through which it will navigate).
- Artios part is an element under this root.
- WebCenter is a subdirectory of Artios (thus it is a child element of Artios which in turn is its parent element).

A similar logic applies for the second example:

- `http://` part is a definition of a protocol that will be used for processing any element selected by this "path".
- `myserver` part is a root namespace; in this case it is a server by the name `myserver`, that should contain the selected element at the end of this "path".

- WebCenter_Inst part is context name of the web application that contains the selected element; myserver part of the path is its parent element.
- Login.jsp is the selected element of this path; it is a child element of WebCenter_Inst and myserver elements.

Now if you take a trivial XML structure like:

```
<car>
  <engine HP="500">
    <parts>      Some parts    </parts>
  </engine/>
  <wheels>
    <tires>      Bridgestone   </tires>
  </wheels/>
</car>
```

You can use a similar path (this time it's XPath) structure to select (for example) the contents of tires element this way:

```
select = "/car/wheels/tires"
```

This (hypothetical) XPath expression selects the tires element, which returns its contents giving the result value Bridgestone.

If we analyze the path itself, it is very simple > car is the root element, wheels is its child element and tires is in turn child element of the wheels element.

6.2. Maintenance

6.2.1. Installation Tips

Create a Detailed Installation Log

For Installation debugging and troubleshooting purposes, you can create a detailed installation log file for any Esko Installer programs. To do this:

Run setup using the following syntax: Path+program space /v"/l*v space path+logfile name

- For example: For ArtiosCAD Enterprise installation from CD-ROM in my D:\ drive,
- Open a command prompt and Change to the D:\ drive
- Type: `setup /v"/! *v c:\temp\ACsetup.log"`

6.2.2. WebCenter Schema

Every time a new installation or upgrade is performed, the Database Schema scripts should always be run. Schema changes are guaranteed for each version and build.

Since WebCenter 12.1, the database schema scripts can be run automatically from the installer, which is recommended. In case a problem occurs, or additional parameters are needed, the scripts can still be run manually.

Note: Since WebCenter 12.1, no files need to be copied to the database server in case the database is not installed on the Application Server. The scripts can simply be run from the Application Server itself.

To run the database scripts manually from the Application Server, execute the following steps:

1. Open a command prompt and go to `\Esko\Artios\WebCenter\ServerTools`.
2. Type `update_db.bat` to check your current configuration.
3. To run the database script, type `update_db.bat` and at least the "sa" password for MSSQL or "sys as dba" for Oracle. This operation can take a considerable amount of time in case there are a lot of projects and documents with attributes.
4. In case of errors check the `servertools.log` in `\Esko\Artios\WebCenter\ServerTools`.

6.2.3. Cleaning Up the Database and FileStore

Items deleted through WebCenter's web interface are not permanently deleted from the Database or the FileStore, only removed from the user interface. An Admin may be able to restore them if necessary.

To delete them permanently (to keep the Database and FileStore sizes manageable), you should run the **Cleanup Utility**.

Note: We recommend you run this regularly (every week for example).

Important: Do not run this utility during busy hours. The users might experience database deadlocks.

Read also <https://wiki.esko.com/display/KBAS/KB74647891:+WebCenter+-+Use+of+Cleanup+Utility+in+WebCenter>

- To run the utility:

On the **Application Server**, go to `C:\Esko\Artios\WebCenter\ApplicationServer\Cleanup` and double-click `cleanup.bat`.

You don't need to enter any parameter in the script. It will run and close itself automatically when done.

This cleans up all FileStore files and Database records deleted through the WebCenter interface.

- To configure the utility to only clean up files and records deleted a certain time ago in the interface:
 - a) On the **Application Server**, go to `Artios\WebCenter\ApplicationServer\Cleanup\config` and open `access.properties` in a text editor.
 - b) For each table, change `age=0` to the number of hours ago files and records must have been deleted for them to be cleaned up.

For example, enter **168** hours if you want to only clean up files and records that were deleted at least 1 week ago in the interface.
 - c) Save and close `access.properties`.
 - d) Restart the WebCenter services on the Application Server.
- To schedule the Cleanup Utility to run automatically, use the Windows Scheduler.

6.2.4. Temporarily Block Access to a WebCenter Site

There will be times when you want to bring down an WebCenter server for maintenance or upgrade. This is when you want an easy way to prevent users from accessing your WebCenter sites. You can simply stop all IIS services on the Web Server. However, this will give anyone who types in your URL an error message "Page Cannot Be Found". The better approach is to let the users know what is going on. You can easily display a user-friendlier page, such as a "Site currently under maintenance. Please check back in 2 hours".

To redirect a virtual site to a specific page:

1. Create a custom user friendly page. To keep it simple, you can create an HTML page that communicates the required message.
 2. Save this page as something easy to remember such as "Default_Repair.htm"
 3. To save your custom page into IIS directory on the Web Server.
 4. On the Web Server, logged in as a local administrator, save your page into `\inetpub\wwwroot`.
 1. This is usually on the C:\ drive.
 2. Save any images that your page uses in the `\inetpub\wwwroot\images` directory.
 3. Change each WebCenter Virtual Site to use your custom page only.
 4. On the Web Server, open IIS Manager and expand Web Site node.
 5. Right click on an WebCenter Virtual Site and choose Properties.
 6. On the Virtual Directory tab, locate the Local Path field and click <Browse> button.
 7. Select the IIS directory where you saved your custom file (should be `c:\inetpub\wwwroot`).
 8. On Documents tab, click the <Add> button.
 9. Type in the exact name of your custom page, then click <OK>.
 10. Use the Move button to move your custom page to the top of the list (YOU MUST DO THIS!).
 11. Click <OK> then <Apply>
- Test changes in IIS Manager.
 - Right click on the Virtual Site name and choose <Browse>.
 - You should see your custom page display correctly in right half of console.
 - Test changes using Internet URL.

- Open a web browser and type in the site's URL. You be brought to your custom page as well.
- Repeat these steps for each WebCenter virtual site you desire to 'block access'.

To stop redirecting WebCenter sites to a custom page:

- Change each WebCenter Virtual Site to use its own Tomcat directory.
- On the Web Server, open IIS Manager.
- Control Panel – Administrative Tools – Internet Information Services.
- Expand your Web Site node until you see your WebCenter virtual sites listed.
- Right click on an WebCenter Virtual Site that is redirecting (i.e. WebCenter_Dev).
- Choose Properties.
- On the Virtual Directory tab, locate the Local Path field.
- Click <Browse> button.
- Change to \Artios\WebCenter\WebServer\Tomcat\webapps directory.
- Select the folder name that matches the virtual site name (i.e. WebCenter_Dev).
- Click <Apply>.
- On Documents tab, highlight your custom page name at top of the list.
- Select <Remove> button.
- Click <Apply>, then <OK>.
- Ensure WebCenter services are all started on the Web Server and the Application Server.
- Test this site in IIS Manager.
- Right click on the Virtual Site name and choose <Browse>.
- You should reach the WebCenter login page.
- Test this site using Internet URL.
- Open a web browser and type in the site's URL. You be brought to same WebCenter login page.
- Repeat these steps for each WebCenter virtual site you desire to allow access.

6.2.5. Moving the FileStore

WebCenter's "FileStore" is installed by default on the Application Server within the \Artios\WebCenter\ directory. The name and location can be changed as long as it meets the below requirements (even if it is a non-Windows system):

- Default share is named FileStore and can be renamed using alphanumeric characters only. For example: instead of using default location C:\Artios\WebCenter\FileStore, you may create a new share on D: partition called **ESKOFs** instead, D:\ESKOFs.
- New destination share must have local user called BGSYSTEM with exact password of "XXXXXX". Password should never expire.
- It is NOT recommended that the group EVERYONE is given access to the new destination share. If so, please remove this share and security permission.
- New local user BGSYSTEM must have FULL share and security permissions to new destination share.
- The new destination share must be reachable from WebCenter's Application Server.

- If configuring a production Automation Engine server instead of the OBGE (not recommended), the Automation Engine production server's local user BGSYSTEM also requires full permissions to the new destination share via Windows networking.
- At no point in time can WebCenter's Application Server lose its connection to the new destination share - if so then all WebCenter services must be restarted.

To move the FileStore from its default location:

1. Create the new share and ensure it meets the above requirements.
2. Test communication to new share from the Application Server.
 - From Application Server, log in as local user BGSYSTEM.
 - Browse to the new share.
 - Create a new text file within new share. Delete test file after successful writing.
3. Stop IIS and WebCenter Services on both the Web and the Application Server. This ensures that no files are in use and locked for backup.
 - On Web Server: IIS Admin, Word Wide Web Publishing, HTTP SSL, and WebCenter Tomcat.
 - On the Application Server: WebCenter JBOSS, and WebCenter CAD-X.
4. Backup the Web Server, Application Server, Database, and current FileStore share. You want to have a full normal backup of any \Artios directory on both servers, as well as a full backup of current FileStore share.
5. Move entire contents of current FileStore share to its new destination share.

After the move, follow these steps to ensure it works correctly:

1. After move is completed, ensure new share is not marked as 'Read Only'. If so, remove attribute on share and all subfolders and files.
2. Uninstall WebCenter completely. Please note that changing configuration files is not supported. A reinstall is **always** required.
3. Inspect the old FileStore share's **Properties**. Record the total size, number of files and folders. Use this information after the reinstall is finished for comparison.
4. Rename old share (i.e. \Artios\WebCenter\FileStoreOLD).
5. Reinstalling WebCenter using the new FileStore share. **You must use a UNC path to the new FileStore share in these files.** You CANNOT use a mapped network drive.
6. On WebCenter's Application Server, configure the OBGE to use the new FileStore location.
 - Using the Pilot, login as an admin user.
 - Delete the old container and add a new container.
 - Using the Configure tool (Tools - Configure) delete the container pointing to the old FileStore share (FileStore@<application_server_name>).
 - Using the Configure tool, create a new container pointing to the new FileStore share (<new_share_name>@<new_server_name>).
 - Delete the old hotfolder or Access Point and add a new hotfolder/Access Point.
 - Convert the old JDF Folder to a normal folder.
 - Convert the new hotin folder to a JDF hotfolder or Access Point Folder.
 - Expand the new container pointing to the new FileStore share.
 - Configure the hotin and hotout folders of your new JDF hotfolder or Access Point.
 - Make sure your Folder is Active.
7. Restart IIS and WebCenter services on both Web Server and Application Server.

8. Test WebCenter with the new FileStore location.
9. Login to WebCenter as an admin or a project manager.
10. Create a new project.
11. Upload a new "Graphics File" document. Follow the successful upload link to the document details. Ensure you see a "Checking and Registering" message in the document header.
12. Wait about a minute and refresh the WebCenter page. You are waiting for Checking and Registering to finish. You will see a 3D thumbnail and 'View and Annotate' will appear in the Document Actions menu.
13. Launch the View and Annotate applet on the new Graphic file.
14. Search and open an existing Graphic file. Ensure you can launch the View and Annotate tool as well.
15. Upload an ArtiosCAD ARD file and ensure can view 3D Model successfully.
16. Download any document.

6.3. Configuration

6.3.1. Configuring ArtiosCAD Defaults

To properly configure CAD-X for best WebCenter performance and display, make the necessary changes to the ArtiosCAD settings that WebCenter uses.

The following settings should already be applied after installing ArtiosCAD 12.1 or higher, but you can verify or change them:

1. On the Application Server, open ArtiosCAD.
2. From menu bar, choose **Options > Defaults**.
3. Expand **Database Defaults** and open the **General Options**.
4. Make sure the **Design Thumbnail** format is **ArtiosCAD 3D**, click **Apply** then **OK**.
5. Expand **Design Defaults - VRML Export Options for CAD-X**.
6. Make sure **Use compression** is selected, deselect **Automatically Open**, and click **OK**.
7. Set the **View Zoom Factor** to 90%.

To enable different download formats for CAD files, execute the following steps:

1. Expand **Outputs - Artios - Export to Common File Formats**.
2. Repeat the steps below for each export conversion desired for WebCenter downloads:
 - a. Open the data item (DXF Inch, etc.) by double clicking it.
 - b. Within the **Shown In** section, select **WebCenter**.
 - c. Click **OK**.

After changing the Defaults, make sure to save them by choosing **File > Save**.

6.3.2. Configuring to use NAT translation

It is essential for the correct working of WebCenter that the Web Server can find the Application Server via host name resolution and that the host name used for directing the Web Server to the Application Server matches the host name set for the Application Server.

JBoss on the Application Server resolves its own host name dynamically and communicates this to the Web Server. The host name must match the one provided on the Web Server or WebCenter will not work.

The best way to make this work, is if the Web Server can find the Application Server via DNS records or via active directory look-up.

If however this is impossible (for example for security or other reasons), a possible workaround is to manually configure the host mapping on the Web Server. If this workaround is used it is ESSENTIAL that it is properly documented. It will make the system work, but without proper insight into the configuration, troubleshooting can become problematic (for example when the IP address of the Application Server is changed).

To preform this workaround, open `C:\Windows\System32\drivers\etc\hosts` in a text editor and add the line: `<ip_address> <app_server_host>` (for example: `10.20.30.40 mywcrappserver`), then save the file.

From then on any resolving of the Application Server host name from the Web Server side will result in the provided IP address.

In case of NAT translation it is of course the IP address visible to the Web Server that needs to be used.

6.3.3. Create Usage Log Files for Each Virtual Site

WebCenter creates Usage Log files for each WebCenter site. Refer to LOG FILES section for details. The location and names of these log files can be changed so that each virtual site has its own set of log files.

For example: I have 3 virtual sites (WebCenter, SamAdams, and BlueMoon). I configure WebCenter site to have different log files than SamAdams and the BlueMoon sites. This way I know who is doing what and from which UI - even though they are all using the same database!

On the Web Server, using Notepad, Edit each site's config.xml appropriately.

- Located in `\Artios\WebCenter\Tomcat\webapps\<sitename>\config` folder.
- Locate the `<MetricsFiles>` tag, as seen below:

```
<MetricFiles>
```

```
<MetricsFile id="CheckOut" path="C:\Artios\WebCenter\logs\WebCenterCheckoutLog.txt"/>
```

```
<MetricsFile id="Download" path="C:\Artios\WebCenter\logs\WebCenterDownloadLog.txt"/>
```

```
<MetricsFile id="Upload" path="C:\Artios\WebCenter\logs\WebCenterUploadLog.txt"/>
```

```
<MetricsFile id="Login" path="C:\Artios\WebCenter\logs\WebCenterLoginLog.txt"/>
```

</MetricsFiles>

- Modify the path and file name of each the 4 log files as desired.

Attention: If you change the path of the log files, be sure that the local Administrators Group and the local IIS users (IUSR_<localcomputername> and IWAM_<localcomputername>) of the Web Server have full permissions to the destination location, and that the new location's local Administrators Group has full permissions to the virtual sites tempfiles folder on the Web Server. Without proper permissions, log files cannot be written there.

- Save Changes and Exit.
- Repeat for each Virtual Site.
- On the Web Server and the Application Server, restart WebCenter services for changes to take affect.

6.3.4. Modify main configuration files

appconfig.xml

This file contains configurable application data (described below):

- FileStore location (changing not recommended, reinstalling WebCenter is always preferred)
- Log File names and locations
- Search Crawler settings
- ArtiosCAD 2D View layers used in WebCenter (overlays)
- ArtiosCAD Design files print side used

On the Application Server edit `C:\Artios\WebCenter\Config\appconfig.xml` (this is always on the C:\ drive).

- Make modifications, Save changes, and Exit.
- Restart all IIS and WebCenter services on both the Web Server and the Application Server for changes to take effect.

ImageList.ini

The Viewer's configuration file contains the path and location of the FileStore, which holds the pyramid files to be retrieved by viewer.

Attention: If you have moved your FileStore after initial application installation, it is always recommended to reinstall WebCenter.

- on the Application Server, open \Artios\WebCenter\ApplicationServer\program\ImageList.ini and verify that the paths are correct.

6.3.5. Change file name used at the time of download

A configuration has been added for allowing you to decide how a specific site handles file downloads. Each virtual site has its own configuration, so they can all be different. The purpose is to control the file name assigned to the file being downloaded—whether it keeps the name displayed in WebCenter or the original disk file name it was at the time of upload.

In WebCenter, on the General Information page of any Document, there is new data displayed called "Original Disk Filename". No--this "Original Disk Filename" value is NOT searchable.

Here is an example of how these download settings work:

- Config file set to False.
- Uploaded Peter.txt file as version 1 to WebCenter.
- On Gen Info page, Orig. disk Filename = Peter.txt.
- Locked Peter.txt.
- Uploaded New version --but browsed to Melissa.txt.
- Result was:
- Document remains named Peter.txt as version 2.
- BUT on Gen Info page, Orig. disk Filename = Melissa.txt.
- When choose to download version 2, name of file to be saved is Peter.txt
- Config file set to True.
- Uploaded Craig.txt file as version 1 to WebCenter.
- On Gen Info page, Orig. disk Filename = Craig.txt.
- Locked Craig.txt.
- Uploaded New version --but browsed to Chris.txt.
- Result was:
- Document remains named Craig.txt as version 2.
- BUT on Gen Info page, Orig. disk Filename = Chris.txt.
- When choose to download version 2, name of file to be saved is Chris.txt.

To change the way a specific site downloads files:

- On the Web Server, edit \Artios\WebCenter\WebServer\tomcat\webapps\\config\config.xml.
- Locate section below:

```
<!-- Download name option -->
```

```
<!-- true - to use the uploaded document version file name when downloading -->
```

```
<!-- false - to use the original document name when downloading -->
```

```
DocVersionDownloadName value="false"/>
```

- Change value of DocVersionDownloadName from true to false as desired.

- On the Web Server, Restart WebCenter Tomcat service for changes to take affect.

6.3.6. Change CAD plotting style in WebCenter and Viewer

- Backup your style.xml file within your FileStore share.
- Within your FileStore share, Browse to \FileStore\views\Style directory.
- Make a copy of style.xml for backup purposes.
- on the Application Server, open ArtiosCAD and modify Defaults.
- From the menu bar, choose Options – Defaults, then expand Plotting Style Catalog.
- Select desired plotting style(s) and make necessary modifications.
- Click <Save as XML> button, and save the file to desktop with exact name of style.xml.
- <OK> to exit, Close Defaults, Save Changes, and Exit ArtiosCAD.
- Copy new style.xml file from desktop into existing FileStore location.
- Copy the new file and replace one in your FileStore in the \FileStore\views\Style directory.
- Changes will take effect immediately, no need to restart any WebCenter services.

6.4. Backup and Restore Strategy

To properly back up WebCenter and ensure you can recover from a disaster, such as disk failure, there are 3 major components to be able to restore successfully and minimize your downtime:

- WebCenter application, configurations, and Virtual Sites
- WebCenter's FileStore and Database
- OBGE/Automation Engine application, configurations, and Database

In the event of a disaster (disk or system failure) or in case you want to setup a test system that mimics your production environment from a specific point in time, then you will need to rely on whatever Backup Plan you have in place to successfully Restore to a specific state in time.

Backups can be performed using 3 methods: **Full**, **Incremental** and **Differential**. We suggest you choose one of the following Backup Modes:

- **Always Full** - you back up all files every time, whether some of them were changed or not.
- **Full+Incremental** - you create a **Full** backup relatively seldom: once a month, or once a week, or on achieving some important point in your work. You create all other backups with the **Incremental** mode, only backing up files changed since the last backup.

This approach is good when the project includes too many files to do a **Full** backup each time. It is faster and takes less disk space than a **Full** backup. It also allows you to create backups more frequently.

However, to restore all the files, you have to restore the last **Full** backup, then all the following **Incremental** backups.

- **Full+Differential** - is an intermediate mode. Each **Differential** backup includes all the project files changed since the last **Full** backup. It takes less time and space than **Always Full**, but more than **Full+Incremental**.

The good thing is that restoring is simpler than for **Full+Incremental** - you will only have to restore the last **Full** backup and the last **Differential** backup.

6.4.1. What to Back up for WebCenter

- The WebCenter application, configurations, and Virtual Sites.
- The Application Configuration only needs to be backed up after initial installation, upgrades, or when changes are made to application configuration files.
- Virtual Sites need to be backed up when they are initially created and after each modification.
- WebCenter's FileStore and Database.
- The Database and FileStore need to be backed up at least on a daily basis. Furthermore, they must be backed up at the same time. One is useless without the other.
- The database cannot be locked in any way during backup procedures, otherwise WebCenter will stop responding and all WebCenter services will need to be restarted.
- If the database is out-of-sync with the FileStore, or vice-versa, then your clients will receive errors and your data will become corrupt.
- It is recommended that you create a backup plan that will copy the database and FileStore at the same time several times per day, during your peak hours of activity.
- The OBGE/Automation Engine application, configurations, and database.
- If the OBGE was installed on the Application Server, then its application and configuration only needs to be backed up after initial installation, upgrades, or when changes are made to the configuration files.
- If using a Production Automation Engine server rather than the OBGE (which is NOT recommended but is possible), its database should be backed up daily, if not several times per day.
- If backups of the database and FileStore cannot be synchronized fully, it is preferred to first back up the database and immediately thereafter the FileStore. This will ensure all files referred in the database are also present in the FileStore. Files added after the database backup will be orphaned and are best removed after restore using the WebCenter clean up tool.

An Example Backup Plan

- WebCenter application, configurations, Database, and Virtual Sites
- After initial installation/upgrade, make full system backups of the Web, Database, and Application Servers.
- Store these backups off-site on tape for safe keeping.
- When changes to Virtual Sites and/or application configurations are made, retrieve the tapes and back up the Web and/or Application Server in full again. Return tapes to off-site storage when finished.
- OBGE/Automation Engine application, configurations, and database.
- During initial installation, either the OBGE was installed on the Application Server, or a production Automation Engine server was configured. Determine which server was used.
- Using the Server Admin tool, located at **Start > Programs > Esko > Automation Engine**, configure and setup backups for the software application and database:
- On the Automation Engine tab, configure a server software backup and Backup Server Software configuration using the Wizards.

- On the Database tab, use the <Manage Databases> button to Database Properties and Backup Database.
- WebCenter’s FileStore and Database
- Hardware Configuration: Configure a mirrored disk RAID subsystem on the Application Server. The rest of the disks should be configured with a different RAID level, such as parity. On the mirrored partition, only the system Operating System is installed and a directory for the purpose of storing temporary backup files, such as “WC_BACKUP”. The parity RAID drives will be where WebCenter applications and OBGE are installed.
- Schedule Full backups:
- On the Application Server, use backup software, such as Veritas, to schedule a Full backup of the FileStore to Tape every Sunday at 2 am (a day and time where little or no system activity can be guaranteed).
- On the Database Server, use database backup software, such as Veritas SQL Server Agent, to schedule a Full WebCenter Database backup to Tape at exactly every Sunday at 2 am, the same time as the FileStore backup.
- Store these weekly Full backup tape(s) off-site for safe keeping when not in use during the week.
- Schedule daily Incremental backups to local disk:
- We determined most active hours for WebCenter activity. We choose times of day that will satisfy us in the event we have to recover (8am, 12pm, 4pm, 8pm).
- on the Application Server, schedule daily Incremental backups (8am, 12pm, 4pm, 8pm) to backup FileStore to local disk on the Application Server in directory “WC_BACKUP” on the mirrored disk raid.
- On the Database Server, schedule daily Incremental backup at exactly same time as the FileStore backup (8am, 12pm, 4pm, 8pm), to backup the database to a local disk on the Application Server in the “WC_BACKUP” directory .
- Schedule daily Differential backups to tape.
- We determined a time of day that has least WebCenter activity and ensures that the other daily backups have completed writing to disk (11 pm).
- on the Application Server, schedule a Differential backup of the FileStore to Tape every day (except Sunday) at 11pm (a time after the last Incremental backup completes and when little or no system activity can be guaranteed).
- On the Database Server, schedule a Differential backup of database to Tape every day (except Sunday) at exact same time as FileStore backup at 11pm (a time after the last Incremental backup completes and when little or no system activity can be guaranteed).

Example Backup Schedule

Frequency	Day & Time	What	Where	How	To
Manually as needed	At time of installation and when changes are made	Entire system, all partitions (contains WebCenter application files, configurations, Database, and Virtual web Sites)	Web Server, Database Server, and Application Server	FULL	TAPE

Frequency	Day & Time	What	Where	How	To
Manually as needed	At time of installation and when changes are made	Entire system, all partitions (contains OBGE/Automation Engine app, configurations, and Database)	Application Server or Production Automation Engine server	FULL	TAPE
Weekly	Sundays at 2am	WebCenter's FileStore	Application Server	FULL	TAPE
Weekly	Sundays at 2am	WebCenter's Database	Database Server	FULL	TAPE
Daily	8am, 12pm, 4pm, 8pm	WebCenter FileStore and Database	Application Server	INCREMENTAL	DISK
Daily	8am, 12pm, 4pm, 8pm	WebCenter's Database	Database Server	INCREMENTAL	DISK
Daily (except Sundays)	11 pm	WebCenter FileStore and Database	Application Server	DIFFERENTIAL	TAPE
Daily (except Sundays)	11 pm	WebCenter's Database	Database Server	DIFFERENTIAL	TAPE

An Example Restore Plan

Attention: Anytime you restore a WebCenter SQL Server database, you must fix orphaned logins before the database is usable. See [Restoring the master database](#) on page 1061 for more information.

PROBLEM: Disk failure on the Application Server, Thursday 6/15/06 at 2:26 pm.

SOLUTION: Assuming the backup schedule is the same as the chart above, this is a 5 part restore plan:

- Determine exact period of data loss and inform specific users of activity that will need to be redone.
- Repair systems
- Restore WebCenter application to a working state.
- Restore WebCenter application configurations.
- Restore data using most recent point of backup for the WebCenter FileStore, Database, and Virtual Sites.

This is a possible course of action:

- Determine data loss risk and begin communicating this to end users.
- Calculate the difference between the time of failure and the time of the last incremental backup to disk.
- In this example, the data loss risk would be 12pm – 2:26pm, approximately 2.5 hours.
- This means that any changes made to WebCenter during these 2.5 hours will be lost.
- Determine which users were logged into WebCenter during the 2.5 hours and inform them they will need to redo this work after system has been restored.
- Using WebCenter usage log files, you can determine what users were logged in at the time of failure.
- Using WebCenter usage log files, you can determine what activities users performed in WebCenter as it relates to Uploads, Downloads, and versioning of files during the 2.5 hours where you will lose data.
- Resolve point of failure in hardware or software.
- Reinstall from original Media or Restore WebCenter application from Tape (no data at this point).
- Ensure that you use the exact same version and build used before point of failure.
- Test blank application.
- Ensure WebCenter application is working in the correct network configuration (such as in a DMZ with SSL security) using a blank database, blank FileStore, and the Installation site is accessible (WebCenter_Inst).
- Ensure that you can create a new project, upload a document, use View and Annotate tool, download a document, etc.
- Restore Database, FileStore, and Virtual Sites
- Using backup Tapes, restore files from the Last FULL Tape Backup (Sunday 6/11/06).
- Then restore files using the previous nights DIFFERENTIAL backup Tapes (Wed 6/14/06).
- Then restore files using ALL the current days incremental backups to Local Disk up until point of failure, ensuring to apply them in proper order (Thurs 8am first then Thurs 12pm).
- Run the database restore script to reset 'WebCenter' user login.
- For the SQL Server, you must run the stored procedure against WebCenter4_0 database.
- Using Query Analyzer, type in these 2 command lines below:

Use WebCenter4_0

```
Sp_change_users_login auto_fix, WebCenter, null, XXXXXX
```

- Run the query.
- You should see a message that orphaned records have recovered.
- Restart all IIS, WebCenter, and Database services on the Web Server, Application Server, and Database Server.
- Test the application with the restored data.
- Verify can view existing projects, download docs, and use View and Annotate tool on existing documents.
- Verify can create new projects, upload documents, use View and Annotate tool on new docs, download new docs in existing database, etc.
- Do a FULL backup on all systems.

6.4.2. Microsoft SQL Server 2008 R2 Backup and Restore

Backing up the WebCenter database is a critical part of its maintenance. If the database is lost, there is no way to rebuild it without a valid backup.

Microsoft SQL Server 2008 R2 uses a master database in conjunction with the WebCenter4_0 database. Both must be backed up regularly in order to be able to recover from a database failure.

Backing up the WebCenter database

To back up the Microsoft SQL Server 2008 R2 database used by WebCenter, do the following:

1. Log on to the database server as a member of the local **Administrators** group.
2. Start **SQL Server Management Studio Express** in the Microsoft SQL Server 2008 folder on the **Start** menu.
3. In the **Connect to Server** dialog, enter the server name in the **Server name:** field if it is not there already, followed by **<instance name>**, such as **MBCAPPSERV\WEBCENTER**.

If you used the default instance and not a named instance, just enter the server name.

4. Click **Connect**.
5. Click the plus sign (+) next to the **Databases** folder icon to expand it.
6. Right click **WebCenter4_0**, click **Tasks**, and then click **Back Up**.
7. In the Back Up Database - WebCenter4_0 dialog, set the **Backup type:** to either **Full** or **Differential**.

Full is a complete backup, while **Differential** is everything that has changed since the last full backup. The first backup must be a full backup.

A recommended strategy is to make a **Full** backup once a week and a **Differential** backup on the other days.

8. In the **Backup set** group, enter the current date in the **Description:** field.
9. In the **Destination** group, select either **Disk** or **Tape**.

Tape is unavailable if there is no tape drive attached to the system. Most installations will use Disk.

A default backup location and file name is shown. To change the location and file name, first select the default location and click **Remove**, and then click **Add** and enter a new location and file name.

A disk backup may only be made to an internal physical disk on the system; you may not specify an external drive or a network drive.

10. Click **Options** in the **Select a page** pane.
11. In the **Overwrite media** group, select **Overwrite all existing backup sets** for a full backup. For a differential backup, leave **Append to the existing backup set** selected.
12. Click **OK** to start the back up.
13. Click **OK** when informed that the back up of database 'WebCenter4_0' completed successfully.

Copy the backup file whose location was set in step 9 to a different hard drive or networked drive. It is also recommended that the location is part of your general backup strategy.

The WebCenter database is now backed up.

Backing up the master database

The master database does not need to be backed up as frequently as the WebCenter database, but it still should be backed up regularly.

To back up the master Microsoft SQL Server 2008 R2 database, do the following:

1. Log on to the database server as a member of the local **Administrators** group.
2. Start **SQL Server Management Studio Express** in the Microsoft SQL Server 2008 folder on the **Start** menu.
3. In the **Connect to Server** dialog, enter the server name in the **Server name:** field if it is not there already, followed by \<instance name>, such as **MBCAPPSERV\WEBCENTER**.

If you used the default instance and not a named instance, just enter the server name.

4. Click **Connect**.
5. Click the plus sign (+) next to the **Databases** folder icon to expand it.
6. Click the plus sign (+) next to the **System Databases** folder icon to expand it.
7. Right click **master**, click **Tasks**, and then click **Back Up**.
8. In the **Backup set** group, enter the current date in the **Description:** field.
9. In the **Destination** group, select either **Disk** or **Tape**.

Tape is unavailable if there is no tape drive attached to the system. Most installations will use Disk.

A default backup location and file name is shown. To change the location and file name, first select the default location and click **Remove**, and then click **Add** and enter a new location and file name.

A disk backup may only be made to an internal physical disk on the system; you may not specify an external drive or a network drive.

10. Click **Options** in the **Select a page** pane.
11. In the **Overwrite media** group, select **Overwrite all existing backup sets**.
12. Click **OK** to start the backup.
13. Click **OK** when informed that the backup of database 'master' completed successfully.

Copy the backup file whose location was set in step 9 to a different hard drive or networked drive. It is also recommended that the original location is part of your general backup strategy.

The master database is now backed up.

Restoring the WebCenter database

There are three situations in which you would have to restore the WebCenter database: a hard drive failure, a corrupt database file, or corrupt data within the database.

Recovering from a hard drive failure

When the hard drive holding the WebCenter database fails, after you have replaced it and reloaded the Microsoft SQL Server 2008 R2 software (if necessary), do the following to restore the WebCenter database:

1. Log on to the database server as a member of the local **Administrators** group.
2. Start **SQL Server Management Studio Express** in the Microsoft SQL Server 2008 folder on the **Start** menu.
3. In the **Connect to Server** dialog, enter the server name in the **Server name:** field if it is not there already, followed by \MBCAPPSERV\WEBCENTER.

If you used the default instance and not a named instance, just enter the server name.

4. Click **Connect**.
5. Once connected to the database, right-click the **Databases** folder and click **Restore Database** on the context menu.
6. In the Restore Database dialog, in the **Source for restore** group, click **From device**.
7. Click the ... (Browse) button at the end of the **From device:** field.
8. In the Specify Backup dialog, click **Add** and select the file to which you backed up the WebCenter database, for example **WebCenter4_0.bak**.
9. Click **OK**. The selected file should be listed in the **Backup location:** field in the **Specify Backup** dialog.
10. Click **OK**. A list of full and differential backup sets should appear.
11. Select all the backup sets in the Restore column. If you chose to not have full backups overwrite each other, select the most recent **Full** backup and all the **Incremental** backups (or the last **Differential** backup) taken after it.
12. In the **Destination for restore** group, in the **To database:** list, select **WebCenter4_0**.
13. Click **OK** to start restoring.

Click **OK** when informed that the restore completed successfully.

The database should now be restored and ready for use by WebCenter.

Recovering from a corrupt database file

If the database file becomes corrupted and unreadable, meaning **WebCenter4_0.mdf** still exists but Microsoft SQL Server 2008 R2 cannot read it, do the following to restore the WebCenter database:

1. Log on to the database server as a member of the local **Administrators** group.
2. Start **SQL Server Management Studio Express** in the Microsoft SQL Server 2008 folder on the **Start** menu.
3. In the **Connect to Server** dialog, enter the server name in the **Server name:** field if it is not there already, followed by \MBCAPPSERV\WEBCENTER.

If you used the default instance and not a named instance, just enter the server name.

4. Click **Connect**.
5. Once connected to the database, right-click the **Databases** folder and click **Restore Database** on the context menu.
6. In the **Restore Database** dialog, in the **Source for restore** group, click **From device**.

7. Click the ... button (Browse) at the end of the **From device:** field.
8. In the Specify Backup dialog, click **Add** and select the file to which you backed up the WebCenter database, for example **WebCenter4_0.bak**.
9. Click **OK**. The selected file should be listed in the **Backup location:** field in the **Specify Backup** dialog.
10. Click **OK**. A list of full and differential backup sets should appear.
11. Select all the backup sets in the Restore column. If you chose to not have full backups overwrite each other, select the most recent **Full** backup and all the **Incremental** backups (or the last **Differential** backup) taken after it.
12. In the **Destination for restore** group, in the **To database:** list, select **WebCenter4_0**.
13. In the **Select a page** pane, click **Options**.
14. In the **Restore options** group, select **Overwrite the existing database**.
15. Click **OK** to start the restore.

Click **OK** when informed that the restore completed successfully.

The database should now be restored and ready for use by WebCenter.

Recovering from corrupt data

If the database file contains corrupted data, meaning that Microsoft SQL Server 2008 R2 can read the database but that there is missing or incorrect data, think carefully about the restoration, as whatever data was added to the database since the last backup will be lost after the restoration with no way to recover it. You should ensure as few users as possible are using WebCenter before performing this procedure.

1. Log on to the database server as a member of the local **Administrators** group.
2. Start **SQL Server Management Studio Express** in the Microsoft SQL Server 2008 folder on the **Start** menu.
3. In the **Connect to Server** dialog, enter the server name in the **Server name:** field if it is not there already, followed by \<instance name>, such as **MBCAPPSERV\WEBCENTER**.
If you used the default instance and not a named instance, just enter the server name.
4. Click **Connect**.
5. Once connected to the database, expand the **Databases** folder, right-click **WebCenter4_0**, and then click **Properties** on the context menu.
6. In the **Select a page** pane, click **Options**.
7. In the **Other options:** list, scroll to the bottom and double-click **Database Read-Only** to change its value from `False` to `True`.
8. Click **OK**.
9. Click **OK** to confirm changing the properties of the database and to close all other connections.
10. Right-click the **Databases** folder and click **Restore Database** from the context menu.
11. In the Restore Database dialog, in the **Source for restore** group, click **From device**.
12. Click the ... button (Browse) at the end of the **From device:** field.
13. In the Specify Backup dialog, click **Add** and select the file to which you backed up the WebCenter database, for example **WebCenter4_0.bak**.
14. Click **OK**. The selected file should be listed in the **Backup location:** field in the **Specify Backup** dialog.
15. Click **OK**. A list of full and differential backup sets should appear.

16. Select all the backup sets in the Restore column. If you chose to not have full backups overwrite each other, select the most recent **Full** backup and all the **Incremental** backups (or the last **Differential** backup) taken after it.

17. In the **Destination for restore** group, in the **To database:** list, select **WebCenter4_0**.

18. Click **OK** to start restoring.

Click **OK** when informed that the restore completed successfully.

The database should now be restored, automatically set back to multi-user mode, and ready for use by WebCenter.

Restoring the master database

If the master database is damaged or absent, as long as the **sa** user can connect to the database and backups have been made, use the above procedures to restore the master database, substituting **master** in the **System Databases** folder for **WebCenter4_0** as necessary.

If the master database is lost because of a disk crash and no connections are possible, uninstall and reinstall Microsoft SQL Server 2008 R2 and then restore the WebCenter4_0 database using the procedures described above.

After restoring the WebCenter 4_0 database subsequent to reinstalling Microsoft SQL Server 2008 R2, recreate the WebCenter user login for the database by doing the following:

1. Log on to the database server as a member of the local **Administrators** group.
2. Start a command prompt.
3. Type `osql -Usa -P"sa_user_password" -Sdatabase_server \instance_name` and press **enter**. If you are using the default instance, use `-Sdatabase_server` instead.
4. At the 1> prompt, type the following: `sp_addlogin 'webcenter', 'XXXXXXX', 'WebCenter4_0'` and press **enter**.
5. At the 2> prompt, type `go` and press **enter**.
6. At the 1> prompt, type `use WebCenter4_0` and press **enter**.
7. At the 2> prompt, type `go` and press **enter**.
8. At the 1> prompt, type `sp_change_users_login update_one, webcenter, webcenter, null` and press **enter**.
9. At the 2> prompt, type `go` and press **enter**.
10. At the 1> prompt, type `exit` and press **enter**.
11. Close the command prompt window and log off the database server.

The database is now restored and ready for use by WebCenter.

6.5. Troubleshooting

6.5.1. Testing WebCenter

On the Application Server and the Web Server, ensure IIS and the WebCenter services are started and configured to start automatically.

After starting/restarting the WebCenter services, always wait a few moments until the CPU processor activity on both servers become idle (<5%) before attempting to access the login page.

Testing each facet of WebCenter in the exact order below helps to easily and quickly identify points of failure, if any.

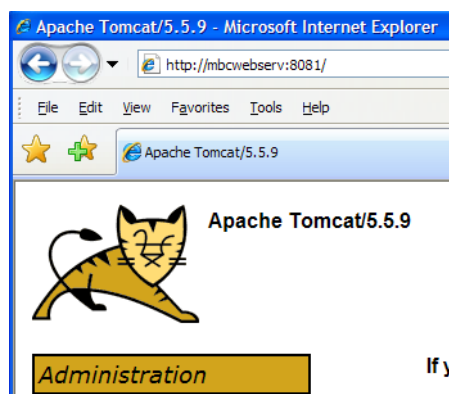

- IIS Connectivity – use IIS Manager to access the WebCenter_Inst site
- IIS Security settings – can access the home page after logging in
- Database connection and Schema – can add a new record to the database
- FileStore connectivity – can write a file to the FileStore and then retrieve it
- View Data generation – can upload a graphic file and the OBGE does its job
- View and Annotate applet – can launch the applet successfully on a Graphic file
- View the status in the Trouble shooting tool for **View Server Deployment Status**

Verify IIS is working

- On the Web Server, from a web browser type: //**<webservername>** (such as //MBCWEBSERV).
- If you get an “Under Construction” page, IIS is working.
- If you get “The page cannot be displayed”, then most likely IIS services are not started or still starting.

Verify Tomcat is working

- On the Web Server, from a web browser type: //**<webservername>:8081** (such as //MBCWEBSERV:8081).
- If you get Tomcat’s home page, Tomcat is working.

Test IIS connectivity

- On the Web Server, open IIS Manager and expand the website node.
- Right click on WebCenter_Inst virtual directory; choose Browse (only test with this directory for now).
- Wait... watch progress in status bar. Will take longer very first time...

- You should be brought to login page (login.jsp). If you get to this page, then you know IIS is responding.
- If not, verify IIS and WebCenter services are all Started. This is one of the most common errors.
- If services are all Started and still cannot access login page from IIS Manager, then see if you can bypass IIS and talk to Tomcat directly.
- Close IIS Manager and Open a web browser.
- In address URL type: `http://<name_web_server>:8081/WebCenter_Inst` (case sensitive)
- You should be brought to login page (login.jsp).
- If you can access this way using port 8081, then you know IIS cannot talk to Tomcat.
- Check whether 32-bit applications is set to **False** in IIS.
- Check via netstat whether TomCat is listening on port 8009.

Test IIS security settings

- Logon to WebCenter as username admin (if this is a new database, the password will be blank).
- Wait... watch progress in status bar. Will take longer very first time...You should be brought to the home page (homepage.jsp).
- If you get to this page, then you know that your security settings within IIS Manager are correct.
- If you get an error page, then you must look at your IIS settings for this virtual directory. Most of the time Execute Permissions and Application Protection settings need to be modified. This happens when the IIS default settings for the entire Web Site have been customized. You will experience this most often when a customer is installing WebCenter into an existing IIS web server. Also check whether 32-bit applications are enabled in IIS.

Test Database connection and schema

- After logging in as user Admin successfully, create a new project. If you can add a new project successfully then your Database schema has been created correctly.
- If you cannot add a new project or receive SQL errors, run the Database Schema batch file again and ensure there are no error messages.

Test FileStore connectivity

- Still logged in as Admin, upload a PDF or Word Document as type "Other" to the project you just created.
- When receive successful message, click on file name link to view document Online.
- Either a new web browser window will open or native application will launch automatically and display contents of file. If you can view the contents of the file, then you know your FileStore is configured and working properly.
- If you cannot open and view it, then you may have FileStore permission issues. Did you move your FileStore off the Application Server? If so, go back and follow those directions again.

Test View Data Generation

- After correctly configuring WebCenter and OBGE on the Application Server, you should be able to upload ArtiosCAD design files, PDF, and Esko Graphic files as document type "Graphics File" and successfully use the View and Annotate tool on these types of documents. This means that the Checking and Registering message disappears and "View and Annotate" action is added to the document action list in top right corner.
- If the Checking and Registering message seems to take forever to disappear or never disappears, you can watch the communication between the two to see what is happening. To do this, open the OBGE and watch the jdf hotfolder activity.
- on the Application Server, login to Pilot as user admin.
- Expand the FileStore container.
- Expand JDFHotFolder - hotin subfolders. This is the folder in which WebCenter composes a JDF ticket and drops it off in this location for Automation Engine (OBGE) to pick it up and take action.
- Minimize Pilot.
- Open a web browser and login to WebCenter as user ADMIN.
- Upload a document of type "Graphics file" to a project.

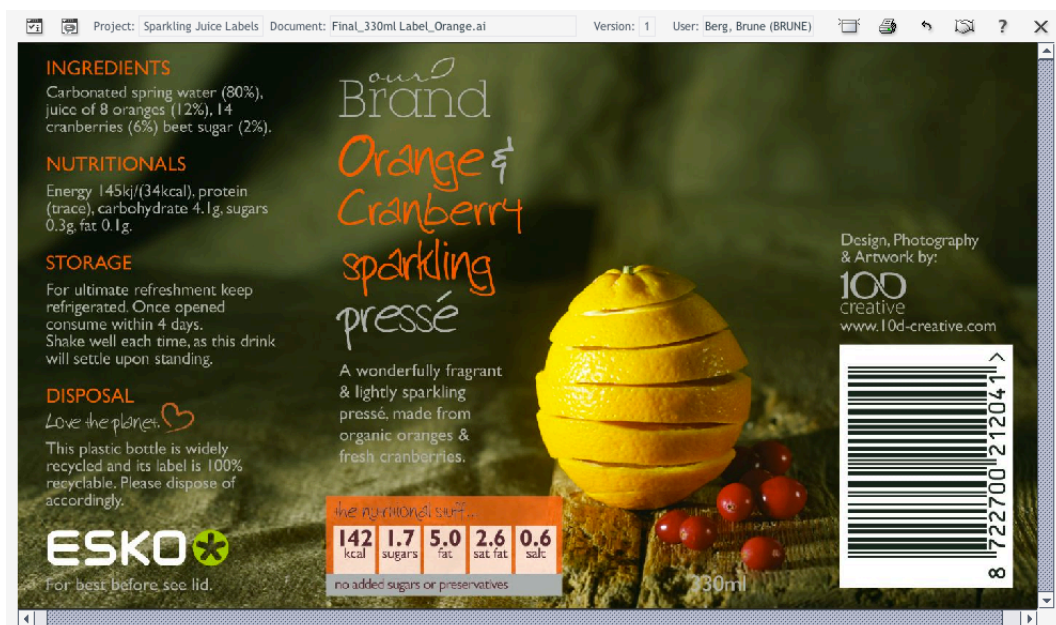

Attention: As soon as you click Upload button you must act quickly to do next few steps to be able to watch real-time communication between WebCenter and the OBGE.

- After upload says successful, immediately click file name link to jump to Graphic Details page.
- In document header you should see message next to document name "Checking and Registering..."
- Quickly minimize WebCenter, maximize Pilot.
- Watch creation of JDF ticket appear in the hotin folder.
- In the FileStore Container View within the monitor pane, you should see when Automation Engine (OBGE) begins processing the JDF ticket.
- You should see a running task named "Prepare for Viewer". Task should finish fast (definitely less than 1 minute).
- Once task finishes (successful or failed), you can see the JDF ticket move to the hotout folder.
- Minimize Pilot, maximize WebCenter.
- You should still be on that document's details page with "Checking and registering..." message still displaying.
- Refresh your browser window (F5).
- The "Checking and registering..." message should disappear and View and Annotate action appears in Document Action Menu.
- If task failed, a red 'X' and failure message will appear next to document name and no new action will appear in menu. Review the task log file within Pilot to see why task failed.

Test View and Annotate Applet

- Logged into WebCenter, locate a Graphic document type that has successfully generated view data, meaning that there is an action called "View and Annotate" on the document actions menu.
- Click the "View and Annotate" action to launch the Applet.
- The page will change and go blank for a moment, or turn light grey.
- You should see the Java Sun logo with a progress bar, then the tool will launch and display the Graphic File.

- If you get a Red 'X' in top left corner instead (as seen below), then Java is being blocked from downloading or installing on your computer. This usually happens when either:
 - a company's firewall or Proxy Server prevents automatic downloads,

- browser settings need to be modified to allow applets.

- Try these steps to resolve it:
- Install Java manually
- Visit www.java.com, choose correct OS (Windows or Mac), download and install the free Java Software.
- Close any open browser windows.
- Try to access the Viewer applet again.
- If Java is installed on the client, but you still get a Red 'X', then most likely your browser settings are locked down tightly and blocking Applets.
- Ensure your browser options allow applets.
- Ensure that under Advanced settings within your Internet Options, you have a section for Java Sun and that "Use JRE <for applet> (requires restart)" is there and checked. If not checked, check it and reboot computer. Try again.
- In Internet Options where you can define custom settings for the Internet zone, customize your current settings to ensure the below are set to Enabled or Prompt, but not Disabled:
 - Run Active X controls and plug-ins.
 - Java VM
 - Scripting – Active Scripting
 - Scripting of Java Applets
 - Close any open browsers and try again.
 - Clean out Java cache
- From Control Panel – Java, delete Temporary Internet Files and check Applets, Applications, Other Files. After deleting these can close Java console and try again.
- If you still cannot use the Applet then you need to contact your system administrator as some other local setting is preventing the applet from running on this client.

Cannot access WebCenter login page anymore

- Restart WebCenter Services in the correct order. Either use the batch files on desktop or do them manually as below:
- Stop all IIS and WebCenter services on the Web Server and the Application Server.
- Start services on the Application Server first (JBoss, CAD-X, FlexLM, BGMD).
- Then start services on the Web Server (IIS and Tomcat).
- Wait until the CPU activity is idle on all servers (<5% activity).
- Try to access the installation site (WebCenter_Inst) again.
- Verify you are using the correct URL.
- Ensure you are using the correct case– the W, C, and I are uppercase in WebCenter_Inst.
- Test WebCenter's individual components.
- Do all of the previous steps under [Testing WebCenter](#) on page 43. This can rule out a port conflict or installation problem.

- Determine if the Code and web pages are the same version.
- If you can access the installation site (WebCenter_Inst) but not a custom deployed site, it is possible that the installation site pages are a different version than your other virtual sites.
- For sites to be on different versions, WebCenter was upgraded but your custom sites were not. In this case, your WebCenter application has new code and is expecting the web pages to be version B and able to read new code, but the pages are still version A. This won't work.
- After an upgrade the only site that gets upgraded automatically is "WebCenter_Inst". It is your job to use the deployment tool to redeploy new sites.
- Determine if your configuration files are corrupted.
- Certain non-XML standard editors, such as WordPad or FrontPage, corrupt XML files when used and Java cannot compile them. The most common file that gets corrupted is APPCONFIG.XML.
- on the Application Server, browse to C:\Artios\WebCenter\Config (always on the C:\ drive).
- Open appconfig.XML file using a web browser.
- Right click on the file and choose Open With... choose Internet Explorer.
- You do NOT want to receive the error page saying "The XML page cannot be displayed" as seen below.
- If you receive this message, your APPCONFIG.XML is corrupt. This means that someone edited this file with WordPad or an editor that changed the XML formatting.

- To fix a corrupted page, you can restore this file from a known good backup, or reinstall WebCenter on the Application Server only. The latter means you will have to reconfigure most settings again.
- Once you have restored the file, you must restart all IIS and WebCenter Services on the Web Server and Application Server for the new file to take effect.
- Verify IIS ISAPI filters are correct
- On the Web Server, open IIS Manager.
- Right click on web server name node, and choose Properties.
- On the ISAPI Filters tab, WCTomcat should have a green arrow pointing up.
- Right click on WebCenter_Inst node, choose Properties.
- In the Application Settings section, ensure Application Name = "WebCenter_Inst" and isn't blank.
- If blank, choose Create button to create it.
- Right click on Jakarta node, choose Properties.
- On Virtual Directory Tab, local path should= \Artios\WebCenter\WebServer\Tomcat\bin\win32\i386

- If not, browse to it.
- Review IIS and WebCenter log files for obvious errors. Refer to the log files section for log file locations and details.

6.5.2. Easily Identify when WebCenter is Ready to Access

WebCenter services load a lot of data into memory during startup of its services. It is important to watch the CPU activity before accessing a WebCenter site.

You want both the Web Server and the Application Server to have a CPU activity of under 5% before accessing the site, otherwise all components may not have started and you may experience error messages. Another way is to check whether `wcr_jboss_srv.exe` threads exceed 160 and `wcr_tomcat_srv.exe` threads exceed 100.

To help watch the CPU activity easily, add the CPU performance monitor to the system tray of each WebCenter server. To do this (on both the Web Server and the Application Server):

1. Create a new shortcut in the **Start Menu > Programs > Startup** folder.
2. Browse to `Windows\system32\TASKMGR.EXE`.
3. Set the shortcut to Run "Minimized".

6.5.3. Log files

Installation

A log of how WebCenter was installed, repaired, or upgraded will always be located on the Web Server right under the C:/ drive (`C:\WCInstall.log`). You can review this file for obvious errors and to see what settings were entered during the initial installation.

Web Server logfile rotation

Web server log files are split into day-encompassing blocks in the same way that the Application server log files are. This means that shortly after midnight each day all the logs recorded the previous day on the Web server are zipped into a single ZIP archive with the time stamp of the day in the archive name for easier troubleshooting for the administrator.

This logic adds all the following log file types on the Web server into the target archive:

- `catalina.log`
- `SDK.log`
- `localhost_access.log`
- `localhost.log`

Note: Some of those log file types may not always exist for that particular day. For Example, Access log file is only written if a servlet error occurred during that time period in the Web server.

Shared log file age limit

Both the Application and Web server log files share the age-limit. The length of time the log file archives are to be stored in the system can be set. Log file archives older than the set value will be removed shortly after midnight each day.

Site Usage

Usage log files are located on the Web Server by default, in `\Artios\WebCenter\logs`. They record activities such as:

- Logins/Logoffs (including when sessions time out and when users click **Logout**).

WebCenterLoginLog.txt example:

```
Action Date/Time User Reason
LOGOUT Apr 21, 2006 4:23:18 PM JOEC Reason: user logged out
LOGIN Jun 13, 2006 9:46:01 AM MELISSAA
LOGOUT Jun 13, 2006 10:14:53 AM MELISSAA Reason: session timed out
```

- File CheckOuts/CheckIns (Lock & Downloads and Upload of new versions).

WebCenterCheckoutLog.txt example:

```
Action Date/Time User File Unique Doc ID Size (bytes)
CHECKIN Jun 7, 2006 2:13:08 PM MIKEG ACAD Demo.ARD 00002_0000025472 50176
CHECKOUT Jun 8, 2006 2:07:20 PM CHRISJ R.ARD 00002_0000025613 10240
CHECKIN Jun 8, 2006 2:07:54 PM CHRISJ R.ARD 00002_0000025614 10240
CHECKOUT Jun 9, 2006 8:24:15 AM CHRISJ 4A.ARD 00002_0000025688 4098
CHECKIN Jun 9, 2006 8:24:25 AM CHRISJ 4A.ARD 00002_0000025689 40912
```

- File Downloads/Uploads (including when downloads start, finish, and fail).

WebCenterDownloadLog.txt example:

```
Date/Time User File Version Unique Doc ID Size Status
Jun 7, 2006 3:13:30 PM BEAPM 123_Hoegaarden_silver_front.pdf 1 00002_0000000683 85373
Download Started
Jun 7, 2006 3:13:30 PM BEAPM 123_Hoegaarden_silver_front.pdf 85373 Download Finished
Jun 8, 2006 2:17:24 PM MIKEG Scope_fc.pdf 1 00002_0000001681 1068473 Download Started
Jun 8, 2006 2:17:50 PM BEAPM WebCenterDownload.zip 196608 Download failed
```

WebCenterUploadLog.txt example:

```
Date/Time User File Project Size Status
Jun 9, 2006 2:14:10 PM DAZZ docB1.txt bea p 115 Upload started
Jun 9, 2006 2:14:10 PM DAZZ docB1.txt bea p 115 5 Upload finished
Jun 12, 2006 8:15:10 AM ADMIN CMM_CASE.JPG permtest666 0 Upload started
Jun 12, 2006 8:15:10 AM ADMIN CMM_CASE.JPG permtest666 182090 Upload finished
Jun 12, 2006 1:59:57 PM ADMIN DCS.ct bjrtest 0 Upload started
Jun 12, 2006 1:59:58 PM ADMIN DCS.ct bjrtest 189672 Upload finished
```

Note:

On the Web Server, the local Administrators Group, the SYSTEM user, and both IIS users need full permissions to the log folder(s) location and the tempfiles folder within each virtual site. To do this:

- Browse to the `\Artios\WebCenter\Logs` folder
- Ensure that these users and group have full permissions to the `log` and `tempfiles` folders: `IUSR_<Web Server_servername>`, `IWAM_<Web Server_servername>`, `SYSTEM`, `Administrators Group`.

Tomcat Service

These log files are located on the Web Server in \Artios\WebCenter\WebServer\tomcat\logs directory. You can also download them from the [WebCenter user interface](#).

- isapi.log
- Logs IIS to JSP redirection.
- *.log, Catalina*.log, host-manager*.log, localhost*.log, and manager*.log
- Logs various start-up information and service errors.

IIS Services

These log files are located on the Web Server in the \Windows\system32\LogFiles\W3SVC1 directory. They follow the format of exYYMMDD.log, where YYMMDD refers to the calendar Year, Month, and Day.

The date and time the log file was created represents the first request made on that day. These log all HTTP and HTTPS requests for that specific date. If there is no client activity on an WebCenter site that day, no log file is created.

- For example: ex122205.log was created at 5:46 am.
- This means that the first site activity for WebCenter was at 5:46 am and this log file contains all activity made on 12-22-2005.

Example IIS log file:

Time of request	IP address of client	Method	Page returned to client	Status code
17:09:52	10.31.226.94	GET	/WebCenter_Inst/images/logo_esko.gif	200
17:09:52	10.31.226.94	GET	/WebCenter_Inst/images/bg_Dots2.gif	200
17:10:18	10.31.226.94	POST	/WebCenter_Inst/dologin.jsp	200
17:10:18	10.31.226.94	GET	/WebCenter_Inst/home.jsp	200
17:10:18	10.31.226.94	GET	/WebCenter_Inst/homepage.jsp	200

JBoss Service

These log files are located on the Application Server in the \Artios\WebCenter\ApplicationServer\JBoss\server\default\log directory. You can also download them from the [WebCenter user interface](#).

- Boot.log and Server.log: These record JBOSS startup activity. The created date and time of this file represents the last time the WebCenter JBoss service was started or restarted.
- server.log.YYYY-MM-DD: this records the server activity for the specified day, where YYYY-MM-DD refers to the calendar Year, Month, and Day.

Viewer Applet

This log file is located on the Application Server in \Artios\WebCenter\ApplicationServer\program directory.

- imageList.log: This logs information about the View & Annotate Tool.

Change logging level for troubleshooting

You can adapt the logging level in `<webcenter_install>\ApplicationServer\Jboss\server\default\deploy\jboss-logging.xml`.

Levels are:

- NONE = don't log anything
- SEVERE = logs only the important issues
- WARNING = logs all of the above but also possibly unexpected but less critical problems
- INFO = logs all of the above and a lot of information about internal state
- FINE, FINER, FINEST = logs all of the above and debugging output in 3 levels of detail
- ALL = logs everything

Log levels should not be changed in general, but might be changed for troubleshooting reasons (increase logging) or on heavy loaded systems to reduce disc spamming with logging data (reduce logging).

Note that these changes can be made to the app server logging without needing to restart the JBoss, the configuration is reloaded dynamically.

Logging can be changed for the console by changing the name attribute value of the level node in the console handler: `/logging/console-handler/level`

```
<level name="ALL"/>
```

It can be changed to any of the mentioned levels.

Logging can be changed for the file based log by copying the level node mentioned above to: `/logging/periodic-rotating-file-handler/level` and again adapting the level.

It is also possible to do more granular logging adaptations, for that just go to the bottom of the config file.

```
<logger category="com.esko">
  <level name="INFO" />
</logger>

<logger category="com.esko.webcenter.src.root.BaseObjectDB">
  <level name="INFO" />
</logger>

<logger category="WEBCENTER">
  <level name="INFO" />
</logger>

<logger category="appx">
  <level name="INFO" />
</logger>

<!--<logger category="com.esko.webcenter.search12">
  <level name="ALL"/>
</logger-->
```

Here you see different possibilities to raise or lower the logging level.

The WEBCENTER category is used by some of the historical webcenter code. Recent or updated webcenter code will use a category matching it's class (e.g. 'com.esko.webcenter.src.util.Statement'). This allows to adapt logging levels up to the class. So the following would silence any logging information coming from the statement class.

```
<logger category="com.esko.webcenter.src.util.Statement">
<level name="NONE"/>
```

The categories are hierarchical (with the '.' as separator) which means that you do not need to declare each an every class all the time.

```
<logger category="com.esko.webcenter.search12">
<level name="ALL"/>
```

The example above will enable all (full detail logging) for all the classes/categories in the reworked search component. The actual logging level is determined by the best match declared here. So this specific example will enable all logging for 'com.esko.webcenter.search12.SomeClass' but 'com.esko.webcenter.src.util.Statement' will not be affected. That one is covered by the second last example or if that is not defined by 'com.esko'.

6.5.4. Interacting with services for troubleshooting

You can change any service to display activity in real-time by starting a .bat file:

- To start TomCat, open a command window on the Web Server at \WebServer\tomcat\bin. Enter wcr_tomcat_srv_cmdrun.bat to start the service interactively.
- To start JBoss, open a command window on the Application Server at \ApplicationServer\JBoss\bin. Enter wcr_jboss_srv_cmdrun.bat to start the service interactively.
- To start CadX, open a command window on the Application Server at \ApplicationServer\CadXServer\bin. Enter wcr_cadx_srv_cmdrun.bat to start the service interactively.

6.5.5. Possible Problems

Cannot connect to Database

If you attempt to access login page or login and then receive this error, these are the common causes:

1. You lost the connection to your database server for some reason.
2. You did not use the correct instance name during installation.

Something is preventing the database services from starting or staying started. First try the following first: Restart your database services. Verify you are using the correct Instance name.

In case that does not help, perform the following steps:

- Check the log files `JBoss\server\default\log\{server.log,boot.log}`. The inability to connect to the database is clearly indicated: `'ConnectionException'`.
- Read and interpret the messages that are passed by the: `'ConnectionException'`, they are quite descriptive.

Three of the most common connection problems are:

- The database is local but TCP is not enabled:
 - Look for the 'SQL Server Configuration Manager' in the Windows **Start** menu and start it.
 - In the network section, select Protocols for the WCR database (typically WEBCENTER) and enable TCP.
 - Go to the server services and restart the database in order to make the TCP enablement effective.
 - Restart the WebCenter Application Server.
- Browser is not enabled:
 - Go to the server that contains the database and ensure the database browser service is running.
 - Restart the WebCenter Application Server.
 - If it still does not work, you may try enabling the same option on the Application Server service and restarting the Application Server again.
- The connection information is incorrect:
 - Use SQL Management Studio (it should be on the Application Server since it is a prerequisite) and verify the connection information.
 - Once you have the correct connection information, we recommend you uninstall the Application and Web Server and reinstall them.

Cannot connect to Application Server

This usually means one of 4 things:

- WebCenter JBOSS service on the Application Server is stopped or has not finished loading yet.
- on the Application Server, verify WebCenter_Jboss service is Started. Restart it.
- on the Application Server, open the Task Manager; in the process view enable the threads column; the app server is started when the number of thread reaches or exceeds about 160.
- There is a JBOSS port conflict on the Application Server.
- Do port testing to ensure that port 1099, 4444, 2500 and 3873 are not in use when all WebCenter and OBGE services are stopped on the Application Server.
- During the Web Server installation, the name of the Application Server was not entered correctly.
- On the Web Server, Using Notepad, Edit `\Artios\WebCenter\WebServer\tomcat\webapps\WebCenter_Inst\Web Server-INF\classes\jndi.properties`.
- Ensure name of the Application Server is correct with the correct port number.

Note: The Web Server needs to locate the Application Server based on the host name (strict requirement, see NAT section).

- Restart WebCenter services on both the Web and the Application Server if changes were made.
- The Web Server cannot access the Application Server (meaning Tomcat can't talk to JBOSS).
- Ensure you can telnet to the Application Server's IP address on WebCenter ports (default 1099, 4444, 2500, 3873) from the Web Server.
- Use this syntax: telnet <ip_address> <port_number>.
- Ensure that you get a Java response and successfully can telnet on each port.
- Ensure that if you are using NAT that you have configured the Web Server and the Application Server appropriately.

Page 404 after logging in

In this case you can access WebCenter's login Page. However after you enter in login credentials, you receive a "Page 404" rather than WebCenter's home page.

- 99% of the time this is because all WebCenter services haven't finished starting completely.

Could not load a valid license for WebCenter

Usually this means you don't have a license or the license has expired.

- Make sure you have a WebCenter License and you have activated it (see the License Manager User Guide for more information).
- Contact Support hotline to ensure your license has not expired.

Cannot access WebCenter site from external Internet

In this case you can access the site by using the Web Server machine name or IP address within the LAN (i.e. MBCWEBSERV/WebCenter_Inst), but you cannot access the site(s) using the registered domain name over the internet (for example http://www.meeberboxcompany.com/WebCenter_Inst).

- Verify that your ISP has registered this domain name with an 'A' record setup with your ISP.
- Verify that your ISP is forwarding HTTP and HTTPS traffic for this domain name to your firewall.
- Verify that your Firewall routes HTTP and HTTPS traffic to the Web Server server within the DMZ.
- Ensure IIS on the Web Server is configured to receive HTTP or HTTPS traffic on correct port and assigned IP address.
- Refer to the **Exposing WebCenter to the Internet** section in the Installation Guide to review the things needed to access your site from the external Internet.

Note: It is recommended not to use internal server names as this will cause certificate errors for valid certificates.

Automation Engine error when publishing to WebCenter site

You will only get this message on Automation Engine servers that attempt to publish files to a secured WebCenter site that uses `https://`.

If for example the SSL certificates haven't been installed properly on the WebCenter Web Server, all Automation Engine Publish tasks will fail with the following error message:

```
javax.net.ssl.SSLHandshakeException:  
sun.security.validator.ValidatorException: PKIX path building failed:  
sun.security.provider.certpath.SunCertPathBuilderException: unable to  
find valid certification path to requested target
```

To fix this, you can either:

- make sure the certificates are installed properly on the WebCenter Web Server (see [Secure your WebCenter Site with SSL](#) on page 50 in the Installation Guide),
- import the WebCenter site's SSL certificates into Automation Engine's keystore (see [Install SSL Certificates on the Workflow Production Server](#) on page 59 in the Installation Guide).

Cannot use WebCenter SQL Server Database after a restore

Anytime you restore an WebCenter SQL Server database, you must run a stored procedure to fix orphaned logins before the database is usable.

- Run a manual query against WebCenter4_0 database: sp_change_users_login auto_fix, webcenter, null, XXXXXX
- Alternately, follow the instructions at the end of [An Example Restore Plan](#) on page 1055.

VRML 3D Animations "stutter" and some graphics may be missing

When viewing a 3D Model on a server, this is to be expected as servers generally do not have good quality graphics cards.

For clients, when both ArtiosCAD and Cortona are running on same video card, both using Direct3D or OpenGL to draw 3D designs with a moderate amount of graphics, there is competition for video card memory. This causes Cortona to "stutter" while running animations and some graphics may be missing. There are 3 possible workarounds:

- Close ArtiosCAD and re-open VRML in Cortona.
- Specify that Cortona is to use 'R98 Renderer'.
- Upgrade your Video Card.

No license present to use the Launch API

Sometimes this error appears when trying to use the View and Annotate tool. Sometimes everything seems to stop working in WebCenter all of a sudden. To resolve:

- Restart WebCenter and OBGE services on the Application Server.
- Try again. If still get error, then verify that the Graphics license has the Task Launching API module in it (flfastif).
- On OBGE edit \Esko\bg_data_system_v010\licenses.dat.
- Verify that it contains an 'flfastif'. If not, have a new license file generated.

The Page cannot be displayed

This means that IIS and/or WebCenter Tomcat service on the Web Server are Stopped.

The Viewer suddenly stopped working on a Windows XP client

This is a known problem with Windows XP, when an older version of Java is installed on client by another application.

To fix, clean out the Java Applet Cache. This will allow our applet to use the most recent Java version.

- From Control Panel, open Java configuration.
- On General tab, in 'Temporary Internet Files' section, click the <Delete Files> button.
- Check all settings, choose <OK> to empty cache.
- Click <OK> to exit.
- Attempt to access Viewer tool again. Applet should load now.

6.5.6. E-mail Troubleshooting

Symptom: You get a "Mail Server Connection Error" while trying to send a Test Mail.

Possible resolution: This means that the service cannot connect to the specified mail server. It can either be down, not accepting external mail session connections, or unreachable from your current subnet.

First, try to connect to the mail server manually. This is done by running the **telnet** command from the command prompt on the appropriate Application Server.

The syntax for telnetting to the mail server is: **telnet <MAIL SERVER NAME> <LISTENING PORT>**

For example, **telnet mail.eskowebcenter5.com 25** tries to connect to the mail server `mail.eskowebcenter5.com` that is listening for mail session connections on port 25.

If the telnet command connects to the server, you should also send a **EHLO** command in the Command Prompt window, to make sure it is prepared to accept incoming e-mail messages. The Output of the EHLO command should return **OK** on the last line. If the output return another result, consult your mail server administrator.

Symptom: Sending a Test Mail succeeded but WebCenter notifications are not sent.

Possible resolution: This situation points toward a possible error in notification handling on the client and/or server side. You should first check the Application Server and the Web Server logs for any error messages.

On the Application Server:

- mail service is logging under this header: `com.esko.webcenter.service.MailDispatcher.onMessage`
- notification message e-mail creation and sending to a JMS queue is logging under this header: `com.esko.webcenter.mail.MailNotificationBean`

On the Web Server:

- notification message data preparation is logging under this header: `com.esko.webcenter.jsp.TaskNotificationMgr` (where the Task part is replaced by an

appropriate Notification Type that you're looking for; other possibilities might be ApprovalNotificationMgr, ProjectNotificationMgr and so on; search for NotificationMgr inside the Web Server log file).

Note: WebCenter MBean Services will have their own log files in the future.

If you cannot find any suspicious log messages related to any of the notification dispatchment phases, you should also check the **JMS E-mail Queue** for corrupted messages that block correct messages from being sent.

To check a JMS Queue, open the JBoss admin console that is used to inspect all running JBoss services. To open the admin console, open a browser and point to the following URL: `http://<Application Server Host Name>:8086/admin-console/` where `<Application Server Host Name>` is the host name of the machine that is running the WebCenter JBoss (if it is the current machine, then you can just use localhost).

Note: Even though the JMX console is listening on port 8080 by default, WebCenter uses port 8086. As username and password use bgsystem and XXXXXX.

When you open the admin console, you have to locate the appropriate E-mail Notifications JMS queue, which actually is a JBoss service. It is found at `<hostname> > JBossAS Servers > JBoss AS 6 (default) > JMS Manager > JMS Queues > jms.queue.WCRMaiQueue`. From here you can check how many messages are waiting in the JMS queue (message count). From the control section you can also flush the queue.

An alternate way to flush the queue is disabling e-mail in the WebCenter e-mail settings. If you don't plan to use notifications, e-mail should always be disabled to prevent the mail queue from filling up.

Symptom: If the e-mail notification seems to be sent correctly, but the recipient doesn't receive it:

Possible resolution: This situation indicates that there are issues on the mail server side. The e-mail service within WebCenter is only responsible for connecting to an appropriate mail server and dispatching e-mail message through this connection. Further processes that run on the mail server side are out of the scope of WebCenter. There are several aspects of the mail server configuration that affect if the WebCenter notifications really get sent to the appropriate recipients:

- **Spam policy:** messages may be considered spam by the server. It is important to have a valid e-mail address in the FROM address field on the E-mail Environment Setup page in case there is a spam policy in place on the appropriate Mail Server
- **Authenticated mail session:** this situation is already observed by the e-mail service, but some mail servers might be configured more strictly in this respect.
- **Internal vs. external recipient addresses:** some mail servers are configured to process outgoing e-mail messages based on their target e-mail addresses. The distinction is between internal addresses and external addresses is determined by the domain part of the address. For example, the domain part of `user@esko.com` is `esko.com`. The mail server may be configured to dispatch e-mail messages to an internal address (so, from the example above, a mail server with hostname of `xxxx.esko.com` would consider `user@esko.com` to be internal, while `user@elsewhere.cz` would be external), but it would not send any messages to an external target.

All these issues are determined by the setup of a given mail server, so if you encounter any indications toward such issues, consult the mail server administrator.

But how would you find out what happens on the mail server when the WebCenter mail service communicates with it? There is an option to turn on a debug mode for mail sessions in the Mail Dispatcher MBean.

To do so, open the JMX Console of the running WebCenter JBoss Server and open the management interface of the Mail Dispatcher Mbean (at the bottom of the entire list of registered Mbeans under the section **webcenter** and service name **service=MailDispatcher**). Inside the management interface is a List of Mbean Attributes.

Change the **DebugSession** attribute to **TRUE**, which will switch the mail session to debug mode.

If you turn on debug mode, the log file on the Application Server will contain a log of the communication between the WebCenter mail server and the mail server. Inspect these extra log messages to see what your problem may be and report the results to the mail server administrator.

6.5.7. Troubleshooting proxy servers

The influence of proxy servers on your configuration

A proxy server services the requests of its clients by forwarding requests to other servers. The client is mostly a browser but it can also be another computer program like Automation Engine.

The proxy server provides the resource by connecting to the specified server and requesting the service on behalf of the client. A proxy server may optionally alter the client's request or the server's response, and sometimes it may serve the request without contacting the specified server.

A proxy server that passes all requests and replies unmodified is usually called a gateway or sometimes tunnelling proxy.

For the Automation Engine to WebCenter connectivity, proxy servers that just act as a gateway are ideal. No extra configuration is required.

- In the other case (not a pure gateway) it can happen that the proxy server is programmed to act differently than expected on the Automation Engine calls to WebCenter.
- It might decide to just not pass them through; Automation Engine to WebCenter upload fails.
- It might request authentication; nobody there to answer the authentication request since Automation Engine is an automatic program.
- It might bother the Java viewing.
- It might slow down the communication.
- It might bother the JMS connectivity in the approval feedback.

Most problems can be solved by bringing the proxy server closer to the ideal gateway situation. However, in many cases it is difficult to convince the local IT people to do any changes to the setup.

How to detect proxy problems?

Proxy problems are mostly detected because certain operations between Automation Engine and WebCenter fail:

- Upload from Automation Engine to WebCenter fails.
- Approval feedback from WebCenter to Automation Engine fails.

Proxy problems are not the only possible reasons why these operations can fail. Other reasons are:

- Wrong parameters in the upload ticket (mistakes with user accounts, passwords, network address of the web server, ...).
- Broken networks

The best way to troubleshoot is as follows:

- Check whether you can reach WebCenter from a normal internet browser from the Automation Engine computer. If that doesn't work, first troubleshoot this. Check whether WebCenter itself is on the internet (can you reach it from anywhere?). If that works, try reaching Google from the Automation Engine computer. If that doesn't work, your Automation Engine computer is not connected to the internet. Contact local IT to get this fixed. If you can reach Google, but not WebCenter and you can reach WebCenter from outside, then there is a big chance that proxy settings are in the game.
- If you can reach WebCenter from a browser but upload doesn't work, then first check the connection in Automation Engine configure (there is a check button). If this works, double check the ticket settings. If it doesn't work, it means that Automation Engine doesn't have the same abilities to go to the internet as a browser. Mostly this means that the browser has a proxy setting in use.

In your browser, check the LAN settings for your internet connection. In Internet Explorer, this is found under Internet Options, Connections. There you normally can see whether a proxy server is used and what settings it uses for the HTTP connection. These same settings need to be used by Automation Engine.

You need:

Name of the proxy server for HTTP, further called proxyHost

Port number, further called proxyPort

In some cases (not so common) it is also possible that the proxy server demands authentication. You might see this because an authentication window displays when trying to connect to Google or WebCenter via the browser. In that case you'll also need a username and a password. You should get this from local IT.

This username is further called proxyUser and the password is proxyPassword.

We have a tool (makeurlconnection.jar) to test a connection with these settings before even trying them out of Automation Engine. The tool is used as follows:

Save the **makeurlconnection.jar** file somewhere on the disk of the Automation Engine server. Open a command prompt, go to that directory and type the following command:

Simplest form:

```
Java.exe -jar makeurlconnection.jar http://the_url_to_the_login_page_of_their_webcenter.
```

Note: The above command supposes that java.exe is in the path. If not, you need to specify the location of java.exe, for example.

```
"C:\Program Files\Java\jre1.6.0_01\bin\java.exe" ... (other parameters as above)
```

It also supposes that it is Java 1.6. It is possible you need to install Java 1.6 first.

This checks whether a connection can be made without specifying anything about the proxy server. If this works, you get the WebCenter login html code dumped on your screen (scroll back to verify this). If it doesn't work, you either get an error message or it hangs (type Ctrl-C in that case).

In case it doesn't work, try specifying the just-found parameters. The most complex form is:

```
Java.exe -Dhttp.proxyHost="name of their proxy server"  
-Dhttp.proxyPort="80"  
-Dhttp.proxyUser="their_domain_if_applicable\user name"  
-Dhttp.proxyPassword="guess what comes here"  
-jar makeurlconnection.jar http://the_url_to_the_login_page_of_their_webcenter.
```

Note: All the parameters are case-sensitive. Get help from your local IT administrator if necessary.

Once you know these settings, you need to use them in Automation Engine.

Running cfsedt2.bat in ..\bg_prog_fastserverctlnt_v070\com_win. Browse to the keys as shown in the screenshot and modify the values. Do a "net stop bgmd" and "net start bgmd" to activate the changes. Then the upload from Automation Engine to WebCenter should work.
